KEW GARDENS contain a good collection of species of *Catasetum*, *Cynoches*, and *Mormodes*, the plants exhibiting good culture. The species flower at varying times of the year, but at present a more than usual number is in bloom. The following is a list of the species noted in flower at Kew during the past week.—*Catasetum Bungeorhizii*, *C. B. var. aureum*, *C. callosum*, *C. Darwinianum*, *C. fimbriatum*, *C. labiatum*, *C. Lemosii*, *C. macrocarpum*, *C. maculatum*, *C. meentosum*, *C. Oerstedii*, *C. planiceps*, *C. Russellianum*, *C. spinosum*, *C. splendens* and its varieties, *C. tabulare*, *C. t. var. levis*, *C. uncatum*, *C. viridiflavum*, *Cynoches chlorochilon*, *C. Egertonianum*, *C. Loddigesii*, *C. pentadactylon*, *C. peruvianum*, *Mormodes badium*, *M. b. var. luteum*, *M. Buccinator*, and *M. pardina*.

NURSERY NOTES.

MESSRS. HUGH LOW & CO., BUSH HILL PARK.

LESS than thirty years ago this nursery business was carried on at Clapton, London, N., but owing to the district having become very densely populated it was necessary to remove further away from the centre of population. The larger area available at Enfield enabled the firm to develop the nursery business on wholesale lines and to give more attention to the raising of fruit trees of a hardy kind. The firm also specialises in Carnations, especially in the American or perpetual-flowering varieties, Figs, and Vines in pots, stove and greenhouse plants, Orchids, and Water Lilies. The nursery embraces about 10 acres, with many glass-houses, nearly all of which are span-roofed structures. The land is situated at the end of the village street, and is a little less in altitude than Enfield town, which is distant about one and a half miles, Bush Hill Park Station being on the Great Eastern Railway about half a mile distant. The land consists of level tracts which at one time were under pasture and arable culture; the soil is of considerable depth, as

much as 5 feet in parts, and is of good quality to its fullest depth. It consists of a rather heavy sandy loam, which is very suitable for the growing of fruit trees, and imparts to them fine vigour and foliage of a healthy tint. The trees of hardy kinds form a large stock in standard, bush, dwarf, double or single cordon, and other forms. A speciality is made of cordon trees of Apple, Pear, Plum, and

Nonsuch, Ecklinville Seedling, Cox's Orange Pippin, Allington, and Kerry Pippin Apples as cordons were noted. Fan-trained Apple trees, chiefly desired by Scotch gardeners, were observed in some numbers. Trees with horizontally-trained branches are preferred by the English gardener; but it is not a matter of much consequence in Apples and Pears, although in the case of stone fruits the fan form is the

FIG. 90.—CATASETUM CLESIANUM: FLOWERS GREENISH YELLOW.

Cherry for planting against walls, fences, and buttresses, for which last purpose the double cordon is very suitable. As will be understood, the cordon trees are erect in form, but they are readily bent at any reasonable angle in an oblique or horizontal direction. Excellent examples of Lane's Prince Albert, Peasgood's

only method applicable. The breaks of maiden Pears afforded a perfect picture of uniform growth, the height of the trees averaging 5 feet. Plums, have this year made very sturdy shoots, of more than average length.

There were trees of various varieties of Plums as low standards or bushes having stems from

3 to 4 feet high. For this type of tree the demand to-day is a very large one. They are sold under the trade term, "untrimmed." In this nursery the side shoots are not trimmed till the third year from the bud, and then only the lower ones are removed, and the upper left so as to afford strength to the stem. This practice is followed with other fruits, and the result is a stout stem that carries its head without bending under the weight, which it usually does under the "whip stock" style of cutting away earlier all the lateral growths. Nearly 80 varieties of Plums are grown.

Nectarines are worked only on the Brompton Plum stock, and of these a fine lot of dwarf trees were observed. There are this year four acres of trained Plum trees, and among them I noticed the varieties *Monarch*, *Rivers' Late Blue*, *Denyer's Victoria*, *Jefferson*, *Coë's Golden Drop*, *Greengage*, *Red* and *White Magnum Bonum* were largely planted.

Of trained Pear trees there are large numbers, including 2,000 trees of *Williams' Bon Chrétien*; likewise great quantities of *Doyenné du Comice*, *Louise Bonne de Jersey*, *Beurré Diel*, *Pitaston Duchess*, *Jargonelle*, *Marie Louise*, &c., all of them being varieties that find a ready sale.

The Cherry makes beautiful growth in this sandy loam, but it is not too rapid, and thus no sign of gumming was apparent in the shoots. There are large breaks of *Morello*, *Belle Magnifique*, and *Carnation*, which possess the *Morello* character. Some of these trees are trained in the fan form, and the training is so managed that sun and air have access from both sides, consequently perfect ripening of the wood is obtained.

The breaks planted with Peach trees number half a dozen. The trees have stems varying in height from 2 feet to 7 feet. The list of varieties is considerable, and I was informed that *Hale's Early*, *Grosse Mignonne*, *Sea Eagle*, *Early Crawford*, *Thomas Rivers*, *Late* and *Early Admirable*, *Mr. Gladstone*, *Duchess of York*, *Peregrine*, and *Duchess of Cornwall* are in greatest demand. Nectarines that are favourites with planters are *Pineapple*, *Erluge*, *Stanwick*, and *Dryden*. Some breaks of two-year-old Apple trees, worked on the broad-leaved *Paradise* stock, were noted in fruit, to the number of four to six on each little specimen. The varieties included *Peasgood's Nonsuch*, *Bismarck*, *James Grieve*, a cross between *Peasgood's Nonsuch* and *Cox's Orange Pippin*, possessing the flavour of the latter, *Cellino*, and *Worcester Pearmain*. *Brambles* and *Bramble* hybrids showed healthy growth. They consisted of the *Loganberry* and the *Lowberry*, a cross between the common *Blackberry* and the first-named. It bears capital fruit, which is suitable for dessert, as well as for making jam.

The break of maiden trees of *Damsons*, such as the *Crittenden*, *Fairleigh Prolifera*, and *King of Damsons*, leaves little to be desired. Mention must be made of a plantation of standard Apple trees consisting of new varieties, such as *Chas. Ross*, the fruits of which improve as the tree ages; *Allington Pippin*, *Emmeth's Early* (syn. *Early Victoria*), an Apple from the Fen district which is said to have a future, as being superior to *Lord Suffield* and bearing transit well. The fruits of *Newtown Wonder* are as large as those of *Bramley's Seedling*, and the tree has the advantage of coming earlier into bearing, whilst the fruit is good enough for use as dessert when nearing the end of its season.

A speciality in this nursery are trained *Gooseberries*, mostly on stems 4 feet in height, useful for growing on warm walls for early ripening and on northerly ones for lengthening the *Gooseberry* season. The plants are likewise trained on the gridiron pattern. *Gooseberries* occupy five acres of land.

Of other fruits grown largely I may mention *Vines* and *Figs* in pots, the *Figs* being tall and also short-stemmed, and many of them bearing immature fruit. *Golden Privet* was observed in great quantity as standards about 4 feet high.

A large stock was seen of *Acer californica aurea*, a beautiful golden-leaved Maple. For effect it is better than *Acer Negundo variegata*. F. M.

CULTURAL NOTES.

WATERING: GOOD METHODS AND BAD.

The summer of 1908 will be remembered by gardeners as one of the most trying in recent years because of the constant need for watering large plants as well as small. In this connection it is interesting to note that there is a fixed theory amongst certain professional gardeners to the effect that if once the watering of border plants is begun, it must be continued practically every day until a really heavy downpour occurs. The gardener who believes in this principle does not put it quite in that way, perhaps, but presumably this is what he means when he says "If you start watering you must keep on," and he argues that if you cannot "keep on," you had much better leave the plants to take their chance of perishing from the drought.

One cannot believe that this argument is entirely sound, although, of course, there is reason in it up to a certain point. But it is only when watering is done improperly or imperfectly that it becomes a daily necessity. Rough and ready watering or, worse still, mere surface sprinkling, is bad, and for good reasons. Flooding the ground roughly by tipping a canful of water out at the roots of a plant, and thereby washing away the soil and exposing the roots, besides creating a hard-washed surface which will cake hard directly it dries again, is certainly bad, since half the water used runs away; while sprinkling simply encourages the plant to form small roots near the surface only to have them dried up again directly the sun absorbs the moisture. Plants watered in either of these haphazard ways cannot flourish and would certainly be better if left alone, but this is not real watering. Watering, if properly done, need not be perpetually repeated, and although it takes much time on each occasion when necessary, its results are lasting and its effect satisfactory to the plant. A plant well watered only once in a long drought must be better than one not watered at all.

Large plants, such as *Roses*, *Dahlias*, or ornamental trees and shrubs, are worth extra trouble, and the ground around them should be carefully prepared for watering. A small hoe, gently used, will remove the top inch or two of soil so that the roots are almost exposed; the plant is then thoroughly but gently watered, and the soil drawn back as before after the water has been all absorbed. Smaller plants may be treated in more wholesale fashion with a nozzle of suitable coarseness fixed to the hose or can, and the operation must continue long enough to soak the soil to a depth of some inches. When the surface begins to dry it should be gone over lightly with a Dutch hoe or fork so that the top layer of soil may be rendered friable. A well-worked surface will retain moisture three times as long as one that is caked or lumpy.

If watering be carried out according to either of the foregoing methods there will be no occasion to "keep on," even in the driest weather, for soil thus moistened will remain so for days together. Even better results are obtained by mulching after a good application of water, and subsequent waterings through the mulch will not cake the soil or evaporate quickly. The only disadvantage to mulching is that it is too untidy except in the kitchen garden, as the birds search amongst it for insects in dry weather. The points to bear in mind in applying moisture by artificial means are the roughness, gentle application, and the prevention of rapid evaporation. Edw. Sisson.

THE ROSARY.

A ROSE HOUSE.

THE sketch given at fig. 91 shows a section of a most useful and inexpensive span-roofed structure for growing *Roses*. I have found this type of house to answer admirably, as a portion or even the whole of the roof can be removed entirely during the summer months. Top ventilation can also be given by ventilators regulated by iron rods on either side, opening upwards from the ridge board, and admitting air without creating a draught. The lights, which measure 6 feet by 4 feet, are removable, being held by two screws through each into the purlin and wall plate. The ventilators—4 feet by 2 feet—are hinged on the top of the lights, and open away from the ridge, so that practically the whole roof can be removed by this very simple plan. Front ventilation is secured by movable boards, 9 feet long and 9 inches wide, facing a row of 4-inch hot water pipes. In a house 50 feet long eight posts are required to carry both purlins on either side, and three posts to carry the ridge board, besides the door and end. Up these and along the purlins strong free-blooming *Tea* and *Noisette* *Roses* of climbing sorts can be trained. The front stage can be used for pot plants, or, being removable, it can be dispensed with, and the ground, if desired, be occupied and planted like the rest. The site of the *Rose* house should run from north to south, and be on well-drained mellow loam, that has been trenched 2 feet deep, and had incorporated with it a good dressing of half-inch bones and well-fermented manure. The digging is best done some weeks in advance of planting, as it allows the ground to settle down. The months of September and October are suitable for this work. In the middle bed I should suggest planting half and quarter standards of sorts given below, and

FIG. 91.—A ROSE HOUSE.

A, ventilators, 4 feet x 3 feet; B, hot-water pipes; C, plant stage, 9 feet x 3 feet; D, purlins, 4 feet x 2 feet; E, side posts, 6 feet to eaves; F, standards; G, purlins and ridge board; H, hinge to ventilator.

dwarf plants nearer to the front. Good established *Roses* in pots for turning out can be procured from most nurserymen, and they can be gently forced the first year, but fresh plants lifted from the ground in October would require to be planted a season to establish themselves in the ground before any attempt is made to force them, so that, in using already established plants, there is a clear gain of a season. For planting out the *Hybrid Tea* *Roses* give the best results in freedom and perpetuity of flowering, and any of the following varieties can be selected to answer the purpose:—*Lady Batterssea*, *La France*, *Caroline Testout*, *Duchess of Albany*, *Killarney*, *Mrs. W. J. Grant*, *Mildred Grant*, *Perle des Jardins*, *Niphetos*, *Safrano*, *Liberty*, *Madame Abel Chateaux*, and *Kaiserin Augusta Victoria*. These varieties answer admirably grown either as short standard or dwarf plants. J. D. G.

FLORISTS' FLOWERS.

THE CARNATION AND PICOTEE.

THE month of September is a busy time for the cultivator of the *Carnation*; it is the month for removing the layers from the parent plants, either for planting out in the open ground or for wintering as pot plants in garden frames. It may be of value at this season to describe the various sections or classes into which the *Carnation* and *Picotée* are divided, and also to fully describe their cultural requirements. These charming garden flowers are exceedingly popular, and they are not only

easily cultivated, but are so cheaply purchased that they are within the reach of even the cottager. Those persons who are able to refer to the volumes of the *Gardeners' Chronicle* of 20 years ago will find that as far as border Carnations were concerned the most popular were the florists' types of bizarres and flakes and the white-ground Picotees. The aim of the florists for 100 years and more was to produce perfectly formed flowers, with certain defined colours, and anything outside this standard of excellence was promptly rejected; but it is quite evident that as far as this florists' type is concerned the acme of perfection has already been reached, as during the last half century no real improvement has taken place. The first class of the florists' type is the scarlet bizarre, and the leading point after perfect form of calyx and corolla is a white ground; on this white ground are flakes of scarlet and maroon. The next class is the crimson bizarre, with flakes of crimson and purple on the white ground; there is also the pink bizarre, with pink and purple flakes. Others are known as purple, scarlet, and rose flakes; these contain one of each of these colours in flakes on the white ground.

The white-ground Picotees form a very charming class, and the standard of excellence is well defined. The white ground, as in the Carnation, is a *sine qua non*. It has taken years of careful selection to obtain the admirable varieties now in cultivation; a true Picotee has a margin of red, purple, rose, or scarlet, of various widths, light, medium, or heavy, but no marks of any colour except on the margin. It requires the production of many hundreds of seedlings to obtain one really perfect white-ground Picotee; but in the process of selection many good self colours are obtained. In crossing two light purple-edged Picotees, the flowers white with a margin of purple, so light as to be scarcely discernible, a fine purple self was raised, and it was put in commerce under the name of Purple Emperor. Self colours are freely produced from the flakes and bizarres, as well as from the white-ground Picotees.

Another class or section is the yellow-ground Picotee. In all respects except colour this class has similar properties to the white-ground Picotees. It is only during recent years that this section has attained to the high standard of excellence of the white grounds. Mr. Martin Smith, Hayes, has produced the best varieties in this class. He made a great advance eight or ten years ago in raising from seed (Child Harold); the latest production from Hayes is John Ruskin, a variety with clear yellow ground, perfect in form, and with a margin of red.

The most popular type of border Carnations are the self colours and fancies; they are usually of vigorous growth. The selfs are held in greater estimation than the fancies. A fancy Carnation is not easily described: those with yellow grounds are held in greater estimation than those with white, and it may be stated in brief that any Carnation that does not fit into the above classes is termed a fancy.

The next two sections are practically confined to greenhouse culture. The Souvenir de la Malmaison type is well known; the best still are the old blush and pink varieties, but amongst the new varieties there are some of great beauty and value, both for greenhouse and conservatory decoration, as well as for cutting.

The tree or perpetual-flowering Carnations are deservedly popular; these are readily distinguished from the other types by their habit of throwing out growths from the main stem, and their great value consists in producing flowers in winter, if a proper temperature is maintained, but they will not produce good blooms, if any, in an ordinary greenhouse from which frost is merely excluded. It is of great importance in the culture of Carnations that the plants be free from insect pests and fungal diseases. If they are clean at the start their subsequent culture is easy.

Growers are now removing the layers from border Carnations and Picotees, and one moiety is planted out in the open garden, while a number are potted into medium or large 60s, one plant in the smaller and two in the larger pot. First as to planting, for which the ground should be prepared at least six weeks previously. The soil should be deep, not less than 15 inches, and if manure is added it should be placed 6 inches below the surface. The time of planting is not material. Some 25 or 30 years ago the pitmen and mechanics on Tyneside used to produce magnificent blooms of flaked and bizarred Carnations, as well as the white-ground Picotees. The sweepings of Newcastle Cattle Market was considered the best manure, and it was thought the second week in November was the best time to plant out the layers; this may be done any time after the middle of September and on to the middle of November. If there is any reason to fear damp in winter the beds should be raised about 6 inches above the surrounding land, and mortar rubbish is excellent to mix with clay soils. The plants should be set out 15 inches asunder each way. Any plants needing it should have a stick put to them for support, and as a protection from severe frosts in winter a light mulching of manure from a spent hot-bed is excellent. The layers must not be allowed to remain long out of the ground; they should be planted almost at once, covering the stems up to the first pair of leaves. It is well to have some plants of each variety potted up in case of accidents during winter, for hares and rabbits, the leather-coated grub, wireworms, &c., may do mischief; moreover, those who cultivate for exhibition purposes will require a number of the best varieties to be potted now in small flower-pots, to be kept in frames through the winter and repotted into their flowering-pots in the following March or April.

The greenhouse and conservatory Carnations—that is the Malmaison and perpetual-flowering types—require different treatment to those described. The Souvenir de la Malmaison Carnations are propagated either from layers or cuttings. They are layered as soon as the flowering period is over, the earliest in May; and as soon as the shoots are well rooted they are removed from the parent plants and potted into large 60 flower-pots; a succession is obtained by repotting at various times. Two-year-old plants are grown in flower-pots 10 or 11 inches in diameter. The Carnations do best in a minimum temperature of 55°, and will flower in March or April; but for flowering all through the winter the tree Carnations are alone to be depended upon. The earliest slips or cuttings may be taken off and put into a propagating frame in December, and a succession may be propagated until the end of March. These, as soon as rooted, are potted off into small 60s, and they must be grown in a moderately warm house until April; about the end of that month they will do best in ordinary garden frames, and by the end of May they may be put out-of-doors. The main point in their culture is to report them before they become root-bound. The earliest struck slips will be in 7-inch flower-pots by the month of September, and at that time they will produce the finest flowers in an ordinary greenhouse, and will continue so to do well into October. With the advent of November the plants require heat sufficient to bring the night temperature up to 55° and to dispel damp, as much moisture in the atmosphere at that time carries the outer parts to rot. The best potting soil for all Carnations is four parts good fibrous loam, one part decayed stable manure, and one part leaf-mould, with medium-ground oyster shells in lieu of sand, to keep the compost open. As to insect and other pests, red spider attacks the leaves in hot weather, but it can be combated by syringing. Green fly is destroyed by fumigations, and the "rust" which is sometimes troublesome is best treated by cutting off and burning any affected leaves. J. Douglas.

NOTICES OF BOOKS.

* KEW GARDENS.

KEW in its several associations, royal, historical, botanical and horticultural, is a fruitful theme for the able writer. The historical account of Kew to 1841, which appeared in the *Kew Bulletin* in 1891, the jubilee of the establishment as a national institution, is an admirable sifting of the records, local traditions and local histories, showing the origin and development of the Royal Gardens as a place of botanical study. We were promised then, in a subsequent number of the *Bulletin*, the completion of the history up to the present time, and as this can only be given thoroughly by those who have access to the Kew records, it is to be hoped that the present Director will be able to fulfil the promise made by his predecessor, Sir W. T. Thistlethorpe-Dyer.

Mr. Hope Moncrieff has dealt with the subject chiefly in its historical associations with royalty, and he has done this exceedingly well. Founded in the sixteenth century, it is supposed by the botanist William Turner, who spoke of his garden at Kew, it continued to be a garden of some repute until Sir Henry Capel acquired it. Evelyn visited him in August, 1678, and again ten years later, and speaks of his beautiful Orangery and Myrtum at Kew. He became Lord Capel, and his collections may fairly be regarded as the actual starting point in the botanical history of Kew." In 1730, Frederick, Prince of Wales, obtained a long lease of Kew House from the Capel family, and the grounds were laid out under the direction of the celebrated landscape gardener Kent.

After the death of this prince, his widow, the Princess Augusta of Saxe-Gotha, continued to live at Kew, and, before her death, in 1772, she gave to Kew Gardens the definitely scientific character they have ever since retained. She was helped by Lord Bute, who appears to have occupied the same position with regard to Kew as that subsequently filled by Sir Joseph Banks. Lord Bute was no doubt responsible for the employment of "Capability" Brown to plan the alterations in the grounds, and also for the selection of John Haverfield, who had charge of the gardens. He it was, no doubt, who engaged in 1759 the young Scotchman William Aiton, one of Philip Miller's Chelsea boys. Aiton's task was to work up a botanic or physic garden, and in doing this he worked himself up also, so that when Haverfield died in 1784 at the ripe age of 90, Aiton took entire charge.

George III., the "Squire of Kew," and his queen Charlotte, appear to have settled down to live the simple life at Kew, farming, gardening and looking after their children. Mr. Hope Moncrieff devotes nearly half of his book to the doings of the Georges at Kew, and it is most entertaining reading. We agree with him that Sir William Chambers did much to disfigure Kew with his "outlandish erections," most of which have long ago disappeared, the pagoda being the most conspicuous of those that remain. William Cobbett and John Rogers were employed as young gardeners under William Aiton, and the celebrated William MacNab was trained at Kew before he was selected, in 1810, as foreman in the Edinburgh Botanic Gardens, where he afterwards became curator. We may note in passing that history has somewhat repeated herself by sending a Kew-trained man to fill Philip Miller's old place in the Chelsea Botanic Garden, and another to that of the emperorship at Edinburgh. The Aitons appear to have shown a strong predilection for Scotchmen; their successors at Kew Gardens were Scotchmen, too.

* *Kew Gardens*, by A. R. Hope Moncrieff, with 21 full-page illustrations in colour, printed by T. Agnew & Sons, Ltd., London. A. & C. Black, 1908.

until the record was broken by the appointment, in 1886, of a Yorkshireman. Mr. Hope Moncrieff recognises the great services to Kew of Sir Joseph Banks, "virtually through the greater part of his life Director of the gardens," without salary.

George IV. did not care for Kew, and the second Aiton, being then Director of all the royal parks, allowed the gardens to fall into neglect, though they were still opened to "all well-dressed strangers" on Sundays in summer. At that time Kew had a formidable rival in the Royal Horticultural Society's gardens at Chiswick; Syon Park was also a great garden then. When the late Queen began to reign Kew had fallen so low that it was threatened with extinction, and it is a matter of history that had it not been for the exertions of Dr. Lindley, in 1840, at that time Editor of the *Gardener's Chronicle*, Kew, as a garden, would have ceased to exist. Fortunately for botany, for horticulture, and for the British Empire, "steps were taken and funds provided for bringing the gardens to the present position at once as a popular resort and as a national scientific collection."

always evident in the writings of those who have dealt with matters in which Kew has been concerned. We heartily recommend the book not only to those who want to know about our great national garden, but also to people who find pleasure and profit in good writing.

The 24 full-page coloured illustrations by Mr. T. M. Martin are beautiful little pictures, slightly exaggerated perhaps in colouring, but that is no doubt due to the process of reproduction. They are exquisite in design, and catch the spirit of the view exactly. "Wild Hyacinths," facing page 132, and the "Water-Lily Pond," facing page 64, are almost perfect pictures.

THE CHEDDAR PINK (*DIANTHUS CÆSIUS*).

PINKS, with their carpet-like stretches of foliage, studded in spring and early summer with numerous flowers, may well be termed one of the chief ornaments of the rock-garden. There are many types, from the miniature *D. glaucialis* to the robust and spreading *D.*

The Week's Work.

FRUITS UNDER GLASS.

By T. COOMBER, Gardener to LORD LANGATTCHE The Hendre, Monmouthshire.

The orchard house.—Plum, Apple, Pear, and other fruit trees growing in pots, that cropped early, are in a condition to be repotted. Pot trees require attention at their roots each year, as they soon fill the receptacles with roots that exhaust the soil. Preparatory to carrying out the work, cleanse the trees of any insect pests that may be present. Use clean pots, and put plenty of material for drainage in the bottom; also see that the soil about the roots is moist before the plants are turned out of the pot. As a compost, use rich loam, mixed with a small quantity of finely-broken mortar rubble, wood ashes, and bone-meal. Any trees that require increased root room should be afforded a larger pot; but do not give fully-grown trees extra rooting space. The operation of potting is best performed as follows:—Turn the plant out of the pot, place the ball of soil in a wheelbarrow, so that the stem projects over the wheel side, and, with a pointed stick, pick away the old soil from the ball with as little disturbance to the roots as possible; shorten with a clean cut any strong-growing roots that need it. Pot firmly, using the tanner freely and a piece of linn wood to push the soil down and well into the cavities, so that there may be no bare spaces about the roots. When this is finished, water the plants and place them in a cool, freely-ventilated house, or, if this is not available, they may be stood in the open, selecting a sheltered position for their staging. Stand the plants on a bed of ashes, and cover the pots with short litter. Keep the tree shaded from bright sunshine for a week or two, and syringe them overhead daily. Late-cropping trees, that have developed many vigorous shoots, should be pruned of these latter, for it will not only afford extra nourishment to the buds that are left, but allow extra light to reach the fruits. Ventilate the structure freely, and provide the trees with plenty of moisture at the roots, occasionally giving them a little liquid manure.

Melons.—Plants intended for late cropping should never be allowed to receive a check, and, owing to the altered weather conditions, this is likely to occur with late, more than with early plants. See that the temperature of the Melon pit remains steady, but do not heat the pipes sufficiently to cause a dry atmosphere. It is just as important to guard against an excess of atmospheric moisture, therefore syringing should be done carefully, and on bright days only. When opening the ventilators, particularly on cold and windy days, see that no draughts are set up, and when the sun is declining towards the end of the day, shut up the house entirely. Plants in flower should be afforded a temperature of 65° to 70° at night-time, with the usual increase by day. Pollinate the blossoms, and allow the young fruits to remain for some time after they are set before thinning them, so that no risk of unexpected failure is taken.

Strawberries.—The rains have benefited these plants, and they have made rapid growth. Every means should now be taken to ensure the proper ripening of the crowns. For this purpose, weak side shoots should be removed, and the plant confined to one strong crown. Remove all runners, also any weeds as they appear, and, in order to check the roots from growing through the drainage hole, turn the pots round occasionally. Stimulants, in the shape of weak liquid manure, can still be applied, and on no account allow the roots to become dry.

THE HARDY FRUIT GARDEN.

By F. JONES, Gardener to THE DOWAGER LADY NEWBOLD, Woking, Surrey.

Root-pruning and lifting trees.—The time is at hand when these operations must be done, and although it is too early at present to commence the root disturbance, preparations should be made and the necessary loam got ready. Generally speaking, good loam of medium texture is all that is needed, but, according to the nature of the soil, lime rubble, burnt soil, wood ashes, and other material may be added. These are operations that require

(Photograph by W. Irving.)

FIG. 92.—*DIANTHUS CÆSIUS*: THE CHEDDAR PINK.

Sir William Hooker was appointed director, a definite scheme was decided upon, and the State provided the means. Kew is now the envy of nations, whilst its popularity is revealed by the great crowds of visitors to be seen there daily, 50,000 on a Sunday afternoon being quite an ordinary number.

The history and topography of Kew are given by Mr. Hope Moncrieff in delightfully readable style. He does not say much about the inner workings of the establishment, but he says enough to satisfy the layman, and there are other sources of information for the searcher after "specifications." After reading his book, we felt grateful first that we had got out of it a wholesome idea of several eminent persons; secondly, a very good insight into the way that Kew was built, or, should we say, grew; and, thirdly, we were pleased to perceive in the author a right appreciation of the importance and value of Kew, an appreciation not

plumarius. Some are at home on sunny ledges, where their hanging foliage forms a curtain over the face of the rocks; others do well in rocky fissures or cracks of old walls, where they soon form large tufts. One of the most useful and easy of culture is our native Cheddar Pink. In the wild type (see fig. 92) the flowers are rather small, but the plant compensates for this defect by the freedom with which it produces its flowers. Many forms of the species are in cultivation, some having flower-stems 2 to 3 inches high, and bearing large single flowers, while others have branching stems and reach to a height of 6 inches or more. This species hybridises freely with *D. plumarius*, and many intermediate forms between the two exist in gardens, but they are not so neat and carpet-like in growth as in the type of *D. cæsius*. Few plants are so well adapted for planting on old walls or rocky ledges as the one under notice. H. Z.

care and should never be entrusted to unskilled persons, who may remove too many roots, or otherwise do harm. Young trees grafted on dwarfing stocks rarely require lifting or root-pruning more than once, if the work is done properly. The operations are resorted to more for the purpose of bringing the roots near to the surface than for checking growth altogether. In the case of young pyramid, bush, and other trained trees, lifting is better than root-pruning, as the roots can be easily examined and laid out carefully near to the surface. Large trees should be root-pruned and not lifted, and barren trees especially need root-pruning. If the tree is an old specimen and of no particular value as to variety, it is better to grub it up and plant a new tree in its place. In lifting, commence by taking out a trench at a suitable distance from the stem, varying in depth from 2 to 4 feet, according to the size of the tree. Very large trees may have half their roots lifted one season, and the remaining half the following year. This will not check the trees so much as if the work was done all at once. Sever any deeply-plunging roots, trim the ends of all damaged ones, and shorten others to the root if they are much above the surface soil, and if the old staple is very unsuitable, entirely replace it with fresh loam. Place the roots regularly near to the surface, tread the soil about them firmly, and finish the work evenly. Early-fruiting Peach trees are best seen to in October, directly the trees are cleared of their fruit. For stone fruits a little lime rubble should always be added, and in their case it is essential that the soil be trodden firmly.

PLANTS UNDER GLASS.

By THOMAS LUNT, Gardener to A. STIRLING, Esq., Keir, Perthshire, N.B.

Sonchus de la Malmaison Carnations.—Shoots that were laved last June are now well rooted, and should be severed from the old plants with a sharp knife. But then into Bunch pots, using as a compost good fibrous loam mixed with leaf-soil, lime rubble, wood ashes, and sand, but no manure. Use clean pots, and provide plenty of material for drainage purposes. Pot fairly firmly, especially around the collar, and in order that excess of water may not be given fill the pots with soil close up to the rim. Any plants that are leggy or drawn and require a support should be provided with a neat stake. If the plants become loose in the soil they seldom make satisfactory growth. Place the newly-potted plants in an unheated frame, which should be kept closed for a few days, and if the weather is bright, syringe them once each day. When they have recovered from the check caused by potting, ventilate the frame freely and allow the plants a maximum amount of light, for which purpose they are best stood close up to the glass and facing a south aspect. The bottom of the frame should be provided with a good layer of ashes. They may remain in this structure until frost is apparent, when they must be shifted to warmer quarters. But it must be remembered that in no place do Carnations succeed so well as in cold frames.

Roses in pots intended for early forcing that have had a suitable period of rest should be pruned, repotted, and placed in an unheated frame.

Enphorbia (Poinsettia) pulcherrima.—These plants should be removed from the unheated frame and placed in a structure having an intermediate temperature. Give them a position near to the glass, so that they may enjoy an abundance of light. Afford ventilation freely on bright days, and damp the foliage by means of a syringe each day if weather conditions permit. Maintain a moist atmosphere, and allow plenty of space around each plant, so that they may become sturdy, and not be so likely to shoot up when placed in a warmer temperature. The pots containing Poinsettias soon become filled with roots, and they can assimilate plenty of liquid manure.

Tender plants still in the open should be placed under glass, as frost may occur at any time. See that the floor and other parts of the house are not dry, for plants that have been in the open during the summer months suffer if they are subjected to a dry atmosphere when first brought indoors.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Potatoes.—Main crop varieties promise a heavy yield of tubers, but, unfortunately, the cold, wet weather has favoured the disease which is spreading in some parts, and especially in low-lying districts, where the soil is very heavy and retentive of moisture. The best plan will be to cut off the haulm and burn it before the Potatoes are lifted, but digging should be commenced as soon as possible after this is done, choosing fine weather for the purpose. I know of no better method of storing Potatoes than placing them in clamps. Tubers showing the slightest trace of disease must be rejected, and as the Potatoes are placed in layers a little newly-slaked lime should be dusted over it. As the clamp proceeds place suitable apertures for ventilation at intervals. This will prevent the Potatoes from heating. When they are placed in position a good layer of straw should be used as a covering, and then on top of this sufficient soil to exclude frost. Medium-sized tubers should be selected for next season's planting, and these should be spread out thinly in a shed that is well-ventilated. Seed Potatoes obtained from Ireland have again done remarkably well this year, giving far better results than any others. When the digging is completed clear the ground of all diseased tubers, weeds and rubbish, placing these in heaps and burning them at once.

Celery.—The plants in all stages of growth are remarkably healthy and growing vigorously, notwithstanding earlier in the season the foliage was much infested with the Celery fly. Celery will require much attention during the next two months; all unnecessary side growths and damaged leaves must be removed, weeds kept in check, and the plants fed liberally with liquid manure, which should alternate with ordinary waterings, more or less according as to the weather conditions. Frequent dressing of soot and some suitable artificial manure should be given, especially if the weather is showery. It is advisable to employ three persons when digging soil about the stems, one to place the foliage in position, and the others on either side to do the necessary spade work. Avoid adding too much soil to the stems at one time, as when it is placed in small quantities the growth of the plant is better. When specially fine heads are required for exhibition or other purposes, the blanching should be done by means of bands of stiff brown paper tied around the stems. In this case also, it is advisable to do the blanching gradually, for which reason the paper should be added about 4 or 6 inches at one time, allowing about 10 days to elapse before another 6 inches is applied. Before commencing to place the band in position, sprinkle a small quantity of fresh soot around the base of each plant.

Beetroot should be examined and roots of a suitable size lifted. It is a mistake to allow this vegetable to remain in the ground after it is large enough for the table; it will keep equally as well whether pulled early or late in the season. Beet may be stored in sand or ash-ashes under a north wall. Care should be taken not to damage the ends of the roots; the leaves should be twisted off and not cut.

Turnips.—Thin the plants and hoe the soil in the row. Lift and store any roots that are of a suitable size. Two or three sowings of this vegetable may still be made.

THE FLOWER GARDEN.

By W. FIFE, Gardener to Lady WASTON, Lockinge Park, Berkshire.

Flowers for autumn.—The damage caused by recent storms, combined with the natural decline of many of the summer-flowering subjects, gives the flower garden a rather untidy appearance. It is always advisable to include a certain number of autumn-blooming plants, such as Helianthus, Liatris, Rudbeckia, Lobelia cardinalis, Veronica Andersonian, Solidago tricolor, Senecio pulcher, S. Chorum, S. tangentus, Sedum spectabile, Salvia splendens var. Zurcher, S. Picher, Chrysanthemums in variety, Hardy Fuchsias, including F. Ricartoni, and Montbretia in variety. These will give a touch of colour in the flower garden when the summer bedding plants are past their season of blooming.

The following plants form an effective combination for an autumn flower-bed:—Hydrangea paniculata, Lilium tigrinum, L. Fortunei, (Cannothus azareus (the variety Gloire de Versailles being especially fine), and Lobelia cardinalis. Colchicum autumnalis is very effective when planted amongst grasses such as Eulalia, Gynemum pumilum, G. variegatum, Arundo conspicua, and the finer-growing Bamboos, such as Bambusa gracilis, Arundinaria auricoma (syn. Bambusa Fortunei), and its golden variety.

The Libancon border.—The plants need attention, especially in the matter of staking, for the recent winds have displaced many of the shoots, but if these are properly tied and the plants made trim a bright display of flowers may still be expected.

Spring bedding plants.—Violas, Primroses, Polyanthus, Pansies, Aubrietia, Arabis, Alyssum, Daisies, Hepaticas, Violets, Myosotis, Silene pendula and its variety compacta, Honesty, Wallflowers, and other spring-flowering plants are all growing freely. Many of these may be used in conjunction with early-flowering bulbous plants, and this gives a better effect than massing larger quantities of bulbs by themselves. For several years past I have associated bulbs with most of the plants named, and during their season of flowering, which is a long one, they find many admirers. The following varieties of Tulips are suitable for the purpose:—Coeur Cardinal, Cottage Maid, Grace Darling, Prince of Austria, Murillo, Vermilion Brilliant, Proserpine, Yellow Prince, Prince de Ligne and La Candeur.

Propagation.—The cuttings of Calceolarias, Pentstemons, Antirrhinums, &c., should now be inserted in light sandy soil in a cold frame. Place about 4 inches of soil upon a firm foundation made with ashes, and cover the soil with a thin layer of sand. By this time all cuttings of tender plants used in summer bedding should be inserted.

THE APIARY.

By CHILTONS.

Wintering and autumn feeding.—To have a successful season in 1909 it is necessary that the bees should be well fed during the month of September, and by the end of the first week in October the operation should be completed. Each spring complaints are frequent of stocks dying, and many apiarists are at a loss to understand the cause. When bees have plenty of food they do not go out in search of nectar during the cold and stormy days of early spring. All hives should be completely overhauled in order to ascertain how much food they contain so that those which are short may be replenished. Many beekeepers are of opinion that where bees have 20 lbs. of sealed honey they may safely be left without a further supply, but this depends upon the weather of winter. Should the winter be an open one then the bees are active in the hive and consequently consume more food. To be on the safe side it is always best to leave about 30 lbs. in each hive.

What to avoid when feeding.—At this time of the year bees have little work to do in the fields and are ever ready to rob weaker stocks, and nothing tempts them more than syrup. Always feed bees in the evening, taking the utmost care not to spill the syrup, and close the entrances to prevent more than one bee entering at a time.

To make the syrup.—Take 6 lbs. of cane sugar and boil it for a few minutes in 3 pints of water, adding a little salt. If the feeding on syrup be not completed by the middle of October, then candy must be used.

Making candy.—The easiest way to make soft candy is to take some warm honey and fine sugar and mix them until of the consistency of a stiff dough. If honey be out of the question, then the candy must be made of sugar and water. Take about one quart of boiling water and add 5 lbs. of cane sugar and stir well to prevent burning, draw the simpan away, remove the scum, and return the pan to the fire, allowing the sugar to boil about 15 or 20 minutes. As soon as it can be softly lifted, it is ready, and should be poured into moulds of paper and then slipped under the quilts.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY of the paper, sent as early in the week as possible and duly signed by the writer. *Unproved, the signature will not be printed, but kept as a guarantee of good faith.*

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

APPOINTMENT FOR THE ENSUING WEEK.

SATURDAY, SEPTEMBER 19.—German Gard. Soc. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last fifty years at Greenwich—55.9°.

ACTUAL TEMPERATURES:—LONDON.—*Wednesday, September 16 (6 P.M.):* Max. 63°, Min. 49°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Thursday, September 17 (10 A.M.):* Bar. 30.1; Temp. 50°; *W. easterly*—Bright sunshine.

PROVINCES.—*Wednesday, September 16 (6 P.M.):* Max. 61° Ireland S. & W. coasts; Min. 52° Scotland, E.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—Dutch Bulbs, by Protheroe & Morris, at 10.30.

MONDAY—Unreserved sale of 29 Greenhouses, piping, &c.; also stock of the Nurseries, Church Road, Leyton, by order of Mr. W. Wheeler, by Protheroe & Morris, at 12.

TUESDAY—Unreserved sale of 92,000 Established Orchids, at the Nursery, De Montfort Road, Brighton, re Camacho & Co., by Protheroe & Morris, at 12.30.

WEDNESDAY—Palms and Plants, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 5.

FRIDAY—Collection of choice Cacti; also Orchids in variety, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

Amongst the Alpine gardens we have seen on the Continent, the Jardin de Linnaea at Bourg St. Pierre on the Great St. Bernard road in Valais (Switzerland) is one of the prettiest and the most natural; though perhaps a greater number of plants are to be seen at the well-known gardens at Chêne Bourg, near Geneva, which belong to Mons. H. Correvon, who is also the Director of the Jardin Botanique de la Linnaea.

M. Correvon was the President and moving spirit of the Association for the Protection of Plants founded at Geneva in 1883 to struggle against the destruction of the Alpine flora; but this year the association has been amalgamated with the Swiss League for the Protection of Natural Beauty, which corresponds in many respects with our Selborne Society.

In 1894 it became clear that the Jardin d'Acclimation at Geneva could no longer, without further funds, continue to give plants and seeds gratis to other gardens, &c., so M. Correvon took it in his own name and transformed it into a real nursery, and in 1903 he bought land at Chêne and transferred it there; but he still continues to give plants away to botanical gardens and to sell them at reasonable prices to people who want them. The garden is much frequented by the public, for it is open every Thursday afternoon.

The Alpine Garden at Bourg St. Pierre is managed by an International Committee, of which Professor Chodat, of Geneva, is the President. Lord Avebury, the President of the Selborne Society, has always taken a keen interest in it, as also have Dr. Romanes,

and certain other well-known English persons, to several of whom rockeries are dedicated.

Bourg St. Pierre, of which we give a view taken from the Alpine Garden, is a somewhat miserable-looking village about 15 miles from the Great St. Bernard route leading from Martigny in the Rhone Valley to the beautiful city of Aosta in Piedmont, a total distance of 45 miles. But the village contains records of more important days, with which the history of the pass is bound up. The church tower is very ancient, and in the churchyard wall is a Roman milestone of the younger Constantine. The original hospice of the pass was at Bourg St. Pierre as early as the 6th century. Napoleon's visit to the village in May, 1800, on his way over the St. Bernard with 30,000 men is commemorated by the name of the older inn, "Au Déjeuner de Napoleon," the room which he occupied being still shown. But the small new Hôtel du Grand Combin, five minutes beyond the village and immediately below the Linnaea, is a primitive but more pleasantly situated hotel at which to stay.

There is an interesting flora all the way from Martigny to the top of the Great St. Bernard Pass, and in the lower part of the Val d'Entremont above Sembrancher, where the beautiful Val de Ragnas enters the main valley on the east, the botanist will observe many plants usually characteristic of a warm climate, along with sub-Alpine species which have descended from the neighbouring mountains. Thus *Ononis Natix* and *O. rotundifolia*, *Vicia onobrychioides*, *Caucalis graniflora*, *Euphrasia lutea*, *Campanula bononiensis*, *Bromus squarrosus* and *B. tectorum* may be found with *Scutellaria alpina*, *Sempervivum arachnoideum* and *S. montanum*, *Juniperus Sabina*, *Poa alpina*, &c.

At Sembrancher the celebrated botanist Murith was born in 1742. He was a Prior of the Great St. Bernard and was the first person to ascend Mount Vélan, which forms such a beautiful object as seen from the Jardin de Linnaea. Not long ago a variety of *Saxifraga oppositifolia* which grows in the Western Alps and the Pyrenees was named after M. Murith.

The Grand Combin on the Italian frontier is not visible actually from Bourg St. Pierre, but this superb mountain, one of the highest in the Alps, can be seen from various points of view to the north of the village.

The rocks, though they vary much, both in texture and composition, are chiefly of calcareous nature, and hence are very rich in plants. Granite districts, as is well known, are comparatively poor, the Chamoniix Valley being a good example of this. Indeed, the whole massif of Mont Blanc, consisting chiefly of granite, cannot boast of the rich and varied flora of the Zermatt district or of most of the valleys south of the Rhone.

Edelweiss is supposed not to grow at all in the Mont Blanc range, and it certainly prefers limestone or gneiss; but there is a deal of absurd sentiment about this plant, and it is absolutely incorrect to fancy that Edelweiss grows only in difficult places at high elevations. It very often grows in grassy pastures where children could romp, and it is comparatively rare above 8,500 feet. It thrives in a host of localities in dry, broken ground

in warm aspects, but particularly at from 5,500 to 7,000 feet above the sea. Edelweiss is, of course, easily grown in England when propagated from seed.

The Linnaea Garden is situated about 1,694 metres, or approximately 5,550 feet, above the sea, and it occupies a picturesque rocky hillock facing north and immediately overlooking the village. The northern slope is so well screened from the scorching sun by high rocks that Ferns and other shade-loving plants such as *Cortusa Mathioli*, *Saxifraga rotundifolia*, *Achillea macrophylla*, *Eryngium alpinum*, one of the handsomest of Alpine plants, *Actaea spicata*, &c., flourish luxuriantly.

The steep hillside is intersected with small paths, and over 200 Alpine and sub-Alpine plants continue to grow there spontaneously in their natural habitat, while in the cleverly-laid-out rockeries a great many other species of mountain plants are found. A few of these rockeries are devoted to collections of such plants as *Primulas*, *Saxifragas* and *Sempervivums*, the collection of *Primulas* being a particularly fine one. Conspicuous among them at the beginning of July, when the majority had ceased flowering, was *Primula Sikkimensis* with its primrose-coloured pendant blossoms, six to eight in a head, and also the far rarer and larger *P. longiflora*, which early in June forms so beautiful an object on the Gletscher Alp above Saas Fée. *P. Sikkimensis* is also distinguished by its long, spatulate, serrate leaves, which, however, are not mealy like the stem. It seeds and reproduces itself abundantly at Linnaea.

Many plants of other mountainous countries besides the European Alps are to be found at Bourg St. Pierre. The Pyrenees, Caucasus, Himalaya, Atlas, North America and the Arctic regions are all represented by separate rockeries. Self-sown Poppies (*P. nudicaule*, a native of Siberia in the Arctic regions) in white, yellow and orange, give a blaze of colour to the scene, and the rare *Papaver alpinum* thrives there equally well, but it hybridises freely with *P. nudicaule* and other Alpine species.

Among the Arctic plants noticed were *Epilobium latifolium*, from Labrador, with flowers 2 inches across, *Chrysosplenium glaciale* from Lapland, *Polemonium campanulatum* in great abundance and *Anemone sylvestris* of Siberia, the Caucasus and Central Europe. The beautiful pink *Androsace Chumbi* from the Himalayas, with its long runners like those of Strawberries, flourishes here, as does another *Primula* (*P. Cashmeriana*) and *Lindelia spectabilis* with its purplish-blue drooping flowers, somewhat resembling a *Cynoglossum*. *Primula cortusoides*, which so well deserves its name, appears from Central Asia.

Saxifraga cochlearis, endemic in the Maritime Alps, grows well at this altitude despite the colder climate, and *S. Aizoon rosea* with red stem and calyx but white flowers forms a striking variety of this common but beautiful and very variable *Saxifraga*. The gardener informed us this variety appeared spontaneously and was not the result of artificial cross-fertilisation.

The Pyrenees are well represented with such plants as *Horminum pyrenaicum*,

Saxifraga capitata, *S. longifolia*, *Erinus hirsutus*, *Arenaria purpurascens*, *Reseda glauca*, *Geum pyrenaicum*, *Potentilla alchemilloides*, *Eryngium Bourgatii*, and the tiny *Dianthus brachyanthus* only 2 inches in height.

Saxifraga Compositii, with its large pure-white flowers, came from the Spanish Sierras, and among the other rare or noteworthy plants observed may be mentioned *Linaria alpina alba*, *Aquilegia Stuartii*, an exquisite hybrid from Edinburgh, mauve outside but with the spurs white inside; the little *Campanula pulla* from the Austrian mountains; *C. Allionii* of the Western Alps; *Potentilla fruticosa*, just as it grows in Teesdale; *Saponaria lutea*, one of the treasures of Mont Cenis and Dauphiné; the orange *Senecio tyrolensis* and bright-red *Hieracium aurantiacum*, which decks several mountain sides between this region and Mont Blanc; *Centaura axillaris* and the little *Myosotis rupicola*, which is so well known to cultivators of Alpine plants.

Few species are more difficult to grow than the exquisite *Erithrichium nanum*, and although it is established in the garden it was not inclined to blossom this season, and the stems were elongated so that the tufts had lost something of their compact character. *Senecio aurantiacus* is another orange-brown Composite, of which there are several in the Alps, conspicuous by their brilliant colour. It is a good instance of the deepening in colour at high altitudes of a genus of plants, the species of which are almost always characterised by yellow tints in the plains. *Primula* is another genus in which a pale yellow colour predominates in the lowlands, but includes species bearing pink or purple flowers in the high mountains.

Between Bourg St. Pierre and the Great St. Bernard Hospice, at an altitude of only about 6,500 feet, was a specimen of the rare little *Campanula cenisia*, a plant peculiar to a very confined area in Central Europe. The seed had evidently been carried down by the mountain torrent, on the debris of which it was growing, for this plant is rarely seen at a lower elevation than about 8,500 feet and usually it grows at between 8,500 and 9,000 feet. At Linnæa the specimens come from the Valsoray, the beautiful valley leading towards the snow-capped Vélan, the stream from which falls in a fine cascade visible from the garden, and then thunders down the narrow gorge which separates the garden from the village.

FLORISTS AND THE FACTORY ACT.—Several important concessions have been granted, in the case of florists and some other trades, under the Factory and Workshops Act, 1901. Women and young persons employed in florists' workshops may on a day on which they are employed in the workshop before and after the dinner hour be employed in the business of the workshop, outside the workshop, before or after the period of employment appointed for such persons for that day by the notice affixed in the workshop in pursuance of section 32 of the above Act, for a further period not exceeding two hours which shall not begin before 6 a.m. or end later than 10 p.m. This special exception shall be subject to the following conditions:—(1) To every person employed in pursuance of the special exception an additional interval at least equal to the further period as aforesaid, shall be allowed

during the period of employment, on the same or following day. (2) No person shall be employed continuously whether inside or outside the workshop for more than five hours without an interval of at least half an hour. (3) On each occasion of employment in pursuance of the special exception the following particulars shall be entered forthwith in the general register:—Name of each person so employed. Date, and hours of beginning and ending, of such employment. Date, and hours of beginning and ending, of the additional interval allowed during the period of employment on the same or the following day. Also the period of employment of women may on certain days and subject to

the annual whole holidays or half holidays on different days to any of the women and young persons employed in the factory or workshop or to any sets of those women and young persons, and not on the same days. An exception is also granted permitting women and young persons employed in a florists' workshop to have the times allowed for meals at different hours of the day; and another permits women and young persons during the times allowed for meals in the workshop to be allowed to remain in a room in which a manufacturing process or handicraft is being carried on; subject to the condition that in every workshop the occupier of which avails himself of this exception there shall be affixed a

FIG. 93.—BOURG ST. PIERRE FROM THE JARDIN BOTANIQUE DE LA LINNÆA.

certain conditions be between six o'clock in the morning and eight o'clock in the evening, or between seven o'clock in the morning and nine o'clock in the evening, or between eight o'clock in the morning and ten o'clock in the evening. Provided that it shall be a condition of the employment of any woman in pursuance of this Order that—(1) There shall be in each room in which overtime is being worked at least 400 cubic feet of space for each person employed therein; (2) a woman shall not be employed overtime on any process other than a process named in this Order. A special exception authorises the occupier of florists' workshops to allow all or any of

notice showing the names of the women and young persons employed in the workshop and the times allowed to each of them for meals.

PARKS TO REPLACE FORTIFICATIONS.—Parisians are busying themselves with plans for encircling the city with parks and gardens on the site of the old fortifications and in the near future the manner in which the work is to be accomplished will be decided. The Government has offered the whole of this fortified terrain to the city for a sum of 64 million francs, but the council has declined the offer in the hopes of obtaining the site on more favourable terms.

INTERNATIONAL EXHIBITION OF THE EAST OF FRANCE.—An international exhibition is announced to be held at Nancy from May to October next year, and we have just received the regulations and schedules of the horticultural section. The permanent display will be in the park at Nancy, and consists of 26 classes, including collections of Conifers, trees, shrubs, climbers, aquatic plants, carpet bedding, Roses, and collections of seeds. Provision is also made for exhibits relating to the art of garden design and sundries, including rockeries, kiosques, rustic bridges, &c. Temporary shows, lasting four days, are arranged for novelties, greenhouse plants, outdoor plants, floral art (bouquets, &c.), fruit, and vegetables. These will be held as follows:—June 19 to 22, July 13 to 16, August 21 to 24, and September 25 to 28. All applications should be made to the committee, of which M. GERBEAUX is secretary.

STILL ANOTHER COLOUR CHART.—Quite recently there has been published in France in book form another colour chart, consisting of a portable little volume entitled *Codex des Couleurs*. There are about 20 small squares of colours, which are all numbered, but not named either in French or any other language. The publisher announces that, in general use, the colours included in it may be referred to as "C.C. No. —." Some confusion may result with the older work, if the exact title of each is not given when quoting a certain colour. This is all the more necessary seeing that, in the R.H.S. announcement of the *Repertoire des Couleurs*, it is stated to be sufficient if the users will simply quote "Colour Chart, p. —, shade —."

FERRARI.—We are reminded in the visit of Cardinal FERRARI, from Italy, of another FERRARI, who has a place in the annals of horticulture. GIOVANNI BATTISTA FERRARI, a learned Italian Jesuit, who died in 1665, was one of the earliest writers on the Continent to publish a book on flowers. It is a small quarto, written in Latin, the first edition of which, according to PRITZEL, was published in Rome in 1633. Its title is *Flora seu de Florum cultura Lib. IV.*, and a new edition of it appeared in 1664 from the press of J. JANSONIUM, of Amsterdam. The plates are numerous and very finely executed, having been drawn on copper by PIETRO DE CORTONE, a celebrated Tuscan painter. There are some elegant plans of flower-gardens in the work, besides examples of floral decorative art in vases. The work contains chapters on the culture of Narcissus, Crocus, Colchicum, Crown Imperial, Tulip, Fritillaria, Iris, Lilies, Orchids, Hyacinth, Cyclamen, Anemone, Ranunculus, Paeonies, Carnations, and Roses.

THE LONDON PARKS.—We are often asked by correspondents the terms of employment in the parks and open spaces under the control of the London County Council. The following particulars are taken from the Council's official Gazette:—The under-mentioned are the chief classes of officers and employees in the parks department:—(a) *Boy labourers* (age 14 to 15)—10s. a week for boys under 15, 12s. a week afterwards. Boys, as a rule, are discharged on attaining the age of 16 years. (b) *Improvers* (age 10 to 11)—14s. to 24s. a week. (c) *Watermen*.—6s. a day (the employment is temporary). (d) *Under-keepers, under-gardeners, boatmen, and maximum attendants*—27s. a week. (f) *Gardeners*.—28s., rising to 30s. a week. (g) *Keepers and propagators*.—30s. a week. Vacancies filled by promotion. (h) *Acting Keepers*.—28s. a week. Vacancies filled by promotion. (i) *Head keepers*.—37s. to 40s. a week. (j) *Foremen*.—Four classes, initial rate of pay 28s., maximum rate of pay 40s. a week. Vacancies filled by promotion. (k) *Officers-in-charge*.—Four classes, initial rate of pay 27s. a week, maximum rate of pay 40s. a

week. Vacancies filled by promotion. (l) *Park superintendents*.—Four classes, initial salary £100, maximum salary £225 a year. Each park superintendent has a house, with gas and water free. Vacancies filled by promotion. The weekly hours of labour are 48 in winter and 54 in summer. Forms of application for employment as under-gardener or under-keeper may be obtained from the Chief Officer, Parks Department, No. 11, Regent Street, S.W. The age limits are from 25 to 40 in the case of under-gardeners, &c. Vacancies as gardeners are as far as possible filled by promotion, from the ranks of under-gardeners, of such men as pass the examination in practical horticulture held by the Royal Horticultural Society; and in the other ranks by promotion.

WART DISEASE (BLACK SCAB) OF POTATOS.—The Board of Agriculture and Fisheries has scheduled this disease under the Destructive Insects and Pests Order of 1908. This order requires all occupiers of land on which the disease has appeared to report the fact to the Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W. Wart disease has been somewhat prevalent in the Potato crop this year, and cases have been reported from Lancaster, Cheshire, Derbyshire, Leicester, Salop, Stafford, Warwick, Worcester, Meioneth, Glamorgan, and Dumfriess. Growers are, therefore, recommended to examine their Potatoes carefully, while the crops are being lifted, with the view of detecting this disease, which, if neglected, may do serious injury. When the Potato is only slightly attacked warty excrescences grow out from the eyes; in a bad attack the whole tuber has a distorted, almost sponge-like appearance. A leaflet describing the disease and suggesting preventive measures will be forwarded post free on application to the Secretary, Board of Agriculture and Fisheries, 4, Whitehall Place, S.W.

POTATOS.—The acreage in Great Britain under this crop in 1908 has been estimated at 562,105, as compared with 548,920 in 1907, thus showing an increase of 13,185. Potatoes are amongst the few crops in this country which do not show a decrease in the amount cultivated. In Ireland, however, as we learn from the *Agricultural Statistics*, published by the Department of Agriculture and Technical Instruction for Ireland, the total area of Potatoes in 1908 is 587,230 acres as compared with 590,998 acres in 1907, a decrease of 3,768 acres or 0.6 per cent. There is a decrease in Leinster of 2,381 acres, in Munster of 2,313 acres, and in Connaught of 409 acres. In Ulster there is an increase of 1,335 acres. In Leinster the decrease is seen chiefly in Carlow, Kilkenny, King's, Queen's, and Wexford. There is an increase in the area of Potatoes in Dublin, Kildare, Louth, and Meath. In Munster there is a decrease in all the counties, but chiefly in Clare, Limerick, and Tipperary. In Ulster the increase is mainly in the counties of Down, Tyrone, and Londonderry. On the other hand, there is a decrease in several Ulster counties, especially in Antrim, Cavan, Donegal, and Monaghan. In Connaught there is an increase in Mayo and Sligo, but a decrease in Galway, Leitrim, and Roscommon.

THE LATE MR. WHITMORE.—It is with much regret that we learn of the death of Mr. C. A. WHITMORE, which occurred on Thursday, September 10. Mr. WHITMORE for many years represented Chelsea in Parliament. He was interested in horticulture, and was an active member of the committee of management of the Chelsea Physic Garden since its reorganisation some years ago.

THE HOP INDUSTRY.—The recent report presented by the Select Committee of the House of Commons appointed to enquire into the past and

present conditions of the Hop industry affords a valuable insight into the nature of the difficulties that altered conditions may introduce into modern life. The report indicates that whilst there has been a fall in the acreage under Hops, the total amount produced has not appreciably fallen off since 1855, owing to the increase in the yield per acre on the land now cultivated for this purpose. Doubtless more can still be done to improve both the quality and quantity of this yield, but the methods of cold storage which are now employed seem likely to check the rise in prices which used to, at any rate, partly make up for a year of short yield. From the growers' point of view, the principal feature of the report will perhaps lie in the statement that the committee are not prepared to recommend the reimposition of an import duty on the foreign Hops, although they think that an indication should be given on the vessel in which the beer is sent out as to whether English or foreign Hops have been used, and they recommend that the Act of 1860, which requires that English Hops shall be marked, shall be extended so as to apply, as far as possible, to imported Hops also.

THE JOURNAL OF THE R.H.S.—The *Journal of the Royal Horticultural Society* for September contains some interesting articles. Amongst them the account of "Gardening in the Western Highlands," by Mr. O. MACKENZIE, will be read with some surprise by those who do not appreciate the wonderful climate (from the horticultural point of view) of the West Coast of Scotland. An article of much value is that by Col. BEDDOME on "Acanthaceae," whilst the report of Mr. F. WHITE'S lecture on the "Profession of Landscape Gardening" should give food for reflection to those who have the interests of horticulture at heart. We hope to deal with this subject in our own columns at an early date, for it is one of the points of contact, which are rapidly multiplying, between horticulture and what it is the fashion to call higher education.

HORTICULTURAL DIRECTORY.—We are asked by the editor of the *Horticultural Directory*, 12, Milne Court Chambers, Fleet Street, London, if gardeners will notify him of any changes that have occurred since October, 1907, as regards alteration of title or change of address.

NOTES FROM A "FRENCH" GARDEN.

As work for the following year's crops must now be commenced, this may be termed the new year of the "French" garden. Beds must be prepared for seed sowing, and for pricking off the different sorts of Lettuces, Cauliflowers, and Cabbages, to be grown either on hot-beds, in cold frames, or outside early next spring. In old-established gardens this work is deferred until the last moment, but in new gardens it is preferable to do it as soon as possible. We have sown our Cauliflower seeds very thinly, not more than 500 seeds per light, in a well-prepared bed. Some gardeners sow the seeds thickly and prick out the seedlings when small, transplanting again in November, but there is no advantage in this practice. The seedling Ox-heart Cabbages are just appearing through the soil, the dull weather being favourable to their germination.

We are pricking off in well-drained and well-prepared ground the batch of Onions sown on August 15. The seedlings are extremely small and need handling very carefully; they are pricked out 3 inches apart each way, and receive a good watering after the transplanting.

We are planting in their final quarters the Lettuces sown in the first days of August. All decayed leaves are removed, and spotted plants rejected. These Lettuces will be afforded no ventilation unless they grow too fast, which rarely happens. When Lettuces are cultivated on hot-beds in November, they should be pricked

off 30 per cloche, in a well-sheltered place. Neither ventilation nor watering will be required, but should the sun's rays become excessively hot, mats should be spread over the cloches to keep the ground moist. Formerly we used to sow Fassion Lettuce in beds in the open on September 10, the seedlings being planted out in their permanent quarters in the middle of October, where they stood throughout the winter. This system has been largely discarded owing to the great losses through the frost and insect pests.

Cauliflowers planted at the end of June, amongst the first batch of Melons, are just maturing their heads. As a rule the earliest inflorescences are the worst; their precocity is generally due to some irregularity, such as a lack of moisture. Another sowing of Lamb's Lettuce can be made now. We are gathering Melons from the last batch of plants planted at the end of June; the fruits are not so large as those grown earlier in the season. This crop is very useful where a long succession of fruits is required, but for commercial purposes they are not very profitable, owing to their lack of sweetness and flavour.

Though the days are getting shorter and the nights cooler, watering must not be discontinued, especially in the case of Cauliflowers, Carrots and Celery, which are quick growers and need plenty of moisture. Now is the best time to paint, glaze, and repair the lights. To keep a light in good order it is necessary to paint the outside every year and the inside every two years. Sixteen-ounce glass is preferable to twenty-one ounce for glazing these lights, as the frames have a slope of 1 inch only. The frames are made to take three lights. The wood

FIG. 94.—FRAME USED IN THE "FRENCH" GARDEN. Dimensions: 13 feet x 4 feet 3 inches; depth in front 8 inches, at back 9 inches.

of which they are made is ordinary deal, 1 inch in thickness, the back board being 9 inches wide and the front board 8 inches. *F. Aquilias, Mayland, Essex, September 9, 1908.*

FRUIT REGISTER.

APPLE BEN'S RED.

One more season's experience with this Apple convinces me of its value as an August dessert variety. It is especially suitable for a small garden, as the trees crop freely when young. In the autumn of 1906 I planted a score or more of trees, quite ill-furnished with branches; in fact, they were maidens of the previous year, and had not been pruned, being about 4 feet high. I merely took the point out of each leading shoot. Last year they did not make much growth, but they are this year giving a full crop of medium-sized, highly-coloured fruits. This Apple ripens before Worcester Pearmain, and has a very pleasing exterior. *E. M.*

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

ETYMOLOGY OF PLANT NAMES.—Mr. Harold Evans's note about the word Walnut (on p. 204) is best answered by the assertion of a principle which, I think, ought to prevail in these enquiries. It a

name, as now written, can be traced back by a recognised process of transition to an ancient form, it is unscientific to call in another explanation. *Avellana*-nut would naturally pass into Walnut, and there is no reason to suppose that the name *Avellana* was lost. On the contrary, the analogy of Chestnut and Cherry goes to prove that the Roman names of trees imported into Britain were retained. The existence of the local name *Welshnut* does not, to my mind, invalidate this derivation. The word *Avellana* would commonly have the plural "s" attached to it, and forms, such as *Awlins, Wal(n)s*, would arise which would ultimately pass into "Welsh," as being the only current and intelligible word of similar sound. Such modifications are very common; abundant instances are found in English surnames (see *Surnames as a Science*, Ferguson). Safe philological principles must prevail in these enquiries. The derivation of *Pansy* from *pensee* violates the principle that we must not look on old names with modern eyes. Such a derivation belongs to the sentimental, "language of flowers" point of view, which was foreign to the matter-of-fact, mediaeval Englishman, and probably came in with Italian influence in Tudor times. *Pansy*, no doubt, is a much older word with a simpler and more material meaning. If its connection with the *Banwort* is disputed, an alternative and not unreasonable derivation has been proposed from *panaché, pied* or *blotched*. The old form, *Fawnee*, approaches this more neatly. The history of such names is difficult to trace, because earlier literature did not commonly, or in any precise way, concern itself with flowers. Therefore, the compilers of even our most useful standard dictionaries repeat these trite and often false etymologies. *G. H. Engleheart.*

FLOWER SEEDS.—The uncertain germinating powers of certain seeds referred to by Mr. William Mallett on p. 170, affords an instance of one of those problems in nature, the satisfactory solution of which will never be arrived at. It is the general belief that seeds of *Anemone, Hellebore, Primula, Iris*, and of plants belonging to the *Lily family* should be sown as soon as they are ripe, and this has doubtless been followed in many instances with totally different results. I believe the late Professor Michael Foster gave an experience of his in the *Gardener's Chronicle* not long before his death with certain seeds of *Iris* of his own sowing remaining good and producing plants each year for a period extending to 15 years, and he saw no reason why even that long period could not be extended. In my own experience, I have known seeds of a sowing of *Iris* to produce plants each year for five years, by which time the whole of the seeds had germinated. If seeds, under the same conditions of light, heat, and moisture, can remain dormant and good for 15 years, whilst similar seeds, under the same conditions, germinate within a year of the sowing, we are confronted with a problem. At the same time, I am of opinion, based upon experience, that the seeds of certain plants lose rather than gain in point of time in germination from being sown as soon as they are ripe. Some years ago I took from the opening capsules a large quantity of seeds of *Anthemum, Nasturtium, var. major* and sowed them in several boxes within a few hours. A portion of the same seed was placed in a brown paper bag to await orders, and the season over, the surplus was sown in the usual way. This latter seed, dried and rested for several months, produced plants abundantly in the course of a few weeks from the date of sowing, while that sown as soon as ripe remained dormant for upwards of two years, and then the plants appeared in exactly the same order and condition as those sown in the soil that covered them. In this case it would appear that a certain change or development was necessary internally before the seeds were capable of growth, and that such change was more quickly brought about by the dry condition of the seed bag. What is of importance to the gardener and the seedsman is that they may know to what extent seeds may be kept in the dry state advantageously. Old seeds of the *Cyclamen* are as good as any, and seeds a dozen years old are as full of vitality as the newest. Fresh *Primula* seed is regarded as essential to success; yet both these plants belong to the same order. Seeds of annuals and biennials usually germinate quickly and in great abundance; whilst seeds of perennials of the same genera

are often slow and erratic in growth, the herbaceous and the annual *Phloxes* being an example. It is not improbable that, in the case of annuals and biennials, the vitality of their seeds may be influenced, to some extent at least, by the length of the plant's existence. Seeds of *Daffodils* and *Eremuri*, if sown two or three months after harvesting, appear with considerable uniformity in the following spring; while year-old seeds of the last-named plants may not appear at all. *Daffodil* seeds saved four years appear to be as full of vitality as the newest. Many seeds appear to do best when sown in the springtime, and some will refuse to grow if planted two months later. *E. H. Jenkins, Hampton Hill.*

COLOUR CHART.—As the English "collaborateur" of the *Répertoire des Couleurs*, I should like to emphasise the necessity for using the screen or mirette when making comparisons to match colours. It is a simple contrivance, explained on page 33 in the letterpress. Without its use, perfect identification is scarcely possible. There is a brilliancy in the colours of this work that makes it peculiarly suitable for florists. *C. Harman Payne.*

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 15.—The usual fortnightly meeting was held on this date in not very favourable weather. There was a good display of flowers and fruits, a considerable portion of the exhibition consisting of groups of *Dahlias* and other seasonable hardy flowers, including some very fine *Gladioli* shown by Messrs. BURELL & Co., Cambridge. Awards were granted to exhibitors by all the Committees: the FLORAL COMMITTEE gave one First-Class Certificate and nine Awards of Merit; the ORCHID COMMITTEE conferred one First-Class Certificate and one Award of Merit; whilst the FRUIT & VEGETABLE COMMITTEE gave an Award of Merit to a new variety of *Apple*. At the afternoon meeting of the Fellows the continuation of the paper by Mr. Thomas Mawson, Hon. A.R.I.B.A., on "The Ethics of Garden Making," was read.

Floral Committee.

Present: W. Marshall, Esq. (in the chair), and Messrs. Henry B. May, J. Bilney, Chas. T. Dreery, James Walker, John Green, John Jennings, C. K. Fielder, Chas. Dixon, Arthur Turner, H. J. Jones, Chas. E. Pearson, J. T. Bennett-Poë, Jas. Douglas, E. H. Jenkins, W. J. James, Jas. Hudson, and Walter T. Ware.

Messrs. DOBBIE & Co., Rothsay, arranged at the end of the hall one of the most representative groups of *Dahlias* we have seen. Cactus varieties largely predominated, and these, displayed in bamboo and other stands, formed quite a feature in themselves. In addition, there were many of the pompon varieties, together with the single "Star" *Dahlias*, and others of the *Paeony*, single, and decorative classes. The method of arrangement was pleasing, a number of plants of *Kochia* being used for relief to the flowers. (Silver-Gilt Flora Medal.)

Another excellent exhibit of these flowers came from Messrs. CARTER, PAGE & Co., London Wall, the cactus varieties grouped in baskets forming the chief attraction. Some of the more conspicuous varieties were *Gazelle, Fawns, Mrs. Shoemith* (white), *Caradox* (yellow), *Livia* (pink), *W. Marshall* (yellow and fawn), and *Daisy Staples* (rose-pink). The same firm exhibited Tufted Pansies. (Silver-Gilt Banksian Medal.)

Another choice exhibit of *Dahlias* came from Mr. J. T. WEST'S Brentwood Nursery, the group having most of the best kinds in the cactus and pompon varieties. (Silver Flora Medal.)

Messrs. JAS. CHEAL & SOXS, Crawley, showed cactus and single *Dahlias* in variety. (Silver Banksian Medal.)

Some 14 dozen spikes of *Gladioli*, shown by Messrs. J. BURELL & Co., Cambridge, made a particularly good exhibit of these popular flowers, the great vigour of the well-flowered spikes meriting high praise. A large number were of shades of white, pink, and bluish, and the majority were labelled "Seedlings." (Silver-Gilt Flora Medal.)

Messrs. HUGH LOW & CO., Enfield, displayed some fine Carnations, the varieties *Britannia* and *Victory* being very noticeable amongst the blooms of scarlet shades, the pink-flowered varieties being equally well represented by *Enchantress*, *Mrs. Burdett*, and others. (Silver Bankisian Medal.)

Messrs. CANNELL & SONS, Swanley, staged well-flowered Begonias, the salmon-pink flowered *Rochead* being exquisite in the extreme. *Polar Star* (white) and *Mrs. Burden* (golden yellow) were also noted. (Silver Bankisian Medal.)

Mr. A. L. GWILIM, New Eltham, showed blooms of tuberous-rooting Begonias in batches of colours. The shades of pink, salmon, red, scarlet, yellow, &c., seen in the petals were very fine; the blooms, in addition, were large, and represented a choice strain of these excellent bedding and greenhouse plants. (Silver Bankisian Medal.)

Messrs. PAUL & SON, Old Nurseries, Chessington, had an interesting collection of choice flowering and fruiting shrubs, in which many good plants were observed. Of the more striking we may mention *Cercidiphyllum japonica*, with brilliant red foliage, *Clerodendron dichotomum* (finely in flower), *Rhus typhina laciniata* (a very distinct and graceful novelty), *Spiraea Atchisonii* (with white terminal sprays of blossoms), and *Eunonymus latifolia* (crowded with its scarlet fruits just bursting). (Silver Flora Medal.)

Messrs. PENNELL & SON, Lincoln, brought their new variegated Ivy, *Hedera dentata variegata*, the foliage being pleasingly coloured.

The GUILDFORD HARDY PLANT NURSERY showed a small exhibit of choice plants of a hardy nature.

Mr. AMOS PERRY, Hardy Plant Farm, Enfield, had a showy group of seasonal hardy flowers, in which were noticed masses of *Delphiniums*, *Kniphofias*, *Lilies*, *Pyrethrums* and early-flowering *Michaelmas Daisies*. *Pennisetum japonicum* is a most beautiful hardy perennial grass, possessing the graceful habit of the *Fukalia*. (Silver Flora Medal.)

Messrs. EGORIT & SON brought hardy Ferns in variety; the *Misses Hopkins*. Shepperton, staged a small rockwork arranged with Alpine plants. Messrs. R. VEITCH & SONS, Exeter, had some interesting plants, including *Colletia horrida* in full flower, *Dahlia coronata*, the so-called scented *Dahlia* with orange-red flowers on stems that stand well above the foliage, and *Nerine Bowdenii*.

Messrs. G. and A. CLARK, LTD., The Nurseries, Dover, showed a selection of seasonal hardy flowers, amongst which were many *Gladioli*, *Liatis spicata*, *Himmelmania fumarifolia*, with beautiful Poppy-like yellow flowers, *Coreopsis lanceolata*, *Tritomas*, *Zauschneria californica*, &c. (Bronze Flora Medal.)

Messrs. BARK & SONS, King Street, Covent Garden, W.C., showed seasonal hardy flowers, including *Sedum spectabile* in variety, *Bocconia cordata*, China Asters, *Liliums*, *Phloxes*, *Gladioli*, *Anturhinnums*, *Salvia splendens* variety *Fire Ball*, *Coreopsis verticillata* and *Zephyranthes*, *Sternbergia lutea*, *Crocuses* and other early-flowering bulbs. (Bronze Flora Medal.)

Messrs. T. S. WARE, LTD., Feltham, had an array of seasonal hardy flowers. (Bronze Flora Medal.)

A similar award was granted to Mr. FRANK BRAZIER, Caterham, for *Phloxes* and early-flowering *Chrysanthemums*.

Messrs. CUTBUSH & SONS, Highgate, London, N., exhibited vases of the winter-flowering Carnation, having excellent blooms of *White Reflection*, *Enchantress*, *Robt. Craig*, and other popular varieties. Adjoining the Carnations was a batch of plants of the red-leaved *Coleus Cordelia*, and in the annexe a selection of named varieties of *Pentstemons*. (Silver Flora Medal.)

Mr. L. R. RUSSELL, Richmond, displayed excellent examples of well-flower *Clematises*, the more conspicuous being *Beauty of Worcester* (deep clear blue), *Jackmanii* (snow white), *Ville de Lyon* (burgundy) and *Arminie*, *Nellie Moser*, and *intermedia*. *Brandii*, which is best described as dark gentian-blue. It is a very distinct variety. A bordering of variegated *Eunymus* and a background of Palms made a capital setting for the flowering plants. (Bronze Flora Medal.)

Messrs. W. WELLS & CO., Moultham, Surrey, showed a very large exhibit of early-flowering

Chrysanthemums of broad assortment, also a number of vases of *Pentstemons*. (Silver Bankisian Medal.)

Messrs. H. B. MAY & SONS, The Nurseries, Edmouton, showed pot plants of *Zonal Pelargonium*, also *Heliotropes*, *Bouvardia Hanboldii grandiflora*, *Plumbago capensis*, both white and blue-flowered, and a batch of the finely-coloured *Salvia Iride* of Zurich. Ferns were freely interspersed in the group. (Silver Flora Medal.)

Messrs. JAS. VEITCH & SONS, LTD., Chelsea, showed a most interesting collection of hardy fruits and foliage of an ornamental character, many being brilliant in their autumn tinting. There were also many hardy flowering shrubs. Some of the finer were *Vitis Coignetiae*, *V. Henryana*, both brilliantly coloured, *Cornus Mas elegantissima*, *Clerodendron trichotomum*, *Eunonymus latifolius*, *Negundo californicum aureum*, *Stephanandra flexuosa*, *Acer palmatum sanguineum* (finely-coloured foliage), *Viburnum rhytidophyllum* in fruit, *Rose hips* in variety, *Perrettias*, *Ericas*, and *Catalpa bignonioides aurea*. This firm also showed *Eschynanthus grandiflora*, *E. Lobbianus*, *E. pulcher*, *Abutilon*

being tipped with white. These two were shown by Mr. J. T. WEST, Brentwood, Essex.

Dahlia Adela (Pompon).—This pure white flower is singularly neat and well formed and of an ideal size. From Mr. CHAS. TURNER, Slough.

Dahlia Betty (single).—A rosy-mauve flower, with crimson base. From Messrs. J. CHEAL & SONS, Crawley.

Dahlia Brigadio (Cactus).—The incurving florets are a rich tone of reddish-crimson.

Dahlia Monarch (Cactus).—A very effective flower of a tone of reddish-salmon, with a centre of clear yellow. These were shown by Messrs. J. BURRELL & CO., Cambridge.

Dahlia Snowdon (Cactus).—A pure white variety of much excellence. See fig. 95.

Dahlia Teutonia (Cactus).—The colour approximates to amaranth (crimson), with ruby-red shading.

Dahlia Satisfaction (Cactus).—A very pleasing variety, in which the predominant shade is rose; the centre is white. These three were shown by Messrs. JAMES STREWDICK & SON, St. Leonards.

[Photograph by John Gregory.]

FIG. 95.—CACTUS DAHLIA "SNOWDON," REDUCED. (See Awards.)

Golden Fleece, and *Crimm Fothergilli major*. (Silver-gilt Bankisian Medal.)

FIRST-CLASS CERTIFICATE

Populus alba latifolia—A new Poplar from China, with broadly ovate cordate leaves, having a breadth of about 10 inches and a length of 12 inches as shown in quite small plants. The tree is said to reach a height of 15 or 20 feet, and should, therefore, prove a grand addition to our hardy deciduous trees. The footstalks and the more prominent veins are coloured gold-leaf-scarlet. Exhibited by Messrs. JAMES VEITCH & SONS, LTD., Chelsea.

AWARDS OF MERIT.

Dahlia Flora (Cactus).—A variety coloured yellow and fawn, the tips of the florets being almost white.

Dahlia Nellie Riding (Cactus).—A showy variety of crimson-maroon shade, the florets

Orchid Committee.

Present: J. Garney Fowler, Esq. (in the chair), and Messrs. Jas. O'Brien (hon. secretary), Harry J. Veitch, de B. Crawshaw, Sir Jeremiah Colman, H. Little, Stuart Low, R. G. Thwaites, F. J. Hanbury, W. Cobb, A. A. McBean, C. H. Curtis, J. Forster Alcock, Garney Wilson, W. P. Bound, F. J. Thorne, H. G. Alexander, H. A. Tracy, W. H. White, J. Wilson Potter, and W. Bolton. There were several good groups of Orchids, but the number of plants entered for Awards were fewer in number than usual, and resulted in only one First-Class Certificate and one Award of Merit being given.

LT.-COL. G. L. HOLFORD, C.I.E., C.V.O., West-birth (gr. Mr. H. G. Alexander), sent three beautiful hybrids, representatives of which had already received Awards. They consisted of *Cypripedium Rossettii magnifica* (insigne

Sanderianum x Maudie), a beautiful yellow flower veined with emerald green and with a white tip to the dorsal sepal; Sophro-Lælio-Cattleya medea superba, and Lælio-Cattleya Elva superba, both dark and finely-coloured hybrids.

II. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), was awarded a Silver Flora Medal for a group containing a great variety of subjects. Among the rarer specimens were the white and violet-coloured Dendrobium Wyliamianum; the crimson-centred Miltonia vexillaria Leopoldi; Cypripedium H. S. Goodson (Swinburn x T. B. Haywood), a large and finely-shaped flower; C. Fairlawn and C. Olga Bagshaw, both dark and handsome flowers; the singular little white Angraecum distichum; and a selection of Odontoglossums, Cattleyas, Lælio-Cattleyas, &c.

MESSRS. CHARLESWORTH & CO., Heaton, Bradford, secured a Silver Flora Medal for a select group, some of the plants in which were new Lælio-Cattleyas flowering for the first time and not yet matured. Among these were several having new tints and combinations of colours. Other noted were Cypripedium Morganæ Langleyense, still one of the finest of all Cypripediums; C. Daisy Barclay, a large white bloom with deep claret-purple markings; C. I. Charlesworth (I. maxima x Charlesworthi) having a deep, rose-netted dorsal sepal; Lælio-Cattleya luminosa and other Lælio-Cattleyas, Cattleya Enid, C. Lord Rothschild var. delicata, C. Alicia (Iris x Labiata), C. Harrisoniana alba, C. Gaskelliana alba, various Sophronologytes, Zygopetalum Koeblingianum, Z. Burki, and others.

MESSRS. SANDER & SONS, St. Albans, were awarded a Silver Banksian Medal for a group in the centre of which was a plant of the remarkable Cypripedium Eclipse (Stonci x Calypso, Oakwood variety), the stately flower being perfectly flat, the white dorsal sepal being heavily marked with purple at the back and with dark, purple lines of varying length at the base of the inner surface; the lip and petals are yellowish, tinged and veined with purple. Another novelty was Cattleya St. Albans (B. Digbyana x Schilleriana), with green sepals and petals, the front of the pretty, whitish labellum being striped with rose. Others remarked were Brasso-Lælia Helen var. amabile, a large and quaintly-shaped flower; Brasso-Lælia Doris, Brasso-Cattleya Madame Chas. Maron, Cattleya Davisi, C. Iris inversa, and other hybrids; the species including Cœlogyne Micholitzii, Phalanopsis Esmeralda atrobentis, Cattleya Gaskelliana alba, and Vanda cœrulea.

MESSRS. MOORE, LTD., Rawdon, Leeds, received a Silver Banksian Medal for a group in which were good examples of Vanda cœrulea, some very dark-flowered plants of Odontoglossum Harryanum, also Cynoches chlorochilum, various Brasso-Cattleyas, Lælio-Cattleyas, and other hybrids; Trichocentrum albo-purpureum, Cithropetalum appendiculatum, and other interesting species.

MESSRS. STANLEY & CO., Southgate, secured a Silver Banksian Medal for a group in which were several plants of Cypripedium A. de Lairesse, a selection of Cattleya Gaskelliana, and other Cattleyas, including the superb white C. Harrisoniana alba, Stanley's variety. (See Awards.)

MESSRS. JAS. CYPHER & SONS, Queen's Road Nurseries, Cheltenham, were awarded a Silver Banksian Medal for an effectively-arranged group of well-flowered Orchids, amongst which were several plants of Oncidium Papilio arranged with Dendrobium, Phalanopsis, Vanda cœrulea, Cattleya Gaskelliana, C. Pittiana, and other Cattleyas and Lælio-Cattleyas, also Miltonia Bleuana, Cypripedium Maudie, C. Endora, Masdevallia Wallisii stipitata, M. Bocking hybrid, and Zygopetalum rostratum.

MESSRS. HUGH LOW & CO. were awarded a Silver Banksian Medal for a group in which were noticed several nice and rose-flowered Dendrobium Lecanum, D. sanguinolentum Miltonia Reginaldi purpurea, the clear, yellow-coloured Oncidium oblongatum citrinum, Stanhopea oculata, the graceful, white Cœlogyne Veitchii, Vanda Kimballiana, Masdevallia muscosa, M. Peristeria; a selection of varieties of Cattleya Iris, C. Gaskelliana Thyllis, a very pretty and delicately-tinted form; Cypripedium Mrs. F. L. Ames, C. Watsonianum, C. Maudie, &c.

MESSRS. W. M. BULL & SONS, Chelsea, again staged a selection of hybrid Cattleyas.

NORMAN C. COOKSON, Esq., Oakwood, Wylam (gr. Mr. H. J. Chapman), sent Cattleya Angela (internedia nivalis x labiata Cooksoniæ), a very pretty hybrid with well-formed white flowers.

R. G. THWAITES, Esq., Chessington, Christchurch Road, Streatham, showed a selection of Cattleya Adula (bicolor x Hadyanal), a strong rival of the favourite C. Iris, and with great variation and beauty in the tinting of the flowers of the different varieties. Also C. Pittiana var. J. M. Black (granulosa Schofieldiana x aurea), and the pure white C. Dusseldorf Undine.

AWARDS.

FIRST-CLASS CERTIFICATE.

Cattleya Harrisoniana alba, Stanley's variety, from Messrs. STANLEY & CO., Southgate.—The finest pure white Cattleya of its class, and when compared with the original form, larger in size and broader in all the segments, a feature being the broad, openly-displayed lip, which has a clear chrome-yellow zone in the centre.

AWARD OF MERIT.

Cattleya Maroni aurea (Veludina x Dowiana aurea), from SIR TREVOR LAWRENCE, Bart., K.C.V.O., Birtford (gr. Mr. W. H. White).—A distinct form much larger than the original, and with broader and flatter-arranged sepals and petals of a clear citron-yellow colour. The broad labellum is marked in the centre with deep, ruby-crimson, changing to reddi-rose towards the margin, the disc being golden-yellow with dark-red markings from the base.

Fruit and Vegetable Committee.

Present: J. Cheal, Esq. (chairman), also Messrs. A. M. Allan, W. Barnes, W. Bates, J. Davis, A. Dean, C. Foster, W. Fyfe, J. Jaques, G. Hey, J. Macdoad, H. Parr, W. Poupard, G. Reynolds, O. Thomas, J. Willard and W. H. Divers.

A small high-coloured Apple, not unlike Worcester Pearmain, but softer in texture, was shown by Mr. A. Wigan, Chillery, Exmouth.

Two Melons were tasted by the Committee. One was of medium size, white-fleshed, and not unlike Hero of Lockinge in appearance; it was labelled The Peer; sent by Mr. J. Goatley (gr. to Lady NORTHCLIFFE, Sutton Place, Guildford). The other was much larger, also white-fleshed, and named Barnett Hill Favourite. It was shown by Mr. Michelson (gr. to F. W. Cook, Esq., Womersley, Guildford). The flesh was soft, but highly flavoured, and it was decided to request that the variety may be tried at Wisley next year. A fruiting branch of Vitis Coignetiae was displayed.

Lady NORTHCLIFFE displayed a collection of 23 Melons in three varieties, viz., The Peer, Hero of Lockinge, and Sutton's Al. The fruits generally were of good appearance. (Silver Knightian Medal.)

MESSRS. CARTER, PAGE & CO., London Wall, set up a very handsome and comprehensive collection of 24 named varieties of Tomatos in dishes. Yellow varieties were especially fine; they included Blenheim Orange, Yellow Ponderosa, Golden Perfection, Lemon Blush, and Golden Jubilee having the deepest-coloured fruits of all. Of smaller yellow varieties, Chiswick Peach, Pear-shaped, Plum-shaped, Golden Drop, and Yellow Cherry were excellent. The finest red kinds were Lord Roberts, Masterpiece, Triumph, Duke of York, Dobbie's Champion, May's Favourite, Queen Alexandra, and Sunrise. The brick-red forms were Terra Cotta, Ponderosa, and Cooper's Luscious. Of small fruited reds were seen King Humbert, Red Cherry, Semperfructifera, Nisbett's Victoria, and Burbank's Preserver. (Silver Banksian Medal.)

MESSRS. JAS. VEITCH & SONS, Chelsea, staged a large and representative collection of vegetables, which included white Cabbages, Brussels Sprouts, Nonpareil, Market Garden, Ellam's Dwarf, and Celewret Drumhead; Savoys, Early Ulm and De Vertus; red Cabbages, Dwarf Red, and Red Dutch; Cauldower Autumn Giant; Leek, The Lyon; Celery Early Rose and Superb White; also Parsnips, Potatos, Carrots, Onions, Runner Beans, Tomatos, Beets, Turnips, Autocrat Peas, and a large number of ornamental Gourds. (Silver Knightian Medal.)

AWARD OF MERIT.

Apple Red Victoria.—The deeply-coloured Apple sent by Mr. G. W. MILLER, Clarkson Nursery, Wisbech, left over for further consideration and comparison from the last meeting, was again presented in some two dozen fruits, also a branch carrying nine fruits, to show its remarkable cropping quality. Most of the specimens were deeply coloured, and of handsome appearance. Though previously thought to re-embellish Gascoigne's Scarlet Seedling, it has been found to be earlier and to vary in other particulars. It has all the qualities of a fine market variety.

It was definitely announced that the bunches of the fine collection of Grapes now growing at Wisley will be exhibited at the Vincent Square Hall on the 29th inst., the next fortnightly meeting.

ROYAL CALEDONIAN HORTICULTURAL.

SEPTEMBER 9, 10.—The autumn fruit and flower show of this Society, which was held in the Waverley Market, Edinburgh, on these dates, was one of the best which the Society has held, and certainly the best since the great international show of 1905. Although, as compared with the 1907 show, there was a falling off of about 40 in the total number of entries, the quality of the exhibits, generally, was as good. In the fruit classes, especially for Grapes and other hothouse fruits, Pears, Gooseberries, and small fruits generally, there was a deficit; and, notwithstanding an increase of over 100 entries in the Apple classes, there was a shortage in the total entries for fruit of about 100. The exhibits of plants were slightly under last year's numbers, but cut flowers and vegetables were considerably in excess, as were also the entries in the amateur classes.

FRUIT CLASSES.

GRAPES.

The premier prize for fruit was the Scottish Challenge Trophy, offered for Grapes. There were four entries, as compared with eight last year. The trophy, which was presented by Mr. W. H. Massie, Edinburgh, in 1904, and is of the value of 50 guineas, must be won three times (not necessarily in succession) before it becomes the property of the competitor, and up to this show it had been won once by each of the following exhibitors.—Mr. J. H. Goodacre, Elvaston (1901); Mr. J. Beisant, Castle Huntly (1905); Mr. A. Kirk, Norwood (1906); and Mr. T. Lunt, Keir (1907). Mr. Lunt was a competitor this year, and the contest therefore lay amongst the other three competitors mentioned and a newcomer in the person of Mr. Thomas Ireland, Newstead Ayley Gardens. The 1st prize consists of the Trophy, £15, and a gold badge; the 2nd of £10; the 3rd of £5; and the 4th of £3. The point values were 10 for Muscat of Alexandria, 9 for other Muscats and Black Hamburg, and 8 for all other varieties. Mr. Kirk (gr. to J. THOMSON PATON, Esq., Norwood, Alloa) won with two bunches each of Madrasfield Court (71 and 77 points), Muscat of Alexandria (91 and 81 points), Gros Maroc (7 and 63 points), and Directeur Tisrand (6 and 5 points), the total points awarded to him being 97 out of the 70 allowed to the varieties, or 81.4 per cent. of the possible. Mr. GOODACRE was placed 2nd with 55 points out of the 74 allowed for the varieties shown by him, or 74.3 per cent. of the possible. His varieties were Black Hamburg, Muscat of Alexandria, Muscat of Hamburg, and Madrasfield COURT. Mr. BEISANT came 3rd with 52 points out of the 70 allowed; and Mr. IRELAND 4th, with 48 out of 70.

In the class for four bunches of Grapes of distinct varieties, there were nine entries, and the competition was keen. The 1st prize fell to Mr. W. G. Pirie (gr. to C. W. COWAN, Esq., D'O'hoisie Castle) (27 points), the 2nd to Mr. J. HUGHES, Vester Gardens (261 points), and the 3rd to Mr. W. G. GATLOWAY, Gostord Gardens (25 points).

For the best two bunches of Muscat of Alexandria, Mr. GATLOWAY was awarded the 1st prize, Mr. H. E. HUGHES, King's Meadows, the 2nd, and Mr. BEISANT the 3rd; and for the two bunches of Black Hamburg, Mr. MILLER, Castle, Paisley, was 1st, and Mr. J. McDONALD, Edinburgh, 2nd.

In the classes for single bunches the leading prize-winners were Messrs. THOMAS, IRELAND,

McNEILL (Peables), GORDON (Monreith), HIGGATE, GOODACRE, and MATHIAS (North Berwick). For the second year in succession there was no entry for American Grapes.

Decorated table of dessert fruit.—The prizes in this class, amounting to £15, are presented by the City of Edinburgh Corporation, but it only drew forth two competitors, Messrs. GOODACRE and D. KIDD, Carberry Towers. For adjudicating purposes, this class is divided into two sub-classes, (1) fruit, and (2) decoration, £10 10s. being offered for fruit, and £4 10s. for decoration. Mr. GOODACRE was awarded the 1st prize of £5 for fruit, and the 2nd of £1 10s. for decoration; while Mr. KIDD was awarded the 2nd prize for fruit and the 1st for decoration.

The 1st prize for the collection of 12 dishes of fruit was taken by Mr. GOODACRE, who was the only competitor; and for a collection of 12 dishes of fruit grown in an orchard house, Mr. GOODACRE and Mr. MCKINLAY, West Park, the only competitors, were placed 1st and 2nd respectively. Mr. KIRK was 1st in the class for Pineapples; Mr. W. SCOTT, Drumpark, Dumfries, showed the best green or white-fleshed Melon, and Mr. GOODACRE the best scarlet-fleshed Melon; Mr. JAS. DAY, Galloway House, won the premier prize for 12 Figs; Mr. IRELAND excelled in the class for six Peaches; Mr. A. MCKINNON, Clifton Park, was placed 1st for six Nectarines; Mr. B. NESS, Oxfordford, showed the best 12 Appricots; Mr. A. R. S. CASTLE, Castle Ashby, the best 12 Gage Plums; Mr. MCKINLAY the best 12 yellow Plums; and Mr. H. MACFADYEN, Cuckfield Park, was 1st for 12 red Plums and also for 12 purple Plums.

For a collection of dessert Plums, Mr. Searle (gr. to the Marquis of NORTHAMPTON, Castle Ashby) was 1st, followed by Mr. GOODACRE. Mr. B. WHITING, Credenhill, was 1st for culinary Plums.

Apples.—In the Apple classes the competition was keen. It was quite evident, however, that in the "open" classes, the Scottish growers had very little chance against the English exhibitors, so far as colour was concerned; but it had also to be noted that, in the class for four dishes of pot or orchard-grown Apples, those shown by Mr. D. NICOLL, Rossie, Forganendy, were certainly ahead of any others in the show. For the collection of ripe or unripe Apples, in 12 varieties, Mr. WHITING won the 1st prize, Mr. CADNICK taking the 2nd. In the class for a collection of 12 varieties grown in Scotland, Mr. J. DUFF, Threave House, Castle Douglas, was placed 1st and Mr. J. M. STEWART, Mollance, Castle Douglas, 2nd. For a collection in six varieties, Mr. WHITING won the 1st prize. The best four dishes of pot-grown or orchard-house fruits were shown by Mr. D. NICOLL, Rossie, Mr. GIBSON, Welbeck, being 2nd. Mr. GOODACRE won in the class for six dishes of Apples, in two varieties. In the 38 single-dish classes for specific varieties the principal prize-takers were:—Messrs. CADNICK (12 1sts and 6 2nds), LEE (11 1sts and 5 2nds), WHITING (5 1sts and 8 2nds), MCKINLAY, GIBSON, SEARLE, and GRINDROD.

Pears.—For a collection of Pears, in 12 varieties, ripe or unripe, Mr. WHITING was given the 1st prize, Mr. GIBSON winning the 2nd, and Mr. MACFADYEN the 3rd; while for six varieties of Pears grown in Scotland, Mr. GALLOWAY and Mr. R. GREEN LAKE, Perth, Argyllshire, were equal. Mr. GIBSON showed the best four dishes of pot-grown or orchard-house Pears. In the 15 single-dish classes of specific varieties the principal prize-takers were:—Messrs. MCKINLAY (5 1sts and 2 2nds), GIBSON (7 2nds), HOGG (Luffness), and MACFADYEN.

PLANTS.

An important class was that for a group of miscellaneous plants arranged within a circle 18 feet in diameter on the floor. There were, however, only two entrants, Messrs. DAVIS, Ballathie, Perth, and Mr. KNIGHT, Brayton. Both groups were well arranged, but Mr. KNIGHT exhibited more originality in his design, and his plants were of higher value; but it was somewhat overpowered in effect by Mr. DAVIS's, to which the judges gave the 1st prize. For four stove or greenhouse plants in flower, Mr. MACFADYEN, Lasswade, won the 1st prize, Mr. HUGHES the 2nd, and Mr. MCKENNA, Norton Park, the 3rd. For the best green or green-house plant in flower, Mr. W. HOGARTH, Peebles, was 1st. The best four Orchids were shown by Mr. SHARP, Freeland.

Ferns.—Mr. A. McMILLAN, Douglas Castle,

won the 1st prize for four exotic Ferns; Mr. L. MOORE, Musselburgh, showed the best Adiantums; while for four British Ferns Mr. W. BRUCE, Murrayfield, was 1st. Mr. J. MCKENZIE, Ratho, won in the class for nine dwarf hardy Ferns; and for six Scolopendriums (not to include more than three Crispsiums), Mr. J. TURNBULL was 1st.

Foliage plants.—In the two classes for six foliage plants (excluding Palms) the 1st prize went to Mr. A. McMILLAN, the 2nd to Mr. A. KNIGHT, and the 3rd to Mr. W. P. BELL (Bethwell), respectively, in each class. In the other flowering and foliage plant classes the principal prize-takers were: Messrs. MCKAY (Lasswade), BROWN (Dalkeith), KNIGHT, McMILLAN, HUGHES, MCKENNA and J. FRASER (Inverkeithing).

CUT FLOWERS.

Cut flowers were a feature of the show. In some cases, however, such as in some of the Dahlia classes, the entries were rather meagre. The entries for Sweet Peas, too, have been larger on some occasions, but rarely have better blooms been seen. In both classes for 12 and 6 Gladioli Mr. J. C. FORDY, Warkworth, took 1st honours. For the 12 blooms of double Begonias Mr. T. SIMPSON, East Linton, was awarded the 1st prize; while for the 12 single Begonias Mr. R. BROWN, Dalkeith, was 1st. Mr. WM. JENKINS, Cambuslang, took the 1st prize for 12 show or fancy Dahlias; and Mr. R. SUTHERLAND, Kirkintilloch, was 1st for six show or fancy Dahlias, 12 Cactus Dahlia blooms, six bunches of Cactus Dahlias, and six bunches of pom-pom Cactus Dahlias. Mr. J. D. KERR, Duns, won the premier prizes in the classes for nine bunches, the six bunches, and a single bunch of Sweet Peas.

Roses.—The principal Rose prize offered in competition amongst gardeners and amateurs is the Hugh Dickson Memorial. This consists of a silver cup, valued at £15 15s. (to be won three times), and £4 in money. It is offered for 24 Roses in not fewer than 18 varieties. It was won by Mr. A. HUTTON, Can House, Montrrose, Mr. W. PARLANE and Mr. JOHN RUSSELL being 2nd and 3rd respectively. Mr. HUTTON was also 1st for 12 H.T. Roses, and for 12 Tea Roses. Mr. JOHN WOOD, Helensburgh, excelled in the class for six blooms of any variety of crimson Rose. The best vase of Roses was shown by Mr. L. BLACK, and the best six vases of Roses, one variety in each vase, by Mr. PARLANE.

Carnations.—Mr. W. SANDERS, Appleby, and Mr. J. C. WRIGHT, Dunblane, carried off the 1st honours in the two classes for six vases of border Carnations or Picotees respectively. For three vases of tree or petal-throwing Carnations there was only one entry; this was from Mr. D. FRASER, Craigmound, and he was awarded the 3rd prize.

Mr. HUGH McCOLL, Linnithgow, carried off 1st prizes for both 12 fancy and 12 show Panisies; and the 1st prize for 12 sprays of Violas fell to Mr. J. JOHNSON, Law. Mr. W. JENKINS won in the classes for early-flowering Chrysanthemum.

Mr. CHAS. PATTISON, Linwood, Paisley, won the 1st prize for 12 bunches hardy perennials. In the section open to all exhibitors the classes were restricted to Gladioli, Dahlias, Roses, early-flowering Chrysanthemums, Carnations or Picotees, bouquets, epergnes, &c., and decorated dinner tables.

VEGETABLES.

Never before were finer vegetables exhibited at this show, and the collection staged by Mr. GIBSON, Welbeck, which carried off the 1st prize in the display of 18 dishes, left little to be desired, of which the judges' decision to award the Society's Gold Medal along with the prize furnished ample proof. Mr. GIBSON obtained no fewer than 104 points out of 118 allowed for the kinds staged, or 88 per cent. of the possible. Mr. R. STUART, Thirlestane Castle, Lauder, was 2nd with 81 points; and Mr. W. HARRER, Tulliebelton, Perth, was 3rd with 71½ points. For a "display" of vegetables grown in Scotland Mr. GALLOWAY, Gosford, was 1st. Mr. HUGHES, York, 2nd, and Mr. JOSS, Sunnydale, Montrose, 3rd, with 63, 52, and 41 points respectively. The chief prize-winners in the other vegetable classes were Messrs. GIBSON, R. STUART, J. COSSAR (Spot, Dunbar), H. E. HUGHES, and W. HOGARTH.

AMATEURS' CLASSES.

In the amateur section one class of plants which is always well contested is the hardy Ferns, especially the dwarf kinds, and for these Mr. J. JARVIE, Falkirk, and Mr. J. MCKENZIE, Ratho, carried off the 1st prizes. In the other amateur classes the chief prize-takers were:—Plants: R. BROWN, Dalkeith, and W. Y. BRYSON, Edinburgh. Fruit: R. WATSON, R. BINNIE, and A. BRYDON. Vegetables: J. GRAY, Uddingston. Cut Flowers: G. WATSON, Kippen.

NON-COMPETITIVE EXHIBITS.

There were many trade exhibits, and among those to whom Silver-Gilt Medals were awarded were Messrs. R. B. LAIRD & SONS, LTD., and Messrs. THOS. METHVEN & SONS, Edinburgh, for artistic arrangements of flowering and foliage plants; Messrs. J. FORBES, Hawick, and Messrs. DOBBIE & CO., Rothsay, for collections of florist's flowers, &c.; Messrs. STORRIE & STORRIE, Glencairn, for pot-grown fruits; Messrs. CLIBRANS, Manchester, for a collection of vegetables; Messrs. SUTTON & SONS, Reading, for a collection of vegetables, a group of Gloxinias, Gesneras, &c.; and Messrs. T. S. WARE, LTD., Feltham, for a collection of Begonias.

Silver Medals were awarded to Messrs. WM. CUTSHUR & SONS, Highgate, London, N., for herbaceous and aquatic plants and florist's flowers; to Mr. R. BOLTON, Carnforth, for Sweet Peas; to Messrs. AUSTIN & MACLEAN, Glasgow, for a collection of vegetables; to Messrs. CUNNINGHAM, FRASER & CO., Edinburgh, for herbaceous plants; and to Mr. D. W. THOMSON, Edinburgh, for Apples and Gladioli.

The following received Bronze Medals:—Mr. J. DOWNIE, Edinburgh, for flowering and foliage plants; Mr. D. MCQUHIST, Gifford, Chrysanthemums, &c.; Messrs. LISTER & SON, Rothsay, for Chrysanthemums, Panisies, and Violas; Messrs. GUNN & SONS, Ploches, and Messrs. M. CAMPBELL & SON, for Chrysanthemums and Carnations. Amongst other exhibitors were Messrs. A. LISTER & SON, Rothsay, who showed Dahlias; Mr. H. ECKFORD, Wem, Sweet Peas; Mr. J. WILSON, Hereford, who displayed Onions; Messrs. W. WELLS & CO., Merstham, Surrey, Chrysanthemums, &c.; SWANLEY HORTICULTURAL COLLEGE, Apples, Pears, and Plums; and Messrs. MACRIMMON & FULTON, Leicester, Sweet Peas.

AWARDS TO NOVELTIES.

First-Class Certificates were awarded to *Rambler Rose* "Christian Curle," a sport from "Dorothy Perkins," but several shades lighter in colour, exhibited by Messrs. JAS. COCKER & SONS, Aberdeen; and to *Michalman Daisy* "Beauty of Colonsay," a double variety, exhibited by Messrs. T. S. WARE, LTD., Feltham.

Awards of Merit were made to *Chrysanthemum* "Abercorn Beauty," a sport from "Polly," exhibited by Mr. A. BROWN, Abercorn Nursery, Edinburgh; *Chrysanthemum* "Rob Roy," exhibited by Mr. WM. ROBERTSON, Pirig House, Edinburgh; *Chrysanthemum* "D. W. Thomson," exhibited by Mr. A. THOMSON, Dean Gardens, Edinburgh; to *Acalypha Cibiranii*, exhibited by Messrs. CLIBRANS, Atrincham; to *Sweet Pea* "The Star of Colonsay," exhibited by Mr. MALCOLM, Duns; to a new *Croton-leaved Colusa* (for strain), exhibited by Messrs. STORRIE & STORRIE; and to *Dahlia* "Sentinel" (yellow).

THE LONDON DAHLIA UNION.

SEPTEMBER 10, 11.—The annual exhibition of this Society was held on these dates in the Botanic Gardens, Regent's Park. The weather was fine, and the show was a success. The exhibits were accommodated in the large conservatory and corridor, and there were several large displays of Dahlias; also other flowers and a collection of fruit, in addition to those seen in the competitive classes. The Society, in commemoration of their secretary, the late Mr. Richard Dean, award each year two gold medals for the two most meritorious exhibits in a certain section. This year it was offered for the best collection of Pompons, in the professional and amateur classes respectively. There were many new varieties presented for award, and of these no fewer than 19 received the Society's Certificate of Merit. Messrs. DUNN & CO. had a bloom of a single Dahlia which is said to exhale a very faint perfume of Violet.

SHOW DAHLIAS.—There were two classes for show Dahlias, and the inclusion of fancy varieties was permitted. The largest class was for 24 blooms of distinct varieties, and this brought forth four exhibitors. The 1st prize was won by Mr. S. MORTIMER, Kewledge, Faraham, Surrey, with good blooms of the following: Queen of the Belgians, Glowworm, Joseph B. Service, J. W. Girdlestone (a fine bloom of this beautifully coloured self), Perfection, Claret Cup, Wm. Powell, Willie Garrett, John Walker, Pleasance (an elegant exemplar), Mrs. Langtry, Champion Rolfe, George Rawlings, Mrs. Gladstone, Wm. Rawlings, Arthur Rawlings, Tom Jones (cream, with mauve tips), Shirley Hibberd, Mrs. Saunders (yellow, edged with white), Frank Pearce, Nubian, Florence Tranter, and W. H. Williams (a fine bloom). Mr. MORTIMER was easily 1st. He was followed by Mr. CHARLES TURNER, Slough. Although the flowers exhibited by him were not so large as Mr. Mortimer's, they were nicely coloured and well formed, especially good being General Gordon, Arthur Cocke, Maud Fellows, T. Standish, Mrs. Glascock, and T. W. Girdlestone. 3rd, Mr. JOHN WALKER, of Thame.

In the class for 12 blooms were seen also four exhibitors. The 1st prize stand, shown by Mr. J. R. TRAINER, 5, Hart Street, Henley-on-Thames, contained blooms of moderate quality, including William Powell, William Rawlings, Duchess of York, Rebecca, Florence Tranter, 2nd, Messrs. J. CHEAL & SONS, Crawley, Sussex, their best examples being Blush Gem, Goldsmith, and Maud Fellows. 3rd, Mr. M. V. SEALE, Sevenoaks.

CACTUS DAHLIAS.—The classes for Cactus blooms included some for flowers in vases, others to be shown on the regulation show-boards, and others arranged in bunches. The vase exhibits were perhaps more attractive than the others, although the merits of the individual blooms are not seen to such advantage as in the older style of staging. In the class for 12 varieties, staged in bunches of six blooms, some excellent flowers were displayed. The 1st prize was won by MESSRS. STREDWICK & SONS, Silverhill Park, St. Leonards, with magnificent varieties very similar to those displayed by this firm in the champion cup class at the National Society's show. We noticed H. Beauma, Snowstorm, Rev. T. W. Jamesson, Evening Star, Do and G. Wilkins, Mrs. Alfred Dyer, Rev. A. Hall, Satisfaction, Diadem, and J. B. Riding, 2nd, Messrs. J. BURRELL & Co., Cambridge, with very large blooms, though some had dropped when we saw them late in the afternoon. The dark red Burlette was especially good; also Brigadier (another red variety), Crescent, and the Pink Echo. 3rd, Messrs. J. CHEAL & SONS, Crawley.

The 1st prize for the best 24 blooms of Cactus Dahlias, shown on boards, was won by Messrs. J. BURRELL & Co., Cambridge, whose finest examples were those of Nelson, Burlette, Leda, T. A. Havemeyer, Girton, Brigadier, Carcade, Lustre, and Wm. Marshall, 2nd, Messrs. J. STREDWICK & SONS, Silverhill Park, St. Leonards; their best examples were Wm. Marshall, Clincher, Indomitable, Mrs. Grinstead, and Dr. G. G. Gray. 3rd, Messrs. KEYNES, WILLIAMS & Co., Salisbury. We noticed fine blooms of Great Western and Mrs. Grinstead in the 3rd prize exhibit.

In the smaller class for 12 blooms of Cactus Dahlias, shown on boards, Mr. M. V. SEALE, Sevenoaks, beat three other competitors, including Mr. S. MORTIMER and Messrs. J. CHEAL & SONS, who were 2nd and 3rd respectively. Mr. SEALE'S back row contained very fine blooms of Countess Kinnare, Advance, Wm. Marshall, Clincher, Etruria, and Nelson.

BLOOMS ARRANGED IN VASES.—W. Stephens, Esq., Isleworth, presented prizes for three vases of Cactus Dahlias of distinct varieties, shown for the first time in 1908. Six blooms were required in each vase. The winning varieties were Mrs. McMillan (pink, with white centre), Ruby Grinstead (pale rosy-pink), and Wm. Marshall (bronzey-yellow). Exhibited by Mr. C. TURNER.

A prize of a piece of plate was offered by Messrs. R. F. Felton & Sons, Hanover Square, W., for three vases of Cactus Dahlias, each kind of foliage. Mr. JOHN WALKER secured the 1st prize, being followed closely by Mr. M. V. SEALE. Four growers competed in this class.

There were five exhibits in the class for six blooms of Cactus Dahlias of one variety shown on boards, but as two exhibitors each showed two varieties there were seven exhibits in all. The 1st prize was won by Messrs. KEYNES, WILLIAMS & Co. with Glory of Wilts, a new yellow variety (1 merit). Mr. MORTIMER took the 2nd prize for the variety Wm. Marshall.

POMPON DAHLIAS.—The Pompon Dahlias were a feature of the exhibition, so well were they shown. The 1st prize for 12 varieties in bunches of 10 blooms was won by Messrs. J. BURRELL & Co. against five other competitors. As stated, this was the Dean Memorial Medal for the exhibitors. Their varieties were Bacchus, Emily Hopper (pale yellow), Tommy Keith, Midget (pale pink), Ganymede, Nerissa (pink, very neat), Violet, Montague Wooten (red), Donean (delicately shaded with yellow), Hardest of All (very neat), Katie Barrett, and Girlie. The 2nd prize was won by Mr. M. V. SEALE, who had well-formed flowers of well-known varieties. 3rd, Mr. CHARLES TURNER, Slough.

SINGLE DAHLIAS.—The single Dahlias appeared to be rather coarse this season, which is due no doubt to the wet weather of the past few weeks. There was one class for these in the open section, the schedule requiring 12 varieties in bunches of six blooms. The 1st prize was won by Messrs. JOSEPH CHEAL & SONS, Crawley, with brightly coloured flowers, but rather large, Eclipse, Columbine, Snowdrop, Princess of Wales, Serita, Miss Moreland, and Flora are worthy of special mention. The 2nd prize was won by the Rev. SPENCER PEARCE, Coombe Vaccarage, Woodstock; and the 3rd prize by the Rev. A. BRIDGE, North Rectory, Crawley.

A special class was provided for a vase of the large Peony-flowered Dahlias, nine blooms of three varieties with any foliage. Mr. CHAS. TURNER was the only exhibitor, and he was awarded the 1st prize. There was nothing remarkable in this vase save blooms of a very large variety having a yellow ground heavily blotched with red. It is named Geisha.

AMATEURS' CLASSES.

The most important class for Cactus Dahlias was that in which the Hobbies Challenge Cup was offered as the 1st prize, in addition to monetary value. The class evoked a good competition among five exhibitors, the trophy being won by Mr. V. E. PETERS, The Hopscue, Belslow. He had choice examples of A. Pearman (yellow), Lustre (beautiful red), Wilkins, Ruby Grinstead, Ivernia, Rev. A. Bridge, Victorian, Mrs. W. H. Raby, and Wm. Marshall, 2nd, Mr. W. Lockyer (gr. to Rev. G. TRENTYMAN, Greenhill Park, New Barnet). We noticed very choice examples of Wm. Marshall, H. Shoemitch, Mrs. W. Hopkins, and Miss F. M. Stredwick. 3rd, Rev. A. BRIDGE, North Rectory, Crawley. For six varieties of Cactus Dahlias in bunches of three blooms Mr. H. JACKSON, The Lays, Woburn Sands, Beds, was 1st; while for four varieties Rev. A. BRIDGE was successful. This last mentioned proved a very strong class, no fewer than seven persons competing.

Other prize-winners in the amateurs' classes were Mr. W. E. PETERS, Mr. ED. MAWLEY, Rosebank, Berkhamstead; and Mr. JOHN HICKS, Manor Road, Thornton Heath.

AWARDS.

First-Class Certificates were awarded the following new varieties: *Snow*; Tom Jones, see p. 206 (MORTIMER); Tasmania, rose-pink (MORTIMER); Cactus: Una, see p. 206 (BURRELL); Indomitable, rose-pink (STREDWICK); Fairy Queen, white (BURRELL); Echo, pink (BURRELL); Mrs. Alfred Dyer, see p. 206 (STREDWICK); Glory of Wilts, deep yellow (KEYNES, WILLIAMS & Co.); Snowdrop, see fig. 85 (STREDWICK); Evening Star, reddish-orange (STREDWICK); Rev. P. W. Jamesson, see p. 206 (STREDWICK); Brigadier, dark red (BURRELL & Co.); *Pompoms*: Amelia, rose-pink (KEYNES, WILLIAMS & Co.); Lufra, dark red (CHAS. TURNER); Adela, see p. 206 (CHAS. TURNER); *Singles*: Winona, reddish-brown (CHEAL); Betty, see p. 206 (CHEAL); and Flora, reddish-orange, with crimson eye (CHEAL); Mimma, see p. 206 (BURRELL).

Non-competitive groups of Dahlias were shown by Messrs. DODDIE & Co., Rothesay (large Gold Medal); HOBBS, LTD., Dretaham,

Norfolk (large Gold Medal); Mr. J. T. WEST, Brentwood (Gold Medal); Messrs. J. BURRELL & Co., Cambridge (Gold Medal); WARNAR & Co. and Gt. VAN WAYERER & KRUIFF, Sassenheim, Holland (Silver-Gilt Medal).

Messrs. H. SPOONER & SONS, Hounslow, were awarded a Gold Medal for a collection of hardy fruits.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices. Includes Apples (English, Nonsuch, Ecklonville, etc.), Pears (Good's, Lord Derby, etc.), Damsons (Pun.), Grapes (Fruit, per doz.), Nuts (Walnuts, Almonds), and various other fruit varieties with their respective prices per bushel, dozen, or other unit.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices. Includes Artichokes (French), Beans (Scarlet Runner, Broad), Beetroot, Cabbages, Carrots, Cauliflowers, Celery, Cichous, Cucumbers, Endive, Horseradish, Indian Corn, Lettuce, and various other vegetable types with their prices per dozen, bushel, or other unit.

REMARKS.—English Tomatoes are a glut owing to large supplies and a small demand. There is a better demand for culture Apples, such as the varieties, the Good's Nonsuch, and Lord Derby. French Pears are selling well, and prices have advanced for the best fruits...

Potatoes.

Table listing potato varieties and their prices. Includes Kent's, Showdrop, Sharpe's Express, Epicure, Lincoln, and various other potato types with their prices per bushel or other unit.

REMARKS.—Both supply and demand are much better, and trade generally shows a great improvement on that of the past few weeks. Edward J. Neuborn, Covent Garden and St. Pancras, September 16, 1908.

COVENT GARDEN FLOWER MARKET.

All the plants winter plants, including Geraniums, and although there is not a large trade for pot plants the Heaths have sold fairly well. F. Hyemans will be seen in the course of a week or so, also F. Caltra, but since the white variety of geraniums has been sold F. Caltra has not been greatly appreciated. Chrysanthemums have been selling fairly well. The best plants of Early Favourite have been made from 2s. to 3s. per dozen. Plants taken from the ground end not potted may be purchased by 2s. 6d. to 3s. per dozen. Solanums with ripe berries are seen, but they have little

demand. They are later than usual this season, and will sell better a month later. Good Marguerites in flower are rather scarce. Fuchsias are now of uncertain quality. Plants of Campanula are very well flowered; the white variety principally is seen. Foliage plants are well supplied, especially Ferns. The best plants of Aralia Menzies are worth 6s. per dozen in 4 inch pots. Ferns, Aspidistra, etc., are fairly cheap. Hardy shrubs, climbers, &c., for autumn planting are now procurable.

CUT FLOWERS.

Chrysanthemums are the leading feature amongst cut flowers. The best white blooms have been selling fairly well at about 2s. 6d. to 3s. per dozen, but small flowers make very low prices. China Asters are prominent, the varieties Comet, Ostrich Plume, and Queen of the Market being most appreciated. Liliums are more plentiful, but prices for best samples have not fallen much. Roses vary little; best quality blooms are not always to be had, but there are large supplies of ordinary quality. Carnations are well supplied, including good blooms grown under glass. Eucharis, Gardenia, Tuberosa, and White Lapageria can be had in plenty. A. H., Covent Garden, Wednesday, September 16, 1908.

ENQUIRY.

Can any reader inform me of the best method of pre-serving Walnuts during the winter months? E. G. K.

ANSWERS TO CORRESPONDENTS.

ANCHUSA ITALICA: P. C. The Droopier variety does not revert to the type, but, unless liberally fed, old plants deteriorate, so that to ensure large supplies of flowers, it is advisable to replace old specimens with young plants about every three years. If the young plants are to occupy the same position you should enrich the soil before planting, or, better still, replace it with fresh loam from another part of the border. A sunny position should be selected. A stock of plants may be obtained from seeds, which germinate readily; or, as you suggest, by taking root-cuttings.

APPLE GRAVENSTEIN: Dr. B. We have a very high opinion of this variety as a dessert Apple, although the flesh is hard and rather acid. It is in excellent condition for eating at this season. The reason that it is not more cultivated is that, although an old variety, it is not generally known. Until such time as Apples are exhibited for flavour and not for appearance, this variety will not be greatly in evidence. Good as it is, it is not suitable as a market variety, because the demand is for varieties of showy appearance, such as Worcester Pearmain.

BOOK OF WATER GARDENING: G. M. K. The work is published by A. T. De La Mare Printing and Publishing Co., New York.

COLLECTION OF FRUIT: Exhibitor According to the Code of Rules for Judging drawn up by the Royal Horticultural Society, the words kind and variety are used in the following sense, viz., Peaches, Nectarines, Apples, Plums, are, for exhibition purposes, distinct kinds of fruit; Peas, Cabbages, Kales, Savoys, Brussels Sprouts, Carrots, Broad Beans, and Kidney Beans, are distinct kinds of vegetables; Roses, Chrysanthemums, Phloxes, are distinct kinds of flowers; Royal George, Noblesse, Alexander, are distinct varieties of Peaches. As a general rule, for the purpose of exhibiting, all natural genera are kinds, and all variations within a genus are varieties. Nectarines and Apples, and the Cabbage tribe are notable exceptions to this; Black and White Grapes are also for exhibition allowed as distinct kinds of fruit.

EDELWEISS FROM SEED: G. H. F. Edelweiss is perfectly easy to grow from seed in this country. If you sow in a box or in a cold frame in ordinary good soil germination takes place readily. Plant out in soil to which old mortar or other calcareous matter has been added. Although a perennial, the plants lose their beauty in most gardens after a year or two.

PERNS: A. G. S. It is against our practice to recommend individual firms.

GLORIAS AT WARSAW HOUSE GARDENS: E. Z. We are informed that the GLORIAS which formed the subject of the Supplementary Illustration in our issue of August 1 belong to the strain known as Sutton's Erect.

GRAPES: H. C. Your Grapes were so badly packed that they arrived in a condition of pulp, and the letter was rendered illegible.

MARKET WEIGHTS AND MEASURES: R. S. The following weights are recognised in Covent Garden market.—Apples, "bushel" = 42 lb.; "pot" = 63 lb.; "case" = 40 lb.; "barrel" = 140 lb. Pears, "case" = 20 lb. Beet, "pot" = 70 lb. Brussels Sprouts, "pot" = 40 lb.; "hamper" = 60 lb. Onions, "Dutch bags" = 110 lb., taken as 1 cwt.; Valencia case" = 120 lb. Spinach, "bushel" = 24 lb. Turnips, "pot" = 60 lb. Potatoes, "load" = 252 lb. and a "bag" of foreign Potatoes = 1 cwt.

MATERIALS FOR THE 'FRENCH' GARDEN: J. E. Glass cloches and handlights are supplied by Messrs. Boulton & Paul, Ltd., Norwich. You can also obtain them from Mr. Auguste Danré, 29, Rue Victor Hugo, Algérie, Seme, France. This firm also supplies lights, mats, clips, iron bars for frames, and all tools required. When ordering clothes from France, ask for "Cloches Maraisières," to be delivered in crates (re-arrangeable) to hold from 200 to 300 cloches. This large package will save breakages, as the crates have to be lifted by machinery and are not bundled about by hand. Allowance for breakages is 9 per cent.

MELONS FAILING: H. W. See reply to A. H. in the last issue, p. 208—T. K. D. There is no fungus disease, but the leaves are swarming with the debris of insects. Sprinkle the plants with tobacco water.

NAMES OF FRUITS: H. C. Golden Knob — R. Butterworth. You did not number your specimens; the coloured Apple is Red Astrachan, the Russet Golden Knob, — E. S. 1, King of the Pippins; 2, Cox's Orange Pippin; 3, Duchess of Oldenburg; 4, Annie Elizabeth; 5, Wealthy; 6, Lord Suffield; 6, B. C. W. You send twelve varieties instead of six: 1, Norfolk Dumpling; 2, Radford Beauty; 3, Grenadier; 4, Warner's King; 5, Colonel Vaughan; 6, Emperor Alexander; 7, Sturmer Pippin; 8, Braddick's Nonpariel; 9, Cox's Orange Pippin; 10, Worcester Pearmain; 11, Irish Peach; 12, Clapp's Favourite.—F. Carr. The red Plum was smashed, it is probably Fond's seedling; 2, Diamond—A. C. E. 1, Knight's Monarch; 2, Chantrelle; 3, Court Pendu Plat—Fanny; 4, Blush Plum—Eunchoy, 1, Smashed; 2, Cox's Golden Drop; 3, Goliath.—Fovantall, 1, Diamond; 2, Emerald Drop; 3, Damas de Septembre, 4, Prince Englebert; 5, Reine Claude de Bavay; 6, Dalrymple Damson.

NAMES OF PLANTS: Constant Subscriber. Cattleya Warszewiczii, commonly known in gardens as Cattleya ggas.—Fornum 1, Dendrobium moniliforme; 2, Erica amica; 3, Dendrobium Parishii; 4, Adiantum caudatum.—Chase, 1, Mimulus cardinalis; 2, Amaryllis Belladonna; 3, Polyzonium Brunonis; 4, Acanthus spinosissimus; 5, Abelia rupestris; 6, Viburnum Opulus. E. S. 1, Byrns Arja; 2, Phillyrea decora (syn. P. vilmoriniana); 3, Oleria Haastii; 4, Thuja occidentalis var. ericoides; 5, Juniperus chinensis aurea; 6, Raphiolepis japonica.—G. H. K. Populus nigra.

TOMATOS DISEASED: H. B. Most probably your Tomatos are attacked by the Potato disease, but it is not fully developed. It is unwise to plant Tomatos near to Potatos. Burn all the diseased plants at once.

TO PROPAGATE ERICAS AND MENZIESIAS: C. E. Ericas can be readily propagated by cuttings of the current season's growth dibbled into pots containing peaty soil and made very firm. The pots should first be half filled with broken potsheds and covered with a bell-glass or hand-light placed in a cool frame. On sunny days Tiffany or any similar material should be laid over the frame to prevent the cuttings from flagging or withering by reason of the sunshine. Every morning the moisture that has collected on the inside of the glasses should be removed with a sponge or cloth. Cuttings may be inserted at the present time. Menziesias are best raised from seeds sown in light peaty soil in shallow boxes or pans, in a gentle heat in spring.

GATTON PARK, REIGATE.

(See figs. 96, 97 and 100, also Supplementary Illustration.)

THE beautiful Surrey residence of Sir Jeremiah Colman, Bart., with its gardens and pleasure grounds are well known, at least by repute, to most of our readers, and in all its history it is doubtful whether it was ever more interesting or more beautiful than at the present time. Gatton stands in one of the most beautiful spots in the South of England, and certainly no place near London can lay claim to more beautiful natural features than are seen about Reigate and the neighbourhood. The gardens of Gatton are full of horticultural treasures, though, probably, the palm must be given to the magnificent collection of Orchids which the glass-houses contain. The gardener, Mr. W. P. Bound, is a well-known orchidist, and his cultural skill has been exemplified on many occasions in the beautiful groups which he has staged at Vincent Square and elsewhere. As was announced in the issue for September 5 last, Mr. Bound is just on the point of leaving

Gatton to embark on a business career for himself, having taken a nursery and seedsmen's business in the neighbourhood.

Gatton Park has several dominating features. The extensive grass lands with pasture of a beautiful verdure are studded with noble trees commanding the undulations of the park, that is singularly fine and full of artistic beauty. The view of the landscape from the front of the mansion is as broad and

sense of wonder and evokes the highest admiration.

Notwithstanding the calcareous nature of the soil, with a subsol of pure chalk, coniferous plants succeed well in these grounds, especially beautiful being the rich gold shoots of *Cupressus Lawsoniana aurea* and the blue tints of *Abies pungens glauca* and *A. nobilis glauca*. *Retinospora orientalis* is another handsome tree that lends its beauty to

[Photograph by H. N. King.]

FIG. 96.—A PATH WITH ARCHWAY IN THE GROUNDS OF GATTON PARK, THE RESIDENCE OF SIR JEREMIAH COLMAN, BART.

extensive as it is beautiful. Embowered in a grove of lofty trees as though protecting it from harm or decay, there stands on columns, without sides and with roof only, what in ancient days was the Town Hall of Gatton Borough.

The celebrated marble hall, which forms the entrance hall of the mansion, is, however, the chief architectural glory of the place. This apartment has no rival in the kingdom, and, when entered, it creates a

place, and of equal grandeur is *Cedrus atlantica*. The enumeration of other beautiful trees of this class could be continued almost indefinitely, for their numbers and variety are very extensive. Near to the lakes of which there are three, for Gatton is well furnished with water scenery, the Golden Willow (*Salix alba vitifolia*) and the Weeping Willow from St. Helena form beautiful features. There are, of course, many shrubberies, mostly planted for colour

effect. The purple-leaved *Prunus* (*P. Pissardii*) is planted in masses, affording colouring to the surroundings and bringing into relief the golden colour of the variegated *Privet*, which is planted round about them. Elsewhere is seen a big mass of *Ceanothus Gloire de Versailles* and another of *Ceanothus Ceres*. *Spartium junceum* is pegged down to form a carpet for fine plants of *Spiræa Lindleyana*, the edging about them being formed of *Hypericum* (*St. John's Wort*). These are but examples of the many beautiful colour effects produced by hardy shrubs, for, with the exception of a couple of very large vases filled with scarlet-coloured *Pelargoniums*, no flower gardening is practised in the pleasure grounds. But along the sunken margin of the lawn in front of the mansion are a series of massive vases planted with the pink-flowered ivy-leaved *Pelargonium Madame Crousse*. Standing near these flower-vases one can enjoy a glorious range of pastoral scenery of exceeding beauty. In

rambling up poles or forming festoons from the supports. In another direction a rock-garden has been formed for the purpose of masking the kitchen garden from the glasshouses. On the stones of this rockery a perfect carpeting of close dense greenery is afforded by *Herniaria glabra*, and about the rockery *Fuchsias* and other plants thrive admirably, especially noticeable being specimens of *Potentilla Miss Willmott*, with its single cup-shaped flowers of rich deep rosy-red colour; also *Origanum Dictamnus*. A picture of this rockery forms the top portion of our Supplementary Illustration, the bottom of the picture representing the *Iris* garden, the path through the centre being carpeted with *Daisies* and *Myosotis*. This garden also contains fine clumps of *Eulalia japonica* and *Bamboos*; the stately *Galtonia candicans* (*syn. Hyacinthus candicans*) blooms in profusion. On the opposite side of this *Iris* garden is another of a more uncommon character with a carpet of *Alpine* and *bulbous*

santhemums was noticed, ready to be accommodated a little later on in the glasshouses, for *Chrysanthemums* with *Zonal Pelargoniums* are much employed for brightening the conservatories and glasshouses in winter. Hardy fruits are very abundant, especially plentiful being Apples. Several hundreds of fruit trees have been planted in grass orchards, and the young trees are carefully trained and attended to, so that the fruits were of exceptional quality, those of Cox's Orange Pippin glowing with bright red colour. A very prolific fruiter at Gatton is Branley's Seedling, the orchard trees of this variety having a wonderful crop. In the kitchen garden the Apple trees have given splendid crops of fine fruit. Pears are also plentiful, especially on cordon trees against walls. Vegetables are also well cultivated at Gatton. The Gladstone Pea is a favourite for late cropping. There are broad quarters planted with Dwarf Gem Brussels Sprouts, and in the whole of the plants I did not notice a single "rogue." Long rows of Standard Bearer Celery were noticed without seeing any trace of maggot spot. Best of All Runner Bean crops heavily in these gardens, and I also noticed Beet in variety, Parsnip, Carrots, Little Gem Cabbage (the only variety cultivated at Gatton), Cauliflowers, and many others, all exhibiting skill and care in their culture. A. D.

NEW OR NOTEWORTHY PLANTS.

NIGELLA INTEGRIFOLIA, REGEL. (*SYN. N. DIVERSIFOLIA, FRANCHET.*)

This pretty annual was first described by Regel (*Bull. Soc. Nat. Mosc.*, vol. xliii, i., p. 246) in 1870, and again by Franchet (*Ann. Sc. Nat.*, série 6, vol. xv., p. 220, t. 10) in 1883, he having overlooked Regel's description. Both had received specimens of the plant from Turkestan. The late Dr. J. E. T. Aitchison, who was attached to the Afghan Delimitation Commission, rediscovered it in the Hari-Rud Valley in 1885, and it is included in the enumeration of his collections (*Trans. Linn. Soc.*, 2nd series, Bot., vol. iii., p. 30, t. 2), where it is suggested that *N. diversifolia* and *N. integrifolia* are the same species. When, or by whom, it was first brought under cultivation, I have not been able to ascertain, but it has been in cultivation at Kew ever since 1894. It was received there from different sources, under the different names, from which we may infer that it was probably originally distributed from both St. Petersburg and Paris. At all events, both botanists describe the seeds.

It is noteworthy that the cultivated plant is quite different in habit from all the wild specimens at Kew, which are similar to those figured in the *Transactions of the Linnean Society*. That is to say, they are erect and stiff, ranging from 2 to 15 inches high, with few branches, or even unbranched and bearing a solitary terminal flower; whereas the cultivated plants are much branched and the branches flexible, sinuous and trailing or procumbent. As seen thus, *Nigella integrifolia* might be mistaken for a *Campanula*; the blue, bell-shaped flowers completing the illusion. But on closer examination the floral structure is found to be quite different. The upper two or three leaves, divided into very narrow segments, and inserted nearly close together, form a false involucre to the separate

FIG. 97.—STONE SEAT IN THE GARDENS AT GATTON PARK.

the foreground is seen a large sheet of water, a delightful and bright feature, having as a background a belt of noble trees. Three triangular beds are planted with *Fuchsia Riccartonii* which bloom profusely in their season. The landscape is dotted with Cedars of Lebanon, Yews, and Hollies, one of the last-named plants being of perfect pyramidal shape, 60 feet in height, and almost covered with its scarlet berries, forming a most elegant specimen. Mr. Bound directed my attention to a fernery which is carpeted with the *Woodruff*, *Asperula odorata*, while the lesser *Periwinkle*, *Vinca minor*, has been introduced with great success as a margin to the adjacent shrubbery. In fig. 97 is seen a beautifully carved stone seat, from which extensive views of the landscape are obtained.

The principal path through the kitchen garden is flanked on either side by herbaceous borders, which were gay with flowers set off by a background of many beautiful climbers,

plants growing at the foot of flowering shrubs and stately *Bamboos*. Although bush *Roses* succeed somewhat indifferently in this chalky soil, the climbing varieties grow in profusion. In one part numerous old evergreen shrubs have been cut down to within a few feet of the ground, and climbing *Roses* of the *Wichuriana* section planted about them. With these are intermingled *Penzance Briars* and *Kosa rugosa*, the whole quarter having a semi-wild aspect, but quite in harmony with the surroundings.

The extensive range of glasshouses is filled with a variety of plants, of which the chief are the beautiful *Orchids* already alluded to. Fruits are also cultivated in the hothouses, *Grapes*, *Peaches*, *Melons*, and other kinds being grown with great success. There is also a house devoted to a collection of *Nepenthes*, and these plants are crowded with the elegant pitchers, of which there are many hundreds. A large collection of *Chry-*

[Photograph by H. N. King.]

flowers. Within this comes the calyx, consisting of five separate sepals, constituting the conspicuous part of the flower. The sepals are so close together and so placed as to suggest union. The parts of the flower commonly described as petals and sometimes as nectaries, are honey-bearing organs, of which in this species there are usually eight. They are narrow, notched at the tip, shorter than the sepals, and bear a gland on the inside near the base. The stamens number about 20, and there are three carpels.

The illustration was prepared from specimens kindly supplied by Mr. W. E. Gumbleton. *W. Botting Hemley.*

NEW MONTBRETIAS (TRITONIAS).

The Montbretia has always been prized as a garden plant, being valuable alike for its decorative beauty and elegant grace when seen in beds or borders in the open ground, and for its charm as a cut flower in vases or epergnes. In the garden the colour range embraced by even the older varieties seems to be endowed with a special fitness for late summer and autumn decoration, when the varying shades of red and flame-orange or crimsoned

the drooping tendency of the blossoms, the more erect carriage of the flower-spikes, and the nearly complete reflex of the flower. It is in the case of such a variety as Prometheus that the greatest advance is seen, and the influence of this variety promises in the near future to give rise to still better varieties.

For this splendid new race of plants we are indebted to Mr. George Davison, who has charge of the estate and gardens of Major Petre, Westwick, Norwich. For fourteen years Mr. Davison has been steadily working to improve this

PLANT NOTE.

GLORIOSA SUPERBA.

This is a rare plant in this country, and but few gardeners succeed in its cultivation; and in the florists' shops it is rarely observed. Yet it is a highly decorative subject, either as a plant or as a cut flower. The flower has a certain resemblance to a Japanese Lily, with small petals turning backwards, which at the first are yellow and change to a scarlet colour. The plant is of scandent habit, the growths dying down in the autumn. It is grown from seed in the U.S.A., where the flowers are much appreciated; the seedlings produce flowers when two years old. The best month to start the tubers into growth is February; the course of treatment being the same as that usually afforded the tubers of Caladiums. The plant requires a high degree of warmth and full exposure to sunlight, and it grows best when planted in a bed of soil, although it will grow satisfactorily in a large pot or tub. The growths may be trained on wires fixed to the rafters of the stove, or on a slight trellis of wire. Some well-developed flowers were observed in Mr. Reuthe's exhibit at the Royal Horticultural Society's meeting on the 4th inst. *F. M.*

CULTURAL NOTE.

TROPEOLUM TRICOLORUM.

Now is the time to pot this handsome little creeping plant, which was introduced to our gardens in 1826 from Valparaiso. The tubers, which range from the size of walnuts downwards, require to be planted in a mixture of peat and loam with a moderate proportion of sand. Place four or five of the tubers in a 5-inch pot; this may seem a small receptacle, but I have found them better than the larger sizes. The shoots are trained against a trellis, which is kept in position by placing the 5-inch pot into one with a diameter of 7 or 8 inches, and the space between is filled with moss. The plant grows best in a temperate house, exposed to full sunshine and where plenty of fresh air is admitted. When potting place the tubers on a thin layer of sand and cover them with an inch of the compost. Apply water carefully, and arrange the trellis in position as soon as the growths appear. I have found the shoots readily emit roots and form little tubers if they are layered serpentine fashion in a pan. Towards their flowering season they are much benefited by a weak solution of Clay's manure applied twice weekly. *H. W., Tolvean.*

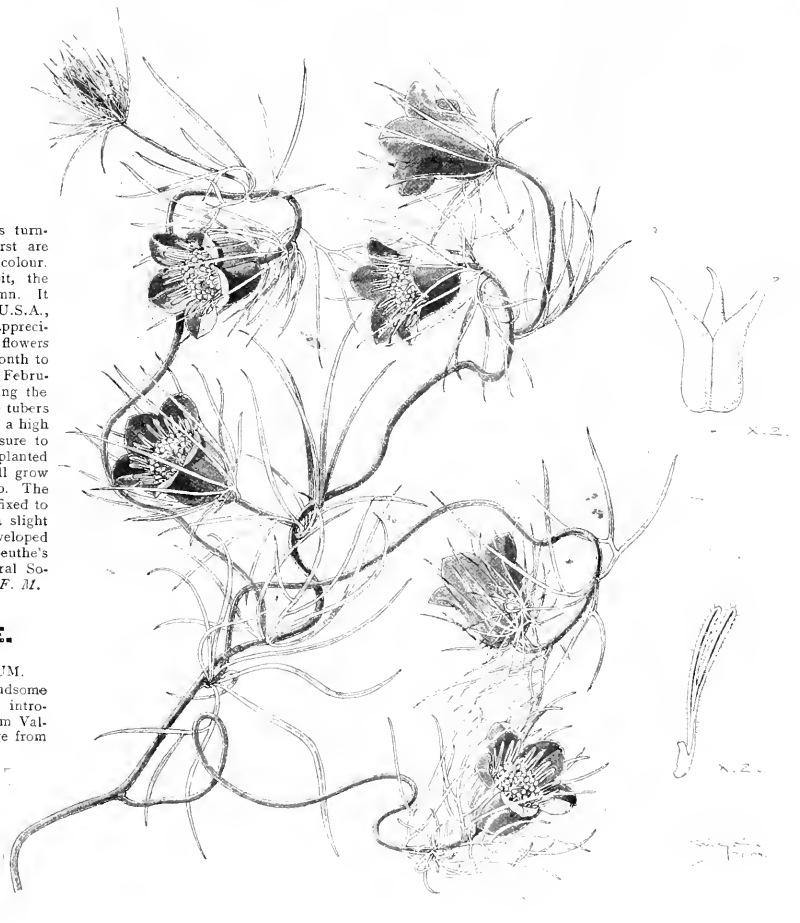

Fig. 98.—NIGELLA INTEGRIFOLIA (REGEL), WITH DIAGRAMMATIC FIGURES OF A PETAL OR NECTARY AND THE PISTIL, ENLARGED: FLOWERS BLUE.

flowers appear to be in such perfect harmony with the rapidly maturing foliage around.

The new or improved race of these plants is new in the sense that the small-hooded or tubular-shaped blossoms of the older varieties are now superseded and replaced by spreading blossoms of larger size, and sometimes recurving at the tips of the petals. Their improvement is not merely in stature, vigour, and greater freedom of flowering, but best of all, perhaps, from the garden point of view, by the elimination of

flower, and, as frequently happens when the available material is limited at the start, not much progress was made for some years. By raising seedlings each year and by subsequent selection and cross-breeding the most striking and beautiful varieties of the present race have been evolved. Having been interested in these plants from the first, I was the more anxious to see them in their growing quarters at home, and therefore availed myself of a recent opportunity to visit Westwick, where I was more than ever

impressed by their value and importance. Indeed, it is only possible to judge of the merits of these plants by seeing them in the garden, as the exhibition tent rather detracts from, than enhances, their beauty. The varieties which appealed to one most strongly are those like *Prometheus*, *Westwick*, and *Norvic*, all of which are characterised by dark-coloured stems and leaves, coppery-coloured calyces, and brilliantly-coloured buds. It is the same varieties, too, which arrest attention at a glance, and long before the flower expands there is a richness and intensity of colour that is quite unknown in the older varieties. At *Westwick* the plants are seen in thousands.

The first variety that displayed a marked improvement over all others raised at *Westwick* up to that time was *George Davison*, the stems of which are nearly 4 feet high, the widely-expanded flowers being 3 inches across and coloured a pale orange-yellow, deeper in tone externally. This variety is the first to bloom: it received an Award of Merit from the R.H.S. in 1902. *Prometheus* is regarded by Mr. Davison as the forerunner of the present race. Following close upon this one came *Ernest Davison*, the result of crossing *Germania* and *George Davison*. The flowers of this variety are large and almost flat, coloured a deep orange, flushed and suffused with reddish-carmine.

Prometheus is the giant of the whole race, the plant being of remarkable stature and attaining to 4½ feet high. The blossoms are 4 to 5 inches across, widely expanded, coloured a flame-orange tone and marked by crimson spots at the base of each segment internally. It is a superb variety in every respect, and one that will hold its own for years to come. *Westwick* is in many ways a notable variety, and a conspicuous one withal. The colour is orange-red; the clear golden centre is of large size and surmounted by crimson, rendering it distinct from all others. *Norvic*, a sturdy-growing plant less than 2 feet high, is one of the most valuable of recent novelties. The plant is somewhat late in flowering and remains in bloom till the arrival of frost. This variety expands its flowers on the main stems and laterals simultaneously, and thus furnishes a wealth of colour. The flowers are yellow stained with red. *Norvic* is a most valuable variety for bedding purposes. *Lady Hamilton* is another beautiful kind, tall and graceful in habit, profuse in flowering, and with moderately large *Watsonia*-shaped flowers of a clear golden yellow colour with apricot. *King Edmund* is a variety of rare vigour and attains to a height of fully 4 feet. The widely-expanding flowers are of golden yellow colour, and marked externally with crimson at the base of the segments. *Lord Nelson* is a tall-growing variety with fan-shaped inflorescence and dark purple stems that are very conspicuous even in a large gathering of these plants. It is the deepest in colour of all known *Montbretias*. The flowers are widely expanded and are coloured deep orange-scarlet. Hereward may be best described as a late-flowering *George Davison*, and therefore a great gain. The colour is a clear golden orange, and reddish on the outside. This variety has the flowers arranged around the spike and is seen to advantage from any point of view; the recurring petals also render it quite distinct. It is a pleasing and graceful variety of great freedom in flowering. One of the best of the yellow-flowered green-stemmed varieties is *St Botolph*. The plant is about 4 feet high, has much-branched stems, and produces large quantities of blossoms. These are the most important of this fine race at the present time, but there are many seedlings of promise.

The cultivation of the *Montbretias* as carried out at *Westwick* is simple in the extreme. The

plants are allowed to remain in the open till cut down by frost, when they are lifted and transferred to frames, pits, or sheds for the winter, to be replanted early in April of the ensuing year. The lifting is by no means essential, as the *Montbretia* is hardy, but the vigour and freedom from disease as seen in the plants in these gardens afford the best proof that the treatment is right. Moreover, it does away entirely with overcrowding, which, as evidenced by the dense and poorly-flowered tufts so often seen in gardens, is perhaps the chief hindrance to a more complete success. E. H. Jenkins.

ORCHID NOTES AND GLEANINGS.

EPIDENDRUM LAMBEAUCANUM DE WILD.

Our illustration (fig. 99) represents a portion of the plant of this pretty species, for which Sir Trevor Lawrence, Bart., K.C.V.O. (gr. Mr. W. H. White), was awarded a Botanical Certificate at the meeting of the Royal Horticultural Society on August 18.

FIG. 99.—EPIDENDRUM LAMBEAUCANUM: SEPALS AND PETALS WHITISH, LIP CLARET COLOUR.

The species was described by Mons. De Wilde-man from a specimen which flowered with Mons. Lambeau, of Brussels, the plant having been imported with *Cattleya labiata*. It was figured later in *Dict. Icon. des Orchidées*, *Epidendrum* pl. 24. The plant is evergreen, of tufted habit, and belongs to the section *Nanodes*. The sepals and petals are whitish, the lip being claret colour with a lighter margin.

The plant calls to mind very forcibly the species which has been grown in gardens as *E. Mathewsii*, for which Sir Trevor Lawrence gained a Botanical Certificate at the Royal Horticultural Society on August 10, 1897, but whether that is identical with the *Epidendrum Mathewsii* of Rehb. f. in *Linnaea* (1877) cannot well be determined. Presumably *E. Mathewsii* of gardens comes from Peru, and consequently from a district widely separated from that whence *E. Lambeaucanum* was obtained.

Epidendrum Lambeaucanum is a very pretty and free-growing plant if grown in a basket or pan, suspended near to the glass of the roof, a position best suited to all Orchids of dwarf stature. It should be placed in a Cattleya or intermediate house.

THE ORCHIDS OF GRENADA, WEST INDIES.

BELOW are enumerated the Orchids which have so far been recorded as belonging to the flora of Grenada. There are five more species known to me that are not included, viz., one *Vanilla* sp., one *Ionopsis* sp., one *Stelis* sp. (?), and two *Spiranthes* sp. (?), but they are at present of doubtful determination. The identifications have been kindly made by the Kew authorities, also by Professor J. Urban, and Mr. Oakes Ames. Two of the enumerated plants I have not met with, viz., *Eleocharis lepidus* Rehb. f. and *Xylobium* (*Maxillaria pallidiflora* Hort.). These, according to the *Kew Bulletin* of 1892, p. 188, were collected by Mr. R. V. Sherring, F.Z.S. The list comprises 50 species, of which few are valuable for horticultural purposes. One, a *Pleurothallis*, Mr. Ames informs me, is a new species. In the *Kew Bulletin*, 1893, p. 255, in which the Orchids of the neighbouring island of St. Vincent are published, the number falls seven short of the Grenada total. When Mr. Robert Cameron, the curator of the Harvard Botanic Gardens, Mass., U.S.A., came to see

me in Grenada at the latter end of 1905, I had the pleasure of spending a few days in the Grand Etang Woods with him, where, among other botanical gems, many of these Orchids were seen. Being a thoroughly enthusiastic plantsman, he went into raptures of delight with what he saw.

Brachionidium Sherringii (Rolfé, n. sp.): The plant grows upon small trees on the mountains of Fedon's Camp, and St. Catherine. *B. parvum* (Cogn., n. sp.): A tiny terrestrial species, bearing pale yellow flowers; habitat, clay banks between Soulier and Azemar. *Brassavola cucullata* (R. Br.): Flowers white, lasting over many days; a favourite tree upon which it becomes attached is the White Cedar (*Teocoma leucosylon*). *Cranichis muscosa* (Sw.): In the cooler parts of the island, upon partially-shaded banks one may often meet with this plant; the flowers are white. *Cyrtopogon Woodfordii* (Lindl.): A large terrestrial species, making its abode upon banks and in open grassy pastures of the higher districts. *Dichaea muricata* (Lindl.): Occurs on Cocoa trees at Annandale, and appears to be a scarce species. *D. hystericina* (Rehb.): It is found growing upon the trunks of large trees, and also

upon the stems and branches of smaller trees in the cool mountainous parts of Azemar and the Grand Etang. *Eleanthus captivatus* (Rchb. f.): This plant forms large clumps in trees at the Grand Etang and Azemar; the foliage is grass-like. *Eleanthus lepidus* (Rchb. f.): This was not met by the writer, but is established as a Grenada plant from material collected by Mr. R. V. Sherrig (see *Kew Bulletin*, 1832, p. 188). *Epidendrum cilicere* (L.): Common on rocks in the shore and lowland parts. *E. ramosum* (Jacq.): Plentiful on neglected *Cocca* trees in the mountains, but is also found on other trees. *E. rigidum* (Jacq.): Very few specimens of this plant are met with, and these are found far away from the coast. *E. strobiliferum* (Rchb. f.): An occasional Orchid on boulders and trees of the highlands. *E. jamaicensis* (Lindl.): Not uncommon at Annandale and the Grand Etang; the flowers are greenish. *E. difforme* (Jacq.) (= *E. umbellatum* Sw.): Found here and there on *Cocca* trees at Annandale. *E. anceps* (Sw.) (= *E. fuscatum* Sw.): A very common plant on boulders in the high lands. *E. miserrimum* (Rchb. f.): A small epiphytal species of mountain woods; occurs infrequently. *E. globosum* (Sw.): A pest on *Cocca* trees of the higher districts. *E. fragrans* (Sw.): Flowers white, with coloured markings, and having a vanilla-like odour; it is plentiful on trees and boulders, especially at Annandale. *E. nocturnum* (L.): There appear to be one or two distinct forms of this species; it is found at varying altitudes, but is never met with along the coastal parts. *E. elongatum* (Jacq.): Occurs in Grenada upon boulders and trees away from the sea. The pretty pink flowers last many weeks. *Hexsea reflexa* (Rchb. f.): An uncommon mountain plant, being only found here and there on trees. *Habenaria alata* (Hook.): A species having greenish flowers, formerly met with in spring numbers in the parish of St. David's, growing on an exposed bank. *H. maculosa* (Lindl.): Occasionally seen in hard, open ground in the higher parts. *Liparis elata* (Lindl.): Only two plants have been found, one in the Grand Etang road near the Rest House, the other lower down on a bank at Madigras. *Ornithidium confertum* (Griseb.): Common on *Cocca* trees at Annandale. *O. cocconum* (Salisb.): Flowers coral red and of horticultural interest; it lives upon *Cocca* and other trees in the mountains. *Ornithidium altissimum* (Sw.): Found in high trees away from the sea; a fine species and one suited for garden purposes. *O. luridum* (Lindl.): This is a showy species, not often met with. The plant inhabits the lowlands, where it establishes itself on boulders and small trees. *Ornithocephalus gladiatus* (Hook.): Gregarious in one or two spots on *Cocca* trees at Annandale; seen also in St. Andrew's parish. *Ocotemera graminifolia* (R. Br.): A small running, species, whose flowers are yellowish and fragrant. It occurs in mountain woods. *Pleurothallis pruinosa* (Lindl.): The flowers are pale green; the plant is abundant on *Cocca* trees on the mountains. *P. ruscifolia* (R. Br.): A true mountainous plant; revels in trees on the ridges where moisture and wind prevail; the flowers are in clusters and are pale white. *P. orbicularis* (Lindl.) (= *P. biflora* Fockii): the trunks of large mountain trees are the habitat of this species. *P. Broadwayi* Ames (n. sp.): A small species, growing on *Cocca* trees in a cool, moist part of Annandale: flowers yellow. *Polystachya luteola* (Hook.): This species favours boulders and tree trunks situated in exposed localities of the higher altitudes; flowers palish yellow. *P. foliosa* (Rchb. f.): Found associated with *P. luteola*. *Prescottia stachyoides* (Lindl.): The whole plant has a reddish appearance; grows in the ground on ridges and mountain slopes, but is not common. *Pontibetia petiolata* (Lindl.) A common terrestrial species, along banks and in mountain woods at the Grand Etang. *P. laucifolia* (Rich): Very local, only one met in fairly large numbers in a very restricted area at Annandale in the ground. *Pelexis setacea* (Lindl.):

Only one plant met, and this at Annandale on a boulder under *Cocca* trees. *Physurus birtellus* (Lindl.): Frequently seen in the ground in the mountains; flowers white. *P. plantagineus* (Lindl.): A much larger species than *P. birtellus*; grows on the higher mountain peaks; met with near the Grand Etang Lake, also in spongy ground; flowers white. *Pogonia macrophylla* (Lindl.): The only place I have found this species was in soft ground under large trees at Azemar; flowers reddish. *Scaphyglottis proliera* (Cogn.) (= *Ponera proliera*, G. Rchb.): Flowers minute, white, plentiful on tree trunks and branches in the mountains. *Sauroglossum elatum* (Sw.) (Ames, non Lindl.): Plentiful upon boulders in the cooler parts of Grenada; often-times growing in company with *Epidendrum anceps*. *Spiranthes orchidoidea* (Hemsl.): A reddish-brown plant which flowers before the leaves are set: common on dry, hot banks and roads. *S. picta* (Lindl.): A very rare plant, but once collected near the lake at the Grand Etang in damp, shaded ground. *Tetragamestus modestus* (Rchb. f.): Not particularly common: found on *Cocca* and other trees in the higher parts. *Xylobium (Maxillaria pallidiflora, Hook.)*: Collected by R. V. Sherrig. See *Kew Bulletin*, 1892, p. 188. *W. E. Broadway, Trinidad, W.I., August 14, 1908.*

NOTICES OF BOOKS.

* MUSHROOMS AND HOW TO GROW THEM.

In the preface to this volume it is stated that in a country with a population of nearly 70,000,000 of people, alert to every profitable, legitimate business, Mushroom culture, one of the most profitable and simplest of industries, is almost unknown. The market grower already engaged in growing Mushrooms appreciates his situation, and zealously guards his methods of cultivation from the public. But the people are becoming alive to the fact that there is money in Mushrooms, and a keen demand has been created for information about growing them.

In these islands the industry is of many years standing, and there are several manuals written by men of great experience, which afford all the information required either by the private or the market cultivator.

With the well-known inventive faculty of the American mind, we expect to find various deviations from our own methods of heating a Mushroom house, cellar, or other locality set apart for Mushroom culture, and in this matter we note the Dodosir's cellar, an excavation made in a sunny part of a garden, in extreme length 83 feet, 8 feet of this space being given up to an entrance pit and heating apparatus. The walls are of brick, and the top of the arch is 2 feet below the surface of the ground. This tunnel is 7 feet in height in the middle and 8 feet wide within, but a raised path 2 feet wide reduces the height in the middle to 6 feet 6 inches. The floor is of earth, no drains being necessary. Three ventilators 16 feet apart are provided in the top of the arch, but this is a mistake, as the condensed moisture in the cellar in the winter from these ventilators always keeps the pit beneath them cold and wet, and almost unproductive. One tall wooden chimney shaft would have been better than the three ventilating holes now there, which are covered with an iron and glass grating.

A 4-inch hot-water pipe passes round the sides about 4 inches from the ground. A three-wide floor of Hemlock Pine is laid for the bottom beds, at a height of 4 inches above the pipe, leaving the space between the earthen floor and the bottom of the bed along the pathway open for the escape of the heated air.

For a cellar of this kind very little heat is required to maintain the proper degree of temperature, and it does not cause dryness of the materials in the bed. These beds, for convenience in making of them, moulding them over, gathering the crop, affording the water, and

removing the spent material, are built against the wall with a rounded face. This gives a surface of 3 feet 6 inches in width as against 3 feet with a flat face. Above the ground another row of beds is constructed the entire length of the cellar. These are only temporary ones and are taken down every year. By having the supporting posts a few inches higher in front, a great part of the weight is thrown on the back walls. The beds have a continuous run of 252 feet, or 706 square feet of surface, and as they are renewed twice a year, 1,512 square feet of surface is provided. A common average crop is three-fifths of a pound per square foot. As the aim is to have a steady supply of Mushrooms from October until May, and not a glut at one time, and a scarcity at another, only two beds are made up at a time, allowing a month to elapse between every two.

When the Mushroom season closes, the cellar is cleared of the manure, the boards cleaned, the walls washed and every part dressed with kerosine to destroy insects and fungi. An upright boiler is used for heating the cellar. Various figures of Mushroom houses are shown, these being sometimes in connection with greenhouses for growing Carnations and other plants; and in greenhouses on close staging and even below those on which Tomatos are planted. In some cases cited the horse manure is thrown direct into the beds without any preparation, a layer of loam being forked into the manure, 1½ inch deep, so as to form an earthy mat 3 inches deep.

A hint is given that the ammonia arising from unprepared horse-dung is likely to prove injurious to other plants in the same house, but no injury is caused if the manure has been previously sweetened by being heated and turned over several times before it is utilised.

It is surprising to learn that no spawn is made in America, but is all imported from Europe, both brick and flake spawn being employed. There is much information that will be of interest to growers on this side of the Atlantic. There are excellent instructions relating to the cooking of the substrate.

The book is furnished with a copious index.

† THE ILLUSTRATED STRAWBERRY CULTURIST.

This small octavo of 50 pages contains information mainly applicable to the cultivation of Strawberries under the various climatic conditions found in the United States of America; and it also deals with the hybrid race of the Chilean species and *Fragaria virginiana*, which are those mostly grown there. The plants belonging to the first-named species have thicker roots than the latter, and they grow taller. As they are natives of the warmer parts of South America, they are liable to suffer from frost in the northern States. The hybrids from *F. chilensis* and *F. virginiana* are hardier, and are most common in cultivation east of the Rocky Mountains. They succeed when grown on "hills" or in single rows, being unproductive when allowed to run together so as to form beds.

Some of the finer fruited varieties are Charles Downing, President Wilder and Manchester. The rows are usually 3 feet apart, and the plants 2 feet apart in the row. All runners are removed as soon as they appear, say once a week; and winter protection has to be afforded the plants in the more northerly States. When grown in single rows the plants are set out at 1 foot apart in the rows 3 to 4 feet apart. In the south, planting is usually carried out in the late autumn or during the winter, but the earlier it is done the better, the moist, cool weather enabling the plants to become established quickly. In the colder parts of the country, August and September are considered the best months for planting, but it may also be carried out early in the spring. A list of American varieties is given, but few of these are known in this country, namely, Sharples, Jumelia, President Wilder, and Hovey.

A chapter on the history of the Strawberry is given. The sexuality of the plants is briefly stated, and the differences between pistillate and perfect flowers explained. It is a suggestive book worthy of the attention of raisers of new varieties as of the general cultivator.

The Week's Work.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICAR GIBBS, Aldenham House, Elstree, Hertfordshire.

The frame ground.—A site in most gardening establishments is devoted to a frame or forcing ground. This should be protected from the north and east winds, but at the same time exposed as much as possible to the south and west, and the sun's rays should not be interfered with by trees or other obstructions, for a maximum amount of light is necessary to success, especially during the winter and early spring months. Every year half the hot-beds in this forcing ground should be renewed, but the other old beds should remain, as they will be found very useful for wintering many kinds of vegetables, and also in the following spring they can be used for affording slight protection to some of the crops. The residue from the hot-beds that are dispensed with will form excellent material for incorporating with the soil in the kitchen garden. It should be placed in a heap in some convenient spot where it may be readily got at during the winter and spring months. The tree leaves for the new beds can be taken straight to the forcing ground, and if sufficient of these are collected they will afford a more lasting heat than manure used by itself. The undisturbed beds will prove admirable places for wintering in cold frames such crops as Endive, Lettuce, Parsley, late sowings of winter Spinach, and many other vegetables. See that plenty of space is allowed between the plants, for if air does not circulate freely about them damping is likely to occur; in all cases give the plants a position as near to the glass as is possible without injuring the foliage. Ventilation should be given whenever the weather conditions are suitable, while too light may be entirely removed should circumstances permit.

Globe Artichokes.—These plants should have all their decayed leaves and old flower-stems removed, and generally be made tidy. They frequently develop a good crop of their inflorescences during September, and these, provided they are uninjured by frosts, are generally of excellent quality. The heads should be cut when they are of a suitable size and the stalks inserted in water, to be stood in a place such as a cellar or cool shed, where they will keep good for a considerable time. The finer varieties of Globe Artichokes are more tender than the coarser kinds, therefore from the best plants good suckers should be taken at this season, potted up into 7-inch pots and wintered in cold frames. If these are planted out early the following spring in rich soil, they will produce a good crop of flowers during the autumn, thus ensuring against risk of failure with the older-established plants.

Late Peas.—The conditions at the time of writing promise a good supply of these vegetables for some time to come. The varieties Autocrat and Gladstone are doing remarkably well, and those in sheltered positions should continue to bear at least another month. It will be advisable to thin out the growths if they are very thick and to pinch out the points of the leading shoots: afford the roots copious supplies of liquid manure.

Cauli flowers.—Make one more sowing of this vegetable, selecting the varieties Magnum Bonum and Walcheren for the purpose. Sow the seeds in a cold frame and prick out the seedlings as soon as they are ready to transplant, placing them 4 inches apart in cold frames in a rather poor soil.

Cabbage.—Continue to plant this vegetable as land becomes vacant, and keep the hoe well plied in the rows between those already planted.

PLANTS UNDER GLASS.

By THOMAS LEVY, Gardener to A. STIRLING, Esq., Keir, Perthshire, N.E.

Chrysanthemum pests.—The extra warmth will favour green fly, which will soon make its appearance, therefore this pest must be looked for, and directly it is detected the house should be fumigated, for aphides are especially troublesome in the developing flower-buds, or if green fly gets amongst the petals it is difficult to eradicate, with the result that the flower generally damps or the petals become crippled, and thus the labour of a season is lost.

Chrysanthemum in vinerias.—In these gardens it is necessary to winter some of our Chrysanthemums in vinerias, and with ripe Grapes hanging ordinary fumigating cannot be practised. The best plan in this case is to use the Empire Hydro. gas powders, and this I have done for a number of years without the slightest damage either to the Grapes or the Chrysanthemums. This hydro. gas imparts neither taste nor smell to the Grapes, and the fruit can be eaten the next day provided they were dry when the operation was performed. Chrysanthemum blooms fully expanded can be subjected to fumigations without the slightest fear of damage to the petals. Support large blooms with a small piece of stake tied close up to the bud, say, within an inch of its base. When the bloom is cut this small stake can be removed with it; this is especially useful in the case of varieties having weak flower-stems.

Chrysanthemums.—Plants intended for furnishing large blooms should now be placed under cover, as they are not safe from frost after this date, especially in Scotland. Before taking them indoors the foliage should be well dusted with flowers of sulphur, as mildew is likely to occur on plants newly housed. The operation is best performed with an "Ideal Powder Bellows," and a large tin tray measuring about 6 feet by 4 feet is also useful. Lay the plant on its side over the tray when applying the sulphur, and turn the pot round so that the powder may reach every leaf. Afterwards give the plant a sharp shake, when most of the superfluous sulphur will fall into the tray and can be used again. Choose a dry, calm day for the operation, or it can be done in an empty plant house. After the plants are housed, see that they do not suffer from insufficiency of moisture, either in the atmosphere or at their roots, as the conditions in a plant house are much drier than in the open. Should the weather be bright and dry, the plants that are not showing colour in the petal should be slightly syringed early in the forenoon for a few days, but where the flowers are colouring a dry atmosphere and shade from bright sunshine is necessary to assist the bottom petals remaining fresh until the bloom is perfectly finished. No manurial stimulants should be given at this stage, clean water alone being sufficient. Any plants with flower-buds that it is desired to hasten into growth should be placed in a house by themselves and in a position close to the glass and not shaded. Afford them a little warmth from the hot-water pipes, with plenty of top and bottom ventilation.

THE FLOWER GARDEN.

By W. FYFE, Gardener to LADY WANTAGE, Lockinge Park, Berkshire.

Carnation.—The earliest layers should now be removed, as it is not advisable to allow them to remain too long connected to the old plants, or they may sustain too great a check when they are taken off later. Do not injure the roots when parting the layers, and plant them where they are intended to flower in soil well prepared by digging, and, if heavy, incorporated with sand or grit. Make the soil firm about the roots, and if the latter are dry afford a copious watering when planting is finished. Should hot weather follow the planting sprinkle the foliage occasionally in the afternoon with water from a fine rose. It is not wise to plant Carnations in the same soil year after year. In all but very coldest situations border Carnations do best out-of-doors, and especially where the soil is light in texture; the Carnation is essentially a hardy plant and will stand the severest winter, its chief enemies being slugs and fog. Carnations in pots should be made firm in the soil and afforded an abundance of ventilation except during very severe frost.

Roses.—The heavy rains have caused a free growth, and the shoots being fairly clear of mildew and other pests, the blooms promise to be more plentiful than was at one time anticipated. Briar stocks that were too late for the first budding may, provided the bark runs freely, be budded now. These late buds will, if a union be effected, remain dormant till the spring, which is an advantage in the case of tender sorts. Loosen or remove the under buds on early Briars as may be necessary. The strong shoots of climbing Roses

should be tied, or they may be broken off by the wind. Entirely remove weak and blind shoots that have borne flowers; this will strengthen those that are left.

Tuberous-rooted Anemones.—By successive plantings of these in the flowering season will be considerably prolonged. If the first batch be planted during the present month, and another in October, which is the time for inserting the main batch, it will suffice, as it is almost useless to plant again unless under very favourable circumstances. Anemones of this type delight in a rich loam, in which has been intermixed well-rotted manure; if the soil is heavy mix with it plenty of sharp sand.

THE APIARY.

By CHARLOS.

Manipulating bees.—Many people would become beekeepers if they could only make sure of handling the bees without the fear of being stung. In order to do this successfully, it is necessary to frighten the bees. When frightened they at once gorge themselves with honey, and when their honey sacs are full they cannot easily turn the abdomen in any direction to sting. Therefore, anything that will cause the bees to consume the honey will fulfil the purpose. A man who smokes has at hand an intimidant that answers admirably; but generally it is best to purchase a smoker for about 4s. 6d., and place in the fire chamber some lighted brown paper, or fustian, or rag, in fact, anything that will smoulder and create smoke. Having got the "smoker" well lighted, give the bees to be handled a little puff of smoke through the entrance, first taking care that the lighted end of the paper is placed at the bottom of the smoker. When the bellows are not being worked, stand the smoker upright, and it will keep alight as long as may be needed. Give the bees a little time to gorge themselves, say, a minute, then, if the hive contains bar frames, take off the top, and as the quilt is raised puff in a little smoke between the frames. If it be a straw skep, give the bees another puff, and as the hive is overturned, put in more smoke to drive down the bees from the mouth of the hive.

Veils.—Some people wish to wear a complete bee dress, but it is not necessary, nor advisable. Ordinary gloves are of no use to prevent stings, for the sting can easily penetrate them. Only rubber gloves are serviceable, and these make the manipulator so clumsy in his work that he agitates the bees, and rouses them to greater anger. A veil will always give greater confidence, and these are very easily made at home. Coarse blank net is best for the purpose. Measure off about 18 inches, sew the ends together, and run a hem around the top. In this hem place a piece of elastic sufficiently large to fit the crown of the hat tightly.

Driving bees.—Many bees in straw skeps will be destroyed by sulphur fumes, and, generally, any person who will take the trouble to drive the bees can have them for so doing. Choose fine weather for the purpose. Frighten the bees as previously described by blowing in smoke, then raise the skep and take it away to a quiet spot, and overturn it in a bucket, which will act as a stand. Over the full hive place an empty skep, fastening it side down with a meat skewer, which will act as a hinge. Next raise the empty skep and keep it open by the aid of driving irons. Place the hive so that the strongest light is at the back of the operator. Beat the sides of the hive containing the comb and the bees will soon commence to go up into the hive above. The rapping on the hive must not be sufficient to break the combs from the sides, but sufficient to jar them. The drumming must continue till all the bees have ascended, and this will take from five to 30 minutes. It is best to drive two or three colonies, and mix the whole by shaking them up in a bag, having removed all but one queen. Transfer the bees to a hive containing from five to six frames of foundation. Disaster is certain if the foundation be not well fastened in, or, better still, wired. Feed the colony on syrup made by boiling 5 lbs. of best cane sugar in 2½ pints of water, adding about 1 ounce of salt, boil for a few minutes, taking care not to allow the syrup to burn. Continue to feed until the bees have stored at least 25 lbs. of honey.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to The Dowager Lady NUNBURNHOLME, Warton Priory, Yorkshire.

The Apricot.—Continuing my remarks of last week on root-pruning and lifting, any Apricot trees that have made excessive growth should be attended to at the earliest opportunity. The Apricot has earned a bad name in gardens from the susceptibility of the branches to canker and die, but this is often the result of a too rich border, causing the trees to make useless wood and gross shoots which never ripen. The Apricot may often be seen planted against cottage walls, rooting in a hard pathway, and yet laden with fruits, whilst others growing in a rich soil in gardens are barren. Efforts should be made to restore any unsatisfactory tree to a better state of health and more moderate growth by root-pruning, or replanting in a poorer compost. A trench should be taken out as recommended in last week's Calendar for Peach trees, the drainage should be set right, and, if the trees are ramifying in a very rich soil, efforts should be made to restrict their root action. Shorten the strongest roots and then fill in the trench with loam of a rather lighter texture than that generally used for Peach or Plum

rectly labelled. The latest varieties of Apples and Pears should not be gathered before they part readily from the tree. It is a good practice to gather the fruits from the top branches first on pyramid and bush trees; those that are left will improve both in size and quality and help to prolong the season. Standard trees produce their finest fruits on the top branches, but as it entails too much labour to go over these trees twice for gathering, the best fruits should be selected at the time of gathering and stored by themselves.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. G. L. HOLFORD, C.V.O., C.I.E., Westonbirt, Gloucestershire.

Dendrobium.—The season has been most favourable for the cultivation of these plants, and they promise well for the future. Amongst those of the deciduous section, the species and hybrids which produce their flowers early in the winter are now rapidly finishing their season's growth. When maturation is completed, which may be determined by the end leaf of each pseudo-bulb being fully developed, the amount of moisture both at the roots and in the atmo-

Dendrobium formosum.—The plants have finished growing and are either blooming or about to expand their attractive white flowers. These are not so pretty as are those of many others in the genus, but they are useful for decorative purposes, and the plants furnish a good display of bloom at a time of the year when Orchid flowers are not over plentiful. The treatment of these plants at this season is similar to that advised for *D. Phalaenopsis*.

Evergreen Dendrobiums such as *D. thyrsiflorum*, *D. densiflorum*, *D. Farmeri*, *D. chrysotomum*, &c., are now fast completing their season's growth. After the shoots have reached maturity, a similar treatment should be afforded these plants as that advised for the deciduous members, with the exception that a more frequent application of water is needed to keep the pseudo-bulbs, foliage, and roots sound and healthy. The species *D. Dalhousianum*, *D. moschatum*, and *D. fimbriatum* are always the latest of this section to finish their growths, and a liberal treatment should be afforded them till the terminal leaf is visible. These plants should remain in the warmest division of the house at all seasons, but during the winter, while resting, infrequent waterings will suffice until the flower-spikes appear in early spring. *D. Byrrymyerum* also finishes its growth late in the season. This species should also be rested in the same house that the plants have occupied during their growing season. The rooting materials must not be allowed to become too dry for long together during the plant's inactive period.

FRUITS UNDER GLASS.

By T. COOMER, Gardener to Lord LANGATOCK, The Hendre, Monmouthshire.

Late-hanging Grapes.—Grapes may be kept upon the vine for a considerable time after they are ripe, but in order to preserve them in the best condition it is necessary to give attention to several details. The temperature should be allowed to fluctuate with the conditions outside, but at no time should it be allowed to fall below 50°. The air in theinery should be kept in circulation, and both the front and the back ventilators should be opened when the weather is dry, but in wet or foggy weather they should be closed, as on no account must moisture be permitted to condense on the berries. Pot plants that require watering should not be brought into theinery, as the moisture from these would be injurious. The vine leaves should be gathered and removed directly they fall, and any decaying berries should be promptly cut from the bunches. If watering the border in the house becomes necessary, do this early in the morning on a fine day. Before water is applied remove the straw or other material that has been placed on the border to lessen evaporation, and replace it later in the day. Outside borders should be protected from heavy falls of rain by placing large lights or other suitable objects over them.

The earlyinery.—Vines intended for starting into growth in November, that have had their shoots shortened as previously recommended, may now be pruned. Make clean cuts and leave two prominent buds at the base of each shoot. When the pruning is finished, thoroughly cleanse and, if required, paint the house. Also remove the loose bark, and especially that about the spurs, for it is in this that red spider and other insect pests lurk. Afterwards wash the rods twice, first using hot soapy water and then before they become dry with a moderately strong, hot solution of Gishurst compound, working the specific well into the crevices. Mealy bug may be destroyed by a mixture of half a pint of coal tar, one wineglassful of paraffin, rather less than one gallon of water, and sufficient clay pulled in it to make the whole of the consistency of paint. The most effectual method of ridding vines of mealy bug is by cyaniding. Instructions for this operation have been frequently given in the *Gardener's Chronicle*. Attend to the borders; skim off the surface soil and replace it with loam enriched with bone-meal, fine mortar or lime rubble, and wood ashes. Make the surface of the border quite firm again. Outside borders should be covered with glass lights or some other protection to prevent the temperature of the soil becoming lowered by cold rains. If a thick layer of tree leaves is spread on the ground before the covering is applied it will be an advantage.

[Photograph by H. N. King.

FIG. 100.—VIEW IN THE GROUNDS OF GATTON PARK, REIGATE.

(For text see pp. 225, 226.)

trees, adding about one part in every four parts old mortar rubble. Dispose the roots evenly as the work proceeds and make the soil firm about them by treading. The shoots should also be attended to, and if any appear to need replacing they should be entirely cut out: shorten back the old spurs. Young trees require little or no pruning, the principal requirements in this direction being the removal of a shoot entirely where it is not required. Any trees that have been disturbed at the roots should be given a good watering when the soil has again been made level. Syringe the old branches and the walls with some suitable insecticide, and defer nailing or tying the shoots of young trees that have lifted until the spring.

Gathering and storing fruit.—Only the very soundest fruits should be selected for storing; any that are bruised, deformed, or small should be set aside for immediate use. It is as well to store Pears in a different room from Apples, for they need to be kept at slightly higher temperature. Try to preserve the bloom on the fruits as much as possible, and see that they are cor-

rectly labelled. The latest varieties of Apples and Pears should not be gathered before they part readily from the tree. It is a good practice to gather the fruits from the top branches first on pyramid and bush trees; those that are left will improve both in size and quality and help to prolong the season. Standard trees produce their finest fruits on the top branches, but as it entails too much labour to go over these trees twice for gathering, the best fruits should be selected at the time of gathering and stored by themselves.

Dendrobium Phalaenopsis Schroderiana.—The flower-spikes of these plants are well advanced, and some are already in bloom. Foggy weather of late autumn has a pernicious effect on these attractive flowers, and it is an advantage, especially in gardens near towns, to have the plants in bloom early. Shading should now be dispensed with, except in the case of plants bearing spikes of expanded flowers. There must be no stint of water at the roots of these plants until the flower-spikes are removed, after which a less quantity will suffice.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W. C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unsold communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticultural correspondents.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, SEPTEMBER 29—
Roy. Hort. Soc. Com. meet. Miel. aelmas, Quarter Day.

WEDNESDAY, SEPTEMBER 30—
Fl. Sh. at the Franco-British Exhibition, Shepherd's Bush (3 days).

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—54.3°.

ACTUAL TEMPERATURES—
London.—(Wednesday, September 23 (6 P.M.): Max. 63°, Min. 56°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—(Thursday, September 24 (10 A.M.): Bar. 29.9; Temp. 60°; W. (bath)—Slight rain.

Provinces.—(Wednesday, September 23 (6 P.M.): Max. 67° Ireland S.; Min. 54° Scotland, E.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulbs, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

WEDNESDAY—
Palms, Plant Azaleas, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 5.

WEDNESDAY, AND THURSDAY—
Annual Sale of Nursery Stock at Sunningdale Nurseries, Windsheim, Surrey, by Protheroe & Morris, at 12.30.

FRIDAY—
Hill Annual Sale of Fruit Trees, &c., at the Nursery, Duxham, Norfolk, by order of Messrs. Bird & Vallance, by Protheroe & Morris, at 12.

George Nicholson

By the death of George Nicholson the world of horticulture has been robbed of a well-known figure, and of a man who commanded the esteem and respect of all with whom he came in contact. His work at the Royal Gardens, Kew, is known to every one, and he was universally recognised as a high authority on arboriculture and horticulture.

Mr. Nicholson, like almost all men who achieve great distinction in any one department of life, was not only a specialist, but a good deal more besides. His knowledge and his interests extended over a wide range of subjects, and he brought into everything he attempted that same enthusiasm which, coupled with his own natural ability, carried him to such a distinguished position in his chosen profession. In this, as in other respects, his example is one that others would do well to emulate, for over-specialisation is one of the evil tendencies of the present time.

Mr. Nicholson was always ready to render valuable assistance to others, and we may here fittingly record our own indebtedness to him for the invariable kindness and courtesy with which he placed his great horticultural and arboricultural experience at our service.

Doubtless his lasting claim to fame will rest on his great Dictionary of Gardening, to which reference is made in another column.

We believe that he took an active interest in the investigations on the wild Fauna and Flora of the Royal Botanic Gardens, the results of which are published from time to time in *The Kew Bulletin*.

Such men as Nicholson are scarce in any walk of life, for it is not given to many to combine exceptional abilities with a disposition that endears its possessor to all around him.

The Pronunciation of Names of Plants.

No one whose business or pleasure leads him to converse with his fellows on the subject of plants can have failed to observe the lack of uniformity which characterises the pronunciation of a considerable number of the names of the genera and species. This is due to a variety of causes, but it is no doubt in a great measure to be attributed to the fact that comparatively few people trouble themselves to enquire as to the sources of the words they employ. To some persons, indeed, the effort involved in tracing a name to its origin appears to be little better than a waste of time, and others who would gladly give the correct rendering of a word if they could do so, are unable, owing to a variety of causes, to ascertain it. We are convinced, then, that a considerable number of those engaged in horticulture would welcome this kind of information if it were made sufficiently accessible. The numerous letters which we have received on the subject have led us to endeavour to take steps to meet the want, and in the present issue we print the first instalment of such a glossary. It has been compiled by the Rev. C. Butler, and is designed to indicate the correct or accepted pronunciation of the more familiar and commonly cultivated genera. We are glad to take this opportunity of thanking not only Mr. Butler himself, but also those other friends, especially the Rev. Prof. Henslow, who have shown an interest in the undertaking, and have afforded much practical assistance in a task which has not proved an easy one.

The list makes no pretence to be exhaustive, although we hope it will be found to include most, at any rate, of the genera likely to be met with at present in cultivation. We are well aware that the mode of pronunciation we have given is not likely to meet with universal acceptance in the case of every word. But the difficulty is one which is inseparable from a work of this kind, and it arises from the lack of definite rules to which we can appeal with the certainty that they will be admitted as valid by every critic. In consequence of this, we have been sometimes obliged to steer a middle course, and to admit the right of ordinary usage to carry weight, even when it contradicts the strictly correct form as dictated by etymological principles. Wherever we conveniently could do so, however, we have endeavoured to keep the pronunciation as far as possible in conformity with the derivation of a word. There are, however, examples—by no means few in number—in which this is hardly practicable. Where custom has so successfully defied technical accuracy, it would seem to be merely idle pedantry to attempt to go behind current usage.

'Quem pene arbitrium est et jus et norma loquendi.'

and the more especially as failure would pretty certainly attend the enterprise. We have, therefore, admitted the common pronunciation of *Veronica* instead of *Veroni'ca*, and, although with great diffidence, we have allowed *Anemone* to stand instead of attempting to revert to the more strictly correct *Anemo'ne*.

Critical readers will doubtless discover examples which may be adduced as evidence of inconsistency on our part, but we might remark, in passing, that this quality of inconsistency is practically inherent in the subject.

We have not pretended to assume the rôle of the reformer, but have limited ourselves to the more modest task of endeavouring to indicate what we conceive to be the pronunciation most nearly in accordance with the best usage or the highest authority. It is not improbable that some errors may have escaped detection, but we venture to hope, notwithstanding, that the result of these efforts will prove on the whole to be acceptable and serviceable to our readers.

ROYAL HORTICULTURAL SOCIETY.—The next exhibition will be held at Vincent Square, Westminster, on Tuesday, September 29. At the afternoon meeting of the Fellows the concluding lecture on "The Practice of Garden Making" will be given by Mr. T. H. Mawson, Hon. A.R.H.B.A.

POPULUS LASIOCARPUS.—In our issue of last week the name of this new Poplar from China, which gained a First-Class Certificate at the meeting of the R.H.S. on the 15th inst., was erroneously given as *P. alba lasiocarpus*. The mistake arose from the label affixed to the plant at the exhibition bearing the name as originally printed. *Populus lasiocarpus* is, of course, a good species, and is not merely a variety of *P. alba*.

EXHIBIT OF ENGLISH-GROWN GRAPES.—The Royal Horticultural Society propose to exhibit at the fortnightly exhibition of flowers and fruits to be held on September 29 at the Royal Horticultural Hall, Vincent Square, Westminster, about 30 varieties of Dessert Grapes from the collection at Wisley Gardens. The exhibit is intended to be chiefly educational, and attention will be specially directed to some of the smaller-berried varieties, which so vastly surpass in flavour larger and more showy varieties. Vine culture was an important feature in the gardens at Chiswick. In the early part of last century the Society propagated varieties of wine Grapes for gratuitous distribution in the Colonies; and at the present time at the Wisley Gardens experiments are proceeding with an open-air vineyard to test the possibility of such Grape cultivation in suitable districts in England, and to ascertain the best varieties for the purpose. Officers of the Society will be in attendance at the exhibit on September 29 to give information and to answer the enquiries of visitors.

PRESENTATION TO A GARDENER.—Mr. J. A. WASELY, head gardener at Sherfield Manor, Basingstoke, was, on Wednesday, 16th inst., the recipient of a clock as a token of goodwill from his fellow parishioners of Sherfield-on-Loddon, on leaving for Bedjebury Park, Goudhurst, Kent. The presentation took place in the national school, and was attended by a large number of friends and subscribers. Mr. WASELY has been connected with Sherfield Manor Gardens for the past 19 years under three successive owners, and while at Sherfield has associated himself with various parochial institutions, especially the annual horticultural show.

MR. H. HEMSLEY, the author of *Rock and Alpine Gardening*, who for many years was in the service of Messrs. J. CHEAL & SONS, Crawley, has recently started into business for himself at Crawley, Sussex. Mr. HEMSLEY has a wide experience in nursery work, and is specially interested in work pertaining to rock and Alpine gardening.

THE LATE FRAU IDA BRANDT.—This lady, who died at Zurich on July 28, will be best remembered as an enthusiastic lover of plants. FRAU I. BRANDT, who was English by birth, in her eighteenth year removed to Russia, and subsequently she and her husband went to live at Zurich. She survived him only 24 days, he having died on July 4 at the Villa Brandt. In 1894 she acquired the considerable collection of Orchids belonging to Consul KRENAST, at Zurich, and continually and with great judgment increased her own collection to the last days of her life. The collection consisted of 700 species, varieties, and hybrids, of which the chief were fine flowering so-called Botanical Orchids, rarely met with in the trade. Several Orchids were named in her honour, as *Cypripedium Frau Ida Brandt*, *Dendrobium Phalaenopsis Brandtiae*, *Dendrobium Brandtiae*, and *Catasepium Brandtiae*. As so often happens, the heir to the property has no taste for Orchids or their cultivation, and the collection is to be disposed of immediately.

NEW GENERA AND SPECIES OF CYPERACEÆ.

—An important number of the *Kew Bulletin* (additional series viii.) has just been issued, containing the diagnoses of the new genera and species of Cyperaceæ, described by the late Mr. C. B. CLARKE, which are represented by authentic specimens in the Kew Herbarium. Mr. CLARKE was well known as the leading authority in the world on this family of plant, and we learn that he has left a large mass of MS., which is of the nature of a monograph. Much time must elapse before this will be ready for publication, and botanists will be grateful to the Director of Kew for rendering the descriptions of the new species available for citation. Certain diagnoses are, however, included which have already, at least in part, appeared elsewhere. Thus, for example, *Fuirena* (*Edipus* and *F. subdigitata*) were described in a paper on "The Botany of Southern Rhodesia," by Miss GIBBS, which was printed in the *Journal of the Linnean Society*, vol. 38. The species in question, which occur in Africa, exhibit features of considerable biological interest in connection with their adaptation to the special conditions under which they occur in their natural habitat.

*** BULBS AND THEIR CULTIVATION.**—Mr. SANDERS has added another excellent little book to the numerous volumes of which he is the author. The work is said to be practical, and it seems worthy to fulfil its object. A feature which amateurs will find useful consists in the table which extends from p. 38 to p. 85, giving the colour, height, flowering period, cultivation, etc., of the plants. We feel inclined to demur to the suggested necessity of rich treatment for *Lilium Martagon* var. *alba*. The plant thrives in quite ordinary soil if planted on the upper part of a rocky, and its rate of increase in such a situation will surprise those who are accustomed to see it listed at 2s. 6d. and upwards per bulb. The chapters on greenhouse culture, &c., of the bulbous plants are excellent, and the illustrations, which are fairly numerous, form an additional attraction to a work that will probably find a welcome place on the shelves of many people who are attracted by the pleasing results afforded by the cultivation of bulbous plants.

NITRIFICATION IN SOIL.—Those who are familiar with the remarkable experimental grass-plots at Rothamsted will recall the curious appearance of the herbage in the plot that has been supplied with nitrogen in the form of ammonium chloride and sulphate for a long period of years. The vegetation consists almost entirely of three grasses, *Holcus lanatus*, *Allopecurus pratensis*, and *Arrhenatherum ævaceuum*, whilst the surface layer of soil consists of a peat-like mat of semi-decayed plant remains. Recent investigations that have been made in the laboratory show that the soil has become acid, a result that often may occur as a consequence of the long-continued use of ammonium salts. It was found that the organisms that ordinarily oxidise the ammonia to nitrates were only present in small quantities, and their action was almost inhibited owing to the acidity of the soil. The slight amount of nitrification observed, together with other facts, which need not be considered here, point to the conclusion that the oxidation is attributable to the beneficial action of the small residual quantity of lime present in the soil. This acts partly, no doubt, as locally neutralising the acidity, and it is possible that further investigation may show that its influence may also be connected with other physiological properties which this substance is known to possess. The acidity of the soil is, at least mainly, brought about by the action of various micro-fungi, which are able to utilise ammonia, setting free the acid in the soil. The general result of the investigation, which has a practical value of considerable importance, indicates that "the decline in fertility of the acid plots may be attributed to the repression of the normal bacterial activities of the soil, and the encouragement of the growth of moulds." (*Proc. Roy. Soc., B.* vol. 80, p. 212.)

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

THE SPECIFIC NAME OF THE COMMON HYDRANGEA.—A short time since I was asked the correct specific name of the common *Hydrangea*, and at once replied "Hortensia," saying that the plant was named in honour of Queen Hortense. This led to my being at once confronted with the last edition of the *Hand List of Trees and Shrubs at Kew*, for it is there given as *Hydrangea hortensis*. I should have regarded this as an error, but for the fact that the specific name of *Hortensia* stands first in the list of synonyms. In the earlier and, I believe, first edition of the same work, published in 1894, the name is given as *Hydrangea Hortensia*. It is this continual changing of names which leads the average horticulturist to often think that our botanical friends do not know their own minds for long together. If

—Our correspondent has touched upon a somewhat complicated case of nomenclature, and one which can hardly be regarded as satisfactorily settled even at the present time. Of course, the reason for the various names (or synonyms) under which a species is known is to be sought in the fact that different authorities, either in ignorance of the older name, or with the deliberate intention of correcting or improving on it, have called the plant by a new one. The history of the synonymy of *Hydrangea hortensis* is briefly as follows, excluding certain obviously erroneous identifications: A. L. de Jussieu introduced the generic name *Hortensia* in 1789, and Lamarck, in the same year, named the species now under consideration *Hortensia opuloides* (*Encycl. in.*, 1789); three years afterwards, J. E. Smith, who gives an admirable figure of the plant, together with a full description and interesting notes, called

the plant *Hydrangea hortensis*, recognising that it should be transferred to this (older) genus. His account (*Il. pict. plant. rar.*, 1790: 93) dates from 1792, and he mentions the fact that the shrub was introduced to Kew by Banks, in 1790. Nearly forty years afterwards, Siebold (*Voy. Bot. Art. Cur.*, xiv, 1830) introduced the specific name *Hortensia*, the earlier generic one, and it has been commonly used by many writers since his time. But Koch (*Dendrol.*, i, p. 353, in 1869), restored the original specific name *opuloides*, while he at the same time recognised the validity of the generic *Hydrangea*. He has been followed by Schneider, in his recent work (*Flora. Handbuch d. Laubholzkunde*), which appeared in 1906. According to the Vienna Rules, now very generally accepted as authoritative in fixing the principles of nomenclature, there seems no doubt that the plant ought to be known under the name *Hydrangea opuloides*, Koch, since this represents the combination of the earliest recognised specific name with that of the accepted genus. Whether it will come into general use remains to be seen, but, in the meantime, the two names mentioned by our correspondent, that of *hortensis* is, beyond question, more correct than *Hortensia*.—E.D.

TRAINED FRUIT TREES.—Having recently paid a visit to Messrs. Hugh Low and Sons nurseries, I can fully bear out what *F. M.* says (p. 211) respecting the quality of the stock grown there, but I should like to ask the authority of the statement, "Although in the case of stone fruits the fan form of training is the only method applicable"? I venture to entirely differ from this dictum; of course, in the case of Apples and Pears fan training is a thing of the past, although it would seem that some Scottish gardeners still prefer it, but why should horizontal training, which is so generally admitted to be far superior to fan training for Apples and Pears, be unsuited for Plums and Cherries? I maintain that all trees which form fruiting spurs are admirably suited to horizontal training, and perhaps the advantages of this system are better seen with Plums than in the case of any other fruit. To begin with, Plums are rampant growers, for a real dwarfing stock has yet to be found for them; every gardener knows the difficulty of keeping Plum trees within bounds on any wall but an exceptionally high one. This difficulty is done away with by horizontal training, for the shoots, being laid in laterally, can be allowed all the space they require, added to which, this form of training checks their vigour to some measure and causes them to be more fruitful. I think, however, that the greatest gain is to be found in the clothing of the wall space with a better wood in a horizontally-trained tree the branches are equidistant, and, consequently, can carry fruit upon their whole length, whereas in the case of the fan-trained trees there is a considerable amount of space lost where the branches ramify, and they are so crowded and strong that fruit spurs are conspicuous by their absence. In speaking of Cherries it will be understood that only those which form fruiting spurs are included, for, naturally, the Morello class, which fruits on the stem, would be trained on the fan system, so that the wood, which carries its crop of fruit, may be cut out and new growths laid in. If anyone desires a proof of this theory they have only to journey to Gurnersbury House and see the wonderful crops of Cherries which Mr. Jas. Hudson grows on his horizontally-trained trees, or to the Manse at Braefridge, where the Rev. C. C. Ellison has a full set of horizontally-trained Plums which last year were studded with good fruit. I only mention these two examples because they are familiar to me; many others could be given. May I further trespass upon your space by asking the question where can a really good Graevenstein Apple be procured? Many years ago I read that this was the favourite Apple of her Majesty (then Princess of Wales), and, thinking to obtain it from headquarters, I wrote to one of the leading firms in Denmark for trees. I had some six or seven varieties sent over (speaking from memory); they were a considerable time in coming into bearing, and were promptly discarded when they had been procured, and neither then nor since have I found a Graevenstein worth growing. *A. H. PARSONS, Tunbridge.*

* By T. W. Sanders. W. H. & L. Collingridge, 1904. Price 2s. 6d.

PRONUNCIATION OF PLANT NAMES.

PRONUNCIATION.—In the first word in each line the accent (') is short; (˘) is long.

In the second word vowels are to be pronounced as—

- arise, ät, äge, ärt, äir, äll
- eat, äge, äat, err, äwe
- in, ät, äie, äu
- on, ötter, äwe, ör, dö, öwl, öil
- u, ötter, äse, üra
- "ch," as in chin; "th," as in thin
- "s," as in soft; "f," as in far
- "g" as in go.

All other letters are unmishtakable.

A

- Abelia, ä-bé'l'i-a
- Abies, ä-bi-'és
- Abobra, ä-böb'-ra
- Abroma, äb-rö-'mä
- Abronia, äb-rö-'ni-a
- Abrotanum, äb-röt'-än-um

(To be continued).

TOMATO TRIAL AT READING.

AT Messrs. Sutton and Son's seed farm, at Reading, is to be seen a collection of Tomatos grown for the purpose of comparison. In all, the trial contains some 230 rows, 10 plants to a row, making a total of 2,300 plants. The average height of the varieties is 3 feet, the most dwarf kinds being about 20 inches, and the tallest 40 inches. The number of varieties is not the same as the number of rows, for, in some cases, several rows are planted with one variety, but they had been obtained from different sources, and were labelled under the various growers' stocks. A remarkable circumstance was the exact truthfulness to character of each stock, a fact which serves to show how thoroughly the characters of Tomato varieties have been fixed. The seeds were, in every case, sown on March 14, the planting-out being done during the second week in June. The plants generally had cropped very heavily, for, although in one or two cases I noticed only few fruits on the haulm, taking them altogether I have never seen a finer trial or heavier outdoor crop, and the plants were remarkably free from disease. It is not to be assumed, however, that the past has been an ideal Tomato season, for warm weather was wanted during early September to ripen the fruits, three-fourths of them being fully grown and needing only sunshine to colour them.

Commencing with the earlier forms of outdoor Tomatos with their somewhat sutured fruits, the varieties were Early Large Red, Open Air, Magnum Bonum, and similar ones, all very heavy croppers. Then the varieties gradually passed into a smoother section, such as Early Market, Winter Beauty (a splendid cropper and handsome fruits), Princess of Wales (another excellent cropper), Abundance, Up-to-Date, Comet (not a good cropper at Reading), Red Dessert (fruits of medium size on long racemes and very prolific), Holmes' Ideal, a variety not unlike Sunrise, which was also in the trial (both nicely fruited), and Sutton's Al (with Apple-shaped fruits). I also noticed the old Ham Green Favourite, Best of All, and Sutton's Eclipse, all carrying heavy crops of handsome fruits. Then there were Hathaway's Excelsior, Main Crop (of which a much smoother form than the original type now exists), Sutton's Cluster (with long racemes of rounded fruits), Cascade (the fruits of this kind are also borne in racemes, but they are smaller than the last mentioned and suitable for dessert purposes or for ornamental uses), the small-fruited Red Currant, the large-clustered Wonder of Italy, known sometimes as Semperfructifera; Peach Blow, with an immense crop of fruits, though none were coloured; and the products of several fine crosses, in which Satisfaction, Best of All, Up-to-Date, and others have been used as parents. The aim of the raiser of new varieties is to obtain greater solidity of flesh and richer flavour. So far as cropping is concerned it would seem from this Reading trial there is little to be desired, but giant crops are not everything. So far the varieties named have been red kinds; the yellow fruiting varieties were massed by themselves. The first I noticed were those two pleasant eating and abundant cropping varieties, Yellow Cherry and the Plum-shaped Golden Nugget. Sunbeam produces egg-shaped fruits; those of Golden Queen are slightly corrugated. The dwarfest grower is Sutton's Dwarf Gem, the plants, 20 inches in height, having good crops of Tomatos. Golden Perfection is one of the best of the yellow kinds.

The trial throughout has been very carefully conducted; each plant has been given equal opportunities with its neighbour, and all seem to have made the best use of the good culture afforded them. A. Z.

SOCIETIES.

ROYAL HORTICULTURAL.

Scientific Committee.

SEPTEMBER 15.—Present: Dr. M. C. Cooke, M.A., V.M.H. (in the chair); Messrs. W. Fawcett, J. Fraser, W. Hales, H. T. Gussow, A. Worsley, A. W. Sutton, L. de B. Crawshaw, and F. J. Chittenden (secretary).

Mushrooms from spores.—Dr. M. C. Cooke, V.M.H., read a communication concerning a Mushroom, *Agaricus elvensis*, which had occurred in two gardens after pieces of this species had been thrown out, and which had evidently grown from the spores so distributed. They had, after their first appearance, grown in the same spot year after year.

Discarded plants.—Mr. H. T. Gussow reported that he had examined the Apples referred to him at the last meeting; and had found nothing upon them except punctures made by some insect. He had also examined the New shoots, and was of opinion that they had been injured either by something having been poured over them or by fumes.

Spots in Papaver Rhoeas.—W. G. SMITH, Esq., of Dunstable, wrote in reference to the Shirley Poppies with bracts at the base of the flowers and otherwise varying from the normal, saying that he had noticed similar forms at Dunstable in *Papaver Rhoeas*, and he found that these came true from seed, at any rate for several years. He had also noticed forms with several flowers growing from just below the flower in its normal position, reminding one of the "hen and chicken" Daisy, in which inflorescences behave in a similar manner.

Ustilago hypodytes.—Dr. C. P. PLOWRIGHT sent a specimen of *Ammophila arundinacea* "affected by the so-called *Ustilago hypodytes*". The affected plant has been growing in my garden for the last fifteen years, annually producing the fungus. The spores are produced inside the leaf sheaths, so that they look as though the stem had been filled with snuff packed in between the stem and the leaf. This year, however, the stems are contorted, and the growth very much distorted. The plant came originally from Wells-next-the-Sea, Norfolk."

Aster tripolium.—Mr. FRASER, F.L.S., drew attention to the strongly entomophilous character of the Sea Aster (*Aster tripolium*), and especially to the great variation in the number of ray florets found in the flower: many plants had the outer florets with broad rays, in some they were narrow, though numerous, in others they were very few, while quite frequently none at all were present. He found, however, that the various forms were all alike regularly visited by insects, especially the hive bee, the humble bee, and various flies (*Syrphidae*). The pollen was spiny in all, and there were numerous papillae (from which an odour was exuded?) upon the corolla and other parts of the flower.

Sisymbrium Sophia.—Mr. FRASER also showed specimens of *Sisymbrium Sophia*, in which, unlike the usual condition of things, the petals were less than half the length of the sepals.

Carrots splitting.—Several specimens of Carrots splitting lengthwise were exhibited, and Mr. SUTTON said that this almost invariably happened when the roots were left in the soil for a considerable time after they had reached maturity. Another cause of the splitting was the rapid absorption of water after a period of drought.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

SEPTEMBER 3.—Committee present: Messrs. R. Ashworth (chairman), Thorp, Ward, Warburton, Shill, Upjohn, Ball, Keeling, Holmes, Cypher, Ashton, Parker, R. Ashworth, and Weathers (hon. sec.).

Z. A. WARD, Esq., Northenden (gr. Mr. Weatherley), staged a handsome group of plants, in which were several choice hybrids, two or three beautiful forms of *Cattleya* × *Iris* being especially noticeable. (Silver Medal.)

R. ASHWORTH, Esq., Newchurch, also received a Silver Medal for a group of plants composed of good forms of *Odontoglossums*, *Cattleya Gaskelliana* alba, and some hybrids.

G. SHORLAND BALL, Esq., Burton, Westmoreland (gr. Mr. Herd), staged a collection of *Cypripediums*, amongst which were such choice and well-known plants as *C.* × *Lord Ossulston*, *C.* × *Milo* var. *magnificum*, *C.* × *Baron Schroder* var. *Ardens* (Award of Merit), *C.* × *Victory* (Award of Merit), *C.* *Curtisii* var. *exquisitum*, and *C.* × *Maudiae*. *Cycnoches chlorochilon* received an Award of Merit, as did also *Brassia Wrayae* from the same collection. Several interesting plants of botanical interest were also recognised by the committee. A Silver Medal was awarded to this exhibitor for *Cypripediums*, and another for the general collection.

MAX ISAAC, Esq., Blundellsands (gr. Mr. Driver), exhibited *Cypripedium* × *Maudiae* *magnificum* and *Lycaste Depelei* var. *giganteum*.

E. ROGERSON, Esq., Didsbury (gr. Mr. Price), showed a few plants, including *Cypripedium* × *Priceanum*, a new hybrid between *C.* × *Harrisianum* and *C.* × *violaceum* (Award of Merit), *C.* × *St. Mary*, *C.* × *Mandarin*, and *C.* × *Princess*.

J. MCCARTNEY, Esq., Bolton (gr. Mr. Holmes), staged a group of *Cattleyas* and *Laelias*, for which a Silver Medal was awarded. *Cattleya Gaskelliana* var. *picturatum* was voted an Award of Merit. Other plants in this group worthy of mention were *Laelio-Cattleya* × *callistoglossa*, *L.* × *C.* × *bletchleyensis*, and *Cattleya Gaskelliana* var. *alba*.

MESSRS. MOORE & CO., Rawdon, near Leeds, were voted a Silver Medal for a miscellaneous collection, in which were some rare plants, principally of botanical interest.

C. PARKER, Esq., Ashton-on-Ribble, was awarded a Bronze Medal for a group of well-grown *Cypripediums*, including *C.* × *veixillarium* var. *Rougieri*.

S. GRATRIN, Esq., Whalley Range (gr. Mr. Shill), obtained a First-Class Certificate for *Cypripedium* × *Rosetii*, a beautiful plant whose parents are *C.* *insigne* var. *Sanderianum* × *C.* *Maudiae*.

W. ARBURTON, Esq., Haslingden (gr. Mr. Dalgleish), gained Awards of Merit for *Cypripedium* × *bingleyense* var. *superbum*, *C.* × *Lawreli* var. *magnificum*, and *Cattleya* × *Iris* var. *Othello*.

H. J. BROMLOW, Esq., Liverpool (gr. Mr. Morgan), received an Award of Merit for *Cypripedium* × *Germain* *Opoix* *Westfield* var. *C.* × *Rappartianum* and *C.* × *Maudiae* were also shown by Mr. BROMLOW.

MR. W. SHACKLETON, Bradford, received a vote of thanks for a small display of plants. P. IV.

BRITISH GARDENERS' ASSOCIATION. LONDON BRANCH.

SEPTEMBER 10.—The first meeting of the autumn session of the London branch of this association was held at Carr's Restaurant on the above date. Mr. G. Gordon, V.M.H., gave a lecture on "Beautiful Flowering Trees and Shrubs." The lecture was illustrated by lantern slides.

At the last meeting of this association, Mr. E. F. Hawes in the chair, six new members were elected, bringing the total up to 1,363. The question of honorary members was deferred for further consideration. A sub-committee was appointed to consider and report whether it would be possible to establish a garden on co-operative principles so as to give employment to any members out of work and to serve as a centre from which employers could obtain professionally-trained gardeners. The secretary will be pleased to receive any ideas or suggestions on this matter. J. IV.

NATIONAL CHRYSANTHEMUM.

SEPTEMBER 14.—The first meeting of the executive committee for the season 1908 was held on the above date at Carr's Restaurant, Strand. Mr. Thomas Bevan occupied the chair. A report of the annual outing, made by the secretary, showed that 160 persons were present, and that the undertaking was a financial as well as a social success. The need for a diploma for honorary fellows was discussed. A report from the committee to consider the desirability of holding the exhibitions in the Royal Horticultural Hall, Vincent Square, was

debated, with the result that it was not considered practicable at the present moment. A report was also submitted from the Market Show Committee, and a resolution passed that this show be abandoned.

The annual dinner will be held at the Holborn Restaurant on November 26, provided the arrangement is suitable for the president.

Several new members were elected.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

SEPTEMBER 14.—The monthly meeting of this Society was held at the Horticultural Hall, Vincent Square, Westminster, on the above date, Mr. Charles H. Curtis in the chair. Four new members were elected, making a total of 52 for the year. The sum paid to sick members since the last meeting has amounted to £39 13s.

Mr. A. Hemsley resigned his office on the committee through pressure of business and inability to attend the meetings. The resignation was accepted with regret, and a vote of thanks was accorded him for his past services.

The annual dinner will be held this year at the Waldorf Hotel, Aldwych, W.C., on Thursday, October 15, at 6.30 p.m. Dr. Botall, of Abinger, has consented to preside on this occasion.

NATIONAL ROSE. (AUTUMN SHOW.)

SEPTEMBER 17.—Another success must be credited to the National Rose Society in their autumn exhibition held on the above date in the Horticultural Hall, Vincent Square, Westminster. The building was well filled not only with exhibits of Roses of all kinds that overflowed into the annexes, but also with visitors. So popular have these exhibitions become that for the members' convenience one hour was set apart for a private view. The weather conditions were glorious, and this contributed not a little to the success of the show. Considering the very adverse weather of the past few weeks it was remarkable to see Roses in such quantity and in such fine condition. There were many varieties presented for awards, and of these four received the Society's Gold Medal, while several others gained a Card of Commendation. The Rose is especially suitable for floral decorations, and the numerous and beautiful exhibits in this section found many admirers.

NURSERYMEN'S CLASSES.

BLOOMS SHOWN ON BOARDS.

The most important class was that for 36 blooms of distinct varieties, and it was competed by seven growers, most of the exhibits being of very fine quality, and especially the two which took the 1st and 2nd prizes, shown by J. COCKER & SONS, Aberdeen, and Mr. HUGH DICKSON, Belfast, respectively. A 3rd prize was awarded to Messrs. ALEX. DICKSON & SONS, Newtownards, who showed a very creditable lot. The blooms in the premier exhibit were: Marchioness of Londonderry, Annie Wood, Gustave Piganeau, Mme. Jules Gravereaux, Mme. J. Bounaire, Captain Hayward, Mrs. R. G. Sherman Crawford, Oscar Cordel, Pharisæer, Alfred Colomb, Exquisite, Mrs. E. Mawley (a choice bloom), Hugh Dickson, La France, Earl of Warwick, Caroline Testout, Farbenkönigin, Florence Pemberton, John Stuart Mills, Mrs. John Laing, Mildred Grant, Betty, Charles J. Grahame (this flower was considered the best hybrid perpetual Rose in the nurserymen's classes and was awarded a Silver Medal), Bessie Brown, Duc de Rohan, Frau Karl Druschki, Helen Keller, Kaiserin Augusta Victoria, Freiherr von Marschall, Duke of Wellington, Lady Sheffield, Rev. Alan Cheales, and Mme. Wagram.

The winner of the 2nd prize, Mr. HUGH DICKSON, Belfast, showed excellent blooms of Mme. Wagram, Comtesse de Turénne (pale pink), Hugh Dickson, Mme. Eugène Verdier (very large), Mme. Joseph Combet, Her Majesty (pale pink with fine centre), Mrs. Stewart Clark, Ulrich Brunner, Gladys Harkness (an exceedingly well-shaped flower of pink colour), Charles J. Grahame, Mrs. Edward Mawley, J. B. Clark, and "Tom Wood" (well-formed).

A Silver Medal was awarded to Messrs. ALEX. DICKSON & SONS, Newtownards, for a large,

finely-formed bloom of the variety Mrs. John Laing in the 3rd prize exhibit, which also contained fine blooms of Mme. Joseph Combet, Comte de Rambaud (dark red), Oscar Cordel, and Gustav Grunerwald.

In the class for 18 blooms of distinct varieties, the 1st prize was won by Messrs. J. JEFFERIES & SON, Cirencester. There were several good blooms in their exhibit, notably Maman Cochet, Mrs. Edward Mawley, Mme. Jules Gravereaux, Mme. Lambert, Perle des Jardins, Souvenir d'Elise Vardon (a grand specimen), Golden Gate, Georges Schwartz (of the richest yellow), and Souvenir de Pierre Notting. Mr. GEORGE PRINCE, Longworth, was awarded the 2nd prize,

Messrs. DICKSON'S varieties included Ulrich Brunner, Gladys Harkness (exceptionally fine), Mrs. Stewart Clark, Frau Karl Druschki, Mrs. John Laing, Mme. Wagram, Comtesse de Turénne (a very clean-petalled variety), Chas. J. Grahame, and Caroline Testout. The 2nd prize collection contained good samples of Betty, Mrs. E. Mawley, Earl of Warwick, Alfred Colomb, Captain Hayward, Caroline Testout, Mrs. J. Laing, and Pharisæer. 3rd, Messrs. W. & R. FERGUSON, Dunfermline.

A class was provided for 12 blooms of one variety. There were five vases; the three premier ones all contained the white Frau Karl Druschki, shown by Messrs. J. JEFFERIES & SON,

[Photograph by J. Gray.]

FIG. 101.—ROSE ALEX. HILL GRAY: RICH YELLOW TEA VARIETY.

(For text see p. 237.)

and among his collection we remarked fine flowers of Mrs. E. Mawley, Auguste Comte, Mme. Vermorel, and Maman Cochet. The 3rd prize was won by Messrs. D & W. CROLL of Dundee, with principally yellow and white varieties.

BLOOMS SHOWN IN VASES.

The class for 12 distinct varieties staged in a space not exceeding 6 feet by 3 feet was of much importance, and occupied a considerable amount of space. There were seven exhibits, much the best being that shown by Mr. HUGH DICKSON, of Belfast, for although the 2nd prize exhibit, shown by Messrs. J. COCKER & SONS, Aberdeen, had some finely-formed and well-coloured blooms they were not so large. A selection of

Cirencester, Messrs. W. & R. FERGUSON, Dunfermline, and Messrs. J. COCKER & SONS, Aberdeen, respectively.

A very large display was formed by the collections of Roses staged in a class for 36 distinct varieties in trusses, arranged as far as possible to show the foliage and habit of growth of each variety. There was a good competition amongst five growers, the 1st prize falling to Messrs. FRANK CANT & Co., Colchester, for a bright lot in big bunches, especially well arranged. As a selection we may enumerate Marie Van Houtte, Papa Gontier, Mme. Hoete, Lohengrin, Dean Hole, Hugh Dickson (shown especially well), Lady Ashton, and Wm. Shean. In the 2nd prize group, shown by Messrs. B. R. CANT &

Sons, Colchester, were many garden varieties, and they were beautiful fragrant whilst, apart from the very bright flowers, the foliage and buds were also pleasing. Their best examples were Marie Van Houtte, Georges Nabonnand, Maman Cochet, Morning Glow, Perle von Godesberg (an exquisite yellow kind), Pharisier, Florence Pemberton, Mme. Jules Grolez, General Schablikine, Mme. Ravary, and Sulphurea.

DECORATIVE ROSES.

The exhibits in this section were required to be arranged so as to show as far as possible the foliage and habit of growth of each variety. There was a class for 24 distinct varieties in which not fewer than three nor more than seven trusses of each variety were permitted, and the space was restricted to 8 feet by 3 feet. There were three groups, and generally the blooms were small. In the winning selection, shown by Mr. JOHN MATTOCK, Oxford, were seen Peace, Mons. Paul Ledic, Irish Elegance, Lady Batterssea, Gen. Schablikine, Lady Waterloo, Carolina La Tosca (an elegant little variety), Viscountess Folkestone, Betty, and others. 2nd, Messrs. F. CANT & Co., Colchester, with Rain-bow, Beryl, Ecclatrate (a notable vase), Peace (also very fine), Mme. Antoine Mari (a very pleasing colour), General Gallieni (with peculiar coloured petals, being wine colour outside and pale rose internally), and Mme. Chedane Guinoisseau (of a beautiful yellow colour, with pretty small buds). 3rd, Messrs. J. JEFFERIES & SON, Cirencester.

There were three exhibitors in the class for 12 varieties, the winners being Mr. J. CONWAY, Penarth, Messrs. W. & R. FERGUSON, Dunfermline, and Messrs. GEORGE PRINCE, Longworth, who won in the order in which their names are given.

In the class for 12 distinct varieties in trusses arranged in bamboo stands, two competitors entered, the 1st prize going to Mr. JOHN MATTOCK, whose vases were artistically arranged on the board. The 2nd prize fell to Messrs. J. JEFFERIES & SON, Cirencester. Some notable stands in the 1st prize exhibit were those containing Bardon Job (fine single Rose of a dark red colour), Mme. Abel Chateau (very effective), Gruss an Teplitz, Catherine Mermel, and Irish Elegance. Among those staged by Messrs. J. JEFFERIES & SON were Lady M. Bathurst (a beautifully formed yellow Rose), Gruss an Teplitz, Hermosa, and Mme. Lombard.

There were six entries to the class for dwarf Polyantha or Poodle roses. Each exhibitor showed, in vases, six trusses of 12 distinct varieties. The three prizes awarded were taken by Messrs. B. R. CANT & SONS, Colchester, Messrs. PAUL & SON, Cheshunt, and Messrs. W. & J. BROWN, Peterborough. The premier blooms Schneewittchen (clusters of little white flowers), Eugenie Lamesch (large trusses of pale yellow blooms, but inclined to be darker in the open flowers), Perle d'Or, Mme. Zelia Bourgeois (with tiny flowers), Katherina Zeimet, Leonie Lamesch (very pretty colouring of a reddish tint). The flowers shown by Messrs. PAUL & SON were not greatly inferior to those displayed by the winner of the 1st prize. They included Katherina Zeimet, Gloire des Polyantha, Cecile Brunner, Perle d'Or, and Rosalinde.

GROUPS OF ROSES.

No space is allotted to non-competitive exhibits of Roses at this show, but the exhibits of groups of Roses by nurserymen, for which the schedule made provision in three classes, take their place. In that for a representative group of Roses arranged in a space not exceeding 100 square feet, in all the types of Roses, either as pot plants or as cut flowers in vases, &c., and relieved with suitable foliage plants, there were two competitors, Messrs. PAUL & SON, Old Nurseries, Cheshunt, and Messrs. HOBBIES, Ltd., Dereham, Norfolk, the 1st and 2nd prizes being awarded in the order given. Each group was arranged in a corner of the building, Messrs. PAUL having neat bunches in pots and baskets, with pot plants at the back, relieved with Ferns and Mosses, and edged with a row of Adiantum Ferns. They showed Paula, Marie Van Houtte, Frau Karl Druschki, Victor Hugo, Mrs. J. Laing, Heinrich Schultzeis, La Tosca (very fine samples), S. M. Rodocanachi, pot plants of Eugenie Lamesch, and others. Messrs. HOBBIES had rather a different arrangement, using at the back tall trained plants in

pots and epergnes filled with fine blooms, Carolina, Dainty, General MacArthur, Marie Van Houtte, and Georges Nabonnand being a selection of the varieties shown.

Class II was for a representative group of cut Roses arranged on staging in a space not exceeding 18 feet by 6 feet. Four fine displays were seen, all exhibiting great skill in arrangement. The best was adjudged to be shown by Mr. GEORGE PRINCE, Longworth, his group being comprised of tall epergnes filled with blooms of well-known varieties and a groundwork of vases containing such varieties as Killarney, Betty, White Maman Cochet, Marie Van Houtte, La Tosca, &c. The 2nd prize exhibit, shown by Messrs. W. & J. BROWN, Peterborough, was also very pleasing, with tall stands at the back facing banks of Roses, in bunches and vases. Most of the best kinds in season were displayed in this group, also in a very pretty exhibit arranged by Messrs. HOBBIES, LTD., which was awarded the 3rd prize.

AMATEURS' CLASSES.

In the class for 18 blooms of distinct varieties, open to any amateur cultivator irrespective of the number of plants he grows, Messrs. R. & T. PARK, Bank House, Aiskew, Bedale, took the 1st prize with a very bright and clean set of blooms, amongst which were noticed good examples of Francois Michelon, Alfred Colomb, Hugh Dickson, White Maman Cochet, President Carnot, and Gladys Harkness. The Rev. J. H. PEMBERTON, Havering, Romford, was a good 2nd, his

[Photograph by J. Gregory.]
FIG. 102.—ROSE LADY ALICE STANLEY, H.T.:
COLOUR PALE SILVERY ROSE.

finest examples being Caroline Testout, Mrs. Theodore Roosevelt, and Gustav Gruenwald; 3rd, Mr. CONWAY JONES, Hucclecote, Glos. The Silver Medal for the best bloom of H.P. in the amateurs' section was awarded to Mr. E. B. LINDSELL, Bearton, Hitchin, for a bloom of Mrs. J. Laing, and shown in this class.

For 12 blooms, distinct varieties, open only to growers of fewer than 2,000 plants, the 1st prize was secured by Mr. W. O. TIMES, Bedford Road, Hitchin, whose finest flowers were those labelled Lady Ashtown, Bessie Brown, Countess of Gosford, Countess of Derby, Mrs. J. Laing, and Frau Karl Druschki; 2nd, Mr. G. SPEIGHT, Market Harborough, with a clean set of blooms, including Mme. Wagram, which was awarded the Silver Medal for the best H.T. shown by amateurs; 3rd, Mr. M. WHITTLE, Belgrave, Leicester.

Mr. O. G. OBFEN, Colchester, secured the Silver Medal for the best Tea Rose with the variety White Maman Cochet.

Mr. W. Upton, Belgrave, Leicester, obtained the 1st prize with an even set of blooms for nine distinct varieties amongst growers of fewer than 1,000 plants, the most notable blooms being Maman Cochet, Frau Karl Druschki, Mrs. J. Laing, Mme. Hoste, J. B. Clark, and White Maman Cochet; 2nd, Mr. E. B. LEHMANN, field, Crawley.

In the class for six blooms, in not fewer than four varieties, open to growers of fewer than 200

plants, Mr. WALTER BENLEY, Lombard Street, E.C., was given 1st place in a keen competition, his best specimens being Frau Karl Druschki, J. B. Clark, Killarney, and Mrs. Theodore Roosevelt. It was closely followed by Mr. STUART HOGG, Hertingfordbury.

The Rev. J. H. PEMBERTON gained the 1st award for 12 distinct varieties, the most effective blooms being Gruss an Teplitz, Frau Karl Druschki, Fellenberg, Trier, Caroline Testout, Mme. Alfred Carriere, Gustav Gruenwald, Lady Ashtown, and Florence Pemberton. 2nd, Mr. J. R. DARLINGTON, Park House, Potters Bar.

TEA AND NOISETTE SECTION.

In the Tea and Noisette section Mr. CONWAY JONES secured the premier award of 12 blooms of distinct varieties, with choice blooms of Lady Roberts, Mrs. Edward Mawley, Maman Cochet and its white form, The Bride, and Anna Ollivier. 2nd, Messrs. R. & T. PARK.

For nine blooms, distinct varieties, open to growers of fewer than 500 plants, Mr. C. H. F. LESLIE was a good 1st with Innocente Pröla, Ernest Edouard, Marie Van Houtte, Cleopatra, Souvenir de Pierre Notting, Souvenir d'Elise Vardon, and Mrs. Edward Mawley in good form.

Mr. W. O. TIMES excelled for six blooms, distinct, the finest flowers being Niphetos, Rubens, Maman Cochet, and Mme. Lombard. Mr. STUART HOGG had good flowers of Catherine Mermel, Mrs. E. Mawley, Marie Van Houtte, and Bridesmaid, with which he won the 2nd prize.

EXHIBIT ROSES IN VASES.

In the class for six distinct varieties, not more than two varieties of Tea or Noisette Roses, five blooms of each, the Rev. J. H. PEMBERTON was again 1st with Bessie Brown, Caroline Testout, Frau Karl Druschki, Earl of Warwick, Hugh Dickson, and Florence Pemberton.

There was only one entry in the class for decorative Roses, the Rev. J. H. PEMBERTON showing a fairly representative set, for which he was awarded the 1st prize.

For six distinct varieties a greater competition resulted, Mr. EDWARD MAWLEY being placed 1st, Mr. J. R. DARLINGTON obtaining the 2nd place.

GOLD MEDAL ROSES.

Lady Alice Stanley (see fig. 102).—A Hybrid Tea variety of pale-rose colour, the inner surface of the petal being of a silvery sheen; the centre is somewhat globular, and although the flower is not, perhaps, of the choicest form, it possesses fragrance, an attribute not always to be found in new Roses.

His Majesty, a fine dark red Rose, sweetly scented, and with a well-formed centre. Both these were shown by Messrs. MCGREY & SON, Portadown.

Alex. Hill Gray (see fig. 101).—A beautiful yellow Tea variety, with very elegant form and richest shade of colouring.

Dr. O'Donnell Brozen, H.P.—A good red Rose, slightly paler on the exterior of the petals, which are of good substance. These two last-named were shown by Messrs. ALEX. DICKSON & SONS.

DEBATING SOCIETIES.

CARDIFF GARDENERS.—The members of this association visited the Fair Oak Nurseries, Bassaleg, on September 9, to inspect the fruit crops. It was surprising after the great glazes of the previous week to find such a large quantity of fruit on the trees, especially after being so recently covered by the late snows and having been blown down. The crops of some of the varieties of Pears had been injured by the cold weather in spring, but the majority of trees were freely fruited. Some fine specimens of fruit were seen on pot trees in the extensive orchard house. The chairman and honorary secretary being away on their holidays, the arrangements for the outing were made by Messrs. Mounthey and Julian.

CROYDON & DISTRICT HORTICULTURAL.—This Society resumed its meetings, for the coming season at the Sandowner Temperance Hotel, and the first paper was on "The Benefits of Gardeners' Mutual Improvement Societies to Gardeners and their Employers." The hon. secretary (Mr. Harry Boshier) was the reader of the paper.

—At the meeting on Tuesday, 16th inst., the lecturer for the evening was Mr. M. E. MILLS, Combe House Gardens, his subject being "Flowering Annuals," and to illustrate some of the varieties under notice he showed several lantern slides.

MARKETS.

COVENT GARDEN, September 23.

(We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that the quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—E.N.)

Table listing various plants and flowers such as Asters, Calla, Carnation, Chrysanthemum, Gardenias, etc., with their respective prices per dozen or bunch.

Table listing various plants and flowers such as Adiantum, Asparagus, Berberis, Croton, etc., with their respective prices per dozen or bunch.

Table listing various plants and flowers such as Ampelopsis, Aralia, Aspidistra, Asparagus, etc., with their respective prices per dozen or bunch.

Table listing various fruits and vegetables such as Apples, Bananas, Beans, Carrots, etc., with their respective prices per bushel or dozen.

Table listing various plants and flowers such as Kents, Marigolds, Nasturtium, etc., with their respective prices per dozen or bunch.

bright colour being received from Madeira. There is a much larger demand for all foliage with red autumnal tints than formerly. Asparagus in long trails, Smitux asparagus, and the fronds of the larger types, also Croton leaves, have had a fair good sale.

CUT FLOWERS. Most Roses grown in the open ground are damaged by wet and stormy weather generally, although when the outdoor petals are covered the flowers are very bright. Supplies of Roses have been more than equal to demands, and their prices are very low. Carnations of the best quality and of the most beautiful shades are in great demand. Flower have advanced slightly. Chrysanthemum are now freely offered, especially those from the open ground. The best white blooms are in the glass and are advanced slightly in value. Asters have been sold very cheaply; they appear to have succeeded wonderfully well this season with most growers, and supplies have been excessive. Galliarids are now extensively grown, and though they keep fresh longer than most flowers I noted this morning that there were large quantities thrown away. Choice indoor flowers are not quite so plentiful. Liliums of the best quality have made better prices, also Eucharis, Stephanotis, Gardenias, Ac, but with all cut flowers it is extremely difficult to estimate prices, as a great deal (Wednesday) there were heaps of good flowers left unsold at closing time, and I noticed that the costers' barrows were loaded with surplus blooms.

FOR PLANTS. The best Chrysanthemum wanted to clear out very well, but those of second quality do not sell so freely. Asters in pots are good, but their prices are extremely low. Most of the plants of Campanula isophylla have erect growth, instead of being trailing, which is considered a great advantage when they were first introduced. Plants of Erica gracilis and the white variety "nivalis" are very good. Some fine conditions were put on offer. Thunbergia, also Erica, Veronicas, Zonal Pelargoniums are of good quality. Azalea mollis is procurable, and I observed a few days ago the very fine plants of this species in the garden with well-coloured buds. Flowers. Liliums in pots have advanced a little in value, yet prices for these plants are still below the average for the season. All foliage plants are in the market, and are generally well accepted. In some instances really good Ferns in 48's pots are sold at about 2s. 6d. per dozen. A. H., Covent Garden, Wednesday, September 23, 1908.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD OF THE weather throughout the British Islands, for the week ending September 19, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS. The weather was almost continuously unsettled, with much cloud and very frequent rain in the western and northern districts, but in the east and south of England the conditions were more serene. Thunderstorms were experienced at various stations over the northern half of England on Tuesday. The temperature was above the average in Ireland, Scotland, and the north-east and north-west of England, but below it in England S.E. and the English Channel, while in the east, centre, and south-west of England the maximum was identical with the normal. The highest of the maxima occurred late in the week, and ranged from 78° in England E. and 76° in England N.E. to 66° in Ireland N. The lowest of the minima was generally on the 18th, to 48° in England S.W. (at Llangammarch Wells) the thermometer fell to 29° in Scotland E. to 30° and in England S.E. and E. to 32°; while at Eddlestone the minimum ran from 39° in the Midlands Counties to 42° in the English Channel, and to 42° in Ireland N. The lowest grass readings reported were 28° at Llangammarch Wells, at Greenwich, West Linton, and Rowley, and 27° at Balmoral, Cockle Park (Morriston), Birmingham, and Newton Ring.

The mean temperature of the sea.—Except at a few places in the north-east and at Eddlestone the water was colder than during the corresponding week of 1907, the greatest differences being 35° at Margate and 5° at Cleggan. The actual figures for the week ranged from between 50° and 60° in the south-east, south, and south-west coasts of England to 51° at Lerwick, and to 49° at Aberdeen. The rainfall exceeded the average except in England E., S.E., and S.W., and in Scotland S.E. In Scotland and Ireland, and also in England N.W., the excess was again large. More than an inch of rain fell at Douglas on Wednesday, P. on Friday, and on Saturday. The greatest measurement being 1.72 inches at Killybeg on the latter day.

The amount of sunshine was deficient over the kingdom generally, but was rather more than the average in Scotland N., England S.E., and the English Channel. The percentage of the possible duration ranged from 92 in the English Channel and to 16 in Scotland S.E., to only 15 in Ireland N.W., and to 16 in Scotland W.

THE WEATHER IN WEST HERTS.

Week ending September 23. The warmest day for six weeks.—The day temperatures were mostly high during the week, and on the 22nd the highest reading in the thermometer screen was 74°, or higher than on any day since the early part of August. The nights were also, as a rule, warm, but on one night the ground temperature was 40° below the surface. Notwithstanding the warm weather of the past week, the ground is still cold for the time of year, being at the present time 2° below the normal in the air at 4 ft. in the open. The rain fell on four days, but except on one day the amounts deposited were so small that the total measurements only amounted to 0.25 inches. The ground is exceedingly moist for the middle of September, as is shown by the fact that on two days during the week measurable quantities of rainwater have passed through the percolation gauge on each short interval. The soil is growing on an average for 4 hours a day, which is three-quarters of an hour a day short of the average for the month. The average amount of rain in the air at 4 ft. in the open, exceeded the quantity for that hour by 5 per cent. E. M., Birkhamstead, September 23, 1908.

COVENT GARDEN FLOWER MARKET.

Mistletoe is already seen in the market. Autumn foliage is exceptionally well coloured this season, the leaves of Ampelopsis Veitchii being red, brubling red, Berberis (Mahonia) aquifolia is remarkably good, some of a very

Obituary.

GEORGE NICHOLSON.—We regret to have to record the sad death of Mr. G. Nicholson, F.L.S., V.M.H., on Sunday, the 20th inst. His retirement from the curatorship of Kew in July, 1901, in consequence of heart disease, brought on, it is to be feared, by mountain climbing in Switzerland in search of plants, was distressing to his many friends and a great loss to the establishment with which he had been connected since 1873, when he entered the service in the capacity of assistant to the curator, John Smith II, whom he succeeded in 1886, and it has been said of Nicholson that he was an ideal curator. The son of a Ripon nurseryman, trained in the nurseries of La Motte, Paris, and of Messrs. Low & Co., Clapton, and endowed with quite exceptional capacity for work and close study, he early developed a fitness for a post where zeal and intelligence were needed, and he found full scope for his gifts at Kew. When he became a member of the staff, Sir Joseph Hooker was actively engaged in forming the Kew arboretum, and he found in Nicholson an apt assistant. This gave him his opportunity, and he made full use of it, the result being that he soon knew more about hardy trees and shrubs than any man in Europe, and became the recognised authority in all questions of tree nomenclature. At the same time, Nicholson was not a specialist, for there were very few plants in cultivation with which he was unacquainted. He was a most competent British botanist, knowing native plants as few men ever get to know them. It was almost impossible to entangle him over a plant name, he knew them all so accurately. His enthusiasm was astonishing. A 20-mile walk on a Sunday to some locality where he had marked a particular plant so as to secure its fruit he thought nothing of. His herbarium of British plants, so rich in critical forms, mostly collected by himself, he presented a few years ago to Aberdeen University. He collected specimens of all cultivated hardy trees and shrubs that were known, and the herbarium he thus formed has played a most important part in the building up of the unique collection of hardy ligneous plants now cultivated at Kew.

Nicholson was gardener, botanist, chemist, traveller, linguist (he spoke French and German with great fluency), a man of many accomplishments, and, as everyone who became acquainted with him soon found out, of agreeable personality. When he retired from the curatorship of Kew, his friends and colleagues, wishing to show their appreciation of his sterling qualities, subscribed a testimonial as an expression of their admiration of him "as a man of science and a gardener and their appreciation of his worth as a friend."

Nicholson did much valuable work at Kew. He was a regular contributor to the pages of the *Gardener's Chronicle*, and his monographs of such genera as *Quercus* and *Acer*, published in these pages, are models of critical study and industry. Whilst he was not a very prolific writer, in all that he wrote he was most conscientious. It was therefore most fortunate for horticulture that he was induced to undertake the editorship of the *Dictionary of Gardening*, a work which has done more towards standardising plant names and developing an interest in horticulture than anything published since Loudon's day. It was his intention, had his health permitted, to write a big book on hardy trees and shrubs, for which he had collected much information, some of which has, we believe, been utilised by Messrs. Elwes and Henry in their work on the *Trees of Great Britain and Ireland*, now in course of publication.

Nicholson was a self-taught man. The rememberers how he would hurry from a botanising excursion to the Surrey Downs to meet a young German from whom he received lessons in German in the evening. He was a quick learner, but he essayed one subject which beat him. Music had great charm for him, and after he had turned 80 he determined to learn to play the piano. How he worked at it; rising at 5 a.m. to practise. But it was of no use, as he put it, "my heart and head are all right, but my hands are too clumsy," and he gave it up. Like most Yorkshiremen, Nicholson was a keen sportsman; rowing and swimming he

loved, and he followed cricket with the greatest ardour.

The great charm of George Nicholson was in his conversational gifts. For he was a most entertaining talker, not about plants only, but about most subjects that interest men. He died comparatively young. Born in 1847, sturdy in figure, full of energy and secure of encourage-

THE LATE GEORGE NICHOLSON, V.M.H., F.L.S.

ment, Nicholson appeared to be of the type that reach or get beyond the term of four score years. He married when about thirty, but was soon left a widower, with one child, a son, who is now a naval engineer.

It was deceased's wish that his body should be cremated, as was that of his friend, the late Mr. Herbst. A funeral service was held at Christ Church, Richmond, and was attended by Lt.-Col. David Prain, the Director of Kew Gardens, Dr. O. Stapf, W. Watson, J. M. Hillier,

THE LATE RICHARD LYE.

A. D. Cotton, and other members of the Kew staff, also Sir George Watts, W. Marshall, J. Walker, C. T. Drury, W. Lale, R. Hooper Pearson (representing the *Gardener's Chronicle*), and others. The principal mourners were the son and the brother of the deceased gentleman, and Mr. W. Botting Hensley. There were present

in the church, Mrs. Ashby (sister) and her daughter, also Mrs. W. Botting Hensley.

Among the wreaths sent was one from the Director and staff of the Royal Botanic Gardens, Kew. It was formed of bronzed Oak leaves and Maple shoots, interspersed with purple Asters. The Oak and Maple were especially appropriate, seeing that Mr. Nicholson had monographed both these genera. Another wreath was formed of Lilies and white Chrysanthemums.

JOHN OUVRRARD, the *doux* of the French gardeners in England and the raiser of *Pteris Ouvrardi*, one of the most deservedly popular decorative Ferns ever grown, passed away quietly in his eighty-fourth year at his residence at Child's Hill on Tuesday, 22nd inst., after a very short illness. Deceased was a most energetic man, for upwards of forty years he was a conspicuous figure in the flower market, Covent Garden, being a most successful cultivator of flowering and foliage plants. He made his *début* in England at the Wellington Nurseries, St. John's Wood, when there were in all their glory. Mr. J. Ouvrard was the President d'Honneur of the Société Française d'Horticulture de Londres, to which institution he was very devoted. He was a striking illustration of perseverance, and remained in possession of his mental faculties to the very last.

RICHARD LYE.—We regret to record the death of this gardener, on September 16, at the age of 51 years, after undergoing an operation for appendicitis in Newbury Hospital. His death was a great shock to his relatives, as previously his condition was such that they had hopes of his recovery. Deceased was a member of the Fruit and Vegetable Committee of the Royal Horticultural Society. Although probably better known in North Hants. and Berks. than elsewhere, he was esteemed by everyone as a man of a kindly and genial disposition, as well as a capable gardener, and, in earlier years, a first-class vegetable exhibitor. Mr. Lye was gardener and bailiff for some 27 years at Sydmondon Court, the estate of the Kingsmill family. Considering the distance of his home from London, he was a frequent attendant at the H.S. Committee meetings, where his presence was ever welcome. It was but recently that an Award of Merit was granted to a Tomato at Wisley, named Lye's Early Prolific, raised at Sydmondon, which proved to be probably the very earliest kind to ripen out-of-doors in commerce. The funeral took place on Monday, 21st inst., in the village churchyard at Eechinswell in the presence of many relatives and friends.

CATALOGUES RECEIVED.

BULBS

- THE AGRICULTURAL AND HORTICULTURAL ASSOCIATION, LIMITED, 92, LOMB AVE., LONDON, W.C.
- JAMES CARTER & CO., 297, 298 & 299, High Holborn, London.
- ARTHUR ROBINSON, 35, Cannon St., City, E.C.—Also flowering roots.
- THOMAS S. WARE, LTD., Feltham, Middlesex.—Also roots.
- SMITH & SIMONS, 36-38, West George Street, Glasgow.—Also nursery catalogue.
- JAMES MURRAY, Duffield, S.F.
- JAMES HANSON, 63, Crawshaw Road, N. Briston, S.W.—Also Seeds.
- FERRY, Hardy Plant Farm, Enfield, Middlesex.—Also Tubers.

MISCELLANEOUS.

- CHARLES TURNER, The Royal Nurseries, Slough—Auriculas, Carnations, Plectes, etc.
- PROTHORPE & MORRIS, 67 and 68, Cheapside, E.C.—Register of nurseries, market gardens, &c., to be let or sold.
- MIS HEMUS, Holdfast Hall, Upton-on-Severn—Sweet Peas, CLEMATIS, Arctostaphylos, Manchester, and Bramhall—CARNATIONS.
- GEO. COOLING & SONS, Bath—Autumn bulb and plant list.
- DANIELS BROS., LTD., Norwich—Bulbs, Roses, Fruit Trees, etc.
- WM. PAUL & SON, Waltham Cross, Herts.—Roses, also Fruit Trees.
- TOM KESHAN, Cross Roads, Keighley, Yorks.—Seeds.
- HORACE J. WRIGHT, Dault Road, Wandsworth, S.W.—Sweet Peas.
- WM. WATSON & SONS, LTD., Clontarf Nurseries, Dublin.—CARNATIONS.

TRADE NOTICE.

MR. GEO. G. WHITELEGGE, for some years Gardener and Orchid grower to the GRASSHAWK, Fern, The Grange, Southgate, has commenced business with Mr. PAGE (under the name of Messrs. WHITELEGGE & PAGE) at the Nurseries, Churchst. Kent, as general nurserymen, seedsmen, florists, and Orchid specialists.

GARDENING APPOINTMENTS.

- Mr. H. G. H. MEN, for more than 14 years Gardener to the Earl of SALISBURY CHAMBERS, Esq., M.A., D.L., of Hill End, 15, Portland-Cliff, Chelsea, as Gardener to J. L. PAVAN, Esq., of Park House, Heath (Surrey). (Thanks for your contribution of 2s. to the R.G.O.F. Bank.)
- Mr. H. CORNISH, late Foreman in the service of Alfred Benson, Esq., as Gardener to the same Gentlemen, Upper Gaudin Park, Merstham, Surrey.
- Mr. REuben SMITH, for nearly 3 years Gardener to Mrs. ROBERTSON, of Caen Lees, Ashford, Surrey, as Gardener to A. C. C. GIBSON, Esq., of Park House, which has been renamed "Floresta." (Thanks for 1s. contribution to the Gardeners' Orphan Fund)
- Mr. WALTER SWORN, formerly of Dalkeith, and Royal Gardens, Windsor, and in the service of Mr. J. B. INGLETON, near Coupar-Angus, N.B., as Gardener to Colonel and Mrs. TUENON, Pinkney Park, Almsbury, Wilts.
- Mr. SWORN enters on his new duties on the 30th inst.
- Mr. A. HANSON, late Gardener and Steward to Sir Wm. Goff, Bart., Glouville, Waterford, Ireland, and formerly 5 years Head Gardener to Lord ABERLAIN, Ashford House, Cong. Co. Galway, as Gardener to P. B. BUCKINGHAM, Esq., Broadlands, Ascot, Berks.
- Mr. A. KILMER, for the past 31 years Foreman at Bushey Down, Tooting, Common, S.W., as Gardener to Sir RALPH BLOIS, Bart., Cockfield Hall, Yorkford, Suffolk.
- Mr. R. LEARMOUTH, for the past 64 years Foreman in the Gardens of the Rt. Hon. Lord LEANINGTON, the Gardens, Monmouth, as Gardener to I. LINDELL, Esq., Sherfield Manor, Hampshire.
- Mr. F. HAYLER, formerly Gardener to Sir R. BLOIS, Bart., Cockfield Hall, Yorkford, as Gardener to R. S. PAUL, Esq., The Boltong, Epsom, Surrey. Mr. HAYLER commenced his new duties on September 15.
- Mr. G. H. COOK, for the past 33 years Gardener to the Hon. H. BOURKE, Wootton Hall, Ashbourne, Derbyshire, as Gardener to J. F. CAMPBELL, Esq., Woodseat, Uttoxeter, Staffordshire.
- Mr. F. W. WELLS, Gardener to the late Earl SONDLES, Lees Court, Faversham, Kent, as Gardener to J. DE PASS, Esq., Middleton, Epsom, Surrey.
- Mr. JOHN COLLIER, for the past 11 years Head Gardener to G. SINGLER, Esq., Cloundon Court, Coventry, as Gardener to Sir JEFFREY COLMAN, Bart., Gatton Park, Kent.
- Mr. WILLIAM MORISON, for the past year at Garter Gardens, Stirling, and previously Foreman at Garmore House Gardens, Perthshire, as Gardener to Colonel PORTOUS, Turfhill, Kirkcubbin, N.B.
- Mr. J. PRYOR, late of Messrs. CLIBBANS' Nursery, as Gardener to STANLEY PEARSON, Esq., Park Hill, Hale, Cheshire.
- Wm. DICK, late Captain Gardener at Sandingham, as Gardener to J. H. NICHOLSON, Esq., Ballah Bury, Kells, Co. Meath, Ireland. Mr. DICK commenced his new duties on the 21st August. (Thanks for 1s. 6d. as a donation to the Orphan Fund Bank.)
- Mr. F. HFOAD, Gardener to the late Canon THOMAS of Penstone, Hude, as Gardener to Hon. Mrs. TWEMANE, Sydenham, Lewdown, Devon.
- Mr. JOHN FORTMEYER, one-year Gardener to Lord LAWRENCE, Chetwode Manor, Buckingham, and for the past 2 years at Owlbrigg, Cambridge, as Gardener to CORNELIUS HANINGTON, Esq., Manor House, Little Berkhamstead, Hertfordshire.
- Mr. Wm. R. READE, late Gardener to Sir FRANCIS LEE, Bart., Lealholm, Yorkshire, as Gardener to Mrs. P. BURNS, 5th, Bldg., 25, Coleridge Alley, Canada.
- Mr. FRED R. HILLS, late Foreman at Kinloch Castle Gardens, and previously 2 years in late Foreman at Chateau de Pontchartrain, S.-et-O., France, as Gardener to Sir GUYONNE D'ARVILLE, Kinloch Castle, Isle of Rhum, Oban, N.B.

CELERY: *Ligusticum*. The earth round the Celery root contained the following. Several small earth worms, a few chrysalides of a small fly, the insects when in the grub state had probably fed on the roots; a number of insects (*Lipurus anbulans*), nearly allied to the "springtails" (these are undoubtedly injurious to the roots of many plants); and a number of small white worms belonging to the family Enchytraeidae, which are also very destructive to the roots of plants. There were no wireworms present, but you no doubt mistook the grub of a fly for these. This grub, unfortunately, could not be found when wanted for further examination. The small white worms may be killed by thoroughly soaking the soil with lime water. A dressing of vaporite would probably kill the *Lipurus* and the other grubs.

CHRYSANTHEMUM INJURED: *Bedford*. There is no disease present in the plants. The trouble is due to a mechanical injury, such as might be caused by a mark of the thumb nail where the bud has been pinched.

CURTIS'S "BOTANICAL MAGAZINE": *W. Z.* The early volumes of this work are not so valuable as some of those published in later years, particularly between 1830 and 1870. We have often endeavoured to complete our own set, which is deficient in the numbers issued during this period, but with no success. Should you be in possession of any that appeared about the time mentioned we should be pleased to know. Your best plan for disposing of the books would be to insert a small advertisement in some botanical or gardening paper.

DRY TENNIS COURT: *W. H.* As you have at your disposal granite, chinkers, and sand, you can obtain a good court by forming a base with the chinkers, making this very firm, and finishing with a layer of sand and granite chips mixed. After this has been well rolled, coat the surface with tar that has been boiled.

DURLEIGH: *J. N. W.* The makers are James Dyson & Co., Atlas Works, Eiland, Yorks.

FIR TREES ATTACKED BY A GRUB: *J. Godds*. The beetle which is attacking your Fir trees is *Hylurgus piniperda*. Whenever possible, break off the infested shoots and burn them, and remove all dying trees and those which have been recently cut down from the plantations, as the insects breed in felled timber. They lay their eggs just beneath the bark, and the grubs feed on the tissue of the cortex and the wood of the tree, which have been felled only a few months may be found with thousands of these insects in all stages. It is useful to leave some boughs with the bark on lying about as traps for this insect, and when the grubs are detected the bough should be burnt.

FRUIT ROOM: *W. Z.* Although the natural soil probably forms the best floor for a fruit house, many of these structures have a concrete bottom. As you state rats are troublesome, we should advise the use of some paving sub as a layer of concrete.

GUMMING SEEDLING: *H. D. B.* A desirable variety, but no advance upon others already in existence.

GRUB IN A SILKEN COCOON: *D. C.* The grub which you found in a silken cocoon had become a chrysalis by the time it reached us, so that it is impossible to give the specific name.

LEAVES SPOTTED: *D. C.* There is no disease present in either the *Pelargonium* or the *Eucalyptus* leaf sent. The injury is mechanical, caused probably by burning with the sun's rays.

MATERIAL FOR A FRENCH GARDEN: *J. J. E.* In our last issue M. Auguste DANE's address should read Alfortville, instead of Algorville. The allowance for breakages is 4 per cent., and not 9 per cent. as stated.

NAMES OF FRUITS: *S. H. J.* Plum Duffin's Golden Gage, Apple Lord Suffield.—*R. H. Walker*. A very fine fruit of Strling Castle. *C. Olivier*. 1, A bad seedling. 2, Tree which has been felled only a few months may be found with thousands of these insects in all stages. It is useful to leave some boughs with the bark on lying about as traps for this insect, and when the grubs are detected the bough should be burnt. 2, Royal Rosette; 3, Lady Derby; 4, Scarlet Golden Pippin; 5, Stormer Pippin; 6, Winter Nonshu—*H. H.* The Grapes received were not shrivelled in the least. Do you mean cracking or shanking?—*Groves*. Roundway's Magnum Bonum—*Madley (E. King)*. 1, Lord Suffield; 2, Cox's Orange Pippin; 3, Emperor

Alexander; 4, Mann's Codlin; 5, Ribston Pippin; 6, Wealthy.—*H. T.* 1, Ecklinville Seedling; 2, Colonel Vaughan; 3, Golden Spire; 4, Worcester Pearmain; 6, Beurre d'Amans.—*M. J. C.* 1, Duchess of Oldenburgh; 2, Chelmsford Wonder; 3, Emperor Alexander; 4, Pott's Seedling; 5, Adams' Pearmain; 6, Jarquonne.—*Gibson*. 1, Lord Suffield; 2, The Queen; 3, Duchess' Favorite; 4, Cox's Orange Pippin; 5, Lady's Finger; 6, Grenadier.—*M. J. C.* 1, King's Codlin; 2, Prince of Wales—*H. T.* 1, Old English Codlin; 2, not recognised, most probably a local variety; 3, Peter Smith; 4, Lord Lennox; 5, Wellingington; 6, not recognised.—*T. J.* 1, Mere de Ménage; 2 and 5, Peasgood's Nonshu; 3, Emperor Alexander; 4, not recognised; 6, King of the Pippins.—*W. Tierby*. 1, Prince of Wales; 2, Black Diamonds; 3, Goliah; 4, Rotten; 5, Kirk's.—*W. H.* Clapp's Favourite.

NAMES OF PLANTS: *J. G.* Clematis flammula.—*Bucks*. 1, *Cupressus pisifera squarrosa*; 2, *Cornus Mas variegata*; 3, *Euonymus europaeus*; 4, *Hypericum elatum*; 5, *Berberis vulgaris folis purpureis*; 6, *Lycium chinense var.*—*A. Fuchsia macrostemon gracilis*.—*M. L. A.* *Fuchsia macrostemon gracilis*; B, *Helix Solieri*.—*S.* *Sonchitis*.—*Epidendrum triste*.—*H. J.* 1, *Abelia rupestris*; 2, *Zingiber officinalis* (Ginger); 3, *Saintpaulia ionantha*; 4, *Chrysanthemum segetum*; 5, *Chelidonium majus*.—*A. W.* *Berberis stenophylla*: the plant will thrive on a rocky as you suggest.—*H. T., Ireland*. 1, A variety of garden Fuchsia; 2, next week; 3, *Polygala Palmarisana*; 4, *Draacena fragrans*; 5, *Klirea* (*Tradescantia*) *discolor*; 6, *Cassia corymbosa*; 7, *Fuchsia injuncus*.—*R. T.* 1, *Dendrobium baccatum*; 2, *Eria conovallarioides*; 3, *Alpinia buccinaria*; 4, *Oncidium barbatum*; 5, *Odontoglossum blandum*; 6, *Ada aurantia*.—*A. H. P.* Probably *Eurycea Cunninghamii* (send when in flower).—*A. E.* *Medicago maculata*.—*H. B.* We do not undertake to name varieties of *Pelargonium*.—*H. & Son.* *Hesperis matronalis*, *Dame's Violet* or *Rocket*.—*W. King* 1, *Arundinaria arizonic*; 2, *Arundinaria Fortunei*; 3, *Arundinaria* (probably *humilis*); 4, *Berchemia racemosa*, 5, *Escallonia*, send when in flower; 6, *Escallonia*, probably *exoniensis*; 7, *Escallonia rubra*.—*R. P.* 1, *Aucuba japonica var.*; 2, *Berberis stenophylla*. 3, Please send when in flower; 4, *Deutzia crenata*; 5, *Ligustrum japonicum*; 6, *Veronica* species, send when in flower; 7, *Neillia opulifolia* (probably).

PEACHES: *Gardener*. Hale's Early, Early Grosse Mignonne, Violette Hative, Crimson Galande, Prince of Wales, and Walburton Admirable ripening in the order in which they are given. Nectarines Early Rivers, Dryden, and Pineapple.

PEAR TREES DAMAGED: *J. H.* Your Pear trees appear to have been attacked by the caterpillars of a small moth, probably *Sesamia Woeberrana*; but the only trace of the insect found was the chrysalis cases, from which a small moth had escaped.

PRESERVING WALNUTS: *J. A.* See note under "Queries and Replies."

PRUNING VINES: *H. H.* It is not good practice to shorten the laterals severely directly the berries are cut, as the foliage is required to strengthen the stems. It is the proper maturation of the shoot is essential for success the following season.

SCARLET RUNNER BEAN: *C. G.* You are correct in your inference that these pods are fruits, and you would be equally correct in stating them to be veg tables.

TOMATO WITH OUTGROWTH: *E. B.* The abnormality is frequently seen, and is due in all probability to a rich soil containing an excess of plant food.

VALUATION OF PLANTS: *J. H.* We cannot estimate the value of Strawberry and Daffodil plants unless we know all the circumstances as to their condition of culture, age, locality, &c. You should seek the advice of some professional valuer.

COMMUNICATIONS RECEIVED.—*H. T.*—*W. S.*—*H. J.*—*A. H.*—*P. E. S.*—*Co.*—*A. J.*—*J. S.*—*C. A.*—*M. A.*—*W. S.*—*B.*—*F. L.*—*Enquiries*—*J. G.*—*M. W.*—*H. V.*—*E. T.*—*F. E. S.*—*J. D.*—*B. ENQUIRIES AND REPLIES.

PRESERVING WALNUTS.—My grandmother kept her Walnuts in tubs or boxes buried in white sand, and was granted an Award of Merit by the R.H.S. for fruits [Nuts] which were 12 months old. This was in days long passed, but doubtless, they would keep under the same conditions now. *A. H. Pearson, Lewdown.*

APPLES WITH SCAB: *Rudie*. The fruits are badly infested with Apple-scab, *Fusicladium dendriticum*. Spray the trees next winter with a solution of sulphate of iron.

BEECH HEDGE: *J. G. S.* Spray the plants with a strong insecticide, such as Paris Green, which contains arsenic.

BEGONIA RUST: *J. T.* Dip the plants in tobacco water to destroy the mite.

CATERPILLARS ON PEAR TREES: *J. H.* The bark of your Pear trees appears to have been infested by the caterpillars of a small moth, but the only trace of the insect found amongst the pieces of bark were the empty chrysalis cases of *Sesamia Woeberrana*, one of the Tortrix moths. The caterpillars would not penetrate far into the wood.

CULTURE OF TULIPS AT KEW.

ALTHOUGH in this country we can never hope to dispense with the supplies of Dutch-grown bulbs, there is no reason whatever why bulbs should not be grown much more extensively in the British Isles. For some years past in some parts of Ireland, and at Wisbech, Cambridge-shire, the culture of Tulip bulbs for sale has been carried on extensively. The most suitable soil is a light sandy loam, which must be well drained, or, failing this, in winter soon after planting many of the bulbs, especially the early Dutch varieties, will rot or fall a prey to disease. Deep and thorough working of the soil is important.

At Kew the nursery ground where the bulbs are grown was originally a kitchen garden. The manuring is done in spring previous to the planting of Polyanthus, Iberis, and other spring-flowering subjects, because if Tulips are planted in freshly-manured ground they are more liable to attacks of disease. The manure becomes well incorporated with the soil by the autumn, when the plants are lifted, and it is then in good condition for the bulbs. A light dressing of

lime, or soot and bone-meal, is generally forked in previous to planting. Most of the bulb planting is carried out in October. The illustration at fig. 105 depicts a nursery bed set out with bulbs ready for covering with soil. For convenience of working, the beds are made 4 feet in width, with a path 1 foot in width between each bed. The medium-sized bulbs are set out 1½ inches to 2 inches apart in rows 4 inches apart. The small bulbs and chits are sown thinly in drills the same distance apart between the rows. All are covered with about 3 inches deep of soil. A second method sometimes practised is to chop out shallow drills 3 to 4 inches deep and place the bulbs a similar distance apart in these. No further attention is necessary till the young growths show sufficiently above the surface to permit of the ground being stirred between them with a Dutch hoe. This

of June, or beginning of July, according to the variety.

The flowering bulbs in the beds are lifted towards the end of May, as far as possible in the order of flowering, a start being made with such sorts as Keizer Kroon and La Reine about May 20, the last to lift being Parisian Yellow and Caldonia. The bulbs are by no means ripe, but as the beds are required for the summer bedding plants they are carefully lifted with the growths attached, and heved in coal ashes to complete the ripening of the bulbs. This takes about three weeks or a month, according to the weather and the variety. When removed from the ashes the bulbs are spread out on shelves in a cool, well-ventilated shed, shelves being arranged all round as in a fruit room. Each sort must be carefully and plainly labelled. The cleaning and sorting of the bulbs pro-

FIG. 105.—TULIPS PLANTED IN THE "NURSERY" AT KEW GARDENS; BEDS FOUR FEET IN WIDTH.

[Photograph by C. F. Raffill.]

must be done several times during the season of growth. Any buds which show should be allowed to open, with a view to ascertaining if the plants are correctly named, for in spite of the greatest care "rogues" are nearly sure to occur here and there. As soon as developed sufficiently to distinguish them, the flowers should be nipped off. In gardens however where large quantities of flowers are required for decoration, the blooms may be cut off with one leaf and stem just above the second leaf, without harming the bulb to any considerable extent. The bulbs are left in the ground till the growths have died down before they are lifted, which will be the end

wides work for wet weather. As shown in the illustration, the bulbs are graded into three sizes. (A) Small bulbs and chits, which must be grown for two or three years in the nursery before they reach flowering size. (B) Medium-sized bulbs; many of these will probably flower, but will be better for one more year in the nursery. The flowers if required can be cut for decoration. (C) Good, sound flowering bulbs for planting in the beds.

It is not the intention to convey in the notes the idea that no Tulip bulbs are purchased for bedding. For obvious reasons, especially in a public garden, it is desirable to vary the scheme of bedding more or less

from year to year. As the beds differ in size, sufficient bulbs of the varieties required are not always available. The nursery ground is also restricted, and, of course, varieties new to the collection are added from time to time. To give an idea of the number grown, it will be sufficient to say that over 20,000 first-size bulbs are available for planting this autumn. In addition to these there must be nearly, if not quite, as many small bulbs and chits to plant in the nursery.

Tulip bulbs are sometimes attacked by a disease known by the name of *Sclerotinia* (syn. *Botrytis*) parasitica, or Tulip mould. On the stem and leaves it forms dark-brown patches. Under the skin the sclerotia is grey in colour, while in very bad cases it forms masses of black sclerotium. The best means of eradicating the disease is to lift all the bulbs and burn them as soon as it appears. The soil also should be burnt, and the surrounding ground dressed with lime. As a preventive measure it is better not to grow Tulips on the same ground two years in succession, as the sclerotia will live in the soil for sometimes a couple of years, if not more. The ground may also be dressed annually with lime.

EARLY DUTCH TULIPS.

This section is by far the most popular for bedding, as they flower sufficiently early to permit of the bulbs being lifted from the beds in plenty of time to plant out the summer

height 15 inches; Rose Luisante, silky-rose, height 10 inches; Thomas Moore, orange, height 18 inches; White Swan, pure white, egg-shaped flower, height 15 inches; and Yellow Prince, rich yellow, height 12 inches.

PARROT OR DRAGON TULIPS.

This is a very distinct class of Tulips, notable for the size and grotesque shape of the brilliantly-coloured flowers. They are really monstrosities obtained from *Tulipa Gesneriana*. The curious way the blooms twist and tumble about is by some growers regarded as a point in their favour, while for this same reason they are condemned by others. The colours of the flowers include crimson and yellow, being the principal colours either as selfs or a mixture of the two. Ten or a dozen named varieties are catalogued, but the general practice, as at Kew, is to grow a bed of mixed varieties. One unaccountable failing which I have not noticed in any other section of Tulips is that really first-class bulbs sometimes fail to flower. Before this character of the Parrot Tulip was thoroughly understood, we blamed the bulb grower for supplying badly-harvested bulbs, but the same defect sometimes occurs in home-grown bulbs.

DARWIN TULIPS.

Of the Tulips cultivated at Kew, the Darwin section thrive best. As the bulbs are

pleno, Wallflowers, and Polyanthus as a groundwork, can better be imagined than described.

The most popular varieties of Darwin Tulips grown at Kew are Ariadne, fiery crimson; Clara Butt, rosy salmon, height 16 inches; Coquelin, fiery red; Europe, fiery salmon-scarlet, white base, height 12 inches; Fra Angelico, almost black, height 24 inches, one of the earliest Darwins to flower; Harry Veitch, deep maroon, height 20 inches; Isis, large, fiery crimson, 21 inches; La Candeur, also known as White Queen, shaded lilac, passing to white, height 23 inches; La Tulipe Noire, the best black Tulip, height 14 inches; Margaret, silvery blush, blue base; Parthenope, pinky-lilac, height 20 inches; Pride of Haarlem, one of the largest-flowered Darwins, colour cerise-scarlet; Rose Queen, lilac-rose; Salmon King, deep salmon-rose, shaded scarlet; The Shah, rich, dark, cherry-rose; and William Pitt, glowing crimson, height 24 inches.

MAY-FLOWERING COTTAGE TULIPS.

The impetus given to the growing of late-flowering varieties by the introduction of the Darwin Tulips has affected this section considerably. Although a very old section compared with the Darwins, it is only since the introduction of the latter that the May-flowering Cottage varieties have been grown so extensively for spring bedding. Used in conjunction with the Darwins, they impart an additional beauty to both sections, as several colours, notably, yellow, not represented amongst the Darwins are plentiful in the section under notice. Although not so robust in habit as the majority of the Darwin Tulips, they are equally valuable for cutting, many decorators preferring them especially for small vases, as the long, slender stems lend themselves more readily to graceful and elegant arrangements. The selection of colours is very varied, ranging from deep crimson and yellow to pure white.

Amongst the numerous varieties in this section grown at Kew, the following are the most successful:—Bouton d'Or, deep yellow, egg-shaped flower, the best yellow for associating with Darwin Tulips, height 16 inches; Bridesmaid, rose, striped white, height 15 inches; Caledonia, orange-scarlet, height 15 inches; Columbus, yellow, striped red, height 14 inches; Elegans, scarlet, recurved petals, height 21 inches; Gold Cup, yellow, flaked carmine, 15 inches; Inglescombe Scarlet, deep scarlet, black base, long petals, height 20 inches; Isabella, primrose yellow, flushed with rose, height 12 inches; La Merveille, an immense flower, distinct salmon-scarlet colour, delightfully fragrant; Parisian Yellow, bright yellow, pointed petals, rather late, height 18 inches; Picotee, also known as Maiden's Blush, white, suffused rose at tips of petals, height 15 inches; Retroflexa, light yellow, reflexed, twisted petals, height 16 inches; Rosalind, fiery rose, white base; Striped Beauty, rose, shaded deep crimson, and white.

In arranging to plant a set of beds with Tulips two important points have to be considered in addition to the colours of the flowers, namely, the time of flowering and the height at which they flower. Both of

FIG. 106.—TULIP BULBS GRADED.

[Photograph by C. F. Kestell.]

hedding subjects. For brilliancy of colour there is nothing to compare with them for early flowering either in beds or massed in long borders. Some varieties grow and increase much better than others. In addition to devoting whole beds to their culture very beautiful effects can be obtained by planting the bulbs amongst low-growing spring-flowering plants, such as Double Daisies, Polyanthus, Double and Single Arabis, &c. One of the most effective arrangements of this kind we have ever had was a bed of Lac Doré, a variety with purple flowers edged white, with a groundwork of Double White Arabis. The early Dutch Tulips vary considerably in height, ranging from a few inches in the case of the Duc van Thol varieties, to 10 or 18 inches in that of Thomas Moore.

Amongst the numerous sorts tried at Kew the following succeed best: Artus, rich scarlet, yellow centre, height 12 inches; Duchess de Parma, orange-red, deep yellow margin, height 15 inches; Keizer Kroon, crimson-scarlet, edged yellow, height 16 inches; Lac Doré, purple, edged white, 9 inches; La Reine, white, suffused pink, height 12 inches; Ophir d'Or, canary-yellow, height 12 inches; Prince of Austrii, scarlet-orange, fragrant,

late in flowering, it makes us a fortnight late in planting out the summer bedding, if they are grown in beds. Anyone, however, who has seen a really good display made by these beautiful Tulips at the end of May cannot but admit they are worthy of extensive cultivation. In gardens where plenty of money is forthcoming for the purchase of bulbs, 10 days or a fortnight may be gained by lifting the bulbs as soon as the flowers drop and throwing them away, purchasing fresh bulbs each autumn. Provided they are lifted with care, and heeled in ashes, we find it possible to lift the bulbs quicker after flowering than with the early-flowering Dutch varieties. Readers who do not care to grow the Darwin Tulips in beds should plant them amongst the herbaceous perennials in the mixed border, or along the front of shrubbery borders. The bulbs can then be left in the ground for two or three years without being disturbed. In addition to their value for garden decoration, their long, stiff flower stalks, the many beautiful shades of colour, and fine blooms make them of great value for cutting. The sight of hundreds of these late-flowering Tulips nodding gracefully in the breeze, with various spring-flowering plants such as Arabis alba flore

these characters, of course, vary somewhat each year, according to the weather. This, however, does not affect the relation in those two respects of one variety with another. To quote an instance of what is meant, according to my notes the variety *Fra Angelico* was at its best on May 2, while the popular variety, *Clara Butt*, flowered 11 days later, namely, May 13. By this circumstance it will at once be seen that due consideration must be given to this point when planting the bulbs.

It will be noticed that no double varieties of Tulips are included in the lists given, as none are grown in beds at Kew. It is found that for effective planting the single varieties are by far the most elegant and useful. A. O.

Noordwijk, where not only Tulips, but Narcissi and Hyacinths are grown in great numbers. At Sessenheim a brief halt was made at the nurseries of Messrs. St. van Waveren and Kruijff, the firm who distributed the pink-flowered *Astilbes*, known as *Peach Blossom* and *Queen Alexandra*. Several acres of these plants were seen in cultivation. Afterwards, the journey was through Lisse, a centre for Hyacinth culture, and to Hillegom, which has developed from a small village into a little town solely by reason of the bulb culture. From Hillegom the way led through Heemstede to Overveen, a district in which bulbs were cultivated almost from the first, and thence to Haarlem, which was approached through what are known as the Haarlem woods or park. An international exhibition of flowering bulbs is to be held in these woods in 1910; if the bulbs are exhibited as growing in beds, the effect will be one well worth witnessing.

Holland commenced to export bulbs in considerable quantities at about the middle of the 18th century, and the industry has not only increased continuously since that time, but recent returns prove that the volume of trade is greater now than in any previous year. Exact returns have been published since 1897, in which year the total exports were 5,701,798 kilograms (kilogramme = 2.2046 lb). In 1900 they were 8,417,482 kilograms, in 1903 9,778,440, and in 1907 13,277,400 kilograms, the value of which is about 10 million florins (florin = 1s. 8d.). According to the published figures Great Britain and Ireland take 40 per cent. of the exports, Germany (including Austria) 25 per cent., the United States 18 per cent., the northern European countries 9 per cent., and France and other Latin countries 5 per cent. It is estimated that there are upwards of 2,000 growers of bulbs, and 150 of these are exporters.

FIG. 107.—TYPICAL DUTCH BULB FARM IN THE NEIGHBOURHOOD OF HAARLEM.

BULBS IN HOLLAND.

At the present time, when the potting and planting of flowering bulbs is in full progress, our mind recalls a visit made to the Dutch bulb fields at the latter end of April last. We had been staying for a short period at Amsterdam, and by appointment proceeded from that city to Leiden, where we were met by Mr. Ernest H. Krelage, president of the Dutch Bulb Growers' Society, and Mr. S. Kruijff, president of the Dutch Bulb Exporters' Association. Our purpose was to make the journey by motorcar from Leiden to Haarlem, the intervening country representing the centre of the Dutch bulb-growing industry, which may now be said to reach as far north as the Dutch Sea Islands, and as far south as the province of Zeeland. Leaving Leiden, our route lay through Rijnsburg, a district in which Tulips are chiefly cultivated; thence to

The reader may imagine the glorious sight the fields of bulbs in full flower presented during our drive, when it is stated that the sun shone brightly all the time, and that the ground is almost as level as a billiard table! Much of the land in the district traversed lies actually below sea level. The lighter, more sandy localities are selected for Hyacinth culture, and the more loamy soils serve for Tulips and Narcissi. The accompanying illustration at fig. 107 will afford some idea of a Dutch bulb farm, the plain building which is used for cleaning and storing being also a feature that may be seen in almost every establishment. As a rule, the varieties are grown together in considerable quantities, presenting great breadths of pink, red, blue, purple, or white, as the case may be, and these are continually repeated until the colours appear to melt into the distant horizon.

The Dutch Bulb Growers' Society was founded in 1860. At the present time it consists of 36 local sections and 2,800 members. This Society publishes a paper twice each week which is sent free to the members. Committees of nomenclature sit during the flowering season, and fix the names of new varieties submitted by members and judge the merits of new seedling varieties or new introductions. In addition to the committee meetings and local shows, the Society organises a great flower show every five years. The next one, as we have already mentioned, will be held in 1910, and will commemorate the half centenary of the Society. There are other newer societies for the promotion of special interests, one of these being the Association of Bulb Exporters, to which we have alluded, and another a union of growers who are not importers. P.

PRONUNCIATION OF PLANT NAMES.

PRONUNCIATION.—In the first word in each line the accent (') is short; (ˊ) is long.

In the second word vowels are to be pronounced as—

arise, át, áge, árt, áir, áll
eud, égg, éat, érr, éwe
in, ít, íe, íir
on, ótter, ówe, ór, ódó, ówl, óll
us, útter, úse, ún
“ch,” as in chin
“th,” as in thin
“s,” as in soft; “f,” as in far
“g” as in go.

All other letters are unmistakable.

(To be continued.)

SAXIFRAGA COCHLEARIS.

REGARDED sometimes as a variety of *S. linguata*, a most variable species with a wide distribution in Southern Europe, *S. cochlearis* is certainly distinct enough to be accorded specific rank. It belongs to the crusted section of the genus, which contains such well-known plants as *S. Cotyledon*, *S. crustata*, and *S. marginata*—all valuable as ornaments for the rock-garden. The photograph of the group shown in the illustration at fig. 108 was taken in June, when the flowering of Saxifragas in this country—which, commencing in January with *S. Bursariana*, continues with other kinds till nearly the end of summer—attains its greatest development. *S. cochlearis* is only found wild in the Alpine regions of the mountains to the north of Nice and Mentone, and differs from *S. linguata* in having smaller rosettes of spatulate leaves, with erect and more open panicles of white flowers. These are very light and graceful, and last for a considerable time in perfection. In cultivation there are two distinct forms, that known as *S. c. var. minor* having much smaller

reliable bulbs are by no means cheap. *Lilium Leichtlinii* is an exceedingly graceful species, the slender flower-spoke, which reaches a height of 2 feet to 4 feet, being plentifully furnished with long, narrow leaves. The flowers, whose segments reflex somewhat after the manner of the Tiger Lily, are in colour pale yellow, with a suspicion of buff, and freely spotted with chocolate. The markings are small, and distributed over the entire inner surface of the flower. My experience is that even good bulbs quickly deteriorate, and after the third season flowers may as a rule be sought for in vain; therefore it needs to be constantly imported afresh, and as it does not seem to thrive in Holland it is necessary to fall back on its native country of Japan to avoid losing it altogether. The bulbs of *L. Leichtlinii* are small, and do not travel particularly well, and as imported they are sometimes mixed with those of *L. Batemannia*. They are, when dormant, exceedingly difficult to distinguish from small ones of *L. Batemannia*, but *L. Leichtlinii* starts into growth much earlier than the latter. A pecu-

length resolved to collect and cultivate the bulbs in their actual home, where the plant grows in the mountains of the island of Oshima, situated 800 miles south of Yokohama. The bulbs are collected, and then grown on good soil on the adjacent land. The venture has been eminently successful. In 1907 the first experimental exportation of 300 to 400 chests was made to Europe and the U.S.A., and the results have proved so satisfactory that the demand for the bulbs has increased enormously. Mr. Unger, a former partner in the nursery firm of L. Bohmer & Co., Yokohama, has paid a recent visit to the island after 14 years' absence, which has afforded him the opportunity of observing the culture and the freedom of the bulbs from disease. As the bulbs, which are known in the trade as *Lilium longiflorum fornosum*, ripen earlier on Oshima than at Yokohama, they are fully one month sooner in a fit condition for exporting, so that the difficulty of getting them to bloom at Easter disappears entirely. F. M.

SOME NEGLECTED ANNUALS.

THERE is some danger that the present craze for novelties in annuals may result in the crowding out of many fine species of earlier introduction. Some perhaps are almost forgotten, and yet they are still deserving of the prominent place which they once held in the best of gardens. The following are a few subjects worthy of culture.

Gilia dianthoides (*Fenzlia dianthiflora*).—A charming, low-growing annual of Californian origin, forming dense tufts of narrow leafage seldom exceeding 6 inches in height, and producing an abundance of large lilac and sometimes purple flowers, with darker or yellowish throats, somewhat resembling single Pinks (*Dianthus*), hence its specific name. It is of very quick growth, perfectly hardy, and is especially recommended as a carpet for Rose beds owing to its dwarf habit and slim growth. It thrives best in a light, sandy, warm position. Seeds may be sown where the plants are required to flower, either in spring or in autumn.

Chorisia heterophylla (*Kauffussia amelloides*).—This plant is of a compact, free-flowering habit, and is especially adaptable for massing or for planting in small beds. The pretty Daisy-like flowers are of a beautiful purple-blue colour, and are produced in abundance. It is an ideal plant for carpeting beds containing taller subjects, and may be had in full bloom within two months of seed sowing, which is best performed in April. Since its introduction two showy varieties have been added, one bearing flowers of a deeper violet colour, while the ray florets of the other are of a showy dark crimson shade. Both are exceedingly pretty varieties. Six inches is the usual height of the type and its varieties.

Onthalodes linifolia.—A very refined South European biennial, producing throughout the summer months an abundance of white flowers that are often tinged with blue. They somewhat resemble huge Forget-me-nots and are borne in loose, bractless racemes. The plant is much branched, each branch terminating in a pretty floral raceme. Nine inches is its maximum height. The foliage is flax-like in appearance. The plant thrives in any ordinary soil. The seed should be sown in April, and again in September.

Platystemon californicus.—A beautiful hardy annual of easy culture, native of California, and known as Cream Cup. It is a member of the Poppy family. The shoots are dwarf and trailing, forming dense tufts, which are smothered during the whole summer with pale yellow or cream-coloured Poppy-like flowers. It is the best species of a small genus, and in common with many of the best hardy annuals, delights in a light, sandy loam. It is best sown in the autumn, although good results may be obtained

[Photograph by W. Irving.]

FIG. 108.—SAXIFRAGA COCHLEARIS: FLOWERS WHITE

rosettes and flowers than those of the type, being only a few inches high. It is often grown under the name of *S. valdensis*, a diminutive species that is rare in gardens. Even when not in flower, *S. cochlearis* is one of the most attractive of Saxifragas, forming neat carpets of silvery rosettes. Like all the other members of this section, it enjoys a sunny ledge, planted amongst boulders in stony soil of a calcareous nature. As all these Saxifragas hybridise so freely, the best means of increasing particular species is by division, or by the numerous off-sets. W. Z.

THE BULB GARDEN.

LILIUM LEICHTLINII.

THIS is a charming Lily, but it is not so frequently seen in gardens as it used to be twenty years ago. The plant is a native of Japan, and was first introduced therefrom in 1867. For some years it was very rare, and even now

riarity of *L. Leichtlinii*, even more pronounced in the case of the Indian *L. neilgherrense*, is, that after leaving the bulb, the flower-stem often travels some little distance underground before it appears above the surface. W.

LILIUM LONGIFLORUM.

THIS favourite species of Japanese Lily, Teppo Yuri in Japanese, from teppo, a gun, from the long, tube-like bloom, and yuri, a bulb, is exported from Japan in three chief varieties, viz. *L. longiflorum eximium*, *L. l. multiflorum*, and *L. l. giganteum*. Through intensive cultivation and insufficient care, the first two have developed a disease which has caused the European gardener great vexation and loss, 50 per cent. of the bulbs not producing flowers, and the exporters have received many complaints. A change of habitat for the cultivation of the bulbs was tried, but the disease being present in the substance of the bulbs themselves no good resulted, and it was at

from spring sowings. Sow thinly in the open border, and thin the seedlings to 6 inches apart.

Polygonum orientale (*Persicaria*).—A delightful annual, of very free growth, from the East Indies, producing flowers of a rosy-crimson colour in abundance in long drooping racemes. The inflorescence is both terminal and axillary, the flowers appearing in August and lasting until destroyed by frost. The plant is of robust habit and is much branched, giving off numerous lateral shoots. The rich green leaves are large, slightly pilose or hairy and oblong in shape. The plant attains to a convenient height, about 3 feet, and is perfectly hardy. Seeds may be sown in the open border in spring, and the seedlings should be thinned so that three occupy one square yard. The species delight in a warm, sunny position. Clumps of this plant dotted at intervals along a mixed border prove interesting and showy.

Salvia carduacea (*Thistle-leaved Salvia*).—A very pretty, small-growing Labiate from California, of dwarf habit and having distinct, elegant, Thistle-like foliage. Its pretty lavender-coloured, tubular-shaped flowers (see fig. 109), with beautifully fringed margins, are set in a woolly calyx, the whole being supported on stout stems scarcely 1 foot in height. Owing to the restricted number of annual *Salvias* of ornamental value, the above-named species is valuable and is well deserving a place in a mixed border of flowers. Seeds should be sown in spring where the plants are to flower. The seedlings should be thinned to 6 inches apart.

Venidium decurrens (*Calendulaceum*).—An exceedingly pretty, dwarf, yellow-flowered Composite suitable for growing on warm, dry, sunny slopes. Throughout summer and autumn its golden-rayed, Marigold-like flowers, with dark brown, almost black, disks often 2 inches across, are produced in great profusion. The foliage is glabrous above with white cottony felt beneath. The exceedingly bright flowers and dwarf spreading habit (its height is 6 inches), combined with its adaptability to poor soils, render this species a valuable subject. It will be found especially effective when disposed in large patches in full sunshine at the foot of a plant border. The seeds should be sown in the open ground in April and May. *William Mallet*.

THE ROSARY.

AUTUMNAL ROSES.

The most precious of all the Roses that adorn our gardens are unquestionably those which have in largest measure what is generally known as the "perpetual" habit, more expressively described as *remontante* by the French rosarians—the capability of flowering freely during the summer, and almost with equal facility, though assuredly with less impressiveness, in the late autumnal months. The flowers that are developed during this season by the finest varieties are necessarily considerably smaller in dimensions than those which charm us during the summer; but, on the other hand, they are not seldom even brighter in colour, while the fascination of their fragrance remains the same. There are certain varieties, especially among the Hybrid Perpetuals, Teas, and Hybrid Teas, on which, in September and early October, we can always rely. Conspicuous among these are the incomparable *La France* and its supposed derivative, *Caroline Testout*, which even at this late period have a freshness and a luxuriance marvellous to behold; *Clara Watson*, introduced by the late Mr. France, of Oxford, one of the loveliest of the Hybrid Teas; *Viscountess Folkestone*, which need not be characterised or eulogised here; *Margaret Dickson*, whose remarkable achievements in my garden I have already described; *Clio*, which

much resembles the last-mentioned Rose in appearance, but usually comes like a *Noisette*, with clusters of buds; and *Fran Karl Druschki*, originally and more expressively called "The Snow Queen," undoubtedly the largest and most beautiful white variety that has hitherto appeared. Of the Hybrid Perpetuals and Bourbons the most reliable at this season are *A. K. Williams*, Duke of Edinburgh (unless its first bloom is very late), *Lady Helen Stewart*, *Hugh Dickson*, *Mrs. Paul*, and *Captain Hayward* (the finest of all), while *Madame Pernet-Ducher*, *Papa Gontier*, *Warrior*, *Corallina*, and *Isabelle Milner* are always conspicuous for their beauty in autumn among the Hybrid Teas. Climbing Roses are in many instances luxuriant at this season, especially such fine varieties as *Glorie de Dijon*, *Bouquet d'Or*, *Aimée Vibert*, *Mme. Pierre Cochet*, and *Mme. Alfred Carriere*. Among the best autumnal bloomers are three recent acquisitions, viz., *Harry Kirk*, *Mrs. Isabelle Milner*, and *Mrs. Dudley Cross*. *David R. Williamson*, *Mansie of Kirkcaldie*, *Wigtownshire, Scotland*.

The Week's Work.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to The Downage Lady, NENEHOLME, WATER FURY, YORKSHIRE.

Preparations for planting.—If much planting is contemplated, advantage should be taken of fine, dry weather to prepare the ground, espe-

FIG. 109.—*SALVIA CARDUACEA*, AN ANNUAL SPECIES; FLOWERS LAVENDER COLOURED.

cially if it be of a heavy, tenacious character. Opinions differ considerably as to the proper depth for a fruit border, and great attention is given to this matter, but soil and climate should be also studied. In well-drained land 18 inches to 2 feet of rich soil is ample for dwarf trees; whilst tall, wide-spreading standards require a greater depth. Dwarf trees are the most profitable to cultivate, and when their shoots are moderately pruned and the roots mulched and otherwise carefully treated, they do not require so deep a compost as many persons imagine. Cold, heavy land that holds water should be avoided, if possible, for the planting of fruit trees, but this may be greatly improved by thorough digging or trenching and adding sand, lime, lime rubble, road scrapings, wood ashes, &c., as the digging proceeds. No manure should be used, excepting for such fruits as Raspberries, Gooseberries and Currants. Ridge planting, with careful root-lifting every two or three years, is preferable on heavy soils. Thorough digging or trenching of the ground is essential for Apple, Pear, and all bush fruits, and although trenching is the most expensive, its influence is of lasting benefit to the trees. In fresh ground, especially if it be of a heavy nature, efficient drainage should be the first consideration. In the case of light soils resting on chalk or gravel, artificial draining is unnecessary, but a layer of rough lime rubble should

be placed under each tree at a depth of 18 inches or 2 feet. If young trees are to be planted to replace useless or worn-out specimens, the old soil should be removed entirely and replaced with fresh compost, as it is useless to plant again in the old soil. Loam should be mixed with road scrapings, old lime rubble and soot, &c. For stone fruits a little more calcareous matter may be added. The materials should be mixed ready and be protected from heavy rains until required for use. Careful records having been taken of the best varieties for the district, a visit should be paid to a nursery and the trees selected. Remember, the strongest and largest trees are not always the best. Also note the character and qualities of the newer varieties, some of which should be given a trial. I do not advocate the planting of too many varieties, but rather would select a few well-known and proved kinds, sufficient to furnish a supply of fruits from August to April.

FRUITS UNDER GLASS.

By T. COOMER, Gardener to LORD LLANGATTOCK, The Herby, Monmouthshire.

Early Peach-house.—The trees having lost their leaves, the shoots should be freed from the trelliswork and tied in bundles. I do that the woodwork and glass of the house may be cleaned with warm, soapy water, and the walls limewashed. If the trees were not pruned immediately after the fruits were gathered, which is undoubtedly the best practice, the work should now be done. In some cases it may be advisable to cut out whole branches that are unsatisfactory, their place to be taken by younger shoots, saved for the purpose. Wash the bark of the trees with a warm solution of Gishurst's Compound, working it well into the crevices of the wood, but the preparation should not be allowed to touch the shoots of the current year, as this would probably lead to the fruit buds dropping. The young shoots should be washed with warm water mixed with a small amount of soft soap. After all these preparations have been completed the trees can be again trained in position, distributing the growths at about 5 to 6 inches apart. Next remove the old mulching material and a portion of the top soil of the border, replacing it with a fresh compost of loam, wood-ashes, crushed mortar, and bonemeal, or some other suitable manure compound. Keep the ventilators of the house fully open and the borders adequately supplied with water until forcing is commenced.

Pineapples in winter.—All shading should be removed from the glasshouses in which these fruits are cultivated. The temperature of the house containing plants for fruiting next summer should be gradually lowered until by the end of October the night temperature is from 55° to 60°, but slightly higher at daytime, and with a bottom heat of 75° to 80°. This will suffice until the forcing season commences. Moisture, both at the roots and in the atmosphere, should also be lessened in winter time, and when the plants are resting a very small amount of water will be required, and it should be slightly warmed before it is applied. Endeavour to keep the plants robust and healthy, but at the same time in a resting condition. A similar treatment should also be afforded to young plants raised from suckers in the autumn, but as they are in smaller pots they may require rather more frequent waterings. Syringing overhead should be discontinued, although an occasional spraying of the surface between the plants may be permitted. Plants of *Smooth Cayenne*, *Charlotte Rothschild*, or *Black Jamaica* varieties that are swelling their fruits should be watered with weak guano water made tepid, and this may be afforded until they commence to ripen, their fruits. After the Pines are cut water should be withheld. Keep a fairly moist atmosphere by damping the walks and other bare surfaces of the house. Warmth from the hot-water pipes will be required in order to keep up the temperature to 65° or 70°. Continue to propagate from the suckers as they become ready, and if sufficient of these are not available, which is often the case with the variety *Smooth Cayenne*, the stock may be increased from the old crowns, which should be potted into 6-in. pots and treated in the manner recommended for suckers.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchard Grower to Lt.-Col. G. L. HOLBOURN, C.V.O., C.I.E., Westonbirt, Gloucestershire.

Autumn treatment.—The shortening days, with chilly mornings and evenings, remind us that the autumn is here. The closing month of the past summer was dull and wet, hence the growths of many plants are not so solid as desired. It needs a bright autumn to favour the thorough ripening of the growths on many species, in order that they may be sufficiently matured to pass the coming winter in safety, and to lay the foundation for next season's flowering. The cultivator will therefore need to make the most of the sunshine that we may have during the next few weeks.

Shading.—It is impossible to give any precise directions as to regulating the shading at this season. Much depends on the aspect of the house and the arrangement of the plants. Gradual exposure to the sun should be brought about as naturally as possible, using the blinds during the middle of the day, and then only when the sun being very bright it is likely to injure tender or newly-potted plants. Directly the blinds can be dispensed with they should be taken down and dried, any that need it being repaired before they are stored away for another season.

Watering.—Moisture must be applied to the roots with great care, for all Orchids cannot be treated alike in this respect. The habits of the various kinds and the condition of each plant must be considered separately and the treatment varied accordingly. In the case of varieties having resting pseudo-bulbs, it is, as I have already advised in these columns, a mistake to withhold water too suddenly, as the roots of many plants are most active just as the new pseudo-bulbs are forming and swelling out. Amongst the larger distichous-leaved Orchids, many are still growing freely, and will require plenty of heat and moisture until the roots show, by the white films covering the points, that they have completed their season's growth. After this, water sufficient only to keep both roots and foliage in a plump and healthy state is needed.

Damping.—There should be less moisture placed about the house than hitherto, as the present conditions of weather do not require it. During bright weather the warm and intermediate divisions of the house may have a moderate damping-down both mornings and afternoons. In the cooler divisions this should only be done in the morning, except on very sunny days, when a light damping early in the afternoon will be beneficial.

Ventilation.—In order to acquire that solidity of texture referred to above, fresh air as well as light should be freely but carefully admitted when the weather conditions permit. Allow the house to become thoroughly dry during the middle hours of the day. This is an important matter, and ensures the proper drying and purifying of the atmosphere necessary for the thorough ripening of the growths.

Temperature.—In accordance with the above remarks, it will be advisable to prepare for winter by reducing the warmth a few degrees in all the houses both at night and daytime. In the cooler divisions a little artificial heat should be permitted, it being better to allow a little warmth in the pipes, with the ventilators open, than to close the house without artificial heat, as a saturated atmosphere, with a low temperature, is most injurious to all Orchids.

THE KITCHEN GARDEN.

By E. BRACKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Eilstone, Herefordshire.

Cucumbers. Much care and proper appliances are necessary to provide a regular supply of Cucumbers during the winter months. Plants which were put out at the early part of last month should now be coming into bearing, and it is of the greatest importance that the plants shall not be overcropped, especially in their early stages of fruiting. Encourage the plants to make stout, hardened growth before the depth of winter. The plants should be kept scrupulously clean, and a good fire-heat, with a moist atmosphere, should be maintained during night and cold weather. The roof glass should be kept clean, so that the plants may have the full advantage of whatever sunshine there may be.

Stop and regulate the growths as they require it and cut the fruits immediately they are ready for the table; these will keep fresh for several days if the ends are placed in a little water in a warm room or house. Make another sowing of a suitable water-fruited variety, sowing the seeds singly in small 6-in. sized pots. Locke's Perfection is one of the very best for this purpose, being of medium length, very prolific, and possessing excellent quality. The seeds should only be given very little water until after germination has taken place, and it will be necessary to raise them in a brisk bottom heat, and cultivate the young plants quite near the glass until they are ready for planting out.

Tomatoes.—If suitable means are at command, it is easy, by selecting suitable varieties, to provide fresh fruit all through the winter and early spring months. Plants which have been specially prepared for fruiting in winter should now be well established in their final pots and should be removed from the cool house to one having an intermediate temperature. Though it is impossible to fruit Tomato plants satisfactorily during the dull days of winter under conditions of very low temperature, it is almost equally unsatisfactory to subject them to too great a heat, as the growths then quickly become weak and the constitution of the plant is ruined. What is of the utmost importance is that a dry, buoyant atmosphere with a temperature of 55° to 60° should be maintained and the plants must never be over-watered at the root. All surplus growths should be removed and the leaves shortened to about one-half their length, exposing the fruits to the light as much as possible. Sunrise and Winter Beauty are, as far as my experience goes, unsurpassed for winter work. Successional plants in small pots should be shifted into larger pots as required, keeping them near to the glass in the intermediate house. These will be useful for fruiting early in spring. Any fruits which may still be unripened in the open, or in very cool houses, pits or frames, should be cut and laid out thinly in heat to ripen. Though many of these may be quite green, if anything like matured, they will be found to ripen satisfactorily under these conditions.

Cabbages.—The latest plantings of these ought now to be made on land which has been heavily manured and well prepared, choosing an exposed site if possible. Plant them in rows 2 feet apart and allow a space of 12 inches from plant to plant. Insert the plants well up to the heart, and make them very firm about the roots. Plants which were put out earlier should be examined and any vacancies made good. Frequently stir the surface soil with the drag, hoe, both to stimulate the growth of the plants and prevent weeds.

Spinach.—Plants raised from early sowings should be thinned out to a reasonable distance. Scatter a little soot frequently over the surface of the soil, and stir the surface with the hoe. Make one more sowing on a south border.

THE FLOWER GARDEN.

By W. FIFE, Gardener to Lady WASTON, Lockinge Park, Berkshire.

The Hollyhock.—In a favourable season, under good cultivation, this is one of the most stately of autumn-flowering plants. The Hollyhock will flower freely when raised from seeds sown early in the year, from summer or autumn rooted cuttings, or eyes. The latter should now be potted up and placed near to the glass in a cold frame exposed to sunshine. At this season it is well to overplant the old plants in both borders, digging up the choicest varieties, removing their old leaves, and cutting back the long roots preparatory to potting them in 7-inch or 8-inch pots, to be wintered in cold frames. These stout will afford a plentiful supply of cuttings in January, February, and March. Insect pests may be destroyed by dipping the leaves in water containing soft soap and flowers of sulphur. The latter substance will also destroy the troublesome mildew to which the plants are subject in autumn and winter.

Pyrethrums.—Herbaceous Pyrethrums form a beautiful and serviceable class of plants, and are perfectly hardy. Unfortunately slugs are particularly fond of the shoots, and they frequently destroy all the young growths as they

appear, ultimately killing the plants. It is desirable, and in many cases necessary, to lift the best varieties, parting them carefully with a plunging fork and putting up the divisions in good loamy soil. Place them when potted in a cold frame or pit for wintering. Strong clumps of commoner kinds may also be increased by division, replanting the pieces in fresh soil.

Marguerite Carnations raised from seeds sown in the spring and grown in the open should now be full of expanded flowers and flower-buds. If desirable, the plants can be lifted with a good ball of soil attached to the roots, and after being carefully potted stored in a cold frame. They should be kept in a close atmosphere for a week or two, and be shaded from bright sunshine till they are re-established. In winter they should be placed in an intermediate house.

Phyllis Albicongii and the stronger-growing *P. Francheti* are very effective subjects in banks and borders at the present time. If the growths are cut whilst in good condition and dried similar to *Helichrysums*, *Pampas Grass*, &c., they will be serviceable for decorative purposes in winter.

Chrysanthemums.—The early sorts are now in full bloom, and later varieties promise well. When the flowers are grown especially for cutting, some protection should be afforded them. If grouped together, a temporary framework may easily be erected over them and covered with blinds, mats, or dressed canvas covers. The plants can be moved when in flower; after moving they should not at first be exposed to bright sunshine, and they must never be allowed to suffer from lack of water.

PLANTS UNDER GLASS.

By THOMAS LUNT, Gardener to A. STIRLING, Esq., Kent, Berkshire, N.B.

Blinds and shading.—All shading must now be dispensed with; blinds should be taken down, dried, and stored in a place free from damp. Substances such as "summercloud" that have been painted on the glass should be washed off, as the maximum amount of light will be required during the dull days of autumn and winter.

Primula sinensis.—The earliest batch of these plants should now be removed from the unheated frame and placed in an airy structure in which a temperature ranging from 50° to 55° is maintained. Allow the plants sufficient space so that they may be turned round twice each week without damaging the brittle foliage. Water should be very carefully afforded from now onward, always keeping the soil a little on the dry side, although never allowing the plants to flag or otherwise suffer from lack of moisture. Watch for decaying leaves, especially about the neck of the plant, for these will communicate decay to the stems. The Stellata or star-flowered type should also be placed in a warmer house and be treated as advised for the ordinary kind. *P. obconica* requires a greater amount of water than *P. sinensis*, and it should also be given liberal doses of manurial stimulants all through the winter months. The foliage at the base is very short-stemmed and somewhat crowded; the flower-stems often having a difficulty in pushing their way through them, but with a little care the leaves in the centre of the plant can be disposed to allow the inflorescences to properly develop. This *Primula* should be grown in a moist atmosphere than the two species previously mentioned.

Violas.—Plants that were layered last August are now ready for placing in unheated frames, which should be kept closed for a few days after planting is accomplished. If one thorough soaking of tepid water is given, no more moisture will be required until the spring.

The Gesnera.—Plants that are now forming their flowering spikes should be afforded neat stakes, so that the growths may be properly regulated and trained. Arrange the tallest shoots near the centre of the pot when ever possible, and to encourage an even growth turn the plants round twice each week, so that every part may receive an equal amount of light. Liquid manure should be given twice each week or oftener if the plants have filled the pots with their roots.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of Plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unsold communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Appointments for October.

SATURDAY, OCTOBER 3—
Soc. Franc. d'Hort. de Londres meet. German Gard. Soc. meet.

TUESDAY, OCTOBER 6—
Nat. Amateur Gard Assoc. meet.

WEDNESDAY, OCTOBER 7—
Nat. Chrys. Soc. Exh. at Crystal Palace (2 days).
Roy. Hort. Soc. Exh. at Regent's Park.

MONDAY, OCTOBER 12—
United Ben. and Prov. Soc. Com. meet. Nat. Chrys. Soc. Com. meet.

TUESDAY, OCTOBER 13—
Roy. Hort. Soc. Com. meet. Brit. Gard. Assoc. Ex. Council meet. Nat. Rose Soc. Com. meet.

THURSDAY, OCTOBER 15—
Roy. Hort. Soc. Exh. of British-grown fruit (2 days).

SATURDAY, OCTOBER 17—German Gard. Soc. meet.

MONDAY, OCTOBER 26—Nat. Chrys. Soc. Com. meet.

TUESDAY, OCTOBER 27—
Roy. Hort. Soc. Com. meet. Croydon Chrys. Show (2 days).

WEDNESDAY, OCTOBER 28—
Kent County Chrys. Sh. at Blackheath (2 days).

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—52.0°.

ACTUAL TEMPERATURES.—

LONDON.—Wednesday, September 30 (6 P.M.): Max. 77°.

Min. 65°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, October 1 (10 A.M.): Bar. 30.2; Temp. 69°; Weather—Fair.

PROVINCES.—Wednesday, September 30 (6 P.M.): Max. 79°
Sheffield; Min. 60° Ireland, W.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—

Dutch Bulbs, at 67 and 68, Cheapside, E.C., by Frothero & Morris, at 10.30.

MONDAY AND TUESDAY—
Two Days' Sale of Nursery Stock, by order of Messrs. S. Eble & Sons, at The Nursery, St. John's, Woking, by Frothero & Morris, at 12.

WEDNESDAY—
Seventh Annual Sale of Nursery Stock, by order of Mr. H. A. Bear at The Old Nursery, Spring Grove, Isleworth, by Frothero & Morris, at 12.
150 lots Palms, Ficus, Azaleas, &c., at 67 and 68, Cheapside, E.C., by Frothero & Morris, at 5.

FRIDAY—
Imported and Established Orchids in variety, at 67 and 68, Cheapside, by Frothero & Morris, at 12.45.
Sale of surplus Nursery Stock, at Warren Nurseries, Upper Tooting, by order of Messrs. Ritz & Co., by Frothero & Morris, at 12.

The International Rubber Exhibition which opened on Monday, September 15, at Olympia is of interest in many ways. It affords the first opportunity which has been given in this country of seeing in a collected form representative exhibits illustrating the chief phases in Rubber production in the principal countries which contribute to the world's supply. The more important Rubber plants of the world are almost, if not all, represented by living specimens. Some have been raised from seed and grain in hot-houses in this country, others merely removed from the Warden cases in which they have been transported thousands of miles by sea from the Tropics. There are also large trunks, some from trees 20 years of age or more, showing

clearly by their scars the modes of tapping which have been employed in order to obtain the Rubber fluid or latex.

Rubber itself is exhibited in all forms, ranging from the great balls, or "biscuits" as they are technically termed, of Para Rubber from Brazil to the various types of biscuit, sheet, crêpe, worm, and block Rubber indicative of the efforts that are being made by the planters of Ceylon, British Malaya, and elsewhere, to find the best method of preparing their produce for the market.

The allied materials, Gutta Percha and Balata, are equally well represented. Living plants are shown, as well as their products as known to commerce.

In addition to the actual specimens of the living plants and their products, there is also a considerable assemblage of herbarium specimens together with a wealth of photographs portraying cultivation and collection. Consequently a careful survey of the exhibition affords an easy way of acquiring a general acquaintance with the principal features of Rubber production as carried on at present in various parts of the Tropics. The exhibition is not, however, confined to illustrating the production of crude Rubber. Machinery connected with its manufacture has been installed and is at work, and some of the processes through which Rubber passes before it emerges in the familiar forms in which it is met with in everyday life can also be watched.

For all connected with or interested in any degree with botanic gardens at home or abroad, the exhibition possesses a special attraction. As is well known, Rubber cultivation has of recent years made great strides. Until about 30 years ago, we were absolutely dependent on the plants growing wild in the great forests of tropical America, Africa, and Asia for our supply of this valuable commodity. But at the present time several hundred thousands of acres are under Rubber cultivation in various parts of the world. It is true that, owing to the fact that the trees take several years to come into bearing, coupled with the circumstance that much of this great development is of quite recent date, the proportion of cultivated to wild Rubber is still quite small, only amounting to little more than 2 per cent. of the whole—but it will attain much greater relative importance in the near future when the acreage already planted comes into bearing. This rapid increase in the plantation of cultivated Rubber is likely to exercise a marked influence on the price, especially if, as seems probable, it should be found that the cultivated product can actually be more cheaply supplied than wild Rubber.

For this desirable state of affairs, the world is largely indebted to the Royal Botanic Gardens, Kew, and also to the botanic gardens of the colonies. The story has often been told how in the seventies, largely due to the foresight of Sir Joseph Hooker, at that time Director of Kew, Mr. H. A. Wickham was commissioned to obtain a supply of seeds or plants of the then botanically unknown plant which yielded the Para Rubber of commerce. This mission was successfully accomplished by Mr. Wickham's enterprise in taking advantage of very exceptional opportunities, and as the result the Royal Botanic Gardens in Ceylon received from Kew a supply of this most valuable Rubber plant.

Since then the work of distribution and introduction into other countries has been actively carried on.

Again, mainly at the botanic gardens and stations, experimental work in tapping and preparing the produce has been prosecuted, notably in the Ceylon gardens, and has helped very materially to establish the commercial success of the new cultivation. At such an exhibition as this we have demonstrated, in a very tangible form, the practical utility of maintaining scientific departments such as those to which we have alluded.

The much looked for exhibit of the Wisley Collection of Grapes, in the form of cut bunches at last Tuesday's meeting at Vincent Square, and it naturally attracted considerable attention. In all there were 31 distinct varieties; a few other varieties had been spoiled owing to indifferent ripening. Those who looked for exhibition bunches were doubtless disappointed with the samples staged, but it had not been at any time assumed that the Wisley Grapes were of that order. Still further, it was obvious that the bunches appeared at their best when seen on the trees rather than on the boards, yet such varieties as the red and large-berried Muscat Champion were shown in excellent bunches. Prince of Wales, with long, tapering bunches, and slob-black berries; Golden Queen, with rich golden-coloured berries, and some others were of such quality that they merited inclusion in the collection from a purely cultural point of view. Grapes like Black Monukka, Muscat of Hungary, Red Frontignan, and Diamant Traube or Scotch White cluster, for instance, would never be likely under any condition to make show Grapes, although they possess merit of a high order regarded from the point of view of flavour. Amongst the popular varieties, Muscat of Alexandria, Canon Hall Muscat, Muscat Hamburg, and Madresfield Court, showed that the highest quality in Grapes, as well as exhibition excellence, was well represented. The collection was essentially an educational one, and doubtless many visitors were well pleased to see these Grapes so prominently exhibited at the meeting.

Leaves were shown with the fruit in order to assist visitors to remember the characteristics of each variety. Black, red, white, and yellow-fruited varieties were fairly evenly divided, there being 17 black and red sorts, and 14 with white and yellow berries. The bunches were staged on the ordinary sloping boards covered with white paper, and they presented an attractive appearance. The Fruit Committee recommended the Council to award a gold medal for the collection, but this commendation it was, not unnaturally, found impracticable to carry out, as the produce was exhibited under the direct auspices of the Council itself.

In most gardens in this country where indoor fruit culture is practised Grapes are considered the most important crop, and if the exhibit on Tuesday last was the means of showing to some Fellows that there are still varieties that, for some quality or another, might be useful to them, in addition to those they already cultivate, the object in making the display will have been served.

OUR SUPPLEMENTARY ILLUSTRATION shows a magnificently-flowering plant of *Odontoglossum Pescatorei*, "Westonbirt variety," in the collection of Lt.-Col. HOLFORD, C.I.E., C.V.O., Westonbirt, Gloucestershire. There are many points of resemblance between *O. Pescatorei* and *O. crispum*, but the former may be readily distinguished from *O. crispum* by the broad, sub-orbicular lip and the truncate wings of the column. The species under notice occurs in the higher declivities of the Eastern Cordillera of New Granada, having been discovered in 1847 by FUNCK and SCHLIM, who sent specimens to M. LINDEN's nursery at Brussels, where it flowered for the first time in cultivation in 1851. M. LINDEN despatched an inflorescence to Dr. LINDLEY, who dedicated the plant to M. PESCATORE, a banker of Paris, who was an enthusiastic Orchid cultivator, having one of the choicest collections of the period. *O. Pescatorei* generally flowers from March to May. The flowers of the Westonbirt variety of this species are 3 inches across, white tinged with rose at the back, the colour showing through on the surface, each segment bearing a few purple spots. By right of priority, the *O. nobile*, Richb. f. (*Linnæa*, 1849), is the correct name of this species, but as *O. Pescatorei* has been the name invariably used in gardens from its introduction, it is more convenient. The great success obtained in the cultivation of this and other species of Orchids by Mr. ALEXANDER, who has the care of Lt.-Col. HOLFORD's collection, has been demonstrated on many occasions in these pages and at the R.H.S. meetings.

MEMORIAL TO MR. GEORGE NICHOLSON.—A committee is being formed with a view to inaugurating a fitting memorial to the late Mr. GEORGE NICHOLSON, V.M.H., F.L.S., executor of the well-known *Illustrated Dictionary of Gardening*. Anyone who is interested in the proposition may obtain further particulars from Mr. WILFRED MARK WEBB, the honorary secretary of the Selborne Society, at 20, Hanover Square, London, W.

—At the meeting of the R.H.S. Floral Committee on Tuesday last, Mr. HENRY B. MAY, who presided, referred in suitable terms to the loss the Committee had sustained in the recent death of Mr. GEORGE NICHOLSON, V.M.H., F.L.S., and subsequently a formal resolution was proposed by Mr. GEORGE PAUL and seconded by Mr. J. T. BENNETT-POE, in which the Committee expressed sorrow for the deceased's relatives, and its sense of the services Mr. NICHOLSON had rendered to the Committee for many years past. Testimony was also borne to Mr. NICHOLSON's kindly disposition, which was one of his most striking qualities. The resolution was adopted by all the members present unopposed.

ROYAL HORTICULTURAL SOCIETY'S EXAMINATION IN HORTICULTURE IN INDIA.—We are informed by the Rev. W. WILKS, M.A., that the enclosed letter has been sent to the directors of the botanic and other gardens in the colonies, as well as to the Colonial Press and others:—"On the invitation of the Government of the United Provinces of India, the general examination of this Society in the principles of horticulture is to be modified so as to fulfil the local requirements, and a first examination will be held in April, 1909, at Saharanpur. This suggests that possibly other countries and districts may feel it desirable to enter candidates for a similarly modified examination, in which case the Council would doubtless be prepared to organise it. The examiners are leading horticulturists in England, and for examinations

abroad will be assisted by suitable experts acquainted with the special horticultural conditions of the various countries desiring to adopt our tests. The general examination is now an acknowledged standard of qualification in horticulture in Great Britain, and it is thought it may be of similar advantage and assistance in your country. Other details arranged will be communicated on application for the examination, but the enclosed prospectus as arranged for 1909 will indicate its general lines and the sort of knowledge required. If you should think at any time of adopting this proposal I shall be glad to hear from you, when also I should greatly value the suggestion of the name and address of a competent person in Great Britain, versed in the horticultural conditions of your country, whom we might ask to cooperate with the other examiners appointed by the Society.—Faithfully yours, W. WILKS."

DUTCH BULB GROWERS' JUBILEE SHOW.—The Dutch Bulb Growers' Society is organising an important flower show to commemorate the half-centenary of the Society's existence. Exhibitions of forced bulbous plants have been held every five years, under the association's auspices, the last exhibition having taken place at Haarlem in March, 1905, when, although the quality of the exhibits was of a high standard, the show as a whole, was not a great success. At the general meeting of the Society it was decided that the next quinquennial show should be held in the flowering season of the bulbs from the first days of April till the middle of May, in 1910. The Haarlem City Council has placed the most picturesque part of the city park at the disposal of the bulb growers as a site for the show.

SOUTHAMPTON CHRYSANTHEMUM SHOW.—The secretary of the Southampton Royal Horticultural Society informs us that, owing to circumstances connected with the hall, the date of the Chrysanthemum Show will be altered from November 2 and 3 to October 28, 29, and 30.

BULB GROWING.—Mrs. LLOYD GEORGE, wife of the Chancellor of the Exchequer, visited Portmadoc recently to plant the first bulbs in connection with an experiment in bulb-growing by the Portmadoc Improvement Association. The experiment is to be made on land reclaimed from the sea many years ago.

EAST ANGLIA.—Messrs. JARROLD & SONS announce they have in the press for early publication a sumptuous volume on the historical homes of East Anglia entitled "Old Norfolk Houses," with 36 illustrations reproduced in colour from the artist's water-colour drawings of many of the most important and picturesque of the old halls and manor houses in the county, with some account of their history; by GEOFFREY BIRKBECK, R.B.A. The issue will be strictly limited to 300 copies.

YORKSHIRE FUNGUS FORAY AT MULGRAVE WOODS.—The most successful of the annual fungus forays so far held in Yorkshire under the auspices of the Yorkshire Naturalists' Union took place from September 19 to 24. The headquarters were at the picturesque seaside village of Sandsea, near Whitby, close to the extensive Mulgrave Woods, the property of the Marquis of NORMANDY. This nobleman kindly gave permission to the Union to investigate the rich mycological flora of these woodlands from Monday to Thursday, September 21-24. The Vicar supplemented this kindness by allowing the members to use the schoolrooms as a general meeting and working centre. Over 20 persons, including two ladies interested in mycological pursuits, from Kew, Cumberland, Derby, Lincolnshire, Lancashire, and Yorkshire, assembled on

the Saturday afternoon. Mr. G. MASSEE, chairman of the mycological committee, was present the whole of the time. It was soon found there would be abundance of material in the woods and adjoining fields. Attention was given to all branches of the subject. Four or five of the members, including Mr. MASSEE, devoted the whole of their time to determining the material collected; thus, more work was got through than on any previous occasion. On summing up the results, it was found that over 500 species had been brought in. Of these, four are new to the British flora—*Tricholoma squarulosum*, *T. carneolum*, *Inocybe commixta*, and *Pholiotia sororia*; 28 are additions to the known Yorkshire fungus flora; and a *Clavaria* is probably new to science. On the Monday, Mr. MASSEE gave an address on "Economic Mycology," referring more particularly to the life cycles of some of the parasitic fungi which prey upon Potato tubers. Mr. HAROLD WAGER dealt with "Spore Development in the Basidiomycetes"; Mr. HAWLEY, Boston, with "New Fungi found at Tumböy"; and Mr. J. W. H. JOHNSON with "Fungi found in Polluted West Riding Streams." The named fungi were exhibited on long tables. Many of the villagers, who were allowed to come in and go out just as they pleased, manifested a keen interest in the proceedings. The rooms were open all day, and one or other of the members were always at hand to go round the tables with the visitors to answer questions. There were 18 or 20 edible species. On the Monday evening the place was crowded to hear the lectures.

NOMENCLATURE OF THE PEAR.—We have received a catalogue-index of the known varieties of the Pear referred to in American publications from 1804 to 1907. It has been compiled by Mr. W. H. RAGAN, expert in pomological nomenclature, and is published by the U.S. Department of Agriculture. The name of each variety is accompanied by a brief description and history, including its origin, form, size, colour, texture, flavour, quality, and time of maturity. Under the head of "Improved Nomenclature" it is stated: "In the future we desire to use but one word for the name of a fruit, as with Baldwin Apple, the Bartlett Pear, the Concord Grape, and other renowned fruits which will be perpetually known by appropriate and easily-remembered names. In a word, we desire to establish a system of nomenclature which shall be pure and plain in its diction, pertinent and proper in its application, and an example not only to our own, but to other countries, to strike off the hundreds of *Beurrés* and *Doyennés* from the names of our Pears where it is possible to do so, and to write Anjou, Diel and Bossouchs in the place of *Beurré d'Anjou*, *Beurré Diel*, *Doyenné Bossouch*, &c." It is not claimed that all names that appear in the catalogue as leading names represent distinct varieties, as it has often been impossible to determine from the meagre information obtainable that such is the case. All names that have been found in an exhaustive search of the literature of the Pear, conducted as preliminary to the completion of this work, are included in its pages. The first published name for a variety is taken as the accepted and recognised name. The work is to be a standard authority for the nomenclature of the Pear in America, and it insists that the name of a variety of fruit shall consist of a single name, and under this rule are a number of minor rules more or less tending to make for simplicity. Such general terms as seedling, hybrid, pippin, pearmain, *beurré*, rare, ripe, damson, &c., are not admissible, neither is a possessive noun if used as a name. A long list of abbreviations of publications mentioned in the work is given. The names of the leading varieties are printed in black-faced type and synonyms in italics.

MR. W. H. CLARKE, at present head gardener to Sir William and Lady Plowden, Aston Rowant, Oxfordshire, is leaving these gardens in order to take up a partnership in the nursery business of Mr. G. F. LETTIS, Hadleigh, Suffolk. Mr. CLARKE contributed a weekly calendar on the culture of fruits under glass to these pages in 1905, and since that time has contributed articles upon various subjects.

FESTIVITIES AT A NURSERY.—The firm of Messrs. JOSEPH CHEAL & SONS, Lowfield Nurseries, Crawley, recently entertained their employees, with their wives and families, to celebrate the marriage of Mr. and Mrs. J. CHEAL's second daughter (Miss HELENA M. CHEAL) to Mr. E. WRIGHT. The gathering numbered some 250 persons.

cost has been reduced from 50 cents per can in 1848 to 7 cents at the present time. With this reduced cost, the output of the factories has increased to an almost incredible extent. The total output of the United States for 1887 was about 3,000,000 cases, of 24 cans each. In 1894 the output was nearly doubled; while in 1904 the trade had grown to 9,000,000 cases, and in 1907 the pack reported was approximately 13,000,000 cases.

FRUIT GROWING IN BRITISH COLUMBIA.—

Writing on the above subject, a correspondent in the *Broad Arrow* gives some useful information to intending settlers. He states that, during the last two years, a large amount of land has been bought for fruit culture on Kootenay Lake and river, and in many outlying districts within

system, a number of unknown or forgotten burial places have been traversed, and many coffins in a perfectly sound condition unearthed. Some of these, judging from the coins and buttons found, undoubtedly contained the remains of Spanish soldiers; but, until July 8, no coffin had been found bearing a date or other means of identification. It so happens that nearly all coffins unearthed contained metal name plates, and these were so much corroded that nothing could be deciphered. During excavations at St. Louis and Basinstreets, a coffin was brought to light which bore the inscription, "Hendric Miller, 1803," carved in the wood. This coffin, except for the discoloration of the wood, was as sound as the day it was made, and an iron cross was found which undoubtedly surmounted the grave, but so badly corroded that only a few

FIG. 110.—CHIMNANTHUS FRAGRANS IN FRUIT.

A, longitudinal section of receptacle showing two true fruits; B, transverse section near the base. C, the true fruit or achene.

TOMATO CANNING INDUSTRY.—In America the larger portion of the area devoted to the culture of Tomatoes is for the purpose of supplying fruit for the canning factories, and it is the demand of the canneries which, more than any other, has given the great impetus to Tomato culture in the United States. Canned Tomatoes as an article of trade owes its origin to Mr. HARRISON W. CROSBY, who made his first venture in 1848, while steward of Lafayette College, Easton, Pennsylvania. There was a ready demand for the goods, and, with increased supply and improved machinery, the

reach of the town of Nelson. The price of land ranges from 25 dollars (£5) to 100 dollars (£20) per acre uncleared, and from 100 to 250 dollars per acre for land cleared and under cultivation; but these prices vary considerably according to location, quality of soil, and facility for transportation. The north-west territories offer practically an unlimited market for British Columbia-grown fruit, especially Apples.

DURABILITY OF CYPRESS WOOD.—We learn from the *Weekly Elmslie's Review*, U.S.A., that, during the recent excavations throughout the older portions of New Orleans for the new sewer

letters and the date are decipherable. The interest in this centres in the oft-repeated story of the durability of the Cypress (*Cupressus virginiana*), and the fact that the hand-made nails where they are driven into the wood were not rusted, disproves the statement that has sometimes been advanced that Cypress wood contains an acid which will cause iron to rust.

Publications Received.—*The Estate Magazine* (September). Price 6d.—*The Book of Fern Culture*, by Alfred Hemsley. (London.) John Lane, The Bodley Head. Price 2s. 6d., net.—*The People's Guide to the Old Age Pensions Act*, by G. F. Emery, LL.M. (London.) Bemrose & Sons, Ltd., 4, Snow Hill, E.C. Price 1d.

CHIMONANTHUS FRAGRANS.

OUR illustration (fig. 110) represents a fruiting spray of *Chimonanthus fragrans*, which we received through the kindness of Sir Edmund Loder, Bart., from the garden belonging to Mrs. Otter, at Bolney Lodge, Sussex.

As in the *Calycanthaceae* generally, the gourd-like structures which at first sight might readily be mistaken for fruits are really formed from the upgrowth of the hollow receptacle of the flower. Upon the rim of this are borne the stamens, and within them is a zone of barren stamens, which persist in the mature structure as tongue-like filaments that more or less close the orifice of the cup. Inside and near the bottom of the latter the real fruits are borne. They are one-seeded, dry, chestnut-coloured, bean-like bodies, and are shown in the figure.

The species is a native of Japan, whilst the species of *Calycanthus*, a genus from which *Chimonanthus* is scarcely separable, are North American.

FLOWERS OF SPENSER.

I MAY be permitted briefly to refer to Canon Ellacombe's notes on the "Flowers of Spenser," having spent much leisure time during the winter months of many years in the study of plant names in general and those mentioned in literature in particular. Those who have given the subject nothing more than a cursory attention may be surprised to know that there is no authority on plant names on whom an unreserved dependence can be placed, not probably will there ever be, the subject being one of great difficulty.

On page 15 I have shown that *Amaranthus* is *Amarantus tricolor*, and *Astrophel* is not *Aster Tripolium*. It may be added that Miss Kent, eighty or more years ago, suggested *Myosotis palustris* as the plant, than which no other is quite so near to the description of the poet in *Astrophel*. It is not *Speedwell*.

Belamour is certainly a flower, and in *The Faerie Queene* the "flower-deluce." The verse in the sonnets in which it appears proves it to be sweet scented, and the sole question is whether the plant be a coloured Iris or *I. florentina*.

Bulrushes, it might have been pointed out, were *Scirpus lacustris*, and not *Typha latifolia*, the Bulrush of to-day.

Doubtless Spenser had a plant in his mind when he wrote the "flower of Camphora." It occurs in *Alphila*, and is there described as being aromatic. *Camphorata* was one of the early names of Southernwood, and not improbably this or an allied species is the plant in question. It is important in determining the identity of a plant to take into consideration the medicinal uses to which it was put, and in this case, with the other plants named, it was employed for some feminine disorder. Coltfoot is one of the others, and if we may regard this as identical with Cowthord = Cowth or Cowt equalling Colt, we have *Matricaria Parthenium*, which was a renowned herb for female complaints, and also esteemed in tincture.

Costmary is by no means obsolete, and long before, as well as after, Spenser's day the plant was cultivated in gardens. It is aromatic in a remarkable degree, and was also known as Cost, Coast, Alecost, Balsam Herb, Maudlin, and in Scotland, Smelling Leaves. It is *Balsamita vulgaris* (*Tanacetum Balsamita*). A plant is certainly referred to in both instances.

One of the names of the wood of the Ash tree was Eboyn, and no fact is better authenticated than that spear shafts were on account of the strength and toughness of the Ash formed of that wood. A cheap class of bows, too, was made of Ash, because there was not sufficient Yew to be had or purchasable. Heben, in more than one of the places in which it appears, may therefore be taken to refer to the Ash rather than the Yew.

In *Virgil's Gnat* the Holly is almost certainly meant, growing as it does, or did, in positions such as indicated. Spenser's reference to *Hyssop* as a vulnerary is quite correct. *Colpeper* signifies that "the green herb bruised and a little sugar put thereto doth quickly heal any cut or sore wounds being therewith applyed."

That Kingcup is the Marsh Marigold is opposed to every authority up to a recent date.

Peacham's Kingcup flowered in June. Gerard's was the meadow Ranunculus. Gay wrote:—

"Fair is the Kingcup that in meadow blows,
Fair is the daisie that beside her grows."

There is Cowper's "Kingcups in the yellow mead" and Scott's Jeannie Deans "thinking on the bonny spots of turf soe fu' of Gowans and yellow Kingcups." The plants I knew by that name when a boy were *Ranunculus bulbosus* and *repens*. It hardly needs observing that Spenser's verse is full of anachronisms.

Spenser's reference to the "Orpine growing still" would appear to be not on account of its being evergreen, but because the plant, or, rather, a piece of the plant, was usually set up in a conspicuous part of the poor man's cottage, always on Midsummer Eve, where, with the exception of applied moisture, it continued to grow without any apparent means of support, hence called *Livelong*. *Sedum Telephium* is the *Orpine* of Spenser. *S. tectorum* is the true

used as a name for Parsley, which is "Perse-lime."

In Spenser's time three plants were known by the name of Sops-in-Wine, viz., *Trifolium pratense*, *Medicago sativa*, and a *Dianthus*, but not the common Pink, the plant to which it is referred by Messrs. Britten and Holland, because it is frequently named in conjunction with the Pink. It seems to have been applied to *Dianthus superba*. And here it may be remarked that, although Spenser may have derived Coronations from Lyte, and Lyte the word from Corona, it does not follow that Carnation is the same word. We find the latter used as a colour name earlier by Iusser in 1575, and also in *The Gardener's Labyrinth: The Profitable Arte of Gardening*, and in 1668 in a letter which is printed in *Habylus's Voweez*, while all the early authorities derive Carnation from a colour—a deep flesh or red.

"Tetra mad" and "Mortal Sammitis" may each be conjecturally named, because the plants

FIG. 111.—FLOWERING SHOOT OF CHIMONANTHUS FRAGRANS; FLOWERS WHITISH OR YELLOW, PURPLISH INSIDE.

Seegreen, a name never applied to *S. Telephium*. The "dead sleeping" and "dull" Poppy is correct, *Papaver somniferum* being the plant, and it is also the species mentioned by Turner in his *Names of Plants*, and not *P. Rhæas*. The references are, of course, to its effects as a drug. The "Queen" Apple was a common garden variety frequently mentioned by early writers.

Spenser differentiates the Sallow and the Willow. In the same canto the latter is "worne of forlorne paramoures" and the "Sallow for the mill." The one is *Salix caprea*, the other *S. alba*.

Savine is the common Juniper, but *Juniperus Sabina*. In Sussex, *Artemisia maritima* is called Savin, and used medicinally for like purposes as the true Savin.

Smallage is *Apium graveolens*, and was never

to which they can be referred are very few. Mandrake, the Egg Plant, and Henbane were described as making those who partook of them mad or furious, and Mortal was one of the names of *Atropa Belladonna*.

No doubt by an oversight several plant names have been overlooked, e.g., *Galingale*, *Oxeye*, *Panachea*, *Polygony*, the "Sabine flower," and *Patience*, and the references to some of those noted are not complete. R. P. Brotherton.

—Anything that Mr. Brotherton writes on plant names is worth attentive reading, and I thank him for his criticisms on my papers on the "Flowers of Spenser." But his statements lose much of their value because he does not give his references, and that makes it very difficult to accept them all. For this reason I must content myself with saying that I cannot accept his criticisms altogether. I do not know

what book he refers to by Miss Kent as an authority, and to give one instance where references are needful I would ask for a proof that the Ash was ever called Heben, or that bows were made from Ash. I daresay they were, but I should like the authority. I had the best authority for saying that Spenser's Heben was the Yew. The omissions named in the last line of Mr. Brotherton's letter were overlooked in the writing, and I regret them, for I had noted them for quotation. *Henry N. Ellacombe.*

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

GYNOECIUM OR GYNÆCIUM?—As in the issue of July 25 of this journal (p. 70) exception was taken to the use of gynœcium instead of "the more usual (and correct) rendering gynæcium," it may be worth while to note the following facts. The term in question was first used by Rœper in the form "gynœcium."† In his *Observationes aliquot in floribus inflorescentiarum natarum* (Linnaea, vol. i., 1826, p. 438) he says:—*"The verticillus foliis tomentosis efformatus habet inepite toran gynœcium nomine designari potest,"* adding in a footnote the derivation of the word *ευν* and *αισιν*. The term was formed in strict analogy with "androecium," which is given and explained (*ex ἀνδρ and οἶκος*—sic) on the preceding page. This paper by Rœper had, earlier in the same year, been published in a French translation (by Duby) in Seringe's *Mélanges Botaniques*, vol. ii., No. 5, pp. 71-98. Here the Latin terms were replaced by the French words "gynœcée" and "androcée," but with the same derivations, that is "gynœce," femine, *ευν* and *αισιν*, for "gynœcée," and "androce," homme et οἶκος, maison, for "androcée." In the following year, however, Rœper had another paper, *Varia, in Linnaea* (vol. ii., pp. 82-86), in which both terms occur repeatedly, but in a different spelling, viz., "gynœcium" and "androecium." No reason is given for the change, but it may be assumed that Rœper had now the classical Greek term *γυναικῖον* in mind, in Latin gynœcium or gynœcium (W. Smith, *Latin-English Dictionary*). This is a word into which *αισιν* does not enter at all, and, therefore, quite different from gynœcium. "Androecium," on the other hand, originated, no doubt, from the faulty French "androce" of Duby—it ought to be "androcée" (Littré, *Dictionnaire*)—and was, in any case, inadmissible. Two years later Rœper used the same terms (gynœcium and androecium) in his important essay, *De Organis Plantarum* (pp. 16 and 17). They are quoted as synonyms in Bischoff's *Handbuch d. bot. Terminologie*, vol. i. (1830), pp. 331 and 132, but on p. 300 "androecium" is given in its correct form, "androecium."

In 1832 Bentham, in his *Labiatum Genera et Species*, took the terms over in their original form, but with the termination *ium* instead of *cum*. Thus, p. xiii., "Gynœcium insidens in gynophorum," p. xxiv., "The Androecium in Labiata"; and p. xxvi., "The Gynœcium is still further reduced than the Androecium." No reason is given for this alteration, but it was probably due to a desire to make it conform to the Linnaean terms, Monœcia, Diœcia, &c. Then in 1843, Endlicher and Unger, in their *Grundzüge der Botanik*, adopted "gynœcium" (p. 261) from Rœper's *De Organibus*, but with the termination "ium," whilst they insisted on "androecium" (p. 223). The frequent use of gynœcium or gynœcium is, however, not due to Endlicher and Unger—at least, I have seen no reference to their work—but to a somewhat loose quotation by Sachs in his *Lehrbuch der Botanik*. I quote from the 2nd edition (1870), where he says, on p. 402:—*Die Gesamtheit der mannlichen Geschlechtsorgane einer Blüthe wird (nach Rœper) als Androecium, die der weiblichen als Gynœcium bezeichnet.*† The fact is, as stated, that Rœper has "gynœcium" as well as "gynœcium" for the female, and "androecium" and "androecium" for the male organs. A similar error occurs in Asa Gray's *Structural Botany* (1879, p. 167, footnote 2), where he says in explanation of the terms androecium and gynœcium:—"The male household and the

female household respectively, were introduced by Rœper (Linnaea, i., 437) in the form of androecium and gynœcium; but the diphthong in the latter should also be 'æ.' The orthography androecium and gynœcium (early adopted by Bentham, in *Labiatum Genera et Species*) is conformable to the Linnaean Monœcia, Diœcia," &c.

From all this it is clear that "gynœcium"† or "gynœcium" has the priority over "gynœcium." Etymologically, all these forms are correct, provided that the vowel preceding the final "um" is given the proper quantity, for we have gynœcium from *γυναικῖον*, gynœcium from *γυναικῖον*, and gynœcium from *γυναικῖον* (root *γυναικ*). But as the term androecium§ is universally adopted, it is evidently desirable that gynœcium should stand in preference to the other forms quoted. Our terminology is already overloaded enough, and we should carefully avoid adding to it by orthographic idiosyncrasies.

Concerning the prevalence of the use of gynœcium or gynœcium, it may be remarked, to quote only some instances, that gynœcium was used by Bentham in his classical introduction to the Colonial Floras [*Flora Hongkongensis*, p. xi. (1861); *Flora Australiæ*, p. xvii. (1863); *Flora of Tropical Africa*, p. xvii. (1865)]; it was adopted by Duchartre in *Elements de Botanique* (1867), p. 43; by Asa Gray in his *Structural Botany* (see above); and also by Coulter and Chamberlain in their *Morphology and Systematics* (1904, p. 24). On the other hand, Schleiden (*Grundzüge der wissenschaftlichen Botanik*, Engl. Transl. 1849, p. 316); Warming (*Handbog i den Systematiske Botanik*, Germ. Transl. 1890, p. 474); and Schimper (in *Strasburger, Noll, Schenck und Schimper, Lehrbuch der Botanik*, 1894, p. 365) have gynœcium; but they also consistently spell androecium instead of androecium, whilst the form gynœcium seems to be more confined to the schools of Sachs, Eichler, and Engler, where we find it associated with the discordant androecium. *Otto Stöpp.*

TITHONIA DIVERSIFOLIA.—Referring to a note by Mr. Alwin Berger on p. 24, I may state that this plant is naturalised here, and flowers almost continually, producing many hundreds of flower-heads. It reaches a height of 5 metres, and even higher. Fruits are abundantly produced, and the plants are spreading rapidly everywhere. I shall be very glad to exchange seeds of the indigenous and naturalised plants of Java for others from foreign countries. *M. Buyssan, Hortus Penggerensis, Lawang, Java.*

GLORIOSA.—It seems strange that a plant so long introduced to gardens, so well known to the majority of gardeners, and of which Erasmus Darwin in his quaint poem, "The Love of Plants," remarks, "Proud Gloriosa led three chosen swains," &c., &c., should be referred to as a rare plant (see p. 227). It may frequently be seen in quite modest establishments. Like other tropical plants of a rampant habit whose season of growth is limited to the few months of summer, its growth is very rapid, and it requires almost daily attention in the matter of tying and training of the shoots. Especially is this necessary if the plant is trained near to the roof. After active growth ceases water should be gradually withheld and the plant thoroughly ripened off previous to storing the tubers for the winter. This thorough ripening is essential, otherwise the tubers may fail to start into growth for some time after being introduced into heat in early spring. For this reason it is wise, as recommended by *F. A.*, to lay them out after the manner of Caladiums, and to pot them up when it is seen that growth has commenced. Several tubers may be planted in a wide, shallow tub, and will give a good effect trained either to the roof; or a few strong, twigg, pieces of pea-wood may be inserted in the tub and the growths allowed to ramble, tying them out as may be required. Less seldom seen in gardens is *Gloriosa simplex*, with its synonymy *G. Planti grandiflora* and *G. virens*; the petals of this variety are wrier, less undulate, and, taken altogether, although a de-

sirable variety, it is not so ornamental a garden plant as *G. superba*. More rare still is the magnificent *G. Rothschildiana* introduced some few years ago from Uganda, and occasionally exhibited at the meetings of the Royal Horticultural Society. *Fred. W. Jeffrey.*

ETYMOLOGY OF PLANT NAMES.—While agreeing with Mr. Engleheart that one should be wary of etymologies which cannot be supported by evolutionary evidence in literature, I cannot think that he has shaken the accepted explanation of "walnut" and "pansy." In regard to "walnut," Professor W. Skeat, finding no trace of the word in English before the fourteenth century, suspects that it was imported from old Dutch, where the form was *walnotte*. He cites the form *walnut* from *Pierce Plowman's Vision* (B. xi., 251), and the word exists in all Scandinavian languages. The plain meaning being "foreign nut," it seems unnecessary to speculate with Mr. Engleheart on the improbable use of the term *acellantia nut*, and its transition to "walnut." The local form "Welshnut" has its parallel in the duplicate German *wälsche nuss*. As for "pansy," Cobgrave, in his *Vocabulry* (A.D. 1600), gives the French "pensée," a thought, also the flower *pansée*; and I fancy few people will discard that for Mr. Engleheart's far-fetched *panché*, a mere guess unsupported by a title of evidence. It would be as reasonable to doubt that "dandelion" stands for *dentelion*, or "Daisy" for "day's eye," though the resemblance of the jagged leaves of the first to the teeth of a heraldic lion is not more obvious than that of the second, as explained by Chaucer, "The dayesye or elles the eye of the day." Chaucer was a mediæval Englishman, untouched by Italian influence, yet both he and the early Scottish poets read much significance into flowers. So let us keep our pansy for remembrance—

"The pensée next, which English maids
Call heart's ease—innocent translation;
As if each thought that springs and fades
Were only source of jubilation."
Herbert Maxwell, Monreith.

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 29.—The meeting of the Committees held on this date brought forth an excellent exhibition of fruits and flowers, the Hall being filled, even in the annexes, with a variety of exhibits, amongst which Dahlias, perennial Asters, early-flowering Chrysanthemums, and other hardy garden plants predominated. An exhibit of Rubus and Vitis species was as interesting as it was extensive. Other groups of especial merit were displays of Nephentes and Selaginellas, and varieties of Grapes from the Society's collection at Wisley. The various Committees all conferred awards on novelties, and, in conjunction with the Floral Committee, the National Dahlia Society granted Certificates of Merit to nine Dahlias. At the afternoon meeting the concluding portion of the paper by Mr. T. H. Mawson, Hon. A.R.I.B.A., was read.

Floral Committee.

Present: Henry B. May, Esq. (chairman), and Messrs. C. T. Drury, W. A. Binley, J. W. Barr, J. Green, A. E. Bowles, G. Reuther, C. J. Salter, J. F. Mead, J. Jennings, W. Howe, F. W. Dixon, G. E. Pearson, W. P. Thomson, J. T. Bennett-Poe, F. Page Roberts, E. H. Jenkins, W. J. James, J. Hudson, Geo. Paul, H. J. Cuthish, H. J. Jones, W. G. Baker, A. Turner, R. Hooper Pearson, and R. C. Reginald Nevill.

Before the ordinary business of the meeting commenced, the chairman, Mr. Henry B. May, called attention to the recent death of Mr. George Nicholson, V.M.H., F.L.S., and a resolution was adopted as is stated on p. 249.

Messrs. James Veitch & Sons, Ltd., King's Road, Chelsea, showed several important groups, for which collectively a Gold Medal was awarded, their exhibits of Nephentes and of Rubus and Vitis species being the most important in the whole exhibition. Never have we seen Nephentes exhibited in better cultural condition, the plants being crowded with their curious pitchers, and all showing robust health

† The accent is on the penultima, as in Lycœum.

‡ Accent on the antepenultima.

§ Even if spelled "androcœcium," it is, I believe, always pronounced in English as well as in German with the accent on the antepenultima, as if the e were short.

* The italics are mine.

that is associated with high culture. The species and hybrids represented the pick of those in cultivation, and, although we have no space to name all the kinds, we may instance *N. Kalliesiana*, *N. Burkei*, *N. mixta*, *N. ventricosa*, with very elegant rim, *N. Mistrisiana*, with quite 50 pitchers, *N. Curtisii* superba and *N. rubella*. Near to the insectivorous plants were arranged greenhouse *Rhododendrons* of the javanic *X. jasminiflorum* type, a batch of *Nerine Fothergillii* major, interspersed with *Abutilons* of yellow and white-flowered varieties, *Begonias* Mrs. Heal, and others of that class, and some flowers of a fine strain of *Streptocarpus*. The *Streptocarpus* represent a great improvement, the shades of rose, blue, purple, lavender, and white seen in the flowers being very fine. The group of vines and *Rubus* species occupied almost the whole length of the building near to the wall, there being about 50 plants of each genera. The most remarkable of the *Rubus* were *R. bambusarum*, *R. leucodermis*, *R. ideabatus*, *R. hypargyrum*, with strong stems like *Rosa canina*, and shoots resembling those of the Blackberry; also several unnamed species. Many of the vines had coloured foliage, the best in this direction being *Vitis Hienryana*, *V. Coignetiae*, *V. flexuosa* major, *V. vinifera purpurea*, *V. Thomsoni*, and *V. Thunbergii*.

A representative collection of *Selaginellas* was exhibited by J. GURNEY FOWLER, Esq., Giebelands, South Woodford (gr. Mr. Davis), the collection attracting much attention. The examples were of large size, and particularly well cultivated, not a few specimens attaining to 2½ feet across, or some even more. There were some four dozen large examples and a considerable number of smaller plants. The following kinds were the more noteworthy: *S. Kraussiana aurea*, a neat, dwarf-growing variety; *S. K. variegata*; *S. Martensii stolonifera*; *S. Schottiana*; *S. atroviridis*, with foliage of a dark green colour; *S. grandis*, for which a Cultural Commendation was given; and *S. Loblii*, a pleasing and free-growing sort. (Silver-Gilt Banksian Medal.)

Messrs. HILL & SON, Edmonton, showed a group of the Bird's Nest Fern, *Asplenium Nidus*, the plants being remarkable for their excellence of culture, the beautiful broad leaves showing to great advantage in the somewhat subdued light of the annexe, that is usually occupied by the Fruit and Vegetable Committee. (Silver Flora Medal and Cultural Commendation.)

Messrs. H. B. MAY & SONS, The Nurseries, Edmonton, staged *Veronicas* of the Andersonii section, some as standard plants; also a selection of *Carnations*, the different varieties being divided by rows of Ferns. (Silver Banksian Medal.)

Mr. J. T. BOASE, Billingham, showed varieties of ornamental *Clucbricaceous* fruits. (Bronze Banksian Medal.)

Choice blooms of tuberous-rooting *Begonias* were shown by Mr. L. L. GUILFORD, New Eatham, Kent. The blooms were of rich shades of scarlet, red, pink, salmon, yellow, white, &c. Some were named sorts, the variety *Sea Shell*, with crimped edged tinged with soft pink, was of charming beauty.

Messrs. F. CANT & Co., Colchester, showed an assortment of *Roses*, having many beautiful kinds in large bunches of bright and fresh blooms. (Silver Banksian Medal.)

Messrs. PAIN & SON, The Old Nurseries, Cheshunt, staged a bank of *Roses*, arranging the exhibit in a corner near the south annexe. Some were shown as pot plants, others as cut blooms, the group being pleasingly relieved with *Palms*, *Eulalia*, *Adiantum Ferns*, *Retinosporas* and other graceful subjects. The best of the *Roses* were *Gruss an Teplitz* (H.L.), *Paula* (creamy yellow), *Joseph Hill* (finely-formed bloom with elegant petals of creamy-bronze colour), *Bird's Nest* (red) and *Mrs. Phillippe Kivoire* (white, with copper-coloured centre). (Silver Banksian Medal.)

An interesting array of sprays of ornamental shrubs and trees, and many good blooms of *Dahlias*, including a stand of the single type were shown by Messrs. JOS. CHEAL & SONS, Crawley, Sussex. The single *Dahlias* were a very pleasing contribution, this flower being a speciality with Messrs. CHEAL. The trees and shrubs embraced many handsome-leaved and bristed species, particularly pleasing being the golden-fruited *Holly*, *Ilex flexilis*, *Cornus Spathii* aurea, *Desmodium pendulifolium*, *Aver*

virginicum rubrum (with highly-coloured leaves), *Symphoricarpos Heyeri* (a white-berried species) *Acer platanoides laciniatum*, the Dartmouth Crab (finely in fruit), *Azalea pontica* (with intensely-coloured foliage), *Aralia spinosa* (in flower, with very big foliage), and *Kalmia rubrum* (shown in flower). (Silver Banksian Medal.)

Mr. RUSSELL, Richmond Nurseries, Richmond, Surrey, displayed a group of bristled and ornamental-leaved plants of a hardy nature, such as ornamental vines, *Fvies*, *Clematis*, *Skimmia*, *Andromeda Mariana* (with intensely-coloured leaves), *Aucuba japonica* (in many plants crowded with the red berries), hardy *Fuchsias*, and others. *Vitis Coignetiae* was shown with rich red leaves. (Silver Banksian Medal.)

Mr. CHAS. TURNER, Slough, showed many finely-coloured and bristled shrubs, also *Dahlias* in variety. The rich autumnal tints of many of the shrubs were very pleasing, and other arboreal subjects were finely in fruit. We may enumerate *Quercus americana rubra*, *Liriodendron tulipifera* (with golden margins to the leaves), *Cotoneaster frigida* (in fruit), *Quercus pannonica* (showing rich autumn tinting), *Rhus Cotinus* (another handsomely-coloured plant), *Acer* in variety, *Cornus*, *Pelia trifoliata*, and *Viburnum Opulus* as some of the more noticeable. (Silver Banksian Medal.)

Mr. J. WEST, Brentwood, Essex, showed *Dahlias* in variety, growing stiffly arranged in long, formal rows, but all the blooms of choice quality and selection as to variety. (Silver Banksian Medal.)

Another exhibit of these seasonable flowers was made by Messrs. CARTER, PAGE & Co., 52 and 53, London Wall, who had also many vases of early-flowering *Chrysanthemums*. (Bronze Banksian Medal.)

A similar group to the last-mentioned was staged by Mr. J. EMBERSON, Hoe Street, Walthamstow.

Messrs. R. H. BATH, LTD., Wisbech, made a pleasing show with perennial *Asters* and early-flowering *Chrysanthemums*. (Bronze Banksian Medal.)

Messrs. W. WELLS & Co., Merstham, Surrey, showed *Chrysanthemums*, principally of the border type, in great variety. (Bronze Banksian Medal.)

Messrs. T. S. WARE, LTD., Ware's Nursery, Feltham, Middlesex, staged a charming group of *Dahlias* and perennial *Asters*, most effectively arranged and comprised of most of the best varieties of these autumn flowers. A prominent position was afforded the fine blue *Aster Beauty of Colwall*, which has received the Society's Certificate of Merit. The white *Grand Duc Alexis Dahlia* was shown very finely in this important group. (Silver-Gilt Banksian Medal.)

Messrs. H. CANNEL & SONS, Swanley, Kent, showed *Dahlias* in variety, including most of the best varieties of the Cactus-flowered type, and many of the *Paeony*-flowered race. Amongst these latter were many of merit, some of the newer kinds, having a desirable shape and form, in addition to size. We may enumerate *Souvenir de Gustave Douzon* (red) and a sport from this variety in which white as well as red is seen; also *Mrs. Van den Dael* (pink), *Souris de Fen* (reddish with orange centre), *Yellow Colosse*, and *La Grand Manitou* (magenta striped with plum colour) as being especially noteworthy. (Silver Banksian Medal.)

Mr. H. J. JONES, Ryecroft Nurseries, Hither Green, Lewisham, showed the great beauty and variety of the perennial *Aster* (*Michaelmas Daisies*) in a charming exhibit of these flowers. The sprays of blooms were lightly arranged with the skill which this exhibitor always evinces in his groups, a white groundwork showing them to great advantage. We especially noticed *Mrs. S. T. Wright* (large flowers of lavender blue), *Hilda Norris* (very pale blue), *Mrs. Huson Morris* (bright pink), *Robt. Parker* (blue), *Lil Fardell* (big rose-coloured blooms), *Nancy* (pale blue), *White Spray* and *Ryecroft* (pink). (Silver Banksian Medal.)

Messrs. W. CUTBUSH & SONS, Highgate, London, N., showed excellent blooms of *Carnations*, staged with much skill in fancy vases; also the double perpetual flowering *Rose*, *Mrs. W. H. Cutbush*, and a large batch of the reddish-leaved *Coleus Cordelia*. (Silver Banksian Medal.)

Mr. G. REUBER, Keston, Kent, staged hardy flowers in variety, and intermingled with these were *Gloriosa superba*, *Guevina avellana*, hav-

ing *Grevillea*-like flowers of a pale colour and with pinnate foliage; *Berberidopsis corallina* with its handsome fruits; *Desfontainia spinosa*, *Nerine Powellii*, and other interesting subjects.

Messrs. BARK & SONS, King Street, Covent Garden, London, W.C., showed seasonable hardy flowers, also *Nerines*, *Vallota purpurea*, a pan of the white variety of *Cyclamen neapolitanum*, *Gladiolus primulinus*, the pleasing rose-coloured *Lupinus polyphyllus*, species of *Tulips*, *Colchicums*, &c. (Silver Banksian Medal.)

Messrs. R. WALLACE & Co., Colchester, had many of the best hardy flowers in season and an assortment of *Monthretias* (*Tritonias*) in improved varieties. There were many *Iliums*, *Michaelmas Daisies*, *Colchicums*, *Pentstemons*, *Gladioli*, *Chrysanthemums*, and autumn-flowering bulbous plants noticed in this excellent exhibit. (Silver Flora Medal.)

Messrs. JOHN PEED & SON, West Norwood, London, S.E., showed seasonable hardy flowers as a background to boxes of Alpine plants. Some small pot plants of succulent species were represented in the exhibit, the interesting *Haworthia denticulata* being in flower.

LEOPOLD DE ROTHSCHILD, Esq., Gunnersbury House, Acton, W., and Mrs. James Hudson, V.M.H., showed 18 varieties of hardy *Heaths*.

Messrs. JAS. BACKHOUSE & SON, LTD., York, showed strong blooming plants of *Colchicum speciosum*, also the white and darker-coloured varieties; *Crocus speciosus* was also included in the exhibit. The *Colchicums* were remarkably fine.

The GUILDFORD HARDY PLANT NURSERY Co. showed a select though small exhibit of hardy blooming subjects. A new tree *Carnation*, named *Hon. R. H. Eden*, was displayed by the WEST OF ENGLAND ROSE FARM, Henlade, Taunton. The colour of the flower is a shade of red approaching an orange tint.

AWARDS.

FIRST-CLASS CERTIFICATE.

Nepenthes *Dr. John MacFarlane*.—This new hybrid was exhibited by Messrs. JAMES VEITCH & SONS, LTD., and is from a cross between *N. sanguinea* and *N. Curtisii* superba. The pitchers are 7 or 8 inches long and very similar in shape to those of *N. sanguinea*. In colour the exterior of the pitcher is brownish-red splashed with a little deeper colour, probably obtained from *N. Curtisii* superba. The throat is bright green with frequent purple markings, being exceedingly attractive. The leaves are 5 to 6 inches across, and wider than those of either parent. The plant exhibited bore five large pitchers and several smaller ones.

AWARDS OF MERIT.

Carnation Winona.—This is a rich pink tree *Carnation* with well-formed flowers of considerable size, and fragrant. The petals are slightly fringed. Shown by Messrs. R. H. BATH, LTD.

Pentstemon japonicum.—This is a rare Japanese species, with inflorescences 3 inches or more long, and these are enveloped with reddish-violet bristles of the involucre, with a tuft of white bristles at the apex of the spike. The leaves are from 2½ feet to 3 feet in length, and very narrow. This ornamental grass is described as quite hardy and perennial. Shown by Mr. AMOS FERRY.

Selaginella emiliana aurea.—This is a pretty yellow-tinted variety of the type which will be appreciated for its lighter appearance. Shown by Messrs. J. HILL & SON.

Vicia corolla purpurea.—This variety was much admired by the Committee for its rich purple flowers and extraordinary freedom in blooming. The individual flowers are small, but the habit of the plant will make it a good border variety. Shown by Messrs. GUNN & SONS, Alton.

DAHLIAS.

The following *Dahlias* were adjudicated upon by a joint committee of the National Dahlia Society and a sub-committee of the Floral Committee of the Royal Horticultural Society, the varieties enumerated thus receiving the "First-Class Certificate" of the former and the "Award of the Merit" of the latter body.—

Elvie Turner (Cactus).—A large flower of the exhibition type, coloured pale lawn and buff.

El-Vino (show).—The well-formed flower is coloured a rosy lilac. Both these were exhibited by Mr. S. MORTIMER, Farnham, Surrey.

Monarch (Cactus).—A large and handsome variety of pale orange shade with a gold centre. From Mr. J. BURRELL, Cambridge.

Nora Reynolds (Pompon).—The blooms of this neat and attractive variety are of a reddish hue.

Lady Beautiful (single).—Of excellent form, and coloured a rosy red shade, the base of the petals being crimson. These two from Mr. M. V. SEMLE, Sevenoaks.

Wellington (Cactus).—The primary tone of colour is deep claret red, but the tips of the florets are white.

Satisfaction (Cactus).—A distinct showy variety of rosy-pink colour with a white centre.

Savonia (Cactus). The colour of the florets is ruby-red with purplish shading, and tipped with white. These three varieties were presented by Messrs. JAMES STREDBWICK & SONS, St. Leonards.

Nellie Riding (Cactus).—A handsome variety of crimson-red tone, the pointed florets being lightly tipped with white. Exhibited by Mr. J. T. WEST, Brentwood, Essex.

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the chair), and Messrs. Jas. O'Brien (hon. sec.), de B. Crawshaw, Harry J. Veitch, H. Little, W. Boxall, J. Forster Alcock, E. Ashworth, R. G. Thwaites, F. J. Hanbury, J. Wilson Potter, J. Charlesworth, A. Dye, J. Cypher, H. G. Alexander, W. H. White, H. A. Tracy, H. Ballantine, Gurney Wilson, W. Bolton, R. Brooman-White, Walter Cobb, and Sir Jeremiah Colman, Bart.

H. S. GOONSON, Esq., Fairlaw, West Hill, Putney (gr. Mr. G. E. Day), was awarded a Silver-Gilt Flora Medal for a group in which were several remarkable new varieties, some of which are referred to under "Awards." The group, which was composed of finely-grown plants throughout, had at one end a number of well-flowered examples of *Cypripedium insigne* Sanderae. At the back were good forms of white *Odontoglossum crispum* mingled with the showy flowers of *Cattleya Iris*, various *Laelio-Cattleyas*, a selection of *Brasso-Cattleyas*, *Miltunia vexillaria* Leopoldii, with exceptionally well-developed flowers, a large white-tipped *Miltunia blueana*, and various hybrid *Cypripediums*.

MESSRS. CHARLESWORTH & CO., HEATON, BRADFORD, were voted a Silver Flora Medal for a group, principally hybrids, among which were noted the white-petalled form of *Cattleya Lord Rothschild*, a number of the showy *C. Iris*, *Brasso-Cattleya Digbyano-Mendelii*, B.-C. Digbyano Warszewiczii, *Sophro-Laelia Heatonensis*, with dark reddish-purple flowers, and other *Sophrontis* crosses; varieties of *Laelio-Cattleya Elva*, L.-C. *luminosa*, L.-C. *Aphrodite*, L.-C. *callistoglossa*, the showy *Sophro-Laelio-Cattleya Marathon*, &c.

MESSRS. SANDER & SONS, ST. ALBANS, secured a Silver Banksian Medal for a group, in the centre of which was a finely-flowered specimen of the rare *Catastium Russellianum*, with curious, fragrant, whitish flowers, striped with green. With it were a selection of *Cypripedium* *Fairrieanum*, various pretty hybrid *Cypripediums*, and other hybrids and species.

MESSRS. JAS. CYPHER & SONS, Cheltenham, were awarded a Silver Banksian Medal for a well-arranged group specially rich in *Cypripediums*, among which were two good *C. Maudiae*, the finely-formed and dark-coloured *C. Milo Westonbirt* variety, *C. triumphans*, *C. Transvaal superbum*, &c.

MESSRS. MOORE, LTD., RUMFORD, LEEDS, showed *Cypripedium Charlesworthii magnificum*, a very large and finely-formed flower, the dorsal sepal being broader than long, white, beautifully tinged, and netted with rose colour. The petals and lip were larger than in the ordinary form, whitish, veined with brownish purple. Messrs. MOORE also showed two forms of *Cattleya Iris*, and a fine head of bloom of *Neobenthamia gracilis*.

MESSRS. HITCH LOW & CO., ENFIELD, staged a selection of Orchids, which included the large-flowered *Cypripedium insigne* King Edward VII., C. *Marstonia*, C. *Baron Schroder*, C. *triumphans*, and other *Cypripediums*; *Bulbophyllum grandiflorum*, *Laelio-Cattleya Bletchelyensis*, with six flowers, *Cattleya Iris*, C. *Atalanta*, &c.

R. G. THWAITES, Esq., Chessington, Church Road, Streatham (gr. Mr. Black), sent several fine forms of *Cattleya Adala*, C. *luis*, C. *Euphrasia*, and four examples of a *Cattleya* obtained by crossing two albinos, viz. C. *Harrisomana alba* and C. *Gaskelliana alba*; but all the resultant plants were distinctly coloured with light rose-pink.

MESSRS. J. & A. McBEAN, Cooksbridge, staged a group of *Odontoglossum crispum* and O. *Harryanum*, together with *Cattleya Iris*, the dark scarlet *Epiphonitis Veitchii*, *Oncidium bicoloratum*, &c.

DE B. CRAWSHAW, Esq., Rosefield, Sevenoaks (gr. Mr. Stables), showed a splendid plant of his hybrid *Odontoglossum Carmania Rosefieldense* (*Harryanum* × *Lucasianum Thompsonianum*), with a very strong spike of 14 flowers and buds. The expanded blooms were large and broad in all the segments, the ground colour of the sepals and petals being cowslip yellow, heavily marked with dark chocolate purple, the broad white lip having purple blotches around the crest.

MONS. CHAS. MARON, Brunoy, France, showed a selection of very fine hybrids, the best of which, *Cattleya Rutiland*, secured a First-class Certificate (see Awards). Among the others were *Cattleya Marcel Dayd* (a finely-coloured hybrid), C. *Maronii* (with 10 flowers on a spike), a very pretty rosy-lilac tinted *Brasso-Cattleya*, and a fine specimen of *Laelio-Cattleya Henry Greenwood*.

H. T. PITT, Esq., Stamford Hill (gr. Mr. Thurgood), sent *Odontoglossum grande Pittianum*, a clear yellow form with white lip, having some yellow markings at the base.

MR. G. W. MILLER, Wisbech, sent *Laelio-Cattleya Cassandra*.

F. J. HANBURY, Esq., showed *Cypripedium Fairrieanum*, Brockthirst variety.

H. W. PERRY, Esq., sent a fine plant of *Cattleya Warszewiczii* with seven flowers on the spike.

AWARDS.

FIRST-CLASS CERTIFICATE

Cattleya Venus (*Iris* × *Dowiana aurea*), from H. S. GOONSON, Esq., Fairlaw, Putney (gr. Mr. G. E. Day). A superb hybrid, surpassing that general favourite *C. Iris* in every way, as might be expected by the second introduction of C. *Dowiana aurea* into its composition. The flower is like a very fine form of C. *Iris*, but more ample in all the segments, especially in the breadth of the sepals and petals, which are of a golden-yellow colour tinged with reddish bronze. The lip is of a deep ruby red, with gold veining from the base to the centre.

Odontidea Charlesworthii, Goodson's variety (*Odontoglossum Harryanum* × *Cochlioda Norziana*), from H. S. GOONSON, Esq. (gr. Mr. G. E. Day). The original plant, which was the centre of attraction in Messrs. CHARLESWORTH'S group at the last Temple show, was illustrated in the *Gardener's Chronicle*, May 30, 1908, p. 333 Mr. GOONSON'S variety has larger flowers of a rich reddish scarlet colour, with yellow markings on the crest. It is a flower of very fine substance, lasting a considerable time in bloom.

Cypripedium Bianca superbum (*Lucanum Prospero* × *insigne Sanderae*), from Lt.-Col. G. L. HOLFORD, C.I.E., C.V.O., Westonbirt (gr. Mr. H. G. Alexander). One of the most chastely beautiful of *Cypripediums* and the first to excel the general favourite *C. insigne Sanderae*, which it resembles in many particulars, but with more massive and compact form. The large dorsal sepal is snow-white, with a well-defined yellowish-green base, the rest of the flower being pale yellow and the surface shining and smooth.

Cattleya Rutiland (*Maronii* × *Fabia Vignona*), from MONS. CHAS. MARON, Brunoy, France. In this the two parts C. *Dowiana aurea*, one C. *labiata*, and one part C. *velutina*, produces a fine flower, equal in size to C. *labiata* and almost entirely of glowing reddish-crimson colour, the lip being the darker.

AWARDS OF MERIT.

Sophro-Cattleya × *Siva Westonbirt* variety (C. *Trilobis* × *Sophrontis grandiflora rosea*), from Lt.-Col. G. L. HOLFORD, C.I.E., C.V.O. (gr. Mr. H. G. Alexander). The flower is large and finely formed, of a deep rose-purple colour with orange tube to the lip, which has the front claret-purple, the colour extending over the margins of the side lobes.

Laelio-Cattleya Golden Oriole, Goodson's variety (L.-C. *Charlesworthii* × C. *Dowiana Rosita*), from H. S. GOONSON, Esq. (gr. Mr. G. E. Day). Flowers with golden-yellow ground colour, nearly covered with deep bronzy red markings.

Oncidium incanum, from Baron Sir H. SCHROEDER (gr. Mr. H. Ballantyne). The fine old spikes of long branched spikes of pretty white and rose flowers. The plant bore 18 spikes.

BOTANICAL CERTIFICATES.

Acineta densa, from H. T. PITT, Esq., Stamford Hill (gr. Mr. Thurgood). Racemes pendulous; flowers waxlike in substance; yellowish, spotted with rose colour.

Habenaria granulata.—A slender species from Darjeeling, with white flowers having green spurs about 2 inches in length.

Spurhia purpurascens.—A pretty species from Madagascar, with bright green leaves and erect spikes of purplish-rose flowers. Illustrated in the *Gardener's Chronicle*, April 9, 1904, p. 227.

Cirrhopetalum Andersonii.—Plant of dwarf habit. Flowers in umbels, each an inch in length, the convex lateral sepals being ovate, whitish with fine rose spots, and some purple lines in the concave dorsal sepal. The above three plants from Sir TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White).

Catastium maculatum, from J. GURNEY FOWLER, Esq., Gblelands, South Woodford (gr. Mr. J. Davis). An old but fine species, now rare. The stout, erect inflorescence bears several large flowers, the greenish fleshy labellums spotted with dark-red being inverted, the margin of the opening coloured olive green, plain, and not bearing teeth as in C. *tridentatum*. The sepals and petals are arranged wing-like over the column and lip, and are greenish, blotched with rose colour.

Fruit and Vegetable Committee.

Present: G. Bunyard, Esq. (in the chair); and Messrs. J. Cheal, A. H. Pearson, O. Thomas, G. Woodward, W. Bates, J. Harrison, A. K. Allan, E. Beckett, C. Foster, H. Parr, J. Davis, H. Markham, J. Lyne, J. Willard, P. D. Tuckett, G. Reynolds, W. Pope, P. C. M. Veitch, A. Dean, G. Wythes, J. McIndoe, J. Jaques, W. Poupart, and H. S. Rivers.

A resolution of sympathy and condolence with the widow and family of the late Richard Lye, for several years a member of the committee, was unanimously voted.

Numerous seedling Apples came before the Committee, and some others for comparison. A Cultural Commendation was given to W. COBB, Esq., Rusper (gr. C. J. Salter), for a superb sample of Apple Charles Ross, grown under glass.

The same award was given to excellent samples of Apple James Grieve from both under glass and outdoors, sent by Mr. C. FOSTER from the University College Gardens, Reading. A sample of the outdoor fruit tasted was of fine flavour.

A similar award was made to Messrs. ROBERT VEITCH & SONS, Exeter, for samples of the true Gravenstein Apple and a large ribbed variety known in the West of England as Red Ribbed Greening or Grand Sultan.

MESSRS. R. SPOONER & SONS, Hounslow, sent a broad, somewhat ribbed Apple named Hounslow Wonder. The variety appeared to be a good keeper, and it was requested that the fruit be shown to the Committee later, and the tree is also to be inspected.

MR. W. ROUFELL, Roupell Park, sent the Grape from which the Sultana of commerce is obtained.

Mrs. NICHOL, 144, Audley Gardens, showed very fine samples of Oranges, Rennie Navel and Washington Navel, grown by F. RAWLINGS, Esq., Woodville, South Australia (see Awards). (Silver Knightian Medal.)

MR. R. NOTCUFF, The Nursery, Woodbridge, set up a collection of 42 dishes of superb Apples. Specially attractive were Peasgood's Nonsuch, Charles Ross, Cox's Orange Pippin, Ribston Pippin, Allington Pippin, Gravenstein, Gledits Prince Albert, Bismarck, Warren's King, Lancashire Noble, Golden Spire, Jas. Grieve, the Queen, Lord Derby, and Newton Wonder. (Silver-Gilt Banksian Medal.)

Messrs. LANE & SONS, Berkhamsted, showed circular-trained vines in Hunch pots. The varieties comprised Gros Maroc, Apple Towers, Melton Constable, Prince of Wales, Black Hamburgh, and Buckland Sweetwater. Each vine carried from 12 to 14 bunches. (Silver Knightian Medal.)

Messrs. DOBBIE & Co., Rothsay and Marks Tey, had a collection of Potatoes, comprising 34 varieties, arranged in baskets. In all the Scotch tubers the skins were very clear and smooth. In the few duplicate varieties from Essex the skins were brown and netted, though the tubers were of handsome form; very fine whites were The Scot, British Queen, The Factor, Dobbie's Favourite, Dalmeny Radium, The Crofter, and Talisman; whilst amongst coloured kinds we noticed Waverley, Climax, Crimson Beauty, Eightfold, Rouge Royal, Purple Eye, Norton Beauty, Queen of the Veldt, and King Edward VII. (Silver-Gilt Knightian Medal.)

AWARDS.

FIRST-CLASS CERTIFICATE.

Grape Fruit of Wines.—The bunches were exhibited by the ROYAL HORTICULTURAL SOCIETY from their gardens at Wisley. It is said to have originated as a sport from Mrs. Pince and has previously received an Award of Merit when shown by Messrs. Jax, Veitch & Sons. The bunches are long and tapering, the berries being large, semi-round, black, solid, and richly flavoured. The variety is a good keeper and an excellent Grape for exhibition purposes.

AWARDS OF MERIT.

Oranges Kinnick Navel and Washington Navel.—Both these are large, round fruits, having solid and rich flavour. From F. RAWLINGS, Esq., Woodville, South Australia.

Apple "Renown," shown by Mr. CHARLES ROSS, Welford Park Gardens, Newbury. It was raised from the same cross as produced the variety Charles Ross. The new fruits are not unlike those of Emperor Alexander. The flesh is solid, crisp, juicy and of full flavour; a cooking variety. The tree has been inspected by members of the Committee, who reported favourably as to its cropping and other qualities.

Potato Deweeka Seedling.—A roundish, white maincrop variety grown under trial at Wisley and judged from samples cooked at Vincent Square. From Mr. J. YULE, Aberdeen.

Potato British Champion.—This has similar form to the last-named, and is a heavy cropper. It was tried at Wisley for cropping, and cooked samples were submitted to the Committee. From Mr. J. CARTER, Tottenham.

Awards of Merit were also made to the following Beets grown at Wisley:—Willow Leaved (DOBBIE), Blood Red, and Pineapple (SUTTON & SONS).

BRITISH GARDENERS' ASSOCIATION.

OCTOBER 8.—A meeting of the London Branch will take place at Carr's Restaurant, Strand, on the above date, at 8 p.m., when the chairman and other members of the executive council will address the meeting on the influence of the British Gardeners' Association and how to increase it. All professional gardeners are welcome. A large number of employees engaged in nurseries is anticipated. General questions are invited.

FRANCO-BRITISH EXHIBITION. HORTICULTURAL SHOW.

SEPTEMBER 30, OCTOBER 1, 2.—An exhibition of horticultural produce was held on the above dates in the Music and Congress Halls, the show proving a success.

The principal feature of the exhibition was a group comprised of flowering and foliage plants, arranged by several exhibitors in conjunction. Amongst novelties were Grapes, Pears, Apples, and Peaches from France, the Peaches being a remarkably fine sample. Fruit trees in pots were admirably shown by various nurserymen. Exhibits of Potatoes in both competitive and non-competitive exhibits were especially numerous. Further comment must, owing to pressure on our space, be reserved until the next issue.

MARKETS.

COVENT GARDEN, September 30.

(We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which the market is supplied in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—Ed.)

Cut Flowers, &c.: Average Wholesale Prices.

Table listing prices for cut flowers and other items. Columns include item name, quantity, and price. Items include Asters, Bouvardia, Calla, Carnations, Cypripedium, Dahlias, Eucalyptus, Galliardus, Gardenias, Gladioli, Hyacinths, Lilies, Marigolds, Petunias, Ranunculus, Roses, Tulips, and Violets.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing prices for cut foliage and other items. Columns include item name, quantity, and price. Items include Adiantum, Asparagus, Camellia, Ferns, and various types of foliage.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing prices for plants in pots and other items. Columns include item name, quantity, and price. Items include Anemone, Aralia, Begonia, Calceolarias, Cyclamen, Fuchsias, Geraniums, and various other potted plants.

Fruit: Average Wholesale Prices.

Table listing prices for various fruits. Columns include item name, quantity, and price. Items include Apples (Nova Scotia, Bramley, etc.), Bananas, Damsons, Figs, Grapes, Melons (Valencia, etc.), Peaches, and Pears.

Vegetables: Average Wholesale Prices.

Table listing prices for various vegetables. Columns include item name, quantity, and price. Items include Artichokes, Beans, Broccoli, Carrots, Cauliflowers, Celery, Cabbages, Cucumbers, Lettuce, Onions, Peas, Potatoes, and various other vegetables.

at 1s. 6d. to 1s. 9d. per dozen lbs. Mushrooms have been practically unobtainable during the last few days, and very high prices have been offered for them. Truffles generally is fairly good. E. H. R., *Cotend Garden, Wednesday, September 30, 1908.*

Reviews.—Trade is steady with good supplies. Disease is present in some samples and these are sold for very low prices. Edward J. Newborn, *Cotend Garden and St. Pancras, October 1, 1908.*

Obituary.

GEORGE REDMAN.—We learn with regret of the somewhat sudden death at Ramsey, Hants., on the 23rd ult., at the age of 56 years, of the head of the firm of Redman & Son, nurserymen and florists, of St. Neots and Ramsey, the cause of death being heart failure. Mr. George Redman was a Hampshire man, and after working up to the position of head-gardener, started in business as a nurseryman at St. Neots some 18 years ago, and subsequently acquired the Blendheim Nurseries at Ramsey, which had previously been carried on by Mr. Palmer, and which Mr. Redman greatly extended and conducted with considerable success. The deceased, who was widely known and respected, has left a widow, one daughter, and three sons to mourn his loss, two of the sons being engaged in the business, Mr. Charles E. Redman at St. Neots, and Mr. George H. Redman at Ramsey.

APPLE NORFOLK DUMPLING: *Anxious to Know.* We are not at all surprised that you are unable to procure trees of this variety of Apple, for it is quite out of date and little grown. Until last year we had several large trees of this kind, but have regretted the whole of them with better kinds, such as Norfolk Beauty. Nurserymen do not, as a rule, stock the variety, as there is little demand for it.

BEETLE IN MATCHBOX: *Oak.* The insect you sent is not a fly but a beetle (*Meteorus paradoxus*); we do not know of an English name for the creature. It is not a common insect, but is quite harmless in gardens; indeed, to some extent it is useful, as it lays its eggs in wasps' nests, and the grubs feed on those of the wasp. The female appears to select a cell in the nest in which a young wasp is nearly full-grown, and lays an egg in the cell, which hatches in the course of a few days. The grub immediately begins to feed on the helpless wasp grub, and when it has entirely devoured its victim it becomes a chrysalis, from which, in due course, the beetle emerges.

BEGONIA PLANTS UNHEALTHY: *W. C.* The trouble is not due to disease, but to wrong cultural treatment. The plants have been afforded too much moisture, and in consequence the leaves have become waterlogged. Ventilate more freely the structure in which they are grown.

BOOK: *J. W.* The work you mention has little value, and is now superseded by more modern encyclopedias. If you could find a purchaser it might perhaps fetch you ten shillings.

CARNATION DISEASED: *F. Lurani.* You send no letter with the specimen. The diseased appearance is caused by eldworms, which are present at the base of the stem. Burn all diseased plants and mix the infected soil with quick-lime.

CORRECTION. In the note on Messrs. Hugh Low & Co.'s nursery which appeared on p. 211, "10" acres should have read "100" acres.

FERN WITH BROWN FRIENDS: *Floris Drinkwater.* The three plants you send are injured by mites. Spray the foliage thoroughly with a solution of soft soap, to which has been added

a trace of paraffin, not more than a dessert-spoonful to one gallon of water. Mix the soap and the paraffin thoroughly with the water.

FIG TREES IN BORDER: *A. S. B.* These trees when planted out often require root-pruning or lifting, in order to keep them fruitful, and especially is this the case with strong-growing varieties. The best time for the work is just before the leaves fall, and it should be carried out in a manner similar to that recommended in the Calendar for September 12 for root-pruning Peach trees. Some new soil should be given at the same time, the most suitable being turfy loam mixed with crushed bones and mortar rubble. Make the soil about the roots quite firm. Remove any small fruits from the points of the shoots, and directly the leaves have fallen cleanse the trees from insect pests. Cut out any of the shoots that are not required for bearing fruit or for the extension of the trees.

GOOSEBERRY SHOOT: *E. S. & Co.* The specimen sent is affected with the American Gooseberry-mildew in both the summer and winter stages.

GRAFES: *T. W.* The injury to the Grapes is due to a parasitic fungus, *Botrytis cinerea*. It appears frequently during dull and dull weather, when it generally attacks ripening berries. Cut out carefully all diseased berries and burn them. For prevention prepare the following mixture and dust the grapes at intervals with it: To 1 lb. of dry Plaster of Paris add 3 oz. of Sodium sulphate. This is a very effective remedy.—*H. H.* The leaves and berries are injured by *Gleosporeum ampelophagum*. Dust the vines thoroughly with a mixture of flowers of sulphur and quicklime in equal quantities. The large blotches on the three separate leaves are caused by drip.

HIPPEASTRUMS: *A. T., Daywater.* The Hippeastrums (Amaryllids of gardens) are widely distributed in South America. There are many species, and, although highly interesting, few of them compare favourably with the garden-raised kinds of the present day. *H. equisetifolium* is found in the West Indian Isles and on the West Coast of Africa, where, however, it was originally an introduced form. The Jamaica variety is the best and that from West Africa the worst form.

NAMES OF PLANTS: *P. O. W.* We do not undertake to name varieties of Carnations or other flowers.—*Vitis.* 1, *Helenium autumnale* var. 2, *Achillea millefolium* var. rosea; 3, *Aster Linosyris*; 4, *Viola* (seedling resembling *Munbyana*); 5, *Chelone obliqua*; 6, *Penstemon Hartwegii*—*R. H.* 1, *Caryopteris mastacantha*; 2, *Corydalis lutea*—*Rev. H. A. Haggard.* *Ceanothus Gloire de Versailles*.—*E. F. Thorne.* 1, *Cratogeomys crugallifolia*; 2, *Boltonia asteroides*; 3, *Aster Novi Belgii* Pursh; 4, *A. N. B. Lavender*.—*C. S.* *Asplenium Trichomanes*.—*Orchis*. *Cnidium incurvum*—*W. G.* *Pambolium*. 1, *Khus Toxicodendron* so far as we can judge by the leaves sent. There are bush and climbing varieties of it, and much variation in the character of the foliage. It is commonly called Poison Ivy, and handling it may cause more or less serious irritation of the skin; 2, *Epidendrum radiatum*; 3, *Strobilanthes Dyerianus*.—*W. H. Y.* The flower sent is a very beautiful variety of *Cattleya Iris* (bicolor × *Dowiana aurea*) and not *C. Pittiana* (*granulosa* × *Dowiana aurea*) as you suggest. *C. Pittiana* variety *J. Wilson* Fother was illustrated in the *Gardener's Chronicle*, Sept. 12, 1903, p. 159, and well shows the difference which the long, pointed side lobes of the lip of *C. granulosa* makes in the hybrid, compared with the very short side lobes of *C. bicolor*, which leaves the column of the species and of *C. Iris* and other hybrids of it almost naked—*F. L.* *Magnolia acuminata*; 2, *Chionanthus virginica*; 3, *Alnus incana* var. *laciniata*; 4, *Pyrus salicifolia*; 5, *Pyrus rotundifolia*; 6, *Pyrus cordata*.—*C. D. Laver.* Apparently *Juglans nigra*—*H. R. G.* 1, *Santolina Chamaeparisus*; 2, *Rhus typhina*; 3, *Vitis inconstans*; 4, *Laburnum album*; 5, *Vitis inconstans*.—*A. Buckingham.* *Larix europæa*.—*H. T. (Ireland).* No. 2, Possibly a species of *Solanum*, but more than a single leaf is necessary for identification.—*R. J. F.* 1, *Sarcocolla paniculatus*; 2, *Acalypha macrophylla*; 3, *Fittonia argyrea*.—*F. H.* 1, *Saccolabium bellinum*; 2, *Aerides maculatum*; 3, *Cymbidium giganteum*; 4, *Epidendrum ochra-*

ceum; 5, *Selaginella levigata*.—*F. W. B.* *Colchicum autumnale*.—*H. R. G.* 1, *Rudbeckia purpurea*; 2, *Eunonymus europæus*; 3, *Mesembryanthemum multiflorum*.—*E. P.* *Anastatica hircanica* (*Rose of Jericho*).—*P. L. H.* *Geoglossum spatulatum*.

DIANTHUS GRANDIS: *T. S.* The abnormal production of the flowers in the example received is caused by two flowers joined together instead of being produced separately. Much more complicated cases of the kind frequently come before us. In the specimen you send both flowers are fairly perfect and are easily separated, showing two perfect flowers, except that the inner lateral sepals in each flower where they were joined were rather narrower than the others.

PALM HOUSE AT KEW: *Amateur.* You are quite right in regard to the Palm house being closed to visitors recently, for we ourselves found it in that condition on Wednesday last. Certain repairs have to be carried out occasionally, and the overhauling of large plants such as those in the Palm house is a matter of some difficulty, and during such processes it is not surprising if the management felt compelled to prevent visitors entering the house. In any case, your letter should have been addressed to the Curator of the Royal Gardens, Kew, rather than to ourselves.

PEAR CRACKING: *W. M. & A. S. B.* This is due to a fungus—*Fusicladium pirinum*. In *The Book of Garden Pests*, by R. H. Pearson, it is recommended that the trees be sprayed with dilute Bordeaux Mixture when the buds are beginning to open, repeating the operation when the petals are falling from the flowers and again when the young fruits have attained to the size of Peas. It is also advisable to spray the trees in winter with a solution of sulphate of iron.

PELARGONIUM LEAF SPOT: *H. R. G.* The spots are probably caused by a *Septoria* fungus, but it is immature, and cannot be determined. Pick off and burn the spotted leaves. Spraying with dilute Bordeaux mixture may prevent its spreading.

POTATOS DISEASED: *G. H.* Your tubers are affected by the Warty disease, which is required to be notified to the Board of Agriculture and Fisheries. See p. 218 in the issue for September 19.

POTATO WITH SCAB: *D. R. D.* The injury is not the result of disease, but has been caused by a millipede—*Julus pulchellus*. These creatures are introduced to the land with manure, &c. They may be destroyed by quicklime.

PURPLE BEECH SHOOT WITH SPOTS: *T. C. & Son.* There is no disease present in the specimens you send. The spots on the branches are normal structures known as lenticels. These have increased abnormally in size, due probably to checked root action.

SEEDLING APPLE: *W. Guy.* In comparison with many other Apples now in commerce, your variety is not worth cultivating. You may send it to the Fruit Committee of the Royal Horticultural Society, and find out their opinion.

VARIOUS PLANTS AFFECTED IN A GREENHOUSE: *W. & T. S.* The injury has been caused by the Lily disease fungus. The soil in which the plants are grown should be treated with quicklime, or, preferably, with gaslime, but if this latter substance is used, a few weeks should elapse before the soil is used for potting purposes.

VIOLET LEAVES AFFECTED: *M. G. W., Linton Hall.* There is no disease present in the Violet plants received. They are, however, badly infested with red spider, a pest that is encouraged by hot, dry conditions. Spray the foliage with clear water, and moisten the surroundings.

COMMUNICATIONS RECEIVED.—*L. C.*—*S. S.*—*W. M.*—*G. W.*—*W. L.*—*L. Tenti*—*Sutton & Sons*—*F. G. B.*—*L. P.*—*A. K.*—*Board of Agriculture & Fisheries*—*H. S. J.*—*R. P.* & *Sons*—*S. F. W.*—*F. of ground almost on a level are devoted to them. As we passed by one of the long borders skirting the path we noticed *Rubus phoenicolasius*, the Japanese Wineberry, with its conspicuous red stems and bearing at the ends of the shoots large bunches of what appeared to be unopened flower-buds. But the flowering was over, and what we saw were really the fruits, the stipules being persistent and enclosing the fruits as they do the flower-buds. *Rubus canadensis* was noticed in flower, its pink blossoms showing up against the dark greenery of its foliage. Various species of *Vitis*, the *Wistaria*, *Solanum jasminoides*, and other climbers were noticed as we passed. Mr. Ladhams has paid great attention to the cultivation of *Anchusa italica*; both the Dropmore and the Opal varieties of this plant are made a speciality. A few of the more interesting plants in the herbaceous grounds may be mentioned, including *Convolvulus althoides*, a variety suitable for a rock-garden; the blue-flowered *Codonopsis ovata*; *Aubrietias* in variety, including *purpurea variegata*, an ornamental-leaved plant; *Eriogonon eximium*, with sweet-scented white flowers, a really lovely

geron gigantea, *Liatris elegans* and *L. pycnostachya*, whose flower-spikes are 4 feet or more in length; *Prunella Webbiana*, a pink-flowered species, forming a very pretty border plant; a double-flowered form of *Geranium pratense*, worthy of inclusion in any hardy plant border; also *Dictamnus Fraxinella*. The ripe fruits of this's last-named plant emit a volatile oil, and when we lighted a match close to the brown seed-pods with a flash the vapour ignited, but we found this phenomenon only occurred with the very ripest fruits and the air needs to be perfectly dry, but we were successful in half a dozen cases. The rose-coloured *Lupinus polyphyllus* "Rose Queen" forms an agreeable change from the blue type form. Then there were seen *Bocconia cordata*, with its handsome foliage and pleasing white inflorescences; *Ononis rotundifolia*, *Laula ensifolia*, and *Salvia Sclarea*, a very showy flowering plant, each shoot crowned with a dense spike of flowers (see fig. 116). The double-flowered *Gypsophila* is a great improvement on the single form. We also noticed a very pleasingly variegated variety of *Funkia ovata*,

Eriogonon, *Sisyrinchium* (we noticed a fine variegated form of *S. anceps*, the foliage being especially pleasing in the autumn), *Stokesia carynea*, *Armeria gigantea*, *Polemonium Richardsonii*, *Lythrum variegatum*, *Echinops ruthenicum* and *Heimerocallis flava* in variety, are a few other plants noted in this interesting collection.

The Shirley Pinks are, like the Poppies of another Shirley, well known for their beauty and freedom in flowering. One of the earliest raised was Ernest Ladhams, and the latest success is the beautiful variety named after Princess Christian, that received an Award of Merit from the Floral Committee of the Royal Horticultural Society on August 18. Other beautiful kinds are The King, Elsie, Miss Vince and Rob Roy.

Mr. Ladhams senior is an enthusiastic hybridiser, and before we left he directed our attention to some rows of Sweet Peas that were interesting. He had brought to his notice a most beautiful white variety of Sweet Pea, and he was so impressed with its worth that he procured seeds and planted them. The progeny came white and creamy-yellow, he selected seeds from the white flowers and sowed them the following year, they then gave almost all colours, in which red and pink shades predominated. Like many another hybridist, Mr. Ladhams is of the opinion that Sweet Peas cannot be successfully hybridised, but that all the new kinds arise as sports. He informed us that he had tried repeatedly to cross species of *Lathyrus*, but has as often failed.

THE ROCK GARDEN.

ACANTHOLIMON VENUSTUM.

Of the few *Acantholimon*s in general cultivation, this species is perhaps the best from a garden point of view. It is a native of the mountain ranges of Cilicia, being found at elevations of 4,000 to 7,000 feet. The illustration at fig. 113 represents a plant growing on the rockery in the Cambridge Botanic Garden, where it forms a dense tuft more than one foot in diameter. The drooping flower-stems appear in early summer and attain to a length of 6 to 8 inches, bearing many rose-pink flowers, each of which is a little more than half an inch in diameter. The flowers appear over a period of nearly two months. According to the *Botanical Magazine* there are two or three forms of *Acantholimon venustum*, but these merge one into the other. The plant from which the photograph was prepared differs somewhat from that figured at t. 7,506 of the *Botanical Magazine*, for it is more glaucous in the foliage, and much more drooping in the flower-spikes. E. J. Allard.

[Photograph by E. J. Allard.]

FIG. 113.—ACANTHOLIMON VENUSTUM; FLOWERS PINK.

species; *Ligularia stenocephala* has very handsome leaves, although the plant is small; *Echium Wildpretii*, *Phygelia capensis* with scarlet flowers and yellow in the throat, *Philonis fruticosa* with its hooded yellow flowers in a whorl, *Aquilegia Stuartii* having very large blue flowers; *Centaurea glastifolia*, the yellow Cornflower; *Delphiniums* in variety, of which the variety *Persimmon* is of a lovely Cambridge blue, like the *Belladonna* strain, but stronger growing. *Spiraea sorbilifolia* attracted our especial attention, for its white spikes of flowers were very fine indeed. *Rhus typhina laciniata* is a very elegant plant; the leaves, as the varietal name implies, are pleasingly subdivided. *Ceanothus Gloire de Versailles* reared its fine blue spikes of flowers above its neighbours. Of *Campanulas* there was a whole host of different kinds; the pretty *C. carpatica* and its white variety had carried the ground with a profusion of flowers. We also noticed *C. elegans*, *C. pusilla*, *C. fragilis*, *C. lactiflora*, of which there were numerous varieties; *C. persicifolia* in great assortment, and many more besides. *Eri-*

the prettily formed leaves being margined with white. It is a charming little plant suitable for edging purposes. Never have we seen *Michauxia campanuloides* in more beautiful flower or growing with greater luxuriance than in this nursery, a large breadth of these plants making a gorgeous display. Unfortunately the plant is a biennial.

Mr. Ladhams has done much to improve the herbaceous *Lobelia*, and he has effected many good crosses with *L. cardinalis* and *L. sylvatica*, obtaining varieties with a wide range of colour from blue, purple, rose, and pink to almost crimson. *Monarda purpurea* is a well-known plant, but rarely have we seen it doing better than here. The nursery is also the home of many improved forms of *Gaillardias*, the object being to produce varieties of upright habit so that the flowers are well displayed. Mr. Ladhams considers *Rownhams' Queen* to be one of the best of the race. It is a fine large flower and very pleasingly coloured. *Scabiosa canescens* and *S. c. alba* are useful plants for furnishing cut blooms. *Galegas*, *Erigerons*,

NOTES FROM A "FRENCH" GARDEN.

We are now sowing Cabbage and Cos Lettices to raise plants for the hot-beds and for cultivation in the open ground next spring. The ground was previously dug and levelled, and the beds covered with a layer, 3 inches thick, of well-broken up manure. There are three rows of cloches on each bed. In the event of the sun being too bright, mats will be spread to keep the soil moist. The Lettuce seeds are sown very thinly under the cloches, and slightly covered with decayed manure finely broken. When a large quantity is required, seeds should be sown every alternate day, say, from October 1 to October 12; thus small, sturdy plants will be ready for pricking off, which should be commenced on the sixth or seventh day after the first sowing.

We proceed with this work as quickly as the weather permits. When the soil has been well prepared, the seeds and young plants do not require any watering, as the dampness of the ground is sufficient.

The Ox-heart Cabbages will soon be pricked off. In this garden these are always planted deeply, so as to strengthen the collar and provide shelter from the frost. The ground should be prepared well in advance for the final planting, which should be done in the middle of November.

The Cauliflowers are just appearing above the ground. Should a considerable number be required, another sowing could now be made under cloches to raise plants for planting out at the end of March.

We are now pulling the Carrots which were sown in July in the hot-beds previously occupied by the Cauliflowers. They are a good size and very tender. This ground is therefore available for pricking off Ox-heart Cabbage.

Celery is doing well, and we are at present blanching a bed of the variety "Chemin" by spreading mats on the tops of the plants.

Endive planted at the end of June is now being tied for blanching. The main batch is doing well, and will be ready for tying in another fortnight.

Spare time is filled up by dispersing the material of the old hot-beds, placing the manure either in heaps, or spreading it where it is required in the garden. We are endeavouring in these gardens to complete before Christmas the heavy work of preparing the ground and material for next spring. *P. Aquinas, Mayland, Essex, October 1.*

THE ROSARY.

ROSES AT THE LEIPZIG SHOW.

A SHOW of Roses cannot be judged from the same points of view as one consisting of trade plants, at which perfectly-finished specimens, fresh from the cultivator's hands, are shown. That idea of a Rose show would doubtless demand the planting of Rose stocks, and their grafting or budding carried out *in situ* at the place of exhibition. For this purpose two years at the least would be required, which is by no means an impossible idea. Bearing this in mind, the verdict that the Leipzig show suffered in the same manner as many other of its predecessors, viz., in the poor development of particular varieties of dwarf Tea and Tea Hybrids, in the faulty grouping of standard Roses owing to the tall and short-stemmed specimens being mixed together. Furthermore, the absence of the great Rose-growing firms could not fail to prejudicially affect an undertaking of this kind taking place in their immediate neighbourhood. Of Dresden rosarians only two put in an appearance. No epoch-making novelty was observed at the show—at least, not in plants.

Varieties of merit that have been brought out in the last five years were either not shown or were so weakly developed that their good points were undiscernible. The out-of-doors show was, in consequence, a new triumph for the older, well-proved, favourite varieties, viz., in dark-red Roses, Grus an Teplitz; deep pink, Caroline Testout and Mme. Jules Grolez; yellow, Mme. Ravary; white, Frau Karl Druschki, varieties which dominated the groups and were generally remarkable for fine development. Among *remontantes* (H.P.s), Ulrich Brunner fills, an excellent variety for forcing and as a cut bloom, was the best. But it is a remarkable circumstance that Mrs. John Laing, an equally good Rose for grouping, was but little shown at Leipzig, and seemed to be generally neglected. The show proved anew that as "garden Roses," and also for affording blooms for cutting, the Hybrid Teas are gaining ground, whilst the so-called Hybrid Perpetuals, which no longer answer entirely to that name, are retreating.

Of H.T.s not mentioned previously, which were noted in good form, were the following—Betty, in colour of a coppery yellow, with a tinge of pink, a strong grower; Frau Lilla Rau-

tenstrauch, of nearly the same colour as the foregoing, but rather paler, its blooms, unfortunately, drooping somewhat; Pharisæer, of the tint of Gloire de Dijon, a strong grower and a free bloomer; Prince de Bulgare, of a variable colour, but usually flesh pink with a yellow tinge; and Apotheker Georg Hofer, purplish-red, a strong grower, with somewhat the character of an H.P., but flowering like other H.T.s.

The newer dark-red H.T.s were not in the best condition, being too weak and the wood cut too long. Concerning the value of Richmond and Etoile de France an opinion cannot be given when these varieties are grown in the open air, whilst under glass they exhibit quite other characters. Both are regarded more as forcing or glasshouse Roses, where the conditions maintained can be regulated to suit them.

Polyantha Roses have become great favourites, and the variety Mme. Norbert Levasseur was present in large numbers.

One of the lessons brought home to visitors was that in forming groups of Roses special attention must be paid to length of stem, and varieties of poor quality must be excluded, and further that half standards should be not taller than 3 feet, and that they should consist of varieties having an erect habit, and of robust growth. As tall standards, only a few of weak growth, and Tea Hybrids with a pendulous habit should be employed. *R. Stavenhagen in Oesterreichische Garten Zeitung für August, 1908.*

ROSE SOUVENIR DE LA MALMAISON.

The unfortunate habit of this variety in producing malformed blossoms during the summer months has largely resulted in bringing this deliciously-scented Rose into disfavour. As an autumn bloomer it is almost a perfect Rose, but by that time the Rose shows are almost over, and as so many enthusiasts are exhibitors, this Bourbon variety seems to be rarely grown. If planted against a wall facing north-east, it will be found that the earlier blossoms rarely show any signs of malformation. In these gardens several plants, growing as described, annually produce a succession of perfect blooms from the end of June till November. It is a suitable Rose for house decoration; the buds open well in water, and, when fully open, remain fresh for several days. In country gardens especially it should be more freely grown, if only in borders, for its autumn blossoms. *A. C. Bartlett, Fencarrow Gardens, Cornwall.*

NOTES ON NEW ROSES.

PERHAPS a few notes and description of various sorts of recent introduction (or of sorts that are not so well known as they ought to be) that have done exceptionally well in my garden may be helpful to those who are hesitating what to order. "Oh!" (some of my readers may say) "we really have no room for any more Roses in our garden." To such I would reply, look carefully over your beds again, and, perhaps, by a little moving or altering the positions of different sorts here and there you can make quite a lot of room without unduly crowding; and nine sorts out of every ten will be all the better for being moved (i.e., lifted) when they have been in the same position for three or more years; as, if you carefully prune away too much coarse or tap roots where you find them and then carefully replant again, the result next year will be less wood and more blooms.

No, you cannot do this. Well, then give away to some friend a few varieties where you find you can really improve by exchange; for example, surely you need not object to have, say, a "Frau Karl Druschki" in your collection at the expense of parting with a "Merveille de Lyon" or even with a "Margaret Dickson." Just one word of caution before proceeding, viz., in ordering new sorts procure the same from the raisers, then—excepting, perhaps, from

a few Continental firms) you are sure of getting strong ground plants.

LENA (*Tea-scented*, Alex. Dickson & Sons, 1906).—In my opinion, this is the most exquisitely beautiful Rose yet raised! Some might describe the colour as deep golden. With me it is a deep glowing apricot; when expanded the edges of the petals approach a primrose-yellow. Its glory is not only in its colour, but in its wonderful shape. The blooms are on slender stalks, yet full. The buds are very long, and every one of them opens perfectly. It is always blooming from early June till the frosts come, and often has a spray of over half-a-dozen, sometimes nine, perfect flowers. I have seen it described as an improved "Beryl." Such a description gives one no idea of its loveliness. Messrs. Alex. Dickson & Sons put up a tripod at the Shrewsbury Show with about a hundred blooms of this Rose. They were superb and created quite a sensation! Mr. Dickson says if only it would grow a little stronger it would be "an ideal garden variety." Well, I do not find any fault with its growth. We do not want all our Rose plants like Gooseberry bushes. Lena is my ideal of a perfect garden variety for the front row. Do not hesitate to order plenty of this, the daintiest flower.

"SOUV. OF STELLA GRAY" (*Tea*, Alex. Dickson & Sons, 1907).—This is another lovely and distinctly novel variety of moderate growth, though very free and branching. I cannot describe the colour, but have seen it growing in quantity at Ledbury, and the raisers' description is very near the mark, viz.:—"The shades of colour are hitherto unknown in any Rose; the predominating tone is deep orange, with splashes or veining of yellow, apricot, salmon and crimson." The blooms are only small, but are very full, and most beautifully formed. I have just a dozen plants, but am ordering more for next year. I had them this summer in a bed exposed to the sun all day, and the first part of the summer the blooms did not come true, but now they are in perfection and coming truly grand. It is exceedingly fine flowering.

LYON ROSE (*Rosa Pernetiana*, Pernet Ducher, 1907).—In addition to being an ideal Rose for exhibition, this magnificent new Rose will certainly become one of our most popular garden Roses. It is the result of a cross between the Hybrid Tea "Madame Melanie Souper" and an unnamed variety, which is itself a direct offspring of "Soleil d'Or." Now, "Madame Melanie Souper" is quite one of the most perfect H.T.s. Certainly, this variety was as much admired in my garden both last year and this as any of the new sorts. She made her bow to the public commercially in 1905. Many of our friends in the trade were "sold out" of stock early last November, so evidently it has a host of admirers. "Soleil d'Or" is a lovely orange-reddish-golden green. Our English growers class this under Austrian Briar Roses. Really, it is one of the "Rosa Pernetiana" class, which may be called quite a new race. This race was the result of a cross between "Persian Yellow" (*Rosa lutea*) and the H.P., "Antoine Ducher." These Pernet Roses retain a good deal of the character of *Rosa lutea*, the wood being reddish, but the foliage is largely improved, a very fine, deep green, and like *Rosa lutea*, they are perfectly hardy, and can withstand severe frosts without protection. Though belonging to the class of the *Rosa Pernetiana*, the Lyon Rose is possessed of all the good qualities of the Hybrid Teas, from which it has derived the principal characters, and, above all, it has that great advantage of perpetual flowering. The flowers are generally produced singly, though occasionally two or three come on the same shoot; the buds are large, long, and a roundish shape; the colour is a beautiful shade of coral-red tinted chrome-yellow at the base. The blooms are very large, with broad petals of great substance, and very smooth, full and globular and perfect form. The colouring is superb; shrump-

pink at the ends of the petals, centre coral-red, or salmon-pink shaded with chrome-yellow. The flowers open freely and are very fragrant. There is no doubt but that this novelty will cause quite a furore in the Rose world.

"MADAME MELANIE SOUFERT" (*H. T., Pernet Ducher, 1905*).—We may in the future see this pretty Rose exhibited well. This summer, with me, it has not done so well as last year, owing to the long spell of dry heat, but since the last days of August the plants are making up for lost time, and the variety is one of the show things in the garden. Of vigorous growth, it has bloomed quite as freely as Madame Ravary. The colour is salmon-yellow suffused with carmine-pink. The buds are long, opening to very large globular flowers with bold petals, not very full. Plants I have in a bed that does not get the midday sun have done very much the

that it has not come the deep sulphur-yellow with me that it does at Newtownards, but then we have not got the Irish climate. If we want a perfect yellow Rose we must wait until we can buy Alex. Hill Gray; but that, I believe, will not be distributed till 1910, and were I a millionaire, when that time arrives, I should buy the lot; but to get back to "Harry Kirk," this variety blooms continuously, and the blooms are large and full, and of great substance and good form. The buds are fairly long and elegant.

MRS. AARON WARD (*H. T., Pernet Ducher, 1907*).—This is another variety that will prove quite one of our best yellow Roses. It is a very vigorous grower, of free-branching habit, with its blooms on erect and firm foot-stalks. What a great point in a Rose this is! It is a real gem, and such a good grower. The colour

it is growing strongly. Its habit is ideal where you want robust, erect growth. The colour is a lovely shade of coppery-pink, suffused with apricot-yellow, especially at the base of the petals, and these (the petals) are exceptionally large and of great substance. It is undoubtedly, as the raisers say, "quite a unique Rose," and the future is certain sure to see this one of our most popular garden Roses.

MRS. MYLES KENNEDY (*Tea-scented, Alex. Dickson & Sons, 1906*).—Had the writer been given the casting vote for the Nickerson Award for the best Tea Rose introduced since 1902, this is the Rose that he would have declared the winner. Mr. H. C. Molyneux wrote in some notes on new Roses last year, "that at the time the award was made, few, if any, of the judges had grown this Rose out-of-doors." Oh! the pity of it that Mrs. Myles Kennedy did not win this honour! When I first saw it in 1906 I at once thought it the best flower I had ever seen. Last year, with me, as a garden Rose it was wonderful, despite the wretched summer. This year it has been glorious, perfect bloom, day after day; all through the drought it has kept its most perfect size, contour and finish. Surely it will take No. 1 position amongst exhibition Teas! And, still better, this beautiful Rose will be one of the best in our garden. The colour is a delicate aqueous silvery-white, shaded buff; deeper pink in the centre, with black edge of petals a slightly deeper shade of pink, giving a picotee-edged effect. This is set off by most beautiful dark green foliage. It has large blooms, and is a vigorous grower. One wants the pen of a poet to attempt to describe this beautiful flower—

"Nurtured of Heaven, thy beauties I'll wear,
Pride of my bosom, I'll cherish thee there."
Leonard Petrie.

(To be continued.)

CYPRIPEDIUM ACTÆUS BIANCA.

This variety gained a First-Class Certificate when exhibited by Lt.-Col. Holford, C.I.E., C.V.O., at the last meeting of the Royal Horticultural Society. The bloom is of much beauty, and is considered to surpass even the handsome C. insignis Sanderz, which formed one of its parents, the other being C. Leeanun Prospero. The general colour is pale yellow, of a smooth and shining surface. The upper sepal is very broad, the major portion of its surface being white; the basal part is a yellowish-green colour. It may be added that the plant was exhibited as C. bianca superba.

OLEARIA STELLULATA AS A ROCK-GARDEN SHRUB.

The majority of Olearias flower about mid-summer, early or later according to the locality, but *O. Haastii* forms an exception, as it flowers during August. The flowers bear a resemblance to those of the Michaelmas Daisies: the ray florets are white, though not always pure, and the central disc is usually some shade of yellow, darkening to brown with age.

Olearia stellulata forms a fine shrub for the rock-garden. It is a mountain plant, and revels in a scanty roethold and on dry aspects, such as not infrequently occur in rock plantings. It combines a neat, fastigiate habit of growth with elegant, small-toothed foliage, which, particularly in the early stages of growth, is covered with a downy tomentum on the underside. The plant reaches a height of 3 to 4 feet, producing its starry white flowers in June and July, and yields them in such quantities that a few specimens planted together present an effect not unlike a winter snow scene.

Olearia stellulata is easily propagated by layers, or by cuttings of the current season's wood, placed in trenches of sharp, gritty soil during the autumn. Small rooted plants can be

FIG. 114.—CYPRIPEDIUM ACTÆUS BIANCA: FLOWERS PALE YELLOW, DORSAL SEPAL SNOW-WHITE ABOVE.

best. This will in time become a very popular garden variety.

"HARRY KIRK" (*Tea-scented, Alex. Dickson & Sons, 1907*).—My plants of this variety have grown as large as ordinary Gooseberry bushes. Our American friends say this is going to be the most popular variety in U.S.A. Dr. Huey, of Philadelphia, writes saying: "We think this Rose superior to 'Killarney,' as 'Killarney' was to other sorts previous to its introduction." Personally, I have found it a gem at the beginning of the season, and again now that August is passed. During the hot, dry weather of July and August it only appealed to me in the bud stage, as the flowers at that time came so thin; but, considering that my garden is situated in one of the hottest parts of England, and this summer has been so exceptionally hot, this should not put a bad mark against this glorious Rose. Can I find any fault with it? Well, only

is most beautiful. The raiser describes it as Indian-yellow, occasionally washed with salmon-rose. I find its colour a marvellous yellow at the base of each petal on the inside. In the bud its shape is not quite as perfect perhaps as we get in "Lena," but rather like we get in "Lady Roberts" sometimes. It is a wonderfully free-blooming sort, and lasts remarkably well.

DOROTHY PAGE ROBERTS (*H. T., Alex. Dickson & Sons, 1907*).—This is one of the most glorious decorative or garden Roses. Some exhibitors will say it is not sufficiently full. This is another variety that, if allowed to develop, will grow as large as an ordinary Gooseberry bush, so give it plenty of room when planting. During the long drought which prevailed during July and August we had to cut the blooms of this very early in the morning, but there were always lots to cut. In June it was charming, and now again that August is past

inserted in the most limited root run, and if they are carefully looked after until growth asserts itself, they soon establish themselves, and, when in flower, appear like pinnacles of blossom springing abruptly from the rocky face. *Olearia stellulata* is perfectly hardy in all but the bleakest exposures. It winters best in well-drained soils and in aspects where the maximum amount of sunshine is secured to mature the wood upon which the flowers are produced next season. Contrary to the experience of some writers, I find that *Olearias* succeed admirably upon our chalky soil, as the species which we cultivate, beside the one under notice, include *O. Haastii*, *O. macrodonta*, and *O. nitida*, and all of them make vigorous growth and never fail to flower well in their appointed seasons. The illustration (fig. 115) shows a portion of the rockery in these gardens facing south-east. Grouped with the *Olearia* is *Saxifraga lingulata*, whose elegant panicles of flowers are just passing out of season when the *Daisy* bush comes into flower. In the foreground is a planting of *Edelweiss* (*Leontopodium alpinum*), a rock-plant singularly at home upon the chalk. An exhaustive article upon the *Olearia* by Mr. S. W. Fitzherbert will be found in *Flora and Sylva*, Vol. III., p. 324. This authority differs from the *Kew Hand-List* in describing *Olearia stellulata* as distinct, and not, as is generally supposed, synonymous with *O. Gunnii*. Thomas Smith, *Walmsgate Gardens, Louth*.

The Week's Work.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to THE DOWAGER LADY NUBSINGHAM, WATER HEURY, YORKSHIRE.

Raspberries.—In some gardens where the soil is of a heavy nature the robust canes which grew during the sunless season of 1907 have not produced this year such fine fruits as usual, but in more favourably-situated places the fruits have been unusually good. Raspberries will succeed in almost any soil provided the water can pass through it easily, and that it is at the same time one that never becomes quite dry. Many failures arise from cultivators allowing the stools to remain upon one piece of ground for too long a time. October is the best month for making a new plantation, and those who have only unprofitable Raspberry canes should now make preparations for planting afresh. If the soil is light in texture and rich in plant food, clean and well-drained, then deep cultivation is all that will be necessary, except for a liberal dressing of well-decomposed manure. In such circumstances the canes may be planted at the end of the present month, but on cold and wet ground some additional preparation is necessary, as the soil must be drained and trenched, or deeply dug, adding during this latter process such materials as burnt refuse, decomposed manure, leaf-mould and road-scrappings. Any or all of these materials may be used to make the soil more porous, and they will improve the ground for a number of years to come. The Raspberry being a shallow, rather than a deep-rooting plant, care should be taken to keep the richest compost near to the surface. The method of planting may be arranged according to the aspect of the ground. It is generally best to have the rows extending from north to south, and the stools should be planted in rows made from 4 to 5 feet apart, putting each plant at a distance of from 2 to 3 feet from its neighbour. Apply a light mulch of stable manure or some other light material over the roots. Good varieties to plant are *Superlatia* (True Stock), *Baumforth Seedling*, *Northumberland Fillbasket*, and *Hornet*. A variety called *Guinea* is one of the best yellow-fruited sorts.

The winter moth.—This pest is most destructive to the leaves and flowers of Apple, Pear, Plum and Cherry trees. At this season of the year the moths emerge from the chrysalis stage. The female moths cannot fly, and, therefore, they have to creep up the stems of trees in order to deposit their eggs in crevices of the bark and near the flower-buds during the months of Octo-

ber, November and December. The eggs hatch in spring, and the caterpillars at once commence to eat the young leaves. As a preventive some cultivators still use grease-proof papers, placing them tightly round the stems of trees at about 2 feet from the ground. If this preventive be adopted, something should be placed underneath the grease paper to prevent it coming into contact with the bark of the tree, and fresh grease should be applied at intervals, or the bands will become sufficiently dry for the wingless moths to walk across them. Winter washes are generally more popular preventives and remedies, and the bands should be applied to the trees both early and late in the season. In the case of badly-affected trees it is a good plan to remove the surface soil from about the roots and burn it, replacing this with fresh compost, and applying a good dressing of quiklime afterwards. All Apples that fall to the ground prematurely should be picked up for use or to be destroyed by fire, as most of them will be found to contain caterpillars.

Figs.—These trees have grown rather stronger than is desirable, and they will not be likely to yield much fruit next season unless every means is taken to encourage the ripening of the wood. The system of little or no pruning may answer very well in specially warm

end of the present month the vines may be placed in position for forcing, plunging the pots in a bed of leaves, in which a small quantity of short stable litter has been mixed. Such a bed will furnish a warmth of 65° to 70°, and care must be taken to prevent the heat increasing much beyond these degrees. Fasten the rods in a horizontal position until the buds break into growth, and, until this stage has been reached, the atmospheric temperature of the house, if derived from artificial means, must not exceed 55°. Promote a moist atmosphere by damping the surfaces in the house, and spray the vines several times each day with tepid water. Little water will be required by the roots until a certain amount of growth has taken place.

Vines for fruiting at mid-season.—These will consist of such varieties as *Black Hamburgh*, *Madresfield Court*, and *Early Muscats*. The vines should be pruned with as little delay as possible after all the fruit has been cut from the canes and the leaves have fallen from the shoots. It is inadvisable to allow the fruits to remain upon the vines for an unnecessary length of time. When the vines have been pruned, it will be necessary to cleanse the house. Wash the vines, and give the same attention to the borders as I have recommended in the case of

FIG. 115.—OLEARIA STELLULATA, SAXIFRAGA LINGULATA, AND LEONTOPODIUM ALPINUM IN FLOWER ON ROCKERY.

districts, but in colder localities it is necessary to train the growths very thinly and to nail them closely to the wall in order to obtain short-jointed, well-ripened fruits. If the trees are growing too strongly the roots must be pruned, and this work may be commenced at the present time. Apply a fresh compost, if necessary, during this process, consisting of loam with a large amount of mortar or brick rubble, and treading it down very firmly as the work proceeds.

FRUITS UNDER GLASS.

By T. COUMBER, Gardener to LORD LANGALFEE, The Hendre, Monmouthshire.

Early-fruited vines in pots.—In order to obtain success with the earliest vines it is primarily necessary to have strong, well-matured canes, and these are most frequently furnished by what are known as cut-back vines. Young vines of this description, having been sufficiently hardened, rested, and shortened to the desired length, should now be thoroughly washed with a warm solution of the Gishurst Compound, and have their shortened ends dressed with Syptic. The surface of the soil should be removed, and a top-dressing of fresh compost afforded. At the

the early vines. Let the ventilators of the house be thrown wide open until it is necessary to close them again for the commencement of forcing. In order that this may be done, be careful not to place any species of plants in theinery that would lead to the ventilators having to be closed, or that would be likely to introduce injurious insects or fungi.

Late-fruited Figs.—No variety of Fig is better than *Negro Largo* for yielding a successive crop of ripe fruits at this season of the year. The best results, however, can only be obtained from a house having a very sunny position, and one in which the shoots of the trees themselves are trained thinly. At this season the roots must be only very sparingly supplied with water; at the same time they must not be permitted to suffer from drought. The atmosphere must be kept dry, otherwise the fruits will be liable to split; for this purpose it may be necessary to close the water pipes slightly warm upon wet or cold days and during the night. Remove all the small fruit from the points of the shoots, and, after the crop of fruit has been gathered, the house should be freely ventilated, and the trees may be root-pruned if this operation be considered necessary.

THE KITCHEN GARDEN.

By E. BURNETT, Gardener to the Hon. VICAR GENERAL, Aldenham House, Elstree, Hertfordshire.

The season.—The recent summer-like weather will have the effect of opening and consolidating the growth of many vegetable crops intended for winter and spring supplies, thus the better preparing them to withstand severe weather later; especially is this the case in regard to all varieties of Brassica, more particularly Broccoli. Take care to remove decayed leaves and weeds from these crops, because the air will the better circulate between the plants. The ground should be kept clear of exhausted crops and rubbish of any kind, which may be disposed of by burning on the smother fire.

Brussels.—The whole of the crop ought now to be carefully lifted and clamped, selecting a position for the clamp where water is not likely to collect about its base. Every care should be taken not to break the main root or damage it in any way. Place a moderate amount of wheat straw at the base, and build the roots up into the shape of a ridge by placing the crowns towards the outside. Place a little straw over the roots, and afterwards about 6 inches of soil or ash, fixing small tufts of straw through the top of the ridge at distances of 3 yards apart for ventilation.

Endive.—Continue to blanch Endive as required. All late sowings should now be lifted and planted in frames or cool orchard houses, allowing the plants sufficient space for the growth to develop properly. The latest sowings of Lettuce in the open garden should be treated similarly.

Carrots.—Late sowings in frames which are intended for keeping up a supply of young Carrots through the winter should be thinned to a distance of 2 and 3 inches apart. Turn the surface soil occasionally, and apply soot and a small quantity of a selected chemical manure. Syringe the plants early on fine afternoons, and close the frames at the same time, doing everything possible to encourage growth. Young Carrots of this description are much appreciated in most establishments during winter.

Celery.—This crop has made excellent growth during the past month or six weeks, and the roots had better be lifted at the first sign of severe frost. Trim off the foliage and store the roots either in sand or ashes in a place secure from frost.

Rhubarb.—Stools of the earliest varieties which have been growing in a sunny position will have sufficiently ripened their crowns for lifting. The roots should be taken up intact, and left upon the surface of the ground for a week or ten days, merely placing a little litter over them. After the elapse of ten days, they may be placed in the position in which they are to be forced for supplying Rhubarb during December. There is no better place than the warmer end of the Mushroom house. Keep the crowns moist and the interior of the structure quite dark. It is useless to attempt to force any except the very early sorts.

Seakale may be treated in the same manner as Rhubarb, but better results at the commencement of the forcing season can be obtained in this case by employing retarded crowns; such crowns may be depended upon to yield Seakale fit for cutting in three weeks or a month after the commencement of forcing.

PLANTS UNDER GLASS.

By THOMAS LUNT, Gardener to A. GIBLING, Esq., 4, Whitechapel Road, N.E.

Cyclamen.—Plants two or three years old that were planted out in an open frame early in the spring may now be lifted and potted up. For the purpose of lifting these plants, use an ordinary kitchen garden fork, and raise as large a ball as possible, taking care not to break or damage any of the roots. Afterwards take a thin, pointed stick and prick out the loose soil around the roots until a firmer ball is encountered, and so reduce the size of the mass of roots before placing them into well-drained pots. The potting soil should be of a rich and porous nature, and it should first be passed through a sieve having a half-inch mesh, in order that it may be easily rammed in amongst the roots and made moderately firm. Apply a good soaking of tepid water, and place the plants in an unheated frame, keeping the lights closed for a few days

until the roots obtain a fresh hold of the soil. Keep a sharp look-out for evidence of damping, and if any flowers are seen in this condition, pick them clean out with a pair of Chrysanthemum tweezers. After about two weeks the earliest of the plants showing buds may be placed into heat, and they will flower nicely in the first week in November. If any sign of earth worms can be seen on the surface soil, apply a watering with limewater.

Violas.—Plants should now be lifted from the open ground and placed in an unheated frame which has a southern aspect. Let the soil in this frame be made to slope in the same direction and degree as the sashes of the frame.

Pancreatum.—Plants that have flowered should be removed from the greenhouse into a warmer structure, and if any require to be reotted, this work may now be carried out.

Acacia.—Plants that have set their flower-buds freely may be fed liberally with liquid manure for some time to come.

Ferns.—Seedlings should be gathered from the tops of pots or shelves and placed in small thumb pots, plunging the pots in a mild hotbed. Next spring the plants will be ready for shifting into 3-inch pots. Seedlings always make the best specimen plants.

Datura (Brugmansia).—Plants that have flowered should now have their shoots shortened previously to being more severely pruned later. This is done in order to save the plants from suffering too great a check.

The greenhouse.—Plants in flower in cool houses, such as the conservatory or greenhouse, should be given a little fire heat during dull or damp weather, but the ventilators should be opened each day so as to cause a circulation of air and evaporate excessive dampness. Any water that falls upon stone paths should be taken up with a mop, and the interior of the house kept as dry as possible.

THE FLOWER GARDEN.

By W. FIFE, Gardener to Lady WANTAGE, Lockinge Park, Berkshire.

Tender bedding plants.—It will now be necessary to remove the tender plants indoors. Such Pelargonium plants as may be suitable for putting into vases next year should be potted into 6 or 7-inch pots, or, failing this, be placed in boxes. Rooted cuttings of various species that are still out of doors may be removed into an unheated pit, which will be all the protection they will need for some little time to come; but it will be well to have some protective material ready for strewing over the glass on occasions when frosts are likely to occur. Strong, healthy young cuttings of Violas may now be obtained, and these, however small, are preferable to the points of old flowering shoots, which, being somewhat hard, are a considerable time before forming roots, and seldom make good plants capable of producing large flowers. Select a hard base, and place upon this from 2 to 3 inches deep of loam, leaf-soil, and sand in equal proportions. Handlights or shallow frames may be placed over this bed and the cuttings inserted at 2 inches apart from each other, but the top of the beds should not be very far from the glass. Pentstemon and many other hardy species of plants may still be propagated under cuttings, but the sooner this kind of work is completed the better results will be obtained. If the cuttings of Coleus, Iresine, and Heliotrope already obtained are not likely to be sufficient for the needs of the garden, some of the old plants should be lifted and potted up in sandy leaf-mould and loam. From these old plants propagation may be commenced early in the new year.

Lifting specimen plants.—In the lifting of standard and bush plants of such species as *Hebe*, *Lantana*, and *Veronica*, the ball of earth secured with it need not be larger than is necessary to hold a fair number of roots. As a rule, such plants should be put into pots having a diameter of 7 inches. The pots should be perfectly clean and ample drainage should be provided. Place the plants in a warm house, provide them with shade from sunshine for a time, and spray them frequently with clear water. They will soon make firm roots and growth, and after the stems have been reached, less heat and moisture will be necessary.

Autumn tints.—Conspicuous for their effective tints at the present time are *Acer Ginnala*, with its small crimson foliage, *A. virginianum rubrum*, *A. saccharinum*, *A. purpureum*, and *A. platanoides*. Amongst the Japanese Maples which are effective are *Acer palmatum* and *A. atropurpureum*. The *Amelanchier*, or Snowy Mespilus, is equally valuable for its autumn foliage. *Liquidambar styraciflua* is now beautiful, with its orange-red-coloured foliage. *Berberis vulgaris* is extra handsome this season, being in fruit, and of a fine colour. The variety *atropurpurea*, with its rich purple-red leaves, freely fruited, is magnificent. *B. Thunbergii*, a deciduous Japanese shrub, with arching stems, is now glowing scarlet. *Rhus Cotinus*, *R. glabra*, *R. laciniata*, *R. typhina*, *R. coccinea*, *R. elegans*, and *R. sanguinea* are effective from early summer until late autumn.

Lawns.—The season having every appearance of being a late one, keep the mowing machines actively employed, and maintain the lawns and paths in as neat a condition as possible, in order to make the best of the present summer-like weather.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. G. L. HOLFORD, C.V.O., C.I.E., Westonbirt, Gloucestershire.

Autumn-flowering Odontoglossums.—While there are other members of this favourite genus that produce flowers at this season, the section containing *O. grande*, *O. Schlieperianum*, *O. Inseleyi*, with their varieties, and similar kinds, are those to which the term "autumn-flowering" is usually applied. These species are much the easiest *Odontoglossums* to cultivate, and therefore they are of great service to the amateur in the greenhouse. The plants should be accommodated in a structure having a cool, intermediate temperature. Root moisture is necessary for them all the year round, the greatest amount being required from the time the flower-spikes commence to develop until the pseudo-bulbs are fully matured. During their period of rest, only sufficient water is needed to keep the pseudo-bulbs plump, and the roots and foliage in a healthy condition.

Leila fraxans and its allies.—These pecty, dwarf-habited autumn-flowering Orchids are cultivated in the cool intermediate division, where they produce their flowers before the new growths are fully developed, the water supply must not be diminished until they have fully completed their pseudo-bulbs. These flowers are capable of retaining their beauty for one month, and without injury to the plant, providing the specimen is healthy and strong.

Disis.—The tuberous roots of these terrestrial Orchids are best reotted at this season, when the new growths push up from the sides of the old flower-spikes. Employ well-drained pots and a compost consisting of two-fifths Sphagnum-moss, two-fifths turfy peat or *Osmunda* fibre, and one-fifth turfy loam. These ingredients should be mixed well together and rendered porous by adding a liberal quantity of crushed crock, charcoal, and silver sand. After the potting operation give sufficient water only to settle the compost, and afterwards afford just sufficient to keep it moist. Disas require a rather shaded position, close up to the roof glass in a cool, moist, freely ventilated house. It is necessary to keep a sharp look-out for thrips and green fly, the latter pest being nearly always troublesome at this season.

Miltonia.—The attractive species, *M. spectabilis* and its varieties, *Morelhana* and *atro-rubens*, with *M. Clowesi* and *M. Regnellii*, are interesting members of this genus for flowering in late summer and early autumn. After the plants have bloomed and the pseudo-bulbs are finished up, gradually decrease the supply of moisture at the roots, and henceforward keep the rooting materials on the dry side till growth becomes active again in the new year.

Trichopilia fragrans.—Plants of this species are now flowering, and care will be needed to prevent slugs and snails devouring the flowers. The best protection is to stand the plants clear of all others, on inverted flower-pots stood in saucers filled with water. After blooming, the plants need a long rest in a cool, intermediate house, and during that period water should only be applied to the roots very seldom.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, OCTOBER 12—
United Hort. Ben. and Prov. Soc. Com. meet. Nat. Chrys. Soc. Com. meet.
TUESDAY, OCTOBER 13—
Roy. Hort. Soc. Coms. meet. Brit. Gard. Assoc. Ex. Council meet. Nat. Kosoc. Soc. Com. meet. Hort. Club meet.
THURSDAY, OCTOBER 15—
Roy. Hort. Soc. Exh. of British-grown fruit (2 days). Annual Dinner of United Hort. Ben. and Prov. Soc. at Waldorf Hotel, 6.30 p.m.
SATURDAY, OCTOBER 17—German Gard. Soc. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—50.1°.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, October 7 (6 P.M.): Max. 63°. Min. 49°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, October 8 (10 A.M.): Bar. 30.1; Temp. 60°; Weather—Overcast.
PROVINCES.—Wednesday, October 7 (6 P.M.): Max. 62° Ireland, W.; Min. 58° Cambridge.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulbs, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.
TUESDAY, AND WEDNESDAY—
Important two days' sale of Nursery Stock, at the Nurseries, South Woodford, by order of Mr. John Fraser, by Protheroe & Morris, at 11.
WEDNESDAY—
Palms, Plants, Azaleas, New Zealand and other Ferns, Bulbs, &c., at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 5.
The Freehold Property Harold Court Nursery, with Cottage, Glasshouses, &c.; also three Freehold Residences and Building Land, at the White Hart Hotel, Romford, by order of Mr. W. Green, by Protheroe & Morris, at 4.
THURSDAY, AND FRIDAY—
Two days' sale of Nursery Stock, at Amner Nurseries, Edgware, Middlesex, by order of Mr. J. J. Foster, by Protheroe & Morris, at 12.
Important sale of the whole of the Collection of Rare Orchids, by order of J. Bradshaw, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 1.
FRIDAY—
Choice Duplicate and other Established Orchids, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 1.

The veteran botanist of La Fariède, near Hyères, Mons. Albert, is well known for the work he has achieved during more than forty years in his own neighbourhood, including the publication of several pamphlets; and Mons. Jahandiez, who is an enthusiastic botanist, has already published an interesting volume on the historical and natural history aspects of the islands of Hyères, the Stochades of the ancient Greeks. That volume, printed and published by the author at Carqueiranne (Var), is beautifully illustrated from drawings made by his brother.

The volume under notice was also printed at the private press of Mons. Jahandiez. The type is excellent, and most of the 16 plates, representing 42 species or varieties, are good, for they are taken from photographs of the plants themselves. The illustrations comprise three plates of *Quercus ilex* and its varieties, and two plates of *Quercus* hybrids, including *Q. bertrandii* and two varieties. A plate is also given of Albert's two new varieties of the Grass *Gaudinia fragilis*, of *Ranunculus millefoliatus*, the handsome and very rare *Delphinium Requinii*, from the Isle of Porquerolles, and a good photograph of *Cirsium tris-*

pinosum, from the island of Levant, giving the habit of the whole plant and three enlarged leaves showing the venation and the arrangement of the spines.

The book is in large octavo, and besides the 44 pages of Prof. Flahault's introduction and the author's preface, there are 613 pages of matter and a coloured map of the Department, drawn by Mons. A. Jahandiez.

We regret to see the authors follow Mons. Rouy in giving the word "forme" precedence over "variety," such an arrangement being sure to cause some confusion. They describe the classification indeed as "a little eclectic." They have followed *La Flore de France* of Rouy as far as the end of Vol. ix., then they have adopted that of Grenier and Godron, with the modifications brought by the recent flora of Abbe Coste. Orchidaceæ has been based on the monograph of Mons. Camus, and grasses on that of Mons. Husnot.

Among the genera particularly well done may be mentioned *Ranunculus*, *Erodium*, *Medicago*, *Vicia*, *Lathyrus*, *Galium*, *Hieracium* and *Quercus*: the varieties of *Solidago Virgaurea* and the varieties and hybrids of *Phagnalon sordidum*, including *P. hybridum* and *P. ambiguum*, of which there are figures.

In the genus *Vicia* we presume Mons. Cavillier's careful note on the characters and affinities of *Vicia elegantissima* was published just too late to be incorporated in the text, though the pamphlet is mentioned in the bibliography. But the same reason cannot be given for the exclusion of *V. monosperma* from Porquerolles (published in the *Journal of Botany* in 1906), for even if the authors consider *V. monosperma* merely an abnormal form of *V. angustifolia*, it is customary to account for all properly-published names when dealing with the flora of any district, and, if possible, to give reasons for the exclusion of any names. In the case of a difficult genus like *Vicia*, which so badly needs monographing, it is particularly desirable to account for all published names of species and varieties when compiling a "Flora" of a country where a particular species or variety has been found.

Under *Juncus*, a new variety of *J. bufonius*, called *minutulus*, is briefly described. Judging from the appearance of some of the type specimens, which are only 1 to 2 centimetres high, the new plant seems to represent merely a small, starved form of this very variable *Rush*, and to be hardly worthy of a varietal name. *Juncus pygmaeus*, which is fairly common in France, has very few localities given in Var, and Hyères is not one of them, though it grows in several of the sandy marshes below the town.

Although the work is comprehensive and well done, it appears that very few public herbaria have been consulted for old records, this being always a difficult task to accomplish, but it is unfortunate that several early records of Var plants gleaned from the great herbaria at Geneva reached the authors too late for incorporation. However, the works of Perrymond, Robert, Hanry, Huet, Shuttleworth, Roux, and some others, have been fully noticed.

Since 1853, when Hanry's Catalogue of the Department of Var was published, no further complete list has appeared, although the Department has one of the richest floras in France, and some hundreds of species are now recorded which did not appear in Hanry's list. But as Albert and Jahandiez's classification is framed on a very synthetic plan, rarely adopted in works

of this kind, they give only 2,165 species and 61 hybrids for the Department, but they say in the preface this number could be increased by at least 600 if they had raised to the rank of species certain sub-species and forms, as has so often been done. The 2,165 good species in this Department of France compares with the 2,047 species (excluding Characæ) in the tenth edition of the *London Catalogue of British (and Irish) Plants*. There are about 5,600 species of flowering plants in the whole of France, according to Dr. Saint-Lager, in *Les nouvelles flores de France*. Huet and Shuttleworth published in 1889 a *Catalogue des Plantes de Provence*, comprising also a part of Italian Liguria and this was soon followed in 1891 by that of Roux, but many species from Var are not mentioned there, and frequently the localities are wanting in definiteness.

Orchids have been well done, and they include no fewer than 60 species, 9 varieties and 14 hybrids, whereas there are only 45 species in the British Isles. A new hybrid, *Ophrys Rainei* (*O. Arachnites* x *bombiflora* ?), has been named after the discoverer, Mr. Raine, an English botanist of Hyères, who has done good work among Orchids. It is a pity that the extremely rare *Serapias cordigera* alba, found at Cavalaire by Mr. Pole, of Bristol, in 1907, was not recorded in this book, for this beautiful case of albinism has only hitherto been noticed in Sicily, whence Tineo, in 1844, in the *Flora Sicula*, records it as the variety *B. floribus flavescens*, and it is an interesting addition to the flora of France. One of the specimens found was sent to the Kew Herbarium, and another was exhibited at a meeting of the Société botanique de Genève. The flowers and bracts were a greenish-white.

In Prof. Flahault's introduction, which begins with a general description of the physical geography of that part of France, he mentions the highest mountains which lie to the north of the Department, the culminating ridge called la Chens being 1,713 metres high. The Beech and the Fir (*Abies pectinata*) are the predominating trees at these heights, and Box and the sea-level Oak slightly cover the lower plateau; but all the northern region of pre-miocene date is very sterile. However, we find on these summits certain Alpine species, and among them are such plants as *Anemone alpina*, *Ranunculus pyrenæus*, *Draba aizoides*, *Polygala alpina*, *Alsine Villarsii*, *Alchemilla alpina*, *Antennaria dioica*, *Gentiana verna*, and *G. cruciata*.

Among the rather lower mountains of the Forest of Sainte-Baume are many sub-Alpine species, which are called "sylvatiques," such as *Aconitum Anthora*, *Dentaria pinnata*, *Polygala Chamæbuxus*, *Mœhringia muscosa*, *Pyrola chlorantha* and *P. secunda*, *Trifolium alpestre*, *Rubus saxatilis*, *Saxifraga rotundifolia*, *Prenanthes purpurea*, *Vaccinium Myrtillus*, *Arbutus Uva-ursi*, *Gentiana lutea*, and *Daphne Mezereum*. Among the rock plants are *Delphinium fissum*, *Alyssum halimifolium*, *Kernera saxatilis*, *Potentilla caulescens*, *Saxifraga aizoon*, and *Primula marginata*.

In the Forest of Sainte-Baume some of the finest Yew trees in Europe are found, mixed with Beech, Holly and Spurge Laurel. With them also grow *Tilia platyphyllo*, three species of *Acer*, *Cornus Mas*, *Fraxinus excelsior* and *Corylus Avellana*.

A sketch is given, in the introduction, of the vegetation from sea level upwards through the various zones, with special reference to the flora of the *maquis*, the name given to the rough entanglement of *Cistus*, *Erica*, *Rosmarinus*,

* "A Catalogue of the Vascular Plants which grow naturally in the Department of Var," is the translated title of a recently published book by Messrs. Abel Albert and Emile Jahandiez, with an introduction by Prof. Flahault, of Montpellier, on the geographical botany of Var and Basses-Provence. Published at 30 francs, by M. Paul Klincksieck, of Paris.

Phillyrea, Daphne Gnidium, Lavandula Stoechas, and Brachypodium ramosum, so characteristic of the Mediterranean coasts and some of its islands. Guy de Maupassant, the famous French novelist, gives a good description of the "impenetrable maquis" in one of his books.

In some interesting remarks on Ecology and plant associations, we are told that Zostera and Posidonia are enough to give character to the submerged sandy shores. Staticina minuta, Anthyllis Barba Jovis and Senecio cineraria characterize the maritime rocks which are not calcareous; Medicago marina, Ammophila arenaria, Eryngium maritimum, and Euphorbia Paralias are the principal plants of the shifting sand dunes, just as three of the species are on our English coasts; and Asphodelus microcarpus, Crepis bulbosa, Juniperus phoenicea are those of the fixed dunes. Salicornia, Aster tripolium and Statica Limonium are the chief essentials of Mediterranean salt marshes, just as they are in the south of England.

Plant associations hold as important a place in forming the landscape of the Mediterranean coasts as they do in any other country. Brachypodium ramosum (always the dominant grass of the undergrowth of woods), Cistus mopsiensis, albidus and salvifolius, Erica arborea, Caluna vulgaris, Posidonia oceanica, Zostera marina, Salicornia frutescens, Buxus sempervirens are as important in the eyes of the phytogeographer as the rarest species, and precisely because these social species are more characteristic than the others by their very abundance, and because the conditions under which they are found are always the same.

But we must not forget, as Prof. Penzig points out somewhere, that amongst plants often called "characteristic" of the Littoral none are really indigenous except perhaps the Olive. Thus the Cypress and the Pine (*Pinus Pinea*) are natives of the Orient; the Date Palms were imported from Africa by the Saracens; Oranges and Lemons come from the sub-tropical zone of Asia; Figs from India and Agaves from Central America.

OUR SUPPLEMENTARY ILLUSTRATION depicts a group of fine foliage plants as arranged for exhibition by Messrs. SANDER & SONS, St. Albans. In forming such groups, the two chief points demanding consideration are those of form and colour. Probably the first place must be given to form, so disposing the plants as to accentuate the differences they present in the shape of their leaves, this being a matter of great interest to all collections of ornamental foliage plants. But, next to this, the arrangement of the colours calls for the exercise of artistic taste. The colours, in general, are less brilliant than those of flowers, but scarcely less rich in tone, and that they may present the best effect they should be so placed that the colour of one plant will be brought out, as it were, or even heightened by the effect produced by those adjacent to it. Messrs. SANDER have gained proficiency in these matters by repeated experience, and their groups always possess attractive qualities. In the illustration the reader will easily recognise the plant of *Pandanus Sanderi superba* in the centre, with its handsome, sword-like, variegated foliage; and, in addition to this plant, there are *Pitanga Micholitzii*, a flowering Anthurium, and other species on the one side, and on the other side *Anthurium Lancheanum* and *Pereskia Godsefiana*, which were exhibited for the first time at the Ghent Quinquennial Show in April last.

ROYAL HORTICULTURAL SOCIETY.—A meeting of the Committees will be held in the Society's Hall, Vincent Square, Westminster, on Tuesday, October 13. At 3 o'clock p.m. a paper on "The Influence of Geology on Horticulture" will be given by Mr. C. H. HOOPER, F.S.I.

BOTANICAL MAGAZINE.—In the October issue of this publication there are descriptions and illustrations of the following plants:—

ECHINOPS TOURNEFORTII, tab. 8217.—This species, from Armenia and Persia, is described by Mr. W. BOTTING HEMSLEY as being perhaps the handsomest of the Globe Thistles in cultivation. The flower heads are few and globose, 2½ to 3 inches, or sometimes as much as 5 inches in diameter, terminal on long stalks, each flower surrounded by an involucre of bristles and sharp-pointed bracts. The corolla, which slightly overlaps the bracts, is white, and the exerted anthers blue. The achenes are densely clothed with long, straight, coarse hairs. The plant grows from 3 to 5 feet in height, and has large, pinnately-divided leaves, the lower ones being tripinnate. Mr. W. WATSON states that this species flowers in August, along with the other Globe Thistles, and appears as hardy as any of them. The illustration was prepared from a plant which flowered in Canon ELLACOMBE'S garden at Bitton in 1906.

ROSA SERICEA, VAR. *PTERACANTHA*, tab. 8218.—This ornamental variety was figured in the *Gardeners' Chronicle*, October 7, 1905, on pp. 260-1. It occurs in company with the typical form at elevations from 3,000 to 11,000 feet in Western China and Manipur. The plant figured in the *Botanical Magazine*, also those figured in the issue of the *Gardeners' Chronicle* already cited, differ from *FRANCHET'S* type in being nearly glabrous and not woody; but two specimens in the Kew Herbarium collected in Manipur by Sir GEORGE WATT in 1881-2 are exactly intermediate in degree of hairiness between the extreme forms. Specimens of *Rosa sericea* itself in the Kew Herbarium show equally varying degrees of hairiness. The extraordinary point about this plant is, as its name suggests, its enormously large, flat, decurrent prickles. These vary from 1 to 2 inches in length, elongated at the base, and frequently extending to the whole length of the internode. The prickles are thin, translucent, of a bright blood-red, rather darker in colour than the *Botanical Magazine* figure, becoming brown and woody with age. The parts of the stem not covered with the large prickles are densely clothed with bristles, which are also of a bright red colour when young. Mr. W. J. BEAN states that, like *Roses* in general, this variety needs a good strong soil to bring out its full attractions; it should preferably be grown in a rich, rather stiff loam. It may be added that the flowers are white and rather smaller in size than those of the species.

ANISOTES DIVERSIFOLIUS, tab. 8219.—This is a genus of *Acanthaceæ* allied to *Justicia*, and includes one Arabian and four tropical African species, in addition to the endemic Socotran *A. diversifolius*. This species was originally described by BALFOUR in *Proc. Roy. Soc. Edinb.*, vol. XII., 1884, p. 88. According to BALFOUR, the family of *Acanthaceæ* forms about one-twentieth of the flora of Socotra, comprising 27 species, which are included in 15 genera. Three of the genera and 21 species are endemic, so that over one-seventh of the endemic genera of Socotra and one-tenth of the endemic species belong to the *Acanthaceæ*. Mr. T. A. SPRAGUE points out that the venation of the corolla in *Anisotes diversifolius* is peculiar. Three veins start from the base of the corolla-tube, one corresponding to the lower lip and two to the upper,

and the two latter each divide into three a short distance above the base. The species is an erect, glabrescent shrub, about 1½ feet high, with greyish bark, and the elliptic-ovate leaves are ¾ to 1½ inches long, and ½ to 1 inch broad, the petioles being ¼ to 1 inch long. The inflorescences are short, axillary cymes, and the flowers are pendulous. The colour of the corolla, which is the showy part of the flower, is flame colour or yellow, 1½ to 2 inches long, conspicuously two-lipped. Mr. W. WATSON states that the species is similar in its habit and requirements to some species of *Justicia*, *Jacobinia*, and *Peristrophe*, and, being easy to propagate by means of cuttings, it may be grown along with the genera already mentioned for conservatory decoration in spring. The plant produces seed under cultivation.

LEWISIA COTYLEDON, tab. 8220.—This is a pretty species from North America, and Mr. W. BOTTING HEMSLEY states that its flowers remind one strongly of those of some species of *Oxalis*. It is a stemless perennial, with a thickened root-stock. The leaves are fleshy, rosulate, oblong-spathulate, 1½ to 2½ inches in length. The flower-scapes are 4 to 5 inches high, 8 to 12 flowered, and bracteate throughout. The flowers are about 1½ inches in diameter, white, with crowded red lines. Sepals two; petals varying in number, usually nine or ten, spatulate notched; stamens seven to ten, shorter than the petals. Ovary one-celled, ovules few. Mr. W. WATSON states that the species grew well and flowered freely in May at Kew, after being potted in sandy soil and placed in an unheated frame. Possibly it will prove hardy in a sheltered position in the rockery. The plant was presented to Kew in 1906. It has not produced seeds, but has developed basal offsets, which, when removed, soon grew into plants.

RAPHIONACME UTILIS, tab. 8221, is a species of *Asclepiadaceæ* from Angola, and is likely to prove of considerable economic importance, as its tubers are capable of yielding a large quantity of rubber, which is said to be of good quality. It has been identified by Dr. STAFF with the "Ecaanda" or "Marianga" Rubber plant, first recorded by Professor GERALDES in his *Estudo sobre os latex borrachiferos*, pp. 143-172, published at Lisbon in 1906, and a full account of it is given in the *Kew Bulletin* for 1908, p. 215, from which, according to Professor GERALDES, the plant is a native of the interior of Angola, growing in the drier parts of treeless, sandy, and alluvial areas, between the River Kwana and the River Zambesi, at an altitude of from 4,000 to 5,500 feet above sea level. Mr. N. E. BROWN describes the plant as a perennial herb, with a Turnip-shaped tuber, 2 to 5 inches in diameter, clothed with a dark brown, flaky bark; the stems are of annual duration, 1 to 4 inches long. The leaves are produced in two to five pairs, opposite, or forming a small rosette close to the ground. They have very short petioles. The flowers are produced in small terminal and axillary cymes or clusters; sepals one-eighth of an inch long, lanceolate, acute, purplish, with green tips. The corolla is a bright purple colour, about half an inch in diameter, and deeply five-lobed. Mr. W. WATSON states that *Raphionacme utilis* was presented to Kew in 1907 by the Companhia de Mocambique, who forwarded tubers of it, stating that "Bitinga" rubber was extracted from it. They were planted in soil and placed under tropical conditions, where they quickly started into growth, and flowered in March this year. The tubers do not shrivel nor suffer when kept dry, and they root and grow readily when placed in heat and moisture. Particulars as to the field culture of this plant are given in the *Kew Bulletin* already quoted.

HORTICULTURAL CLUB.—The house dinners of the club will be resumed on Tuesday, October 13, 1908, at 6 p.m., at the Hotel Windsor, when Mr. ARTHUR W. SUTTON will deliver a lecture on "A Holiday on the Nile," illustrated by painted slides from original photographs. Mr. SUTTON'S last lecture on "A Camping Tour from Damascus to Petra in Arabia" was so exceedingly interesting that a large attendance is expected.

ASTON ROWANT GARDENS.—The vacancy caused by the retirement of Mr. W. H. CLARKE, gardener to Sir WILLIAM PLOWDEN, as announced in our last issue, has been filled by the appointment of Mr. GEORGE ABBEY, Junr., formerly head gardener for nearly 16 years to the late Colonel NORTH, at Avery Hill.

WART DISEASE IN POTATOS.—The Board of Agriculture and Fisheries desire to notify that 24 cases of wart disease or black scab in this year's Potato crop had been reported to them up to October 3. These cases have occurred in the following counties:—Shropshire 30, Staffordshire 57, Lancashire 50, Cheshire 30, Warwickshire 25, Worcestershire and Leicestershire 4 each, Derbyshire 3, Merioneth 2, and one each in Perthshire, Stirlingshire, Dumfriesshire, Cumberland, Nottingham, Berkshire, Flintshire, Breconshire and Glamorgan. A few cases among field crops have been found in the counties in which the disease is most common, but in the great majority of cases the disease has occurred on allotments or in gardens in which Potatos are constantly grown. Enquiries made by the Board lead them to think that wart disease is very common in gardens in five at least of the above-named counties. The disease has been known in certain districts for 10-15 years, and as growers have taken no steps to check its progress, it is now causing serious loss. As wart disease may be carried from place to place in infected tubers, it is important to secure "seed" Potatos free from this disease. At the same time, the greater number of cases reported would appear to be due to the cultivation of Potatos in soil previously infected, or to the use of manure containing refuse from a diseased crop, and in many instances the seed has been viewed with quite unjustifiable suspicion. It should be remembered that even in counties in which wart disease is common, it has not yet seriously affected field crops, and the percentage of diseased Potatos offered for "seed" must be inconsiderable. All cases of wart disease must be notified to the Secretary, Board of Agriculture and Fisheries, 4, Whitehall Place, London, S.W. Persons notifying the disease will receive directions as to its treatment. It is believed that under careful treatment this disease can be eradicated, but if neglected it may render the soil unfit for Potato growing. In the case of farmers who sell "seed" Potatos, notification of the disease is of especial importance, and failure to notify must be regarded as a serious offence. The Board desire to draw the attention of all "seed" growers to the provisions of an Order issued under the Destructive Insects and Pests Acts 1877-1907, which render persons concealing wart disease liable to prosecution and to a penalty of £10. In addition to the names already mentioned, wart disease is locally known as Cauliflower disease, "fungus," and canker.

THE WARM WEATHER.—The commencement of October has been marked by weather of an extraordinary character for so late a season, and probably the fruit trees will gain advantage from the unusual warmth by becoming the better matured. Some growers have told us that one effect of the sudden visitation of summer-like heat has been to cause Apple trees to show such increased activity in respect to sap circulation, that the fruits, being nearly at maturity, have dropped in large numbers. Seedsmen are expecting to gain substantially by having a much better seed harvest. At the middle

of September it appeared as if the yield of Sweet Pea seed in this country would be very deficient. Mr. H. WILLIAMS writes from Redruth, Cornwall, as follows: "We have experienced both extremes of weather recently. On September 13th the thermometer fell to freezing point, and on October 2 we registered 78° Fahr. in the shade, while it ran up to 95° in the sun. On September 25th .50 inch of rain fell in 1½ hours. Up to the present the autumn has not been propitious for the ripening of fruit-bearing wood, and Chrysanthemums have suffered in many places from the recent gales." Mr. W. A. COOK, writing from Leonardslee Gardens, Sussex, on the 30th ult., says: "The temperature to-day has been 76° in the shade, and 59° was the lowest reading last night—the highest of the year!"

A POULTRY RECORD.—We have received the first number of the *Illustrated Poultry Record*, a monthly periodical, edited by Mr. E. P. BROWN, and published by Messrs. BROWN, DOBSON & CO., LTD., price 6d. This issue contains 66 pages of letterpress and illustrations, and, although it is hardly fair to judge a periodical by its first issue, we think that this journal will be welcomed by the numerous poultry-keepers in this country, as it contains a great deal of valuable and interesting matter relating to the feathered tribe.

PEAT AND ITS USES.—Most people engaged in horticulture think of peat chiefly from the point of view of compost. But it seems not unlikely that a considerable industry may be erected on the basis of peat, for it has gradually become apparent that it can be made to yield, by appropriate treatment, a large number of valuable products. This has long ago been recognised and acted on in Germany, and it is intended that peat shall be utilised in Ireland in the near future. It is possible to manufacture gas from properly prepared peat, which can be turned to a variety of mechanical uses through the medium of electricity, inasmuch as it will supply the motive power of dynamos. Sulphate of ammonia, methyl alcohol, tar, and charcoal of excellent quality, can all be made from peat, and the last-mentioned substance finds a valuable application in Germany in connection with the manufacture of steel.

JUMPING SEEDS.—In a note on the so-called "jumping seeds," the *Trinidad Bulletin of Miscellaneous Information* states that these again made their appearance in the Botanic Gardens on March 27 last. They were observed on the "Roble" tree (*Platymiscium polystachyum*, Benth.). "Jumping seeds" are not seeds at all, but a portion of the plant inhabited by a small weevil or snout beetle. They have a seed-like appearance, and their name is given because they are sometimes seen to spring a considerable distance from the ground into the air. This is, of course, due to the presence of the living beetle. It has been observed that the larvae of the beetles enter the unopened flower-bud, and, after eating out its interior, change into the pupa form, using the calyx of the flower-bud as a protective case during the dormant period. As they fall from the trees, the larva is apparently full grown, and about to assume the pupa form, and can at this time jump as much as 4 inches from the ground. The insect is as yet undetermined, but evidently belongs to the snouted beetles or weevils (*Rhynchophora*), perhaps to the family Curculionidae.

THE SUMMER GARDEN OF PLEASURE.—We have read with interest and enjoyment Mrs. BAYSON'S book, "The Summer Garden of Pleasure." It is written in an easy style and contains excellent advice as to what plants to grow, as well as how and where to grow them. There are many useful suggestions on the management of borders and the methods of

securing a succession of bloom. Such hints will especially appeal to the amateur, who is continually confronted by this difficulty. We are, however, unable to commend Mrs. BAYSON'S choice of an artist. No attention has been paid by the latter either to form or to due proportion in his coloured plates. Take Plate XI., for example: there we see an arch covered with what appears to be pink *Sax. Anemones*, suspended in mid air and apparently stalkless; these pink masses are gazing down in wonderment upon a plant of what is stated to be the yellow tree Lupin, but a specimen with such enormous flowers has not yet been seen either on land or sea. Future editions of the work, we think, could well dispense with the coloured plates.

A GARDEN CITY AT HELLERAU, NEAR DRESDEN.—Recently the Second Chamber of Saxony has sanctioned the extension of the electrical railway to the boundary of the garden city at Hellerau, and, with this step, vanished the last obstacle which stood in the way of the realisation of the garden city project. The *Deutschen Werkstätten für Handwerkskunst* stands behind the undertaking, and intends to remove its entire plant to this spot. An area of about 150 hectares is already secured. A portion of the land adjacent to the factory and workshops will be reserved for the erection of small-sized dwellings, and houses for letting in flats will be built in the more pleasing parts of the estate. No house may be erected unless the plan has been previously laid before a commission of artists, and their permission obtained, whilst various regulations will be enforced by which land and house speculators are debarred from obtaining a foothold on any part of the estate. The whole undertaking will be under the management of a co-operative company, the *Deutsche Werkstätten* being also financially concerned. It is hoped that this typical precedent of a manufacturing establishment will receive the attention of all national economic, hygienic, and artistic circles, and find imitators among the manufacturers themselves.

WILD FRUITS IN IRELAND.—According to a correspondent in the *Times*, the Department of Agriculture is distributing broadcast among the small farmers and labourers of Cork and Kerry, printed handbills containing elaborate instructions concerning the harvesting, packing and marketing of wild fruits. That the industry is capable of development and that it has recently received more attention than formerly is shown by the export returns. Last year there was sent to England from Ireland 7,500 cwt. of Black or Bramble Berries valued at £3,378, and as a considerable proportion of the fruit pulped, the Department estimates that the total export for the year was little short of 500 tons, valued at £4,500. There is, it is pointed out, a practically inexhaustible demand, not only for Blackberries, but for Bilberries also called Whorts, which grow in upland and mountainous districts. Wild Crab Apples, which in favourable seasons grow in great abundance in the south of Ireland, are eagerly sought by jelly manufacturers. The Sloe, which is the fruit of the Blackthorn, is becoming more generally known in Great Britain; one large buyer has recently asked for a supply of one hundred tons in one year of this fruit. Until the advent of the Department of Agriculture the bulk of this wild fruit was suffered to drop and rot upon the ground.

Publications Received.—*Little Gardens and How to Make the Most of Them*, by H. H. THOMAS. (London: Cassell & Co., Ltd.). Price 1s. 6d. net.—*Schlich's Manual of Forestry*, Vol. V. Forest Utilisation, 2nd edition, by W. R. FISHER. (London: Bradbury, Agnew & Co., Ltd.).—*Holly, Yew, and Box, with chapters on other evergreens*, by W. DALLIMORE. Illustrated. (London: John Lane, The Bodley Head). Price 7s. 6d.—*Alpines and Bog Plants*, by REGINALD FARRER. Published by Edward Arnold; price 7s. 6d.

* *The Summer Garden of Pleasure*, by Mrs. Stephen Bayson; with 36 illustrations in colour by Osmond Pittman. Messrs. Methuen, 15s. net.

PRONUNCIATION OF PLANT NAMES.

PRONUNCIATION.—In the first word in each line the accent (') is short; () is long.

In the second word vowels are to be pronounced as—

- arise, át, áge, árt, ár, áll
- end, égg, éat, err, éwe
- ia, it, iie, sir
- on, ótter, ówe, ór, dów, óul
- us, útter, úse, úrn
- "ch," as in chin; "th," as in thin
- "s," as in snot; "f," as in far
- "g," as in go.

All other letters are unmistakable.

HARDY FLOWER BORDER.

SALVIA SCLAREA.

THIS species ranks among the best of the *Salvia* for planting in the hardy plant border. The leaves are particularly handsome, and are often 8 or 9 inches in length. The main stems are erect, strong, freely branched and somewhat viscid, bearing in whorls large pale blue and white flowers. Two bracts, very broad and long, are situated at each whorl, and are more or less rose-coloured, especially towards the apices; these bracts add much beauty and attractiveness to the plant. *Salvia Sclarea* is a perennial plant, but success is best assured by sowing a few seeds, which are freely produced, each summer. Plants thus raised will flower the following year, as in the case of a hardy biennial. This *Salvia* is popularly known as the "Clary," and is native of Southern Europe. The species, which is figured in the *Botanical Magazine*, t. 2,320, under the name *S. bracteata*, has been in cultivation in this country since 1820. *E. J. Allard.*

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

THE NATIONAL CHRYSANTHEMUM SOCIETY'S SHOWS.—At last I note the committee of the N.C.S. have had under consideration the desirability of holding their shows in the R.H.S. Hall, Vincent Square. Some members of the N.C.S. appear to be so wedded to their ideas of schedule-making that they cannot budge an inch to adapt themselves to circumstances over which they seem to have little control. One thinks the committee (or some members of it) are the only persons who do not consider the R.H.S. Hall a suitable site. *E.*

VEGETABLES AT SHREWSBURY.—The note on this subject (p. 173) is interesting, as are all Mr. Dean's writings. He, however, does not seem to be satisfied with the existing arrangement of the so-called champion class at Shrewsbury, and pleads for an extension to 12 dishes. If my memory serves me right (I am now writing from memory) Mr. Dean was an advocate for the Shrewsbury class of 12 dishes as formerly arranged to be reduced to its present form of nine dishes. How would this arrangement suit Mr. Dean? Offer prizes for 10 dishes and exclude such sorts as Cauliflower, Celery, Leek, and Onion, for examples. This would provide an opportunity for the inclusion of such kinds as Marrow, Beet, Cucumber, and Turnip. Even Cabbage could then be included. I would also ask, is the point list as adopted by the Shrewsbury executive of 7 as a maximum the most satisfactory? Personally I do not think it is, and for this reason. A dish of Marrows when perfectly staged would obtain under this code as high a position in the competition as a dish of Carrots or Leeks. Now does any vegetable grower say they are as difficult to obtain? Surely such a method would be putting a premium upon easily-grown kinds to the prejudice of the really difficult kinds. Mr. Dean knows how difficult it is in some localities to obtain really fine Carrots, and how much labour is necessary to secure the best Leeks in August, and surely that which is the more difficult to produce should be recognised. Now I come to the question of the pointing of the two collections in question. On p. 154 in the *Gardeners' Chronicle* report of the show the total amount of points awarded to the winning collection was 61, presumably by the six judges appointed to award the champion prize. On p. 173 Mr. Dean says: "Mr. Beckett's exhibit excelled the other by half a point only." Now what do we understand in this? Did the first judges award Mr. Gibson's collection 60½ points? Did the six judges point Mr. Gibson's collection or not? If not, and I hardly think they would, being a 2nd prize award, it shows how near was the pointing by the two sets of judges. A little lower down on

p. 173 Mr. Dean says: "Mr. Beckett won £20 10s., Mr. Gibson but £7, yet the distinction was but half a point." This rather shows that they did point the exhibit, as the £10 champion prize is included in the sum, and that, of course, was made by the six judges, thus seeming to prove how close was the pointing by the two sets of judges. *Inquirer.*

WINTER SEVERITY.—Although Sir Herbert Maxwell's statement, on page 204, under "*Hibiscus syriacus*," that our winter severity varies from east to west is more accurate than the general idea that it does so from north to south, it is of course not intended to be taken without any qualification. While it is true, on the whole, that the farther north one goes from the equator the colder it becomes, there are exceptions. As I pointed out in the opening instalment of the flower garden calendar for last year, the comparative mildness of our climate is due to the influence of the Gulf Stream; but, so far from that influence being general over the whole of our islands, it is at times surprisingly local. So much so, that this small county of Cornwall, though a western one, possesses two distinct climates. In the south and extreme west, broadly, from Looe to Penzance, the conditions are almost sub-tropical,

little of its warmth to north Cornwall, and, in consequence, we grow at Penarrow very few species in the open which cannot be grown around London. Hydrangeas are, perhaps, a noteworthy exception, and these plants were half killed last winter. I met Mr. Cook, of Leonardis Gardens at the last Truro spring show, and he astonished me by naming scores of things thriving out-of-doors so far east as Leonardis which would not exist during one of our mildest winters here. Sir Herbert Maxwell mentions the west coast of Ross-shire. It would be interesting to know how far inland half-hardy subjects can be wintered. Last May Mr. Osgood Mackenzie read a paper at a meeting of the Royal Horticultural Society on "Gardening in the Western Highlands." Mention was made of many shrubs which flourish in his garden at Inverewe on the west coast. Although Inverewe is hundreds of miles north of Penarrow, many of the species are impossible of culture in the open here. For example, *Tri-cuspidaria*, *Leptospermum*, *Metrosideros*, *Dicksonia antarctica* (this did not survive one of our mildest winters), *Acacia dealbata*, *Correa*, *Callistemon*, and *Mandevilla suaveolens*. Some of the Sikkim *Rhododendrons* manage to live here, but only when planted in the comparatively dry and well-drained rockery; they rarely flower,

[Photograph by E. J. Allard.]

FIG. 116.—*SALVIA SCLAREA*: FLOWERS BLUE AND WHITE.

gradually warming as the west is approached. Here, as the columns of the *Gardeners' Chronicle* have so often shown, anything over 6° Fahr. of frost is a noteworthy occurrence, and a surprising variety of Palms, shrubs, and plants grow luxuriantly in the open air, which at Kew have to be cultivated under glass. It is in this part of Cornwall that the Covent Garden supplies of early Broccoli are grown. Going across from Penzance to St. Ives, not more than a good walk, and along the opposite coast eastwards, quite a different class of vegetation is seen, and by the time one gets beyond Padstow the relative hardness of plants in the open nearly approximates the neighbourhood of London. And the reason for this is not so much the fact that we are going eastwards. The distance is trifling, and, as all garden lovers know, there are many gardens in Dorset, Hants, and Sussex a hundred or more miles east of this part of Cornwall, and farther north as well, which provide congenial homes for many of the usually tender subjects which are grown in the Cornish Riviera; but that that portion of the Gulf Stream which strikes against Land's End divides, and, the northern half proceeding up St. George's Channel, yields but

and usually lose most of their leaves during the winter months. Altitude and, in a lesser degree, aspect have also important bearings on this question of winter severity. We are nearly 400 feet above the sea level, and have a north-west exposure, with the result that our spring crops are from a fortnight to three weeks later than those of the nearest part of the town of Wadebridge, which is only three miles distant by road, but lies almost level with the sea. *A. C. Bartlett, Fencarrow Gardens, Cornwall.*

GLADIOLUS.—A seedling has thrown up a flower this year in a manner which is somewhat unusual. The stem, which is quite ordinary and by no means fasciated, is surmounted by two perfect and fully-developed spikes of equal shape, dimensions, and vigour. The blooms are perfectly formed, and appear, as it were, at the four corners of a symmetrical pyramid. Small secondary spikes springing from lower portions of the stem are, of course, very frequently found, in some varieties invariably; but the double spike now described is, in the writer's experience, unprecedented. It will be interesting to see if the corm throws up a similar double spike next year. *P. F. F., Bristol.*

VEGETABLE POINTING AT EXHIBITIONS.—It is a noteworthy fact that whilst the pointing of various fruits in collections at shows rarely leads to controversy, the pointing of vegetables seems to cause dissatisfaction. When the Royal Horticultural Society published its code of judging rules several years since, a special effort was made to obtain the opinions of many experienced growers and exhibitors on the subject prior to its publication so far as vegetables are concerned. Looked at in the light of later experience, that code, so far as it relates to these products, seems not to be quite perfect, and it is with a desire to obtain some full and satisfactory expression of opinion on the subject I submit a revised scale of maximums for each kind of vegetable. This scale is presented in no dogmatic mood, but with a view to securing one that is more perfect, if possible. The basis of the code is chiefly difficulty of culture, and allied to this is the question of table value. Still I hold difficulty of culture must be the dominating factor in any such code. At Shrewsbury, as is now well known, the code is so simple that every kind of vegetable is pointed on the same basis, a maximum of 7 points. That does not give entire satisfaction, and a code based on gradation of maximum values, according to difficulty of culture or production, is probably most in favour. My proposed classification, therefore, is as follows:—*7 points maximum:* Asparagus, Carrots, Celery, Leeks, Onions, Peas, and Seakale; *6 points maximum:* French, Runner, and Long Pod Beans, Cauliflowers, Cucumbers, Potatoes, and Tomatoes; *5 points maximum:* Beets, White Cabbages, Marrows, Mushrooms, Turnips, and Parsnips; *4 points maximum:* Picked Brussels Sprouts, Coleworts, Savoy Cabbages, Lettuces, Mustard and Cress, Radishes, Shallots, Spinach, Chicory, and Endive—30 kinds. *A. Dean.*

TRAINED FRUIT TREES.—On p. 233 Mr. Pearson says: "I maintain that all trees which form fruiting spurs are admirably suited to horizontal training, and perhaps the advantages of this system are better seen with Plums than in the case of any other fruit." Are we to take Mr. Pearson seriously in his reference to Plums? If horizontal training is so advantageous to Plums, why are horizontally-trained espalier Plums so unsatisfactory from a fruiting point of view? I have never yet met a fruit tree grower in a nursery who recommended horizontally-trained Plum trees. I have never found horizontal training check the vigour of Plum trees; it has rather the opposite effect. Will Mr. Pearson say how horizontal training produces more fruit spurs than fan training? The greatest difficulty appears in selecting the growth of Plums. Cherries that are horizontally trained. I much prefer the fan training for all kinds of Cherries, and I have no fault to find with the fruiting of our fan-trained trees. As regards Graevenstein Apple, I have a very fine fruit this season. It is a delicious dessert apple, but does not appear to be very fruitful. *T. H. Slade, Pottimore Park Gardens, Exeter.*

—Mr. Pearson does well to draw the attention of readers to the horizontal method of training Plum trees. He does not name the cordon or single-stem method of training Plums. In some gardens this is a common plan with trees both under glass and in the open, and the results are excellent. Mr. Pearson says, it is difficult to manage young trees trained fan shape on any but a high wall, especially the vigorous-growing varieties like Belle de Louvain for example. This is especially true where there is a desire to cover the walls quickly irrespective of the shape of the tree, and where, consequently, the non-pruning method is so frequently adopted. *E. M.*

—Knowing what an experienced cultivator of fruits may do with his Plum trees, the paragraph in my account of a visit paid to Messrs. Hugh Low & Co.'s nursery is too sweeping in its making out of the "old" (see p. 211). I have learned that the horizontal form of training the main branches of Plum trees grown against walls is making progress in England, but not in Scotland; and I am sufficiently old-fashioned in my belief that the fan is the more appropriate form. The fruits of the Plum are not always produced on spurs, and I contend that the finest examples are obtained from the well-ripened portions of one-year-old

shoots and on those of two and three years old. The shoots, or rather branches, of the Plum become barren with age, or gumming sets in, and the gardener has no option but to remove them wholly or partially, training in young shoots in their places. This is not a difficult operation in fan-trained trees, but it is almost insurmountable in a horizontally-trained one, unless recourse be made to grafting or budding. Again, fan training makes the rejuvenation of an aged Plum tree an easy matter by the gradual removal of old shoots and branches, and substitution of young wood. A wall for Plum trees should measure not less than 10 feet in height, thus allowing for full extension of the main branches. If a tree makes an excessive quantity of rank shoots, the right method to check this exuberance is not by the use of the pruning knife, but by lifting and replanting at a lesser depth, and in the case of old trees by root-pruning by instalments, taking care to search for the tap roots, and severing these. Our nurserymen should make a trial, as a stock, of *Prunus maritima*, the sand or beach Plum of America. It might tend to prevent exuberant growth of any variety of Plum worked upon it. At any rate the purchaser of Plum trees would have a choice of stocks. The Cherry Plum, or Mirabelle of the French and Belgian nurserymen, would serve a similar purpose; and cuttings of the greenish-yellow fruited variety root readily in porous, damp soil. The yellow Mirabelle is an excellent compute fruit. *F. M.*

SOCIETIES.

ROYAL HORTICULTURAL Scientific Committee.

SEPTEMBER 29.—*Present:* Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair), Dr. A. B. Rendle, Rev. W. Wilks, Messrs. G. Gordon, W. Hales, E. M. Holmes, H. T. Güssow, A. Worsley, W. Fawcett, G. S. Saunders, J. T. Bennett-Poe, J. W. Odell, and F. J. Chittenden (secretary), with Mr. G. Paul, V.M.H., visitor. *The late Mr. George Nicholson, V.M.H.*—The chairman referred in feeling terms to the great loss the Committee had sustained by the death of Mr. Geo. Nicholson, who had been for many years an active member of this Committee, and Mr. J. T. BENNETT-POE moved, and Mr. G. S. SAUNDERS seconded, a resolution tendering the sincere condolences of the Committee to Mr. Nicholson's relatives. The resolution was carried in silence, the members upstanding in their places.

Sporing in Retinospora.—Mr. G. PAUL, V.M.H., of Chesham, showed a specimen of *Retinospora squarrosa sulphurea* which was growing into the adult *Cupressus* form known as "plumosa," and which was still retaining the colour of "sulphurea." The adult form of this variety had not before appeared, though the variety alba had produced the plumosa type. *Retinospora* is the juvenile stage of *Cupressus*, and this being so it is interesting to note that *R. leptoclada* has produced fruit and seeds which on germination gave rise to typical leptoclada plants. The form known as obtusa compacta has also produced fertile seeds, but the seedlings have not yet reached a size large enough to judge of their precise character.

Virescent Gaillardia.—Mr. E. M. HOLMES, F.L.S., showed specimens of Gaillardia flowers virescent. These were taken by Mr. SAUNDERS for further examination. Mr. HOLMES also showed galls on the stem of Willow caused by the dipterous gall fly, *Cecidomyia saliciperda*.

Proliferation in Pear.—Dr. A. B. RENDLE, M.A., showed a Pear from the top of which several leaves were protruding. The fruit had been formed from a late flower, and such proliferation is not uncommon.

Malformation in Streptocarpus.—Mr. ODELL showed flowers of *Streptocarpus* in which there were petaloid outgrowths external to the corolla, these outgrowths being reversed, i.e., the part coloured like the inner part of the corolla being turned outwards.

Doubling in Cardamine pratensis.—Mr. FRAZER, F.L.S., remarked upon the various forms of *Cardamine pratensis*, especially with regard to the doubling which results from axial proliferation, the calyx and corolla being repeated again

and again, and the flowers being therefore infertile. He showed a specimen of the double-flowered form of the variety *palustris* of that plant.

Gilanthus Olga.—Mr. E. A. BOWLES, F.L.S., showed flowers and foliage of this autumn-flowering Snowdrop, which has been described as having no green spots on the inner perianth segments, but in this specimen they were well developed. The plants came from Mount Tagaytas, and had commenced to flower at Waltham early in September. The firm differs from *G. Octobrensis* in having a rather longer flower and commencing to flower at an earlier period. They are probably both forms of *G. nivalis*.

Vegetative growth on inflorescence.—Mr. BOWLES also showed a well-developed vegetative growth from an inflorescence of *Kniphofia Northia* seedling. There were three such growths upon the inflorescence, and while all the rest of the inflorescence appeared dead, there was a green strip of living tissue up the stem leading to the vegetative growths.

Fasciation in Oxalis crenata.—From Messrs. BARR came a remarkable example of fasciation in *Oxalis crenata*, the stem measuring over 4 inches across. This is the first time a fasciated specimen of any species of *Oxalis* has come before the Committee.

Multigenic hybrids.—Mr. BOWLES gave notice that at the next meeting the question of the nomenclature of multigenic hybrids was to be raised.

WISLEY GARDENS.

SEPTEMBER 22.—A meeting of the Subcommittee of the Fruit and Vegetable Committee was held on the above date. The mid-season and late Potatoes and the Beet being grown for trial were examined, and it was resolved to recommend Awards of Merit to Potato 64, Devanha Seedling, from Messrs. W. SMITH, Aberdeen; Potato 84, British Champion, from Mr. G. CARTER, Cottenham, Cambridgeshire; Beet 36, Willow-leaved (for ornamental purposes), from Messrs. DOBBIE, Rothsay; Beet 37, Sutton's Blood Red, from Messrs. SUTTON, Reading; Beet 40, Sutton's Fine Apple, from Messrs. SUTTON, Reading.

A report to the above effect was laid before the full Committee at Vincent Square on September 29, together with samples of the produce. After due consideration and examination of the produce the Committee adopted the report and sent it up to the Council, who confirmed it on the same date. *S. T. Wright, Superintendent; W. Wilks, Secretary.*

FRANCO-BRITISH EXHIBITION.

HORTICULTURAL SHOW.

September 30, October 1, 2.

(Continued from p. 255).

A handsome group was displayed by Messrs. H. B. MAY & SONS, The Nurseries, Upper Edmonton. Codiaceum formed the more conspicuous objects; there were finely-coloured plants of the varieties Reidii, Admiration, Queen Victoria, Mars, Duke of Buccleuch, Montfontanensis, Inimitable, and Princess of Wales. Amongst the Ferns *Polypodium Schneideri*, *Nephrolepis Amerpohlii*, *Asplenium marginatum*, *Adiantum peruvianum*, *A. Veitchii*, *Platycerium alcincore*, and *P. grande* were prominent. The whole was very effectively grouped.

Messrs. PAUL & SON, The Old Nurseries, Chesham, N., made a beautiful show with bouquets, large and small, of Roses, mostly Teas and Hybrid Teas. We remarked *Gutierrez Keller*, Mrs. W. J. Grant, Mrs. E. J. Hill (very prettily coloured in two shades of pink), Betty (a grand bloom of pale fawn and pink), Kaiserin Victoria, Mrs. Crawford, J. B. Clarke, and others. The Roses were intermixed with foliage of hardy shrubs, and bordered with a line of *Aliantum* Ferns.

Messrs. W. WELLS & CO., Merstham, surrey, made a central group with cut blooms of *Chrysanthemum* of various classes. Conspicuous varieties were *Polly* (an incurved Japanese), *Cecil Wells*, *Wells' Pride* (a re-entrant and single flower), *Purple* (Grown in a single-flowered variety), *President* (double), and the fine sulphur-yellow variety, *Capt. Julian*. Blooms

of large-flowered Pentstemons and hardy Asters were interspersed in the group, which was backed with tall stands of large-flowered Japanese Chrysanthemums.

Messrs. G. BUNYARD & Co., Maidstone, had a long, narrow group of hardy cut flowers, consisting mostly of Asters, Tritomas, Rudbeckia purpurea, Gladiolus Coquet, Physalis Bunyardii as taller grower than P. Franchetii, Lilium auratum, &c.

Messrs. VILMORIN-ANDRIEU & C^{ie}., 4, Quai de la Mégisserie, Paris, showed Primula obconica with large flowers, Cyclamen grandiflorum Papilio, in diverse colours, and C. persicum grandiflorum in variety. The Primulas formed the most interesting item.

Messrs. T. S. WARE, LTD., Feltham, made a show of moderate extent of single-flowering tuberous-rooting Begonias, many of the named blooms being very beautiful, as, for example, Comness of Dartmouth (pale flesh), King Edward VII. (crimson), and of great substance in the petal. Lady Dudley (old rose), and Comtess Cadogan (reddish-orange).

Messrs. SUTTON & SONS, Reading, showed intermixed with their exhibits of Melons, Tomatos, Cucumbers, &c., a quantity of flowers and flowering plants of Nemesia strumosa in several choice colours, hybrids of Gesnera splendens, Primula obconica grandiflora, improved Marguerite Carnations, single-flowering tuberous-rooting Begonias, and hybrids of Nicotiana affinis.

Messrs. WM. PAUL & SON, Waltham Cross, exhibited cut blooms of Tea and Hybrid Tea Roses, having choice blooms of Mme. Abel Chateaux, Earl of Warwick, Mme. Leon Pain, Frau Karl Druschki, Caroline Testout, Pharisar, and others.

Mr. C. TURNER, Royal Nurseries, Slough, exhibited Dahlias of the Pompon, single-flowered, and Cactus varieties. The quality of the Pompon and florist's varieties was very superior.

Messrs. J. CHEAL & SONS, Crawley, Sussex, had a choice display of Cactus Dahlias.

Messrs. JAMES CARTER & Co., High Holborn, London, combined a floral display with an exhibit of roots, vegetables, and fruit. In the centre a kind of temple was erected, on the supporting rods of which bunches of Asters and Chrysanthemums were slung in tiers, and similarly on connecting wires and arches at the ends. Physalis Franchetii, Lilies, Marguerite and Ice Carnations found place amongst the vegetables.

Mr. S. MORTIMER, nurseryman, Rowledge, Farnham, exhibited show and fancy Dahlias, as did likewise Messrs. KEYNES, WILLIAMS & Co., both contributing capital examples of these autumn flowers.

Mr. W. TRESEDER, Cardiff, and Mr. SEALE, Sevenoaks, exhibited Dahlias in show and fancy varieties in very fine condition.

ORCHIDS

Sir JEREMIAH COLMAN, Bart., Gatton Park, Surrey (gr. Mr. W. P. Boud), showed a group of plants, consisting of Laelio-Cattleya Wood-Baniana, L. C. luminosa, Pachystoma Thomsonianum, Cattleya Wendlandiana, C. Iris, the new Sophro-Cattleya Marya, a brilliantly-coloured bloom 2 inches in diameter, the delicately-coloured Cattleya Mrs. Pitt, the new Bulbophyllum lemiscatooides, Brassia Leopoldina longissima, Miltonia vexillaria Lepoldi, &c. As fossils to the richly-coloured Orchids Nepenthes were used in great variety.

Messrs. STANLEY & Co., Orchard nurserymen, Southgate, N., showed plants of Cypripedium A. Lantosa (a grand hybrid), Odontoglossum grande, Cattleya labata, C. elegans, C. Gaskelliana, Odontoglossum crispum, Pescatorei, Oncidium varicosum, C. bicolor, C. minucia, and others.

Mr. CH. MARON ET FILS, Orbid cultivators, Brunoy (Seine et Oise), showed large, beautifully-flowered plants of Cattleya Maronii a hybrid of C. velutina and C. aurea, Laelio-Cattleya Hy. Greenwood, Cattleya Milano, C. callistoglossa, C. Pittiana, and other species and hybrids.

FRUIT.

The fruit exhibits were of much interest, if only in showing how greatly the French excel in the matters of colour and general development, more especially in Pears, but also in Apples.

MM. CROUX ET FILS, Chateaux (Seine), exhibited a large assortment, the fruits being arranged on stout metal stands, bound with green velvet and set out about 2 feet apart. Of Pears there were Beurré Bachelier, B. Superfin, Marie Louise, Duchesse d'Angoulême, Beurré Ballet Père, Passe Casagne, Président Willemont, General Todleben, Beurré Diel, B. Chateaux, Doyné d'Hyver, Beurré Fouquet, Doyné du Comice, Beurré Sterckmans, B. Hardy, Souvenir du Congrès, and Chas. Ernest. The foregoing were the largest Pears. Of Apples we may mention as being of large size Bismarck, Calville Rouge d'Hyver, Requette de Canada, Belle d'Harcourt, Transparent de Coureuls, Jeanne Hardy, Reine des Reinettes, Calville Blanc, Calville Duquesne, and Alexander the Great.

From the gardens of Le Comte AMÉDÉE, Pépinières, Louveciennes (Seine et Oise), came an extensive assortment of Pears and Apples, many of them of fine size and free from blemishes. The following Pears were unusually large: Duchesse d'Angoulême, Sacré de Montoulu, Belle de Bruxelles, Van Marum, Le Lectier, Charles Ernest, Beurré Benoist, Mere Pierre, Doyné du Comice, Beurré Magnifique. Of Apples we may instance Pourpre Nationale, Requette de Canada, Reine des Reinettes, Peasgood's Nonsuch, and Lane's Prince Albert.

THE SOCIÉTÉ REGIONALE D'HORTICULTURE DE MONTREUIL AND BOIS sent combined exhibits. Pears and Apples were mostly of large size and high colour, and in some cases they were ornamented by means of stencils regarding the colouring. Apple Grand Alexandre was the largest fruit, the next in size being Calville Blanc, and Requette de Canada. Many splendid Peaches were exhibited, but no names were attached to the fruits.

M. LECOMTE, ANCIEN Parisian amateur, showed magnificent Pears and Apples, many of the varieties being well known to British growers.

MM. MILLET ET FILS, Bourg-la-Reine, showed 14 boxes of Strawberries, consisting of perpetual fruiting varieties, some known in this country and others not known. Of these last we may mention Mme. Bottero, La Productive, Piex, La Perle, Orange, Four Seasons (Millet), Merveille de France, Odette, &c. Numbers of Violets in bunches were also shown.

M. PIERRE PASSY, Desert de Retz, near Chambéry (Seine et Oise), showed Pears of great size, including Beurré d'Harcourt, Charles Ernest, Nouveau Poireau, Beurré Hardy, Doyné du Comice, Beurre d'Hardenpont, and Beurré Diel.

Messrs. T. RIVERS & SONS, Sawbridgeworth, Herts., made a great display of fruit trees in pots, vines in pots, and gathered fruits. The gathered fruit consisted of yellow, red, and black Plums, all fine and large samples. The grape vines were loaded with fine bunches, and consisted of Black Alicante and Golden Queen. Cherries in bearing were of the variety Guigne de Winkler.

Messrs. W. PAUL & SON, nurserymen, Waltham Cross, exhibited gathered fruit of fine quality; also a large number of trees in pots heavily fruited, these consisting of Pears and Apples.

THE ROYAL HORTICULTURAL SOCIETY OF JERSEY showed very fine Pears and Apples. In high colour, general development, and freedom from blemish of every kind, the fruits were ahead of all other exhibits.

Messrs. VILMORIN-ANDRIEU & C^{ie}., Paris, exhibited an extensive collection of Gourds, Squashes, Pumpkins, fruits of varieties of the Egg plant, Capsicums in great variety, Tomatos, Beans (yellow and green podded), Potatos, purple, white, and yellow Turnips, Radishes, Onions, Beet, &c.

VEGETABLES.

M. L. FERARD, horticultural seedsman, Paris, exhibited a large number of varieties of Peppers (Capsicums) in the ripe and unripe state; likewise Potatos and Tomatos in variety.

Mr. Ben. Ashton, gardener to the Earl of Lathom, Lathom House, Ormskirk, exhibited a collection of clean-skinned Potatos. There were purple, white, and pink skinned varieties, chiefly of the kidney shape.

Mr. H. BASSY, Spalding, had a large exhibit of named varieties of Potatos, and more than 100 unnamed seedlings.

THE SYNDICATE DES MARAÎCHERS DE LA SEINE exhibited a large assortment of market kinds of vegetables, salads, such as Chicory, Lettuces of the Cabbage section, Dandelion (mossy-leaved), Endive, Ciboules (Chiboules of the Scotch), brown (small) and red (large) Chives, Chervil, gigantic Cauliflowers, Celery, Celeric tubers, and Cardoons.

MM. CAUVETS ET LE CLERC, successors to E. Fourquet, 8, Quai Mégisserie, Paris, showed Potatos in about 100 varieties both French and English.

Mr. GOODACRE, Elvaston Castle Gardens, Derby, showed splendid Apples, Pears, Peaches, Nectarines, Plums, and black and white Grapes.

An enormous display of Potatos was made by Messrs. SUTTON & SONS, Reading. The produce, in about equal proportions, was of the 1007 and 1908 crops.

Messrs. DOBBIE & Co., Rothsay, showed about 40 varieties of Potatos of exceptional quality.

NATIONAL CHRYSANTHEMUM.

EARLY AUTUMN EXHIBITION.

OCTOBER 7, 8.—The first of this Society's exhibitions for 1908 took place on these dates at the Crystal Palace, Sydenham. Although this year shows us not of the importance as are the later ones, there was a bright display of blooms, principally of the decorative or border type, and competition was as keen, and probably keener than at any similar show held in October. The blooms generally were especially bright in colour, and they gave promise of a good Chrysanthemum year. There were many new varieties submitted for award, and of these the Committee selected eight as worthy of a Certificate of Merit. It was unfortunate that in an important class all the best exhibits had to be disqualified for not conforming to the schedule. This, however, was not the only instance in which the rules were not strictly adhered to.

CLASSES OPEN TO ALL EXHIBITORS.

The first class in the schedule called for a floral display of Chrysanthemums, including plants and cut blooms, relieved with suitable foliage plants, occupying an area of 14 feet by 7 feet. There were two competitors, the 1st prize being won by Mr. F. BRAZIER, Nurseryman, Caterham Valley, with a bright group arranged in semi-circular form, and containing in Bamboo epergnes many decorative, and a few large Japanese blooms. Especially pleasing were Goacher's Cimson, Wells' Scarlet, Polly (bronze), Diana, and Tapis de Neige (white).

CUT BLOOMS.

In the class for 24 blooms of Japanese Chrysanthemums in eight varieties, arranged in vases, three blooms in each vase, we could only find one exhibit. This was shown by F. A. BEVAN, Esq., Trent Park, New Barnet (gr. Mr. H. Parr). The exhibit contained many creditable flowers, including Mrs. A. T. Miller (one bloom being especially fine), Valerie Greenham (pink), Lady Helen (bronze), Mrs. E. Milham (here again one bloom was much superior to the other two), Miss P. Chittenden (a weak vase), Mrs. R. Hooper Pearson, Sapho (small), and Formality (a very choice white kind). The exhibit was awarded the 1st prize.

In the class for 12 blooms of Japanese varieties shown on boards there were three contestants. Some good flowers were seen, especially in the dozen shown by Mr. MARTIN SILSBURY, Shanklin, Isle of Wight, who won the 1st prize. The stand was the more noteworthy in that it included many new varieties of Mr. SILSBURY'S raising, one being awarded a Certificate of Merit. He showed Shanklin (a new blush variety), Glory (a large yellow seedling), Valerie Greenham, Mrs. G. F. Coster, Mrs. L. Thorn (an incurved yellow Japanese), Algernon Davies, Mrs. A. T. Miller, Bessie Godfrey, and several other seedling varieties of yellow colour. 2nd, Mrs. JEREMIAH LYON, Ridings Court, Caterham Valley (gr. Mr. G. Halsey), whose stand contained (Gustave Devoz) (white), Joseph Stone (a fine red bloom with paler reverse), Mrs. Geo. Milham, Bessie Godfrey, and others.

3rd, F. A. BEVAN, Esq., Trent Park, New Barnet (gr. Mr. H. Parr).

In the smaller class for six blooms of Japanese varieties of distinct kinds there were four exhibitors, the premier one being shown by T. L. BOYD, Esq., North Fittle, Tonbridge. The exhibiting good blooms, the varieties being: Mrs. A. T. MILLER (a grand flower of this excellent white variety), Marquis V. Venosta, Mrs. George Mileham, Mrs. W. KNOX (good generally, in the various exhibits), J. H. SILSBURY, and Mrs. R. FELTON. 2nd, Mrs. W. FORD, Parkside, Ravenscourt Park, London, W., his best example being a bloom of the white Mrs. A. T. MILLER. Lady Henderson (deep yellow) and Godfrey's Pride were also shown well. 3rd, Miss LANGWORTHY, Gray's House, Holypport (gr. Mr. T. J. Brown).

The best vase of three Japanese blooms of a yellow variety was shown by Mr. G. HALSEY, Caterham, the variety being Mrs. W. KNOX, six out of the seven exhibits being of this kind, the other was Bessie Godfrey.

Mrs. A. T. MILLER was considered the best in the class for three blooms of a white Japanese variety. It was shown by four competitors out of six, Mr. H. CARR, Barnet, having the best vase. Other varieties exhibited were Beatrice May and Miss A. Byron.

In the similar class for three blooms of a variety other than white or yellow, Mr. A. HORTON, Tonbridge, won with the variety Mrs. G. Mileham.

The best two vases of large flowering varieties, each vase containing nine blooms arranged with suitable decorative foliage, were shown by Mrs. JEREMIAH LYON (gr. Mr. George Halsey). The flowers were arranged with Adiantum Fern, variegated Abutilon foliage, Asparagus Spargeri and Codium (Crotons). Notable varieties were Josephine Stoney (a rich red colour), Mrs. Geo. Mileham (rose), Mrs. W. KNOX (yellow), Bessie Godfrey (yellow), Gustave Henry (white), Mafeking Hero (reddish), and Algeron Davies (a rich yellow shade). 2nd, Mrs. FORD (gr. Mr. F. Blackith).

DECORATIVE AND POMFON VARIETIES.

Mr. JOHN SMELLIE, Pansy Gardens, Busby, near Glasgow, won the 1st prize with no competition in the class for 12 bunches of early-flowering Pompon varieties in not fewer than eight sorts. He had Pierrey's Seedling (bronze), Flora (yellow), Scarlet Gem, Blushing Bride (pink), Fred Peale (red), Carrie (a small but shapely flower of yellow colour), Mrs. Selby (pink), Alice Butcher, Filberta (bright yellow), &c.

In the class for twelve bunches of distinct varieties grown in the open and not disbudded occurred the disqualification already referred to. The schedule stipulated that the bunches should not exceed 18 inches in diameter, but all the best exhibits measured considerably more than that breadth and in consequence the 1st prize went to Mr. A. HAWKINS, Gordon Road, Ealing, who had Harrie (bronze), Tuckswood Early, Lillie (pink), Horace Martin (yellow), Goacher's Crimson, Polly (bronzey-yellow), Roi de Blanc, &c. 2nd, F. A. BEVAN, Esq. (gr. Mr. A. Parr).

Mr. JOHN SMELLIE, Busby, had the finest flowers, having Elstob Yellow, Galeta (a pink seedling), White Massie, Champ d'Or (rich yellow), Roi de Blanc, and others in excellent condition. Mr. GEORGE BOWNESS, another Busby grower, was also disqualified with a choice set, and these two growers were not the only exhibitors whose exhibits were passed over by the judges.

Mr. HAWKINS won the 1st prize in the class for twelve bunches of similar flowers disbudded, having no competitor. He showed Lillie (pink), Bronze Masse, Roi de Blanc, Agnes, Marie Masse (pink), Le Cygne (white), Goacher's Crimson, Nina Blick and Yellow Mme. Desgrange.

In the amateurs' classes the principal prize winners were Mr. A. W. TROSSELL, Beckenham; Mr. A. HOGGAN, Busby; Mr. W. H. CHALK, Slough; and Mr. D. B. CRANE, Highgate.

Competition was keen in the decorative classes, tables arranged with Chrysanthemums being very numerous. There were eleven exhibitors in the open class for a decorated table, the best being adjudged that shown by Mr. Stevens (gr. to W. H. STONE, Esq., Laune Park, Sydenham). Mr. Stevens utilised small

blooms of yellow and red varieties interspersed with grasses, Kochia scoparia, Asparagus, &c. Mr. A. W. TROSSELL, Beckenham, was placed 1st in the amateurs' class for a decorated table in competition with four other exhibitors. Miss C. B. COLE, Feltham, excelled in the classes for a hand basket of Chrysanthemums arranged with ornamental foliage, and for a hand basket of berries and autumn foliage, but few persons would care to carry such large baskets as this lady utilised.

CERTIFICATES OF MERIT.

The following new varieties received the Society's Certificate of Merit.

Master James.—A big Reflexed Japanese variety of rosy-chestnut colour with a golden reverse. Shown by Mr. H. PERKINS.

Mrs. J. Kempley.—A small Japanese variety of old rose colour.

Kathleen Lambrick.—Of the same type as the last-named variety, but with bluish-pink flowers. (These two were shown by Mr. W. SEWARD).

Shanklin.—A large Japanese bloom, with broad, bluish-white florets. Shown by Mr. SILSBURY.

Nellie Riding.—A single variety of terra cotta colour.

Fee Parisiomi.—A pink decorative variety.

Provence.—Also a decorative variety of a pleasing salmon-pink shade with a golden centre. The plant is bushy in habit and free in flowering, making it a desirable border plant.

October Gold.—A variety of the Source d'Or type, a shade of old gold. (The last four varieties were from Messrs. W. WELLS & CO., Merstham.)

NON-COMPETITIVE EXHIBITS.

Gold Medals were awarded to Messrs. HOBBS, LTD., Dereham; Mr. NORMAN DAVIES, Framfield; Messrs. W. WELLS & CO., Merstham; and Messrs. T. S. WARE, LTD., Feltham.

Silver-Gilt Medals to Messrs. S. SPOONER & SONS, Hounslow; Mr. H. J. JONES, Hither Green; and Messrs. J. CHEAL & SONS, Crawley.

Large Silver Medals to Mr. T. BRAZIER, Caterham; Messrs. J. LAING & SONS, Forest Hill; Mr. PHILIP LADDS, Swanley Junction; Mr. G. W. RIELEY, Herne Hill; Mr. J. WILLIAMS, Ealing; and Messrs. J. PEED & SONS, Norwood.

LAW NOTE.

FLOWER SHOW PROSECUTION.

AT Ashbourne (Derbyshire) Petty Sessions, on October 1, a cottage gardener was summoned by the Thorpe and Dovedale Horticultural Society for attempting to obtain, by alleged false pretences, two sums of three shillings each on the occasion of the annual show held at Thorpe on August 19 last. Mr. Gordon Fraser, hon. sec. to the Society, said the defendant was awarded a first prize for a collection of fruit, which consisted of Apples, Pears, Plums, &c., but the money was withheld in consequence of certain information which reached the committee. A visit was paid to defendant's garden, and no Pear tree could be seen there, while the other fruit trees did not correspond with the exhibits. Mr. Smith admitted that he had obtained the Pears from a neighbour, but claimed that he had grown all the other specimens. Mr. Fraser added that the Society, which had recently been revived, after some years' cessation, had lost a number of subscribers owing to a practice which had prevailed of persons sending in as their own produce exhibits, which had been obtained elsewhere. The officials had issued a warning that such exhibits would be forfeited, and that "further proceedings might be taken." Witness submitted a copy of the preliminary schedule, showing the rules, one of which was that all exhibits must have been on the premises and in the possession of the intending exhibitor at least three weeks before the date of the show. The chairman of the Bench said the rule was faulty, and while the Society had done well to bring the case before the court, there could be no conviction. The rule should have made it plain that the exhibit was the bona-fide produce of the exhibitor. The summonses were dismissed. Mr. Fraser stating that the rules would be altered as suggested.

ENQUIRIES AND REPLIES.

PRESERVING WALNUTS (see pp. 224, 240).—The method adopted here for preserving Walnuts and Filberts is to dig holes in the open ground, into which are sunk Sealake pots up to the rims. A piece of slate is laid at the bottom to prevent worms from working in. The nuts are put into the pots, and the lids kept on securely. In these circumstances they will remain in a fresh and fine condition for several months. The Walnut trees here, which are full-sized and in number, are carrying full crops—the first time for four years, owing to late spring frosts in previous seasons. *W. Lavender.*

BLACK SPOT DISEASE OF TOMATOS: *H. F. B.* You will find an illustration of Tomatos affected with this disease in the *Calendar of Garden Operations*, a small work issued by our publishing department for 7d., post free. In the text it is recommended to spray the plants at frequent intervals with potassium sulphide (liver of sulphur) in the proportion of one ounce to two and a half gallons of water. Green stable manure and anything else likely to cause cracking in the fruits should be avoided in the soil. Use manure water freely. The disease is found on plants at all seasons.

CELERY DISEASED: *A. B. and H. F. F.* The plants are attacked with a disease known as Puccinia apii. Remove the diseased leaves and burn them. Spray the plants with dilute Bordeaux Mixture.

CHRYSANTHEMUM: *S. B.* The brown spots on the leaves are caused by a pernicious mould, Botrytis cinerea. It is advisable to burn all infested leaves at once, or the plants if they are badly affected. Spraying with Bordeaux Mixture may assist you, but the mould is dangerous, as it attacks many other plants.

COLCHICUM AUTUMNALE ALBUM: *B. L.* This is merely an albino form of the type. Colchicum autumnale is a native of this country, and in some parts of Europe it occurs with such freedom as to give the fields a pink hue. The plant is quite hardy and easy of cultivation. It forms a pleasing subject for the wild or rock-garden.

CRESS AND RADISH CULTIVATED UNDER GLASS: *H. J. G.* Your system appears to be correct. Provide a little warmth from the hot water pipes, especially at night-time. The Cress should be ready for cutting in a few days, and the Radishes may be pulled in about three to five weeks from seed sowing. It will be necessary to provide for a succession by sowing a portion only at one time. You might rotate the two crops. Why address the publisher on such a matter?

CYCLAMEN INJURED: *A. K.* The grubs attacking the roots of your Cyclamen are either those of the "black vine weevil" (*Oriophilichnus sulcatus*) or the "clay-coloured weevil" (*O. picipes*). The best method of destroying them is to pick them out from among the roots, or you can kill them by making four holes in each pot, about 3 inches deep and half an inch in diameter, and placing a little vaporite at the bottom of each hole, filling up the hole again with soil. The females laid their eggs in the soil, but the little grubs at first did not cause any noticeable injury; the weevils only feed at night-time, and so carefully hide themselves during the day. If you find the leaves of your plants are eaten by some insects which you cannot detect, spread a white cloth under the pots, and when it is dark flash a bright light upon the plants, when you will probably trap weevils. The caterpillars attacking your Roses are those of the "bufftip moth" (*Phalera bucephalata*). Hand-picking is the best remedy for this pest.

DESSERT APPLES: Pomona. Of the varieties in your list we consider the best three to be Cox's Orange Pippin, Ribston Pippin, and Allington Pippin. King of the Pippins is not comparable with these, and Blenheim Pippin is rather too large unless small fruits are specially selected.

EMPLOYMENT AT KEW GARDENS: A. H. You should apply to the curator for a form of entry.

FUNGUS: *E. H. B.* The specimen received is Geaster Micheliianus. The Geasters are known as "Earth stars" and their structure is exceedingly interesting. We illustrate the species at fig. 117.

GRAPES: *Miss Pike.* The condition of the Grapes received is due to the vines receiving some check before the berries were sufficiently ripe to be sweet. The withering of the stalks appears to indicate the first stage of shanking; but at present there is no indication of shanking in the fruits themselves. Without knowing anything of the nature of the border or structure in which the vines have been cultivated, we can only surmise that the draining of the border, or the nature of its composition, leaves something to be desired. It will probably be found that some of the main roots have got into soil which is not included in the actual border, and may therefore contain stagnant moisture, or in various ways be unsuitable for the vines.—A. L. Dublin. The

FIG 117.—GEASTER MICHELIANUS, THE EARTH STAR FUNGUS.

berries arrived in too pulpy a condition for a correct opinion as to their failure. There was no fungus disease present. We think your opinion as to relaying the vine an excellent one, or you might cut it back and train in new rods.—H. H. Kindly state again the substance of your first letter, as some time has elapsed since you wrote. Correspondents are expected to give their name and address, not necessarily for publication, but as a guarantee of good faith.—J. H. B. The berries are not diseased, but present the condition known amongst gardeners as "foxy." This is due to some cultural error; vines that are constitutionally weak through lack of proper treatment always fail to perfect their fruits. Endeavour to train in some new rods and see that these are not overcropped when young. Attend to the border if necessary, and be careful in the matter of ventilation, which should be ample.

MARCHEL NIEL ROSE: *J. B. et.* It is the stem which is usually attacked by canker, but not necessarily the point of union of stock and

scion. If the bark is caused to crack it provides a nidus for the fungus. Your treatment may have good results if adopted as a preventive, but time will show.

MUSHROOM: *P. L. H.* The specimen received is the Horse Mushroom, *Agaricus arvensis*, an edible species, but one rather strong in flavour.

NAMES OF FRUITS: *J. C., Swansea.* 1, Muscat Hamburg; 2, Buckland Sweetwater; 3, Lady Downe's; 4, Madresfield Court.—*E. A. M. Dutch Codlin*—*W. Brooks.* 1, Alfriston; 2, not recognised; 3, Requette de Canada.—*A. H.* 1, a splendid specimen of Tower of Glamis; 2, Blenheim Pippin; 3, Gravenstein.—*J. Simons.* Please send again, and number the fruits by sticking a little stamp waste on each.—*Bradshaw.* 1, Lane's Prince Albert; 2, Dumelow's Seedling; 3, Golden Noble; 4, Tower of Glamis; 5, Gascoyne's Scarlet Seedling; 6, Newton Wonder; 7, Dumelow's Seedling; 8, Grenadier; 9, King of the Pippins; 10, Blenheim Pippin; 11, Cornish Aromatic; 12, Ribston Pippin; 13, Cox's Orange Pippin; 14, Duke of Devonshire; 15, Souvenir du Congrès. You have transgressed the rule by sending more than six varieties at one time.—*Chapman.* 1, Stirling Castle; 2, White Westling; 3, decayed; 4, Lord Lennox; 5, Potts's Seedling; 6, decayed; 7, New Hawthornden; 8, Cox's Orange Pippin; 9, Emily Childs; 10, not recognised; 11, Dutch Mignonne (Requette de Caux); 12, not recognised. You should have sent only six varieties at one time.—*Enquirer.* 1, 2, and 3, Cox's Pomona; 4, Hornead Pearmain; 5, King of the Pippins; 6, Alfriston.—*E. O.* 1, Duchesse d'Angouleme; 2, Beurré Hardy.—*H. L.* 1, Cox's Orange Pippin; 2, Newton Wonder; Pear Beurré Clairgeau.—*Nash.* 1, Lane's Prince Albert; 2 and 3, Annie Elizabeth. Pears: 1, Beurré d'Amanlis; 2, Gratiol of Jersey; 3, Comte de Lamy.—*Aldersy.* A very beautiful Apple which we do not recognise. It resembles Gascoyne's Scarlet Seedling. Send six fruits to the Fruit Committee of the Royal Horticultural Society.—*J. Guy.* The damage is done by the maggot of the Pear midge.—*H. C. H. W.* 1, Beurré d'Amanlis; 2, Docteur Pigeau; 3, too small to recognise; 4, Fasse Colmar; 5, Noveau Poiteau; 6, Castle Major.—*G. Mottam.* 1, Deans' Codlin; 2, Malster; 3, Ecklinville Seedling; 4, Old English Codlin; 5, Dumelow's Seedling; 6, fruit decayed.—*W. S.* 1, Vicar of Winkfield; 2, Chaumontelle; 3, Cox's Pomona; 4, Waltham Abbey Seedling.—*J. Morck.* 1, Harvey's Wiltshire Dehance; 2, Cullen; 3, the Plum had decayed.—*J. H.* The Plums had decayed. 1, Waltham Abbey Seedling; 2, Ribston Pippin; 3, please send a better fruit this variety.—*T. J. J. J. T.* 1, Prince Bismarck; 2, Grenadier; 3, Duchess's Favourite; 4, Lady Sudley; 5, Summer Strawberry; 6, Colmar d'Été.—*A. Reader.* 1 and 2, overripe; 3, Beurré Clairgeau; 4, Duchess's Favourite; 5, Calville Rouge Frécoque; 6, Allington Pippin.—*T. J.* 1, Lodgemore Nonpareil; 2, Cox's Pomona; 3, Old Hawthornden; 4, Ribston Pippin; 5, London Pippin; 6, Cox's Orange Pippin.—*T. H. B.* 1, Washington; 2, Herefordshire Pearmain; 3, Pear Beurré d'Amanlis; 2, Pear Léonle Clerc de Laval. Also a very good Grape which we cannot recognise. Please send a bunch to the Royal Horticultural Society's Fruit and Vegetable Committee.—*H. W.* Gravenstein.—*Ponica.* Thanks for your contribution of 1s for the K. G. O. Fund box. 1, Cellini; 2, Lord Lennox.—*C. T. S.* 1, Worcester Pearmain; 2, Alfriston; 3, not recognised; 4, Adams's Pearmain; 5, King of the Pippins; 6, Court-pendu-plat; 7, Requette de Caux; 8, Beurré Superfin; 9, Beauty of Kent; 10, Sturmer Pippin; 11, Melon Apple.—*T. H. B.* 1, Belle de Boskoop; 2 and 3, Allington Pippin; 4, Bow Hill Pippin; 5, Rosemary Russet; 6, Beurré d'Hiver; 7, decayed; 8, Hollandbury.—*W. D. S.* Ribston Pippin.

NAMES OF PLANTS: *Staffs.* 1, Begonia fuhsiodens rosea; 2, Probably Bambusa Fortunei.—*F. Luanan.* 1, Ophiopogon (syn. Liriope) intermedium; 2, Polygonum equisetiforme.—*H. R. W.* We do not undertake to name varieties of Carnations.—*T. T.* 1, Calanthe veratrifolia; 2, *Hamelia discolor*; 3, *Goodyeria repens*; 4, *Cochlidia rosea*; 5, *Dendrobium maculiforme*—*Hillfield* Griffinia hyacinthina. We

do not know to what you refer as Epidendrum chlorochilium. It may be Epidendrum atropurpureum, commonly called Epidendrum macrochilium. If this is the case the Odontoglossum house is scarcely warm enough to flower it successfully. Put the plants in Orchid baskets and suspend them in an intermediate house. Keep them quite dry for six weeks or so after the pseudo-bulbs are fully made up.—*Rex.* Rhamnus catharticus—Buckthorn.—*E. H.* 1, Aster cordifolius; 2, A. nova-belgii; 3, A. vimineus; 4, Helianthus species; 5, Rudbeckia nitida; 6, Helianthus pumilus.

PEARS: *Prunus, J. B., and N. Y. Z.* In each case the fruit is affected with the fungus known as Fusicladium pirinum, which is illustrated at fig. 118. Spray the trees with dilute Bordeaux Mixture when the buds are beginning to open, repeating the operation when the petals are falling from the flowers, and again when the young fruits have attained to the size of Peas. It is also advisable to spray the trees in winter with a solution of sulphate of iron.—*B. Day.* Lord Lennox is a small dessert fruit, in season until January. Old English Codlin is the same as English Codlin, and is one of the oldest English cooking Apples. It is in season from August until October. Both varieties are described in the *Fruit Manual* (Hogg). Peter Smith is a small dessert fruit, with yellow skin, and possessing but third-rate quality. It is mentioned in the *R. H. S. Report of the Apple Congress* held in the Old Chiswick Gardens in October, 1883.

FIG. 118.—FUSICLADIUM PIRINUM ON PEAR.

ROOT-APHIS: *L. C. R.* Mr. Robert Newstead, in his *Monograph of the Cecidias of the British Isles*, p. 64, recommends that growing plants attacked with this insect should be removed from the pots, and the exposed roots and soil be sprayed with carbon bisulphide (CS₂), using a small glass spraying apparatus. Scald the pot and have it in readiness for replacing immediately after spraying. This will not kill the eggs, therefore the process must be repeated. Keep the plants shaded from sunshine for a week after treatment.

ROSE TRADE: *Frau Karl.* You should write to one of the trade papers. Perhaps the Editor of *Horticultural Advertiser*, Lowham, Nottingham, may be able to oblige you.

SWANS: A. K. We cannot tell you where you may purchase these. Insert an advertisement, or write to the superintendents of the larger public parks.

WEEVILS: *D. Z.* See reply to A. K. under the heading *Cyclamen Injured*.

JAPANESE MAPLES.

MANY species of Acer are indigenous to Japan, but the term Japanese Maple is ordinarily applied in gardens to Acer palmatum and A. japonicum together with their respective varieties. The former of these was introduced to this country, according to London, in 1820, and the latter some 40 years or so later, but large plants of either species are comparatively scarce, while really large specimens of the numerous varieties are very rare. These Maples are perfectly hardy, not fastidious as to soil and situation, provided the latter is not too shaded, and are amongst the most ornamental of deciduous shrubs that can be grown outdoors in the country; their comparative neglect, therefore, seems to be somewhat surprising. In point of hardiness the Japanese Maples are equal to the Laurel; they are liable to be cut by late spring frosts, but they quickly recover from its effects. They exhibit a wonderful diversity of form of leafage, some of the leaves displaying a colouring as brilliant as showy flowers. The tints range from tender green or pale-yellow to glowing crimson, through every shade of rose and red. Until the last few years, even small plants of these Maples have commanded high prices, but in many instances they have realised sums far beyond their actual

worth, and this has probably been the cause of their being neglected by ordinary growers. Nowadays many seedlings are raised from seeds saved from large plants of various forms, and though this has tended somewhat to the multiplication of names through slight variations, the plants so raised have been more quickly grown, and, therefore, sold cheaper than the grafted or inarked plants that are imported from Japan. Seedlings of some of the varieties come fairly true to name; they show very little tendency to revert to the type; some are worthless, but many have more highly-coloured or deeper-cut leaves than the parent. Some of these seedlings have received names, though very little different from forms already in existence. A selection of Japanese Maples that can be recommended to the ordinary planter is found in those following:—

ACER PALMATUM.—This is the type species from Japan, and is to a certain extent variable in character, the differences being found mostly in the size and shape of the leaves, though there are also varying shades of green amongst them. The leaves are about 3 inches long, five-lobed, each lobe being cleft nearly to the base, and serrated along its margin. The foliage is of a yellowish-green tint in the spring, but this gradually changes to a bright grass-green hue, which continues until the autumn, when the leaves turn to a bright purple-red colour. The tree is of a spreading habit, and attains to a height of 20 feet to 25 feet by as much, or even more in diameter. The shoots are slender and twiggy, and the foliage is produced in such quantities as to entirely hide the branches.

The varieties of A. palmatum are divided into three groups, viz., the palmatum group, with five-pointed leaves; the septemlobum group, with seven-pointed leaves; and the dissectum group, with five to seven-lobed leaves, having many secondary sub-divisions. These distinctions are, to a certain extent, arbitrary, as the different groups, especially the first two, merge into each other; but the groups serve as a convenient guide.

THE PALMATUM GROUP.

A. palmatum var. atropurpureum and A. p. var. sanguineum are two forms that may be classed together, for in general appearance they are much alike. The leaves are 3 to 4 inches in length, five-lobed, with deeply-serrated edges, and of a bright ruby-red colour, which is very brilliant from the first unfolding of the leaves until the end of June, when it passes to a duller greenish-red. The secondary growth that usually—though not always—appears during July and August is of a brilliant crimson colour, glowing like fire in the sun. The young shoots of A. p. var. sanguineum are of a bright red colour, and the undersides of the leaves are green, and these characteristics constitute the chief difference between the two forms. In these nurseries is a plant of this variety about 15 feet high, with a diameter of 20 feet; there are also several others, but they are rather smaller.

A. E. var. AMPELOPSIFOLIUM.—This much resembles the preceding variety in colour, but the shoots are arching instead of erect, and it is not so vigorous in habit.

A. E. var. LINEARIBLOM.—In this form the three to five narrow strap-shaped leaflets are divided to the base, and are each about 1½ inches long, of a dark green colour when mature, but having a rosy-pink tint in spring. The plant is a slow grower, with a not too robust habit.

A. P. var. ROSEO-MARGINATUM (syn. roseo-color). This is a weak-growing plant, rarely seen to perfection, though very pretty when it blooms. The leaves are about an inch long, are prettily marked with white, and have rosy-coloured edges. It is rather more tender than the majority of these Maples, and requires planting in a position where it will be sheltered from cold winds. Specimens in pots are very useful for conservatory decoration, for which purpose it is perhaps better adapted than for planting out-of-doors.

THE SEPTEMLOBUM GROUP.

A. P. var. SEPTEMLOBUM.—The typical plant of this form has seven-lobed leaves, 4 inches or thereabouts in length, and of a dark green tint when mature. In the spring the foliage is of a rosy-red colour, but this gradually turns green, until, in the autumn, it assumes a brilliant vermilion-crimson tint, having occasional patches of orange yellow. The bark is red, and the petioles are bright red. There are other forms of this plant which have not received distinctive names; they differ chiefly in the size and the shape of leaf, and the colour of the shoots. One has purple-coloured twigs covered with a glaucous bloom. All are of vigorous habit, and for autumn colour effect are the best of the race.

A. P. var. SEP. ATROPURPUREUM.—The leaves of this are rather smaller than those of the preceding variety. They are of a purplish-crimson hue in the summer-time, changing to nearly black, with green mid-ribs, in the autumn. It is a fairly robust grower, and forms a handsome plant.

A. P. var. SEP. ELEGANS.—This is a distinct and pretty form, of vigorous habit, with large, seven-lobed leaves, 4 inches to 5 inches long, and of a pleasing grass-green colour. The lobes are deeply serrated on both edges; the petioles have a reddish tinge. In the autumn the leaves assume a mingled yellow and red colour.

A. P. var. SEP. ELEGANS PURPUREUM.—This resembles the last-mentioned variety in size and shape of leaf, but it differs in the colouring, which is a deep purple throughout the summer months, changing to a greenish-black tint with age.

THE DISSECTUM GROUP.

A. P. var. DISSECTUM.—In this plant the leaves are divided into five to seven leaflets, each of which is sub-divided until it somewhat resembles a Fern frond. The branches are long and slender, usually pendulous, but occasionally horizontal, rendering the plant a suitable subject for cultivating as a low standard, under which form of training it is seen to the best advantage. The foliage and young wood are of a bright red colour in the spring, and they change to a soft pleasing green as they mature.

A. P. var. DISSECTUM ORNATUM.—The leaves of this form are rather more finely divided than those of the typical dissectum: they are of a crimson colour in spring, changing to a bronzy-red shade later.

A. P. var. PALMATIFIDUM and A. P. var. DECOMPOSITUM both resemble the variety dissectum in the form and size of the leaf, also the habit of growth, but they differ in the spring and autumn colouring.

ACER JAPONICUM.

A. JAPONICUM.—This is a species attaining to a height of about 20 feet in its native habitat, but only about half that height in this country. The fan-shaped leaves are palmately divided into

from 10 to 12 short lobes, and are of a deep green colour during the summer months, changing to a brilliant crimson and amber colour in the autumn. For autumnal colour effect this plant is one of the best of these Maples.

A. J. VAR. AUREUM.—The leaves of this form resemble those of the type in shape, but they are much smaller, and of a pleasing sulphur-yellow colour, which obtains until August, when the tints are duller, with a tinge of red. It is hardy, but of slow growth, and has a rather weak constitution.

A. J. VAR. LACINIATUM.—This plant is often met with under the name of *A. j.* var. *cratigifolium*, but there is a true Japanese species of this latter name, and it would save confusion if it was dropped in connection with this plant. The leaves are divided to the base into seven to nine leaflets, each of which is again pinnately divided, giving the whole a pleasing appearance. The colour is a rich green during the summer, but it changes to a bright purplish-crimson and yellow in autumn. It is a handsome plant and of good constitution.

A. J. VAR. MICROPHYLLUM.—The leaves are like those of the type in shape, but less than half their size; they are glabrous on both surfaces, shining beneath, and of a deep green colour, changing to red and yellow in the autumn.

A. J. VAR. VITIFOLIUM.—This has stout, green wood, and leaves 4 inches to 5 inches long, with seven to nine deeply-cut, sharp-pointed lobes, that are serrated at their margins. The foliage is dark green in summer, changing to various tints in autumn, from yellow through amber, vermilion, and scarlet, to deep claret or purple. Sometimes all these colours can be seen at one and the same time on a plant, presenting one of the most brilliant effects of autumn leaf colouring. The young shoots are sticky to the touch. *J. Clark, Bagshot, Surrey.*

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT MESSRS. SANDER AND SONS.

WHEN the hybridising of Orchids was first practised, the scope of the hybridist was supposed to be very limited, but as time went on one strange bigeneric hybrid after another appeared, and the field was then considered to be limited only to the species of allied genera which flowered at the same season. This limit has also been passed at St. Albans by crossing occasional plants flowering out of their season, and some interesting hybrids of this class are under development. The many handsome and dissimilar species included by the botanist under the genus *Zygopetalum* have been very successfully worked, and although even in the most promising crosses of *Z. Mackayi*, as, for example, the *Chondropetalum Fletcheri* (*Chondrorhyncha Chosterstoni* × *Zygopetalum Mackayi*) raised by Messrs. Sander and which is again coming into bloom, there is a strong adherence to the characters of *Z. Mackayi*, much better results are expected from the crosses of the fine blue *Bollea celestis*, and others of that section.

The thousands of seedlings recently put into store pots and the germinating seeds in the seed-raising houses plainly indicate the reason why such establishments are continually wanting more glass-house accommodation. The recently-arranged block of 16 commodious houses joined at one end by the long corridor are full to overflowing with young hybrid *Cattleyas*, *Laelas*, *Brasso-Cattleyas*, *Cypripediums*, &c., from one to three or four years of age; and several of the large houses, formerly occupied by imported Orchids are now filled with hybrids approaching the flowering stage. Two of the most successful batches, viz., *Cattleya Iris*

inversa and the St. Albans type of *Laelo-Cattleya blechleyensis*, have still some in flower, the rich, reddish-rose and purple colour of the flowers of the latter being very attractive. *Cattleya Lord Rothschild* in several specimens of excellent quality are in bloom. *Laelo-Cattleya La France* (*C. bicolor* × *L. tenebrosa*) has several rose and purple flowers; *Cattleya Marston* and *C. Davisii*, both crosses with *C. velutina*, are in flower; and various unnamed *Cattleyas* and *Laelo-Cattleyas*, one of which, with clear, Lidian yellow sepals and petals and violet-purple lip, being specially good.

Of hybrid *Cypripediums*, a large number are in bloom, some of the best being *C. Nippe Sander's* variety, *C. Euryades magnificum*, *C. Transvaal superbum*, *C. Harrisonianum albens*, *C. Maudeae magnificum*, *C. Miss Louisa Fowler*, *C. Rolfei*, *C. Lamonteanum*, and *C. villoso-Rothschildianum*.

The large-flowered *Brasso-Cattleyas* of various crosses with the *Cattleya labiata* section resemble each other greatly, but the varied parentage serves to extend the time of flowering of the class, so much so that some of them are in bloom for the greater part of the year. A few with good, rosy-lilac flowers are now in bloom, but none equal to the fine *Brasso-Cattleya Madame Chas. Mason* "Sander's variety," which secured a First-Class Certificate at the Royal Horticultural Society on September 1 last.

The few hybrid *Odontoglossums* in flower are arranged with the collections of *O. crispum* and *O. Pescatorei* in the large *Odontoglossum* house, and with them in bloom are *O. Rossii majus*, *O. madrense*, *O. blandum*, and some other species. A very interesting fresh arrival is represented by a small importation of the little-known *Odontoglossum Galeottianum*, and which appears to be the true plant, and not the form of *O. nebulosum* sometimes seen in gardens under this name.

A house of *Cymbidium*s has good specimens of *C. Sanderi*, *C. erythrostylum*, and most of the other known species, and in bloom another of Micholitz, introductions from Annam resembling *C. Dayanum*, with arched racemes of white flowers striped with rose-purple. Notwithstanding the smaller demand for large-growing Orchids in recent years, it is found that *Cymbidium*s still are favourites, as their flowers are handsome and they thrive well even in the greenhouse or conservatory.

A large number of *Cypripedium Fairrieanum* are in bloom, but there is not the variety in them that was expected; the dark varieties are rare, and an albino has not yet appeared. *Cypripedium Godefroyae* is flowering in two distinct batches, the one being of the original white type marked with purple, and the other of the *C. G. leucophilum* class, in which the ground colour is more or less yellow, and in which there is much greater variety than in the old type.

Cattleya Harrisoniana is one of the showiest and most useful of Orchids giving its fine rose and white flowers at this season, and there is a considerable number at St. Albans. Probably there have been more of this than of any other *Cattleya* imported during the last few years, and it finds a ready sale because it is easy to grow, it flowers freely, and is suitable for florists' purposes.

Others of this class blooming well at St. Albans are *Oncidium varicosum* and *O. tigrinum*, both in cool houses and bearing fine sprays of yellow-tipped flowers. A batch including many species of *Masdevallias* have a good many of the smaller kinds in bloom. *Cattleya Gaskelliana* alba, blooming out of season, has four flowers. *C. Dowiana aurea* and *C. Hardyana* are good; an interesting collection of botanical Orchids have a few in bloom; a healthy lot of *Phalænopsis* are luxuriating in a warm, moist house, several of the *P. amabilis Rimestadiana* being very large specimens. Good collections of *Erides*, *Vandas*, and *Arachnantes* were noted, and *Laela anceps* is sending up a good

show of spikes. A considerable number of plants of *Dendrobium regium* are now established. *Cynorchis purpurascens* and a batch of the dark-coloured *Miltonia spectabilis Moreliana* and some other *Miltonias* are in bloom.

On one side of the pretty series of cool rockeries planted with Ferns and foliage plants at the entrance to the Orchid houses, a section is planted with *Pereskia Godeffiana*, illustrated in the *Gardener's Chronicle*, April 25, p. 260, this year. Its beautiful yellow, green and red foliage is rendered doubly attractive by the purple tinting of the under-side. The plant is most adaptable, being equally good for baskets, pillars, or rockeries in cool conservatories. It also makes a good display out-of-doors in summer. *J.*

OLIVERANTHUS ELEGANS.

This fine *Crassulaceous* plant, shown in our illustration (fig. 119), was flowering in very good condition in the plant-houses of the Royal Botanic Gardens, Edinburgh, during the summer. Professor Bayley Balfour informs us that the plant was received along with others from Washington in September, 1904, and flowered in Edinburgh in 1905. It was originally brought from Mexico by Mr. Rose, the assistant curator of the Division of Plants in the National Museum at Washington. It was first (1903) called *Oliverella*, but this name had already been appropriated by Van Tieghem for a group of species of *Loranthus*, and the present generic name was given in 1905. The genus is obviously related to *Cotyledon*, from which, like some others of recent creation, it is not very clearly separated.

The plant is a very attractive one, from the florist's point of view, and when we saw it in July last it was covered with beautiful rosy-red blossoms of a large size and good substance, which were borne singly on rather thin stems.

It is said to be easy of propagation, and it will certainly form a valuable addition to our conservatory plants as soon as it becomes more widely known.

ST. ANNE'S, CLONTARF, DUBLIN.

ONE of the finest and most delightful of Irish gardens is that belonging to the Right Hon. Lord Ardilaun, at St. Anne's Clontarf, Dublin, quite close to the tramway line from Dublin to Howth. I have visited this garden quite recently, when I found many improvements that had rendered them even more delightful than ever.

The estate itself is one of great natural beauty, and from its vantage points some magnificent views of Dublin Bay and other parts are obtained. Near the mansion, which is well hidden by trees, vistas have been formed, some after the style of the old "gazebos," and these enable the perspective of the distant country to be enjoyed. The flower gardens are situated quite near to the mansion. The drawing-room leads into a conservatory, and this plant-house is furnished throughout the season with suitable decorative subjects; at the time of my visit some large plants of *Crimum* were in flower; there are also several *Orange trees* in pots.

The flower gardens, as already stated, lie close to the mansion, and a tall New hedge divides the various quarters. This hedge is a good example of topiary work, and harmonises well with the architecture of the house. The flower-beds are filled with the most beautiful plants of their kinds. Some are varieties of Mr. Campbell's (the gardener) raising. One is a tall *Belobelia* named *Morning Glow*. It has dark-coloured foliage prettily covered with bloom almost like that on *Grapes*, while the flowers are coloured a bright rosy-scarlet. The shoots usually grow about 3½ feet high, but this season they have been dwarfier. Another fine *Belobelia* raised by Mr. Campbell is the variety *Lord Ardilaun*, of which a bed was seen at St.

Anne's. He has also raised a variety of *Anemone japonica*, named after Lord Ardilaun, which is cultivated in beds with much success. Another plant worthy of note is a dark-foliaged *Dahlia*, the name of which is unknown, but which I have not seen before. The foliage is remarkably dark, and the flowers are of a deep brown tint. Among other subjects in the beds are *Roses*, *Verbenas*, *Agathæa celestis*, *Stocks*, *Asters*, and other summer-flowering plants. A fine clump of the golden-leaved *Cortaderia* is planted on the lawn in this part of the garden. There is a broad herbaceous border in front

converted into a rockery, thus giving the impression of a piece of natural cliff. It has been skilfully arranged, and is planted with *Rosmarinus prostratus*, *Helianthemum*, *Aubrieta*, and many other good rock-garden flowers.

Another delightful feature in the garden is a circular space surrounded by a tall *Yew* hedge, screening a basin in which are some of the best varieties of *Nymphaeas*, such as *Colossea*, *Chromatella*, and others, whilst statues in the circle harmonise well with the formal basin and the *Yew* hedges.

A little way from this garden, and in a

pergolas, which are models of simple timber structures of the kind, being in the best of taste with their flagged pathways, and their pillars and cross-beams covered with climbers. *Roses*, *Clematises*, *Muehlenbeckias*, and other good plants join in happy companionship in covering this pergola. Mention must also be made of the lovely *Ashford Rose* which is largely employed at St. Anne's for furnishing arches, pillars, and walls. It is of the *Pissardi* type, and makes long, sturdy growths, and gives enormous bunches of delightful pink flowers. Mr. Campbell finds the typical *Rosa Wichu-*

FIG. 119.—OLIVERANTHUS ELEGANS FROM ROYAL BOTANIC GARDENS, EDINBURGH: FLOWERS ROSY-RED. (For text see p. 274.)

of the walls in this garden. The plants are placed in groups of one kind, so as to produce good colour effects. They are representative of the best modern hardy flowers, together with the most select of the older species and varieties. The walls are covered with choice plants, such as *Mandevilla suaveolens*, *Romneya Coulteri*, *Phygelis capensis*, *Clematis*, and other subjects suitable for the purpose. A good effect is produced by an angle of the wall being

sequestered corner surrounded by trees and shrubs, is a small rock-garden, associated with little pools of water. On the edge of the pools and in the water moisture-loving plants are cultivated, while on the drier parts is a collection of rock plants, also many small shrubs.

On the opposite side of the mansion is a walled-in garden, entirely devoted to flowers. It has been the outcome of gradual development, and is now showing its real beauty, the

raiana one of the best for training over arches. Besides the pergolas, there are little pathways as well as broader alleys, fringed by borders of hardy flowers, and arched over here and there by *Roses* and other trailing plants; whilst on the walls are many fine climbers and shrubs. Among the shrubs may be named a superior form of *Exochorda grandiflora*, a perpetual-flowering variety of *Sida dum crispum*, and *Buddleia Colvilei*, which was

expanding its flowers at the time of my visit. I saw also a fine shrubby *Pentstemon*, received as *P. coccineum*, but it does not appear to bear any resemblance to *P. Hartwegii*, of which *P. coccineum* is said to be a synonym. A fine plant of *Carpenteria californica* was also seen in this garden which is so full of rare and beautiful shrubs, herbaceous plants, and annuals. Artistic seats are placed about the garden and appropriate couplets from the poets have been carved on them; Thyme is planted by the stone steps, and exhales its delicious fragrance to the passer-by.

Overflowing from this wall garden, and alongside the exterior of its walls, are other choice shrubs and hardy flowers, also beds of Heaths, *Primula*, and other peat-loving plants. Close by, as well as in openings in the woods, there is a wealth of flowering shrubs, and many parts of the pleasure grounds are planted with bulbous plants. A little glen which leads towards the lake, is planted with Nymphaeas, and the waterside is carpeted with *Anemone apennina*.

The latest development in the gardens of St. Anne's is a "ditch garden." It was desired to convert a ditch which had been used as a receptacle for rubbish and which was near the walled garden into a "thing of beauty." The ditch was practically dry at almost all seasons, but Mr. Campbell has brought water from a higher source along a pipe laid beneath the ditch to its highest point, where it merges like a spring and forms a streamlet. A pathway has been formed along the little ravine, and this once ugly feature has been completely transformed by the planting of *Arabis*, *Abutilon*, and other subjects of a trailing habit. The lower parts are planted with species of *Primula*, including *P. Poissonii*, *P. frondosa*, *P. capitata*, and *P. rosea*.

The glass-houses are extensive, and a somewhat hasty inspection of the houses showed that exotic plants and flowers, including many Orchids, are well cultivated. Unfortunately, time did not permit of a visit to the fruit and vegetable garden.

Good work is being done by Lord Ardilaun in the improvement of the grounds. Fine trees are to be seen in plenty, especially evergreen Oaks, in which his lordship takes a great interest. It may be mentioned that there are about 10,000 seedlings of these evergreen Oaks ready for transplanting. *S. Arnett*.

POLYSTACHYA FLEUQUOSA.

OUR illustration (fig. 120) represents flowers and leaves of this pretty Orchid taken from the plant shown by Sir Trevor Lawrence, Bart., K.C.V.O., Burford (gr. Mr. W. H. White), at the Royal Horticultural Society, August 18 this year, when it was accorded a Botanical Certificate. The plant was imported from Uganda, and in habit and flower it is very distinct from other species of *Polystachya* and quite the gem of the genus. The pseudo-bulbs, which are about 6 inches in height, have bright green leaves almost as long as the pseudo-bulbs on the upper part, the whole plant somewhat resembling a miniature *Ansella*. The slender scape, which is about a foot in length, bears a head of pure white flowers with purple spotting on the lip. The flowers are produced in succession, our illustration representing the final stage, and thus it continues in bloom for several months. *Polystachyas* are usually considered to be chiefly of botanical interest, but a good proportion of the species are pretty enough to render them very interesting objects in gardens, and, moreover, they thrive well in an ordinary warm greenhouse or Orchid house of intermediate-warm temperature.

The species best known in gardens are *Polystachya pubescens*, which is an evergreen species of tufted habit and bearing pretty sprays of yellow, fragrant flowers with red stripes; *P.*

Ottomania, a dwarf species with white flowers; *P. luteola*, which is one of the most widely-distributed and which bears spikes of small greenish-yellow flowers; *P. Lawrenceana*, a very pretty species, with comparatively large flowers; *P. grandiflora*, the largest-flowered of the genus, bearing fleshy-greenish flowers, striped with purple; *P. bracteosa*, a strong grower, with curious flattened pseudo-bulbs and pretty sprays of yellow and red flowers.

Most of these are African species and have been shown or flowered by Sir Trevor Lawrence, in whose collection *P. bulbophyllioides*, *P. Buchanania*, *P. laxiflora*, *P. odorata*, and *P. Zambesiaca* have also been flowered.

THE HOLT, HARROW WEALD.

THE beautiful and interesting garden of Andrew Kingsmill, Esq., is situated in a charming part of the Harrow Weald known as the Bentley Priory estate. Most of the grand old Beeches, Oaks, Spanish Chestnuts, Conifers, and other trees have been allowed to remain,

FIG. 120.—POLYSTACHYA FLEUQUOSA: FLOWERS WHITE WITH PURPLE LIP.

and the natural undulating ground, with hillocks and dells as Nature formed them, provides an ideal situation in which to form a garden. Beneath the stately forest trees patches of Rhododendrons form a bright evergreen undergrowth and display their bright colours in due season. In spring a profusion of flowers is furnished by large patches of *Narcissus*, *Crocuses*, *Snowdrops*, *Tulips*, and other showy bulbous plants, and every month sees the appearance of a new set of flowers. In the glades are patches of graceful Bamboos and arrangements of hardy Ferns; conspicuous amongst the latter are great masses of *Oncoclea sensibilis*, beautiful specimens of the *Osmunda*, both British and American, large tufts of *Polypodium Dryopteris*, *P. Phegopteris*, and some of our dwarfier British Ferns, together with rarer specimens gathered in various countries by Mr. Kingsmill himself. In one clearing is a pretty arrangement of bright flowers, in which the yellow *Hypericum*, the white and mauve *Viola cornuta*, huge masses of *Fuchsia Riccartonii*, and clusters of variously

coloured *Phloxes* are seen, with many species of flowering shrubs in the background. In one opening a grand specimen of *Gunnera manicata*, with huge leaves, forms the central object, beyond which is a rustic arrangement of hardy Heaths with *Gentians*, where the *G. asclepiadea* has thoroughly established itself. Next is seen a colony of American plants, patches of dwarf Alpines delighting in a moss-covered bed, and several bog and water-gardens, in which the white and coloured Nymphaeas are growing luxuriantly; also, finely in flower, *Sagittaria montevidensis*, which grows here so strongly that it requires restraining. *Sarracenia flava* and other rare bog plants appear quite naturalised. Among the more effective of the flowering shrubs are the dark violet form of *Buddleia variabilis* and the bushy *Veronicas*, of which there is a collection. Among the species of *Roses R. alpina*, with its brightly coloured fruits, and many others form pretty objects.

Many plants in this carefully-tended garden appear to great advantage by reason of the opportunity afforded to give each section suitable places, and these advantages have been cleverly utilised. A pergola of considerable extent is covered with various climbing and trailing plants, amongst which the large leaves of *Vitis Coignetiae* and the claret-purple foliage of *V. purpurea* form striking objects. In the formation of this pergola some points are noteworthy. A troublesome feature in such arrangements is that in the course of time the upright posts decay at the spot where they are inserted in the ground and the whole structure becomes in danger of collapsing. To obviate this Mr. Kingsmill caused each of the rustic, upright posts to be grooved longitudinally on one side to the centre, the groove being sufficiently wide to admit a stout gas tube, which was 3 feet longer than the post, the extra length forming that portion which was fixed in the ground, the upright posts merely resting on the surface, the tubing being kept in position in the groove by wire at each end of the rustic post. Thinner gas tubing is used overhead, and rustic wood-work cross-pieces are fixed wherever required, so that the whole is rendered thoroughly durable without sacrificing the rustic features.

The smooth lawn beside the dwelling-house is bordered by a series of pretty nooks and rock-gardens, the inner walk being of flat, rough stones, with dwarf Alpines planted in the spaces between, so that it forms a garden as well as a clean walk in all weathers. In the side beds the garden *Roses* are still beautiful, and in the distance the glowing scarlet and yellow colours of the *Kniphofias* and other showy autumn flowers give bright colour. In one clump *Wichuriana* *Roses*, *Cotoneasters*, and *Pampas Grass* make a pleasing combination; in another a large planting of *Cotoneaster microphylla*, with its red berries, is thickly clustered with the reddish-scarlet sprays of *Tropeolum speciosum*, aptly called the *Flame Nasturtium*, and which here has become almost ineradicable. Patches of Alpine Pinks, several feet across, masses of rock *Roses*, various species of *Polygonum*, showy bushes of *Phygelius capensis*, and numbers of pretty and rare species present themselves in their best aspect.

On a verandah *Ipomoea Purga* is in flower; *Ficus repens* presents its two dissimilar forms of growth; *Vitis heterophylla* is preparing for its annual display of bright blue berries, and several *Acacias* and other shrubs usually considered greenhouse plants are thriving. In the border beneath, a large specimen of the old *Macartney Rose* is well furnished with its large, satiny-white flowers. *Carpenteria californica*, *Raphiolepis ovata*, and other uncommon shrubs are in a perfect condition of health, although the formerly tall specimen of *Eucalyptus Globulus* and a few others were cut down to within 6 feet of the ground last winter. On one side of the lawn is a noble specimen of the weeping *Silver Holly*, beneath which a seat has been fixed.

Too often in gardens is it the rule to plant freshly-acquired plants in any spaces which happen to be most readily available. Mr. Kingsmill's method is to specially prepare sites for all newcomers according to what is known of their natural requirements, and hence the successes are numerous and the failures few.

In the greenhouses are many curious and pretty plants. Overhead are suspended grace-

ful plants of *Ceropegia Woodii*, *C. debilis*, &c., and on the roof *Lapageria rosea* is in fine bloom. *Urceolina pendula* has its pretty drooping yellow and green flowers; the old *Nierembergia gracilis* and many other pretty old garden plants are in bloom. In an unbeaten frame *Todea superba* is growing well, and in all sections of hardy plants a great number of aliens have been successfully naturalised. *J. O'B., September.*

A JAPANESE NURSERY.

(See fig. 121, also Supplementary Illustration.)

The nursery business between this country and Japan has considerably increased in recent years, but it is likely to extend to greater proportions as the means of communication are improved. One of the principal horticultural exports is that of flowering bulbs, particularly species of *Lilium*. In our Supplementary Illustration is shown a portion of a field in the nurseries belonging to the Yokohama Nursery Company devoted to the culture of *Lilium speciosum rubrum* var. *magnificum*, a variety that was introduced by this firm, and one to which the Royal Horticultural Society's Award of Merit was awarded on September 29, 1903. It is remarkable for the rich carmine colouring of the flowers, their large size, and the vigorous and erect flower-spikes. Every care is exercised to keep the variety true to type, and workmen may be seen in the illustration engaged in marking inferior forms that will eventually be weeded from the stock. The bulbs are packed with care in a reddish earth, in which material they will travel well for long distances. Only the best bulbs are exported; the smaller ones are planted in the nursery for another year. *Lilium* bulbs form an article of consumption in Japan, but we suspect it is only inferior varieties that are thus employed.

The portion of the nursery illustrated at fig. 121 conveys some idea of the extent that old specimen Conifers, Wistarias, Acers, Cycads, and other species are cultivated. They are grown chiefly for export, and Europeans visiting Japan are continually purchasing specimens to add to their collections at home. Pot-grown trees rarely suffer in transit to this country if imported in the spring of the year. The Wistarias are very tastefully arranged when in flower, each specimen being isolated in order to display its hundreds of long pendant racemes to the best advantage. We are indebted to Mr. A. Dimmock for the photographs.

THE AURICULA.

It is a matter of surprise to me that there should be so much ignorance not only of the properties of the Auricula, but also of the system of culture to be followed in order to obtain the best results. I have come to the conclusion that the culture and nature of the Auricula is understood by very few persons.

In the early years of the nineteenth century, and down to about the year 1850, the Auricula was much valued and rather widely cultivated. The history of the Auricula has been much written about from the time of Clusius, who entered the service of the Emperor Maximilian II. of Austria, in 1573, and 13 years later Clusius pub. lished a valuable book, the *Kortboom*

FIG. 121.—VIEWS IN THE YOKOHAMA NURSERY COMPANY'S GARDENS, JAPAN.

Plantarum Historia, wherein the Primula family was extensively treated, and Chrusus cultivated the Alpine Auricula in its primal state, as well as the show or edged type; he also admits that the Auricula was widely cultivated in Belgian gardens before his time. I have carefully traced the history of the Auricula, through the early English Herbalists, and there is no mention of really edged Auriculas of the show type. In Hanbury's work entitled *A Complete Body of Planting and Gardening* striped flowers are mentioned in 1770, but Mr. Slater, in *The Amateur Florist's Guide*, writes of edged flowers in 1776, and as early as 1765 we come upon such varieties as Grime's Privateer, Popplewell's Conqueror, Gorton's Champion, Wigley's Northern Hero. They were not of any merit in comparison with the varieties now in cultivation, but they were decidedly grey and white-edged, and as for the self-edged, very good varieties were in cultivation a hundred years previously to this. Early in the nineteenth century a true green-edge was in cultivation, Page's Champion, and, later, Booth's Freedom. I had most of these in cultivation about 1870, but they made but little growth, and except as a matter of sentiment they were not worth the trouble. The fact is that the Auricula was badly cultivated by amateurs, who followed one another in their recipes for compost, &c. They had a notion that manure should be the principal ingredient instead of good, substantial loam. A gardener named Matthew Kenney was a "most successful and eminent grower of Auriculas" in the early years of the last century, and his compost was one-third loam to two-thirds sheep manure, with some coarse sand added; no wonder that the eminent gardener had occasionally to "wash the roots in water, examine them closely, shorten the top or main root, and cut away any decayed or unsound parts." Some of the Auricula growers now insist on removing all the soil from the roots, to examine what they term the "carrot" or main root. Thomas Hogg, writing so late as 1839, describes the compost in general use as follows:—Equal portions of yellow loam, cow manure, night soil, and leaf-mould, and adds, the following compost is also excellent for sown-blooming plants:—One part sound loam, one part dried night soil, two parts dung of sheep, cows, or poultry, mixed in blood from a slaughterhouse." It is probable that some Auricula growers, especially amongst the older florists, still hanker after these over-rich composts, and thus bring disease and death into their collection. The Auricula grows naturally on the mountains of southern Europe, and flourishes in the natural loam to be found there, consequently loam should be the staple of the compost; indeed, any potting soil in which such subjects as Fuchsia and Pelargonium flourish will also suit the Auricula, and the parts of fibrous loam, one part decayed stable manure, and one part leaf-mould, with some coarse, white sand, is a good compost. It is an interesting subject, if one had time to speculate on it, why the Auricula has had such a hold on the people of Great Britain and Ireland for so many centuries, and it is still more ardently cultivated than ever it was, for there are Auricula societies of a national character, and Auricula exhibitions in London, Birmingham, and Manchester, as well as in local districts, and certainly there never were such excellent varieties in cultivation as are now to be seen at these exhibitions. Many persons complain of failures with their Auriculas, probably it may in most cases be owing to too much care, and to want of knowledge of the requirements of the plant. It was the custom to use too large flower-pots, as well as over-rich soil. The proper compost is described above, and the flower-pots used should be well drained and 4 to 5 inches in diameter for the flowering plants. Repotting should be done annually. I begin when the flowering period is over, and as there are many thousands to report, it is continued until well into October; the offsets are potted off all the year round, except during severe frosts in winter. The Auricula makes its leaves very rapidly at flowering time, and these decay shortly after Midsummer, and should be removed as soon as signs of decay are apparent. As the plants settle into their winter rest less water is necessary, but another old practice should be avoided, that of drying the plants off in winter. They should not be watered

during severe frost, but never ought to be dusty dry. It is better to shade the plants from hot sunshine during summer, but at all times they ought to be freely ventilated and stand up close to the roof glass; the frames are apt to become the haunt of slugs, which sadly disfigure the leaves. The best way to diminish the numbers of these pests is to put a thickish dusting of soot over the surface before putting on a layer of ashes in the frames. The plants may either stand upon the ashes or upon a stage. They are not so liable to damp off in winter if they are raised near the glass.

For the guidance of amateurs, a list of the best varieties is appended:—

Green edges: Prince Charming, Abbé Liszt, Mrs. Henwood, Abraham Barker, Revd. F. D. Horner, Shirley Habberd.

Grey edges: Amy Robart, George Rudd, George Lightbody, Lancashire Hero, Olympus, and Richard Headley.

White-edged: Acme, Conservative, Heather Bell, Mrs. Dodwell, Rachel, Smiling Beauty.

Self-edged: Favourite, Harrison Weir, Heroine, Milado, Mrs. Phillips, and Mrs. Potts. *J. Douglas.*

NOTICES OF BOOKS.

"THE BOOK OF FERN CULTURE."

THIS practical work on Fern culture, by Mr. Alfred Hensley, formerly foreman of the Plant Department at the Royal Horticultural Society's Gardens, Chiswick, and for many years actively engaged in Fern culture, will prove highly acceptable to cultivators. The book gives detailed instructions on growing Ferns, from the sowing of the spores to the perfecting of a specimen. Such chapters as that headed "Ferns for Window Boxes" and "Ferns for House Decoration" are serviceable to those who have no glass-houses or accommodation for growing Ferns on a larger scale. The work is written in simple language, scientific terms are little used, and in the matter of nomenclature the names commonly recognised in gardens are adopted. The 21 chapters of the work extend over 112 pages, are well illustrated, and contain a vast amount of information. All the important types of ferns and their uses as garden plants are fully dealt with, and a good index renders reference easy. The one thing to be regretted is that so many errors in the plant names should have escaped notice during the reading of the proofs.

The Week's Work.

THE ORCHID HOUSES.

By H. G. ALFREDSEN, Orchid Grower to Lt.-Col. G. L. Holtrop, C.V.O., C.I.E., Westnort, Gloucestershire.

Vanda carinata.—The climatic conditions of the past summer and the present autumn having been favourable for this species, those plants treated as I advised early in the year should now be in a most healthy and satisfactory condition. At Westnort many plants are fast developing their flower-spikes, while many are in flower and some have already ceased to bloom. Plants flowering at the present time produce better blooms than those which flower late in autumn and early in winter, as the dull, foggy weather usually experienced then, especially in the neighbourhood of large towns, prevents their proper expansion. Plants of *Vanda carinata*, unless given very careful treatment, are liable to be affected with "spot," and this disfigurement seriously detracts from their appearance, as the leaves, when healthy, are so rich a green as to be ornamental. This spotting is caused in many instances by an excessively damp atmosphere, compared with the degree of heat and light prevailing, especially during the resting season. While the plants are growing, they should be accommodated in a house where the heat ranges from 60° to 70°, and afterwards, during the resting season, the temperature should be from 50° to 60°. During the latter period water should only be applied after the rooting material has become moderately dry,

and an abundance of air should be admitted whenever the weather is sufficiently favourable.

Vanda Kimballiana.—The blooms of this species are just opening and at this stage the plants should be afforded slightly dryer and warmer conditions. Thus treated, the flowers will be found to expand more kindly, and they are less likely to become spotted than if left in a cool, moist house. When the flowering season is past and an examination shows that the roots are becoming sealed over, which is a sure indication of the termination of growth, the amount of water applied to the roots should be gradually decreased. During the resting season water must only be applied when the leaves show signs of shrivelling. The plants should be wintered in a cool intermediate house.

Vanda Watsoni.—This charming Orchid resembles *Vanda Kimballiana* in its habit of growth, and the flowers are similar, excepting that these are pure white. Our plants are now developing the flower-spikes in an intermediate temperature, and in these conditions the plants will remain until the flowers expand early in the new year. Until that period arrives the roots must not be allowed to suffer for want of moisture.

THE HARDY FRUIT GARDEN.

By F. JOHNS, Gardener to THE DOWAGER LADY NUBSBOURNE, Warrington, Cheshire.

Strawberries.—Examine all Strawberry plants and Strawberry beds once more and remove any late runners that are found upon them. The surface soil should be lightly hoed and all weeds removed in preparation for affording a mulch. It is advisable to get this work done early, especially on light soils, so that the autumn rains may wash the nutriment from the manure down to the roots. The weather at present is favourable to the swelling and ripening of autumn-fruiting Strawberries, and the plants appear to be capable of yielding a supply of ripe fruits for some time to come. Frames may be placed over them if they are procurable, in order to protect them from heavy rains and frosts, and thus further extend the season.

Medlars and Quinces.—Medlars should never be gathered before they are ready, or the fruits will shrivel and fail to ripen properly. They should be gathered on a dry, sunny day, and in storing them the top of the fruits should be placed downwards, as decay usually commences at the stalk. Quinces are generally fit to gather about the same time as the Medlars, and care should be taken to gather them without inflicting any bruises upon the skin. Both fruits meet with appreciation for the making of jellies, and some appreciate the Medlars in an uncooked condition.

Gathering fruits.—Any Apples and Pears that are still upon the trees in open quarters should be gathered, but late Pears against walls, and, therefore, in a position where they can be protected, may be allowed to hang upon the trees for another week or two, provided the weather continues favourable. Late Pears improve in quality if they are allowed to hang fully as long as it is safe to permit them. Carefully examine early varieties of Apples and Pears in the fruit room and remove at once any decaying fruits.

Walnuts.—These are now falling fast, and the remainder may be knocked off the trees and separated from the husks before storing them in a cool place which requires always to be perfectly dry and laid out thinly on a dry shelf or placed in seed trays if room is scarce. They will then keep in good condition for a longer time than if they were allowed to hang upon the trees in damp weather. Coe's Golden Drop, especially, can be kept for a considerable time after being gathered.

Out-door vines.—Any bunches still hanging on the vines should be cut with the wood attached and placed in bottles or decays in a fairly warm and dry atmosphere, for in these conditions the process of ripening will continue. Shorten the leading shoots and also the spur growths to three or four leaves in order to allow the sun to shine upon all the shoots.

Loganberry and Blackberry.—If the pruning of these has not already been done the old fruiting canes should be cut away, as was previously recommended for Raspberries. After this has been done, secure rather loosely the new growths to the pole or wires. The plants require a suitable soil and need a liberal mulching and applications of liquid manure.

PLANTS UNDER GLASS.

By THOMAS LUNT, Gardener to A. STIRLING, Esq.,
Kent, Fife, Perthshire, N.B.

Nepenthes.—Old plants that are getting leggy should now be cut back, and the cuttings used for propagating purposes. Select well-ripened wood of one year's growth for the cuttings, making each cutting about five or six joints long. Use a very sharp knife and make a clean cut immediately underneath a node. Place the stem into a compost of peat, sand and chopped Sphagnum moss. The cuttings should be made very firm in small pots, and plunged in a hot-bed in a moist atmosphere. I have found *Nepenthes* to root better at this season than any other. As a rule, there is plenty of heat in the water pipes during winter, and if abundance of moisture is given almost every cutting will be rooted and ready for potting-on next spring. Some growers adopt a very good plan, and place the cuttings in inverted pots, packing the stem inside the pot firmly with Sphagnum moss and a little peat. The pots are then plunged in Sphagnum moss and kept damp. In order to take the cuttings out of these pots when they need to be potted-on, it is, of course, necessary to break the pots first, and great care must be taken not to damage the young, tender shoots. *Nepenthes* require a great amount of atmospheric moisture, and a high temperature at all times, 65 degrees being the minimum in winter.

Caladium, Gloriosa and Achimenes.—These plants are now passed for this season, and therefore they should be stored away in dry, warm conditions. They may be placed underneath the stage in a stove, and this is often as safe a place as any available. *Caladiums* especially, must not be subjected to a low temperature. Remove all the decayed leaves and lay the pots neatly on their sides.

Freesia.—The earliest batch of *Freesias* is now growing freely, and should be kept in a position close to the glass in a south aspect. Apply a little weak liquid manure to the roots twice each week. Place four neat, green-painted stakes round the inside of the pot and thin shreds of raffia around them, so as to keep the growths from falling down. The temperature of a greenhouse is sufficient for them.

Roman Hyacinths.—Examine these to see what quantity of roots the bulbs have made. If there are signs of top growth, they should be removed from the ashes and the pots or boxes placed in an unheated frame. A week afterwards a batch may be placed in the forcing house. Apply plenty of tepid water to the roots, and as soon as the foliage and flower-spikes begin to develop remove the plants and put them as close to the glass as possible. As soon as the flower-spikes begin to show colour place them to a cooler temperature, still keeping them close to the glass.

Tulips for forcing.—If the earliest Tulips have not already been potted or boxed-up, the work should be done at once. Their treatment is much the same as Roman Hyacinths. To make extra good pots, place the bulbs in two layers, as advised in the case of *Daillods* in a former Calendar which appeared on page 82.

THE FLOWER GARDEN.

By W. FIFE, Gardener to Lady WANTAGE, Locking Park, Berkshire.

Late flowers.—Many of the flower-beds are still bright, especially those containing *Begonias*, *Calceolarias*, *Heliotropes* and *Salvia splendens*, variety *Zurich*, but at the same time preparations must now be made for clearing some of the beds and replanting them with spring-flowering subjects. The present weather is very suitable for the work, and if it is done at once, the plants will become re-established before winter sets in. Should planting be deferred until November the results will not be so good. If shrubs are used to supersede the summer-flowering plants in the larger beds, they may be planted in any pattern or mixture that appears desirable. Such shrubs include *Eunonymus*, *Holly*, *Retinospora*, *Juniper*, *Box*, *Yew*, and *Erica*, *carnea*, *alba* and *rubra*. The ground around the shrubs might be carpeted with the common *Heather*, and it will be found very suitable. If certain beds are planted exclusively with *Wallflowers* the soil should be made very firm as the work proceeds, as this will cause the plants to make slow but sturdy growth, thus

enabling them to withstand frosts in winter. Large beds may be planted with dark-coloured *Wallflowers* and edged with dwarf yellow-flowered varieties, but very small beds should be made to contain but one variety, and this should be of dwarf habit. A bed which has been much admired here was planted with double white *Arabis* and *Tulip Couleur cardinal*. Another contained *Myosotis* "Royal Purple" and the white *Arabis*, with *Tulip Bride of Haarlem* interspersed. *Myosotis*, with *Tulip La Candeur*, or *Tulip Murillo*, is also a pretty combination. Narrow borders may be made very beautiful if planted with *Wallflowers*, well intermixing the numerous shades.

Hardy Ferns.—At this season of the year the mixture of green, bronze and yellow fronds is very effective, therefore remove any disfigured fronds from the plants, and Ivy (*Hedera*) or *Periwinkle* (*Vinca*) that may have overgrown them.

Shrubberies.—The ground is now in excellent condition for the levelling or relaying of lawns, or for the making of new lawns. The planting of Conifers and other evergreen trees may be carried out at the present time with advantage.

Bulbs.—Bulbs intended for spring flowering should now be planted. Those required for the more important beds should be purchased fresh every year, and after they have been used for one season in those positions they may be transferred to the mixed border or shrubbery. The best effect is obtained from bulbs when they are massed in their separate colours, but mixed beds are charming if the mixing is done very carefully. In the planting of bulbs the distances generally allowed between each are as follows: *Hyacinths*, 8 inches; *Tulips*, 4 inches; *Narcissus*, 5 inches; *Scillas*, *Snowdrops* and *Crocuses*, 3 inches. The depth should be from 3 to 4 inches.

General work.—This will consist in dividing and rearranging herbaceous plants in established borders, and lifting of *Dahlia*, *Canna* and such like roots for storing away in a dry place. Tuberous-rooted *Begonias* may be wintered in cold pits, laying the tubers in soil and allowing a good length of the tops to remain attached. The glass of the frame may be covered with Fern fronds or similar material in severe weather to prevent frost, or the tubers may be placed in boxes containing cocoanut fibre or fine peat, putting the boxes in a frame or cool greenhouse.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VISCOUNT GIBBS, Aldwych House, Fife, Perthshire.

Late Peas.—Owing to the favourable weather late Peas have been plentiful and the quality so good that they compared well with Peas usually produced at the end of June. There is every appearance that in the absence of frost the supply will continue for another month. Any which have not already had their leading growths shortened to the pods, which are already commencing to swell, should be given this attention at once, as it is not to be expected that any at present in flower will have an opportunity to mature. All side shoots should be removed and the roots be well supplied with farmyard liquid manure. If any are only just coming into use, it will repay the cultivator to place a temporary framework over the rows and cover with tiffany or some other light material whenever frost is likely to occur.

Celery.—During the last few days the crop has again been attacked with the *Celery maggot*. Every means should be taken to eradicate this as speedily as possible. Hand-picking is unquestionably the most effective method at this season of the year, picking off those leaves which are worst affected and pinching others with the thumb and finger which are only slightly attacked. It has been found necessary here to give all the late plantings a thorough watering, and in all cases before any earthing up is done care should be taken that the roots are thoroughly moistened. Take the earliest earthing up as soon as possible, being careful to form the ridges in a pleasing and workmanlike manner. There need not be much hurry to finally earth up the later batches, but a small quantity of soil broken up very finely may be placed about the plants at intervals of about ten days or a fortnight.

Turnips.—This crop has done remarkably well of late, and in some cases those sown at the ordinary time for furnishing Turnips for winter use will prove to be much too early. This experience goes to show the necessity for making frequent and small sowings during late summer and early in autumn. Those roots which are of sufficient size for use should now be lifted and carefully stored. Attend to the thinning of the late Turnips and frequently stir the soil between the rows. Even those plants which are now only just in the rough leaf may yet prove to be very serviceable next spring, and even if at the rate produce a quantity of leaves for feeding in the kitchen next spring.

Lettuce and Endive.—Complete the lifting of all *Lettuce* and *Endive* growing in the open garden, and place them in unheated frames or some other suitable structures as soon as possible.

Tarragon and Onions.—Where *Tarragon* is in request for salads or flavouring, a small number of roots should be lifted and planted in boxes, placing these in a moderate heat. Onions for salad purposes should be sown in boxes and placed in a warm house or frame.

FRUITS UNDER GLASS.

By T. COOMER, Gardener to LORD LLANGATTOCK, The Hendre, Monmouthshire.

Melons.—The weather has been very favourable for late Melons. Maintain the atmospheric temperature at night at 65° or 70° with proportionate rise by day. Admit air freely when the weather is favourable, but close the ventilators early in the afternoon, and at this season it is necessary to prevent the atmosphere remaining very moist, as this condition would be liable to cause canker. For the same reason exercise the greatest care in applying water to the roots, and be sparing in the use of stimulants. Light top-dressings of an easily soluble chemical manure are better than farmyard liquid manures at this season, when the roots are less active. As soon as the fruits commence to ripen, maintain the atmosphere dry by keeping the ventilators partially open by day, and to a lesser degree by night also, at the same time employing an adequate amount of fire heat.

Tomatoes.—Plants grown for fruiting in winter must have the lateral shoots removed regularly, and their leading growths carefully secured to the trellis or stakes. The blossoms should be pollinated by artificial means at midday. Employ careful ventilation, keeping the atmosphere in circulation both by day and night, and if a moderate degree of warmth is maintained in the water pipes it will keep the atmosphere comparatively dry. These conditions are essential both to ensure the free setting of the fruits and to prevent them from splitting during the ripening process. As the crops of fruit become heavier, an occasional top-dressing of bonemeal or a similar manure should be applied to the roots, and when the pots have become filled with roots a top-dressing of loam mixed with wood ashes and fine mortar rubble will be necessary. Older plants which have nearly finished fruiting may be cleared away, and the fruits they bear should be placed in a warm house and kept dry. Seeds may now be sown thinly in pans for raising plants to fruit early in spring. Pot the plants singly into small pots as they become fit, and replant them when necessary. Keep them near to the glass in a house having an atmospheric temperature of from 55° to 60°.

Cucumbers.—The winter-fruited plants will now have commenced to bear fruit. Endeavour to keep the growth of the plants firm and healthy. The temperature at night should be 65° to 70°, and may be allowed to rise by day to 75° or 80°. Ventilate the house very carefully during favourable weather, and prevent the atmosphere becoming excessively moist. Stop the young growths regularly and tie them to the trellis, allowing them rather more freedom than is usual in the case of summer-fruited plants. If overcrowding is practised, it will certainly shorten the fruiting period. Top-dress the plants occasionally with fibrous loam mixed with flaky leaf-mould and decomposed horse-droppings, applying these when fresh roots are seen to have come to the surface. Later plants should be potted-on as they become fit, and be given a position near to the glass in a light house.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

APPOINTMENTS FOR THE ENSUING WEEK.

SATURDAY, OCTOBER 17.—German Gard. Soc. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—48.6°.

ACTUAL TEMPERATURES:—
LONDON.—11 *Friday*, October 14 (6 P.M.): Max. 65°; Min. 54°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—*Timothy*, October 12 (10 A.M.): Bar. 30.1; Temp. 60°; Weather—Sunshine.

PROVINCES.—11 *Saturday*, October 14 (6 P.M.): Max. 58° Lancaster; Min 53°—May.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY.—
At 67 & 68, Cheapside, E.C., Dutch Bulbs, by Protheroe & Morris, at 10.30.

MONDAY.—
Unreserved clearance sale of Nursery Stock at Myrtle Road Nursery, Croyborough, by Protheroe & Morris, at 12.

TUESDAY.—
Second annual sale of Nursery Stock at Tivoli Nurseries, Holbourn, Hastings, by order of Mr. T. Reife, by Protheroe & Morris, at 11.30.

TUESDAY, WEDNESDAY, AND THURSDAY.—
Three days' sale of Nursery Stock at Shortlands Nurseries, Guildford Road, Ash, by order of Mr. H. Sleet, by Protheroe & Morris, at 12.

WEDNESDAY.—
A consignment of 1660 cases Japanese Irlums, received direct, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 1.

Palms, Azalæ, Rhododendrons, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.

FRIDAY.—
Unreserved clearance sale of Fruit Trees at Fairley Farm and Elms Farm, Cheshunt, by order of Messrs. T. & G. Oyley, by Protheroe & Morris at 12.

Imported Odontoglossum esquamæ, also Established Orchids, at 67 and 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

For some time past the cultivation of the Camphor tree for commercial purposes has been carried on, even in Formosa, its native country, under the fear of a diminishing trade. Synthetic camphor has been talked about for many years past, and, like the chemical production of indigo, which has threatened the Indian planters with extinction, there has been, and is still, the fear of the triumph of the chemist over the planter in the future supply of the camphor market. Incidentally it may be stated that under the new Patents Act, which came into operation recently, a factory has been erected chiefly for the chemical manufacture of indigo by a German firm on the Manchester Ship Canal near Chester, and no one can tell how soon a similar factory for the production of camphor may follow.

The competition between the two kinds of camphor is sufficiently apparent, when we find both products side by side in the London market, with a strong tendency by the makers of the synthetic product to bring the prices of their article considerably below those of refined natural camphor. With the present camphor supply in the hands of such shrewd commercial people as the Japanese, and with the introduction of the Camphor tree into various other countries, a progress that has been going on for several years past, the future of the European trade has become a

kind of Chinese puzzle. Thus the Japanese Minister of Finance, in an official report issued a short time since, drew attention to the circumstance that if Japan wished to retain the control of the camphor trade in future years, and to meet the ever-increasing demand, she must bestir herself by extending the cultivation of the tree, which requires forty or fifty years' growth before any satisfactory return can be expected. He further said that while this encouraging the production and manufacture of camphor the Government intended also to promote the exportation of the finished article, and commissioners had been sent to Europe and the United States to investigate the conditions affecting the demand. About the same time that this Report was issued a statement also appeared from the United States Consul at Tamsui, of an interview with the chief of the Camphor Bureau of Formosa. In this it is stated that the manufacture of camphor in Formosa affects only those trees of fifty years old or upwards, inasmuch as the cutting down of trees of a less age is forbidden. Recent investigations indicate that the supply of mature trees will, at the present rate of cutting, become exhausted in less than fifty years. The old trees now standing are confined to the mountainous eastern half of the island in regions, for the most part, inhabited by savage tribes. These mountains are covered with dense jungles, and the work of making roads, in order that the camphor forests may be rendered available for profitable exploitation, must involve the expenditure of much time and labour, besides which the sanitary conditions of the country are such as to produce fever amongst the labourers. A thousand coolies were taken by a Japanese company into the Daito prefecture a few years ago for the purpose of exploiting the camphor forests, and 35 per cent. of the workers were completely incapacitated by fever. The greater part of the camphor at present produced in the island comes from the Toon prefecture. Between 1900 and 1906 the Japanese Government planted about three million young trees, and it is intended to follow this up by planting 750,000 in each successive year.

There are said to be two distinct varieties of the Camphor tree grown, one producing the camphor of commerce and the other producing only camphor oil. There would appear, however, to be some mistake in this, as will be seen later on.

Private firms in Formosa wishing to engage in the cultivation of Camphor trees are supplied with young plants from the Government nurseries. Although the Customs returns for China show that 12,000 piculs of crude camphor were exported from that country in 1906, yet the Formosan authorities fear no competition from that source, and the reports of camphor planting in Ceylon, Florida, Texas, and Mexico do not disturb the prospects of the Formosan product in the eyes of the authorities. They contend that the more Camphor trees planted the less likelihood there will be of the successful production of an artificial substitute.

The subject is interesting from two points of view. First, it must be remembered that pharmaceutically genuine or natural camphor is alone acknowledged by the British Pharmacopœia, while synthetically-prepared

camphor is principally and increasingly in demand for the manufacture of celluloid and smokeless powder. Referring to the statement that two varieties of the Camphor tree are grown in Formosa, one yielding camphor and the other camphor oil, we may quote from a recent report of Sir A. Hosie, Acting Commercial Attaché to H.M. Legation at Peking, where he says: "Not only is camphor distilled from the camphor wood chips up country, but the oil resulting from this distillation is brought to Foochow in airtight old kerosene tins, re-distilled, and made to yield some 50 per cent. of its weight in camphor." The process is described as a very crude one, the oil being poured into the retorts, and the distilled oil after passing through the worm is received into kerosene tins, which are placed in tanks of water, where they stand for twenty-four hours to cool and to deposit the camphor in the bottoms of the tins. "The oil is then poured off and redistilled as many as sixteen or seventeen times, until the camphor has all been extracted."

THE GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We are informed by the secretary that the Rev. W. WILKS, M.A., secretary of the Royal Horticultural Society, has forwarded a cheque for £10 to the funds of this institution, being the proceeds of the harvest thanksgiving offertories at Shirley Church.

SOUTH-EASTERN AGRICULTURAL COLLEGE, WYE, KENT. The prizes and diplomas for 1907-8 Session will be given away and the inaugural address for the 1908-9 Session delivered by the Right Hon. Sir HORACE PLUNKETT, F.R.S., on Wednesday, October 21, at 3.15.

THE FRANCO-BRITISH EXHIBITION.—In addition to the firms mentioned in the report of the Horticultural Show recently held at the Franco-British Exhibition, Messrs. CLIBRANS, Aitcrincham, were awarded a Gold Medal for an exhibit of vegetables grown at their trial grounds at Bramhall, Cheshire.

TRAFALGAR DAY CELEBRATIONS.—We are informed that the design of Mr. G. W. BELLGROVE for the decoration of the Nelson Column on Trafalgar Day (October 21) has been accepted by the Navy League for the ninth successive year. The work will be carried out by Messrs. BELLGROVES, LTD., of Holly Lodge Gardens, Grove Park, Twickenham. Four venetian masts are to be fixed at the base of the column proper, and the historical signal will be hoisted in four sections. "England expects—that every man will do his duty," flags measuring 6 feet by 4 feet being used. On a cornice in bronze bas-relief will be a cluster of red oak 20 feet in diameter. The base will have an effective grouping of Palms and flowering plants, and will be festooned with Laurel, leaving spaces for the different emblems which will be sent by the various branches of the Navy League.

CLOTH FROM PINE LEAVES.—It appears from notes that have appeared in *The Technical World Magazine*, of America, that a sort of cloth is being manufactured from the needles of the Bull Pine, *Pinus ponderosa*. It is said that the tree sustains no damage from the deprivation of its leaves, an optimistic belief which experience will perhaps fail to justify. At any rate, this industry, if it should become extensive, will add another to the many uses to which Pines are now turned. We have ourselves seen very strong cordage manufactured in Europe from the roots of the Scots Pine.

DISTRIBUTION OF PLANTS.—The Commissioners of His Majesty's Works and Public Buildings intend to distribute during the autumn among the working classes and the poor inhabitants of London, the surplus bedding-out plants in Hyde Park, and Regent's Park, and in the pleasure gardens, Hampton Court. If the clergy, school committees, and others interested will make application to the superintendent of the park nearest to their respective parishes, or to the superintendent of Hampton Court Gardens, they will receive early intimation of the number of plants that can be allotted to each applicant, and of the time and manner of their distribution.

RETIREMENT OF SIR DANIEL MORRIS.—We learn that Sir DANIEL MORRIS, K.C.M.G., has resigned the post of Imperial Commissioner of Agriculture for the West Indies. Sir DANIEL MORRIS is well known to many of our readers, some of whom will remember him as Assistant Director of the Royal Gardens, Kew, an office which he held from 1886 till 1896, when he received the appointment which he is now resigning. As treasurer of the Royal Horticultural Society, Sir DANIEL did much to re-establish the finances after the Society's disastrous period at South Kensington. He has throughout his official career evinced the liveliest interest in the agricultural prosperity of the Colonies, and for 20 years before he was appointed to the West Indies he had been sent to various Colonies on missions connected with economic botany. In the West Indies he has established the inter-Colonial conferences, which have proved of considerable value in the dissemination of information, as well as in the gathering up and discussion of the numerous economic problems which arise in connection with the extension of agricultural operations in the tropics. The revival of the cultivation of Cotton in the West Indies has been greatly influenced by the stimulus given by his department, while good work has also been done in many other directions. Especial mention may be made in this connection of the investigations on the numerous diseases that are apt to become so acute under the conditions of tropical agriculture. Sir DANIEL will carry with him the hearty good wishes of a large circle of friends, who will regret his retirement from a post which he has filled with conspicuous ability.

GARDENING AT OLYMPIA.—In connection with the Ideal Home Exhibition inaugurated by the *Daily Mail*, which will remain open until the 24th inst., a section is devoted to horticultural and allied products. A spacious wing of the building is set apart for the exhibits in this section, and the whole has been laid out by Messrs. JAMES VEITCH & SONS, LTD., Chelsea. The use of turf has been extensively employed, and well-designed beds and borders have been planted with ornamental shrubs and trees, by the firm mentioned, whilst some flower-beds have been furnished by Mr. HENRY ECKFORD, Wem. Messrs. JAS. VEITCH & SONS also exhibit an admirable collection of Apples and Apple trees, including a remarkable dish of Chas. Ross variety, whilst adjoining are varieties of ornamental gourds. Nearly opposite this exhibit is another display of Apples, also vines and Apple trees in pots, shown by the KING'S ACRE NURSERY, LTD., Hereford. Messrs. SUTTON & SONS, Reading, are represented by a group of vegetables pleasingly set in banks of Lilliums, edged with Lily of the Valley and Astilbe. They have collections of Tomatoes and Potatoes, including interesting species of Solanum; also Melons, Onions, Gourds, Celery, Radishes and other vegetables. Appliances for the French garden are shown by Messrs. DUNCAN, TUCKER & CO., Tottenham, and the FRENCH CLOCHES COMPANY, Evesham, while Messrs. WATKINS & SIMPSON, Tavistock Street, Covent Garden, planted the frames and cloches set on

manure beds with Lettuces, Radishes, and Cauliflowers. The STUDLEY HORTICULTURAL COLLEGE show the students' handiwork in rearing poultry, the making of butter and cheese, bee-keeping, and the exhibit contains a few plants, also bunches of large-berried but badly-finished Grapes. The college have frames arranged on the "French" system. Pergolas, summer-houses and other garden appliances are distributed about the building by Messrs. BOLTON & PATEL, Norwich, whilst Messrs. MESSENGER & CO., LTD., Loughborough, have erected a small greenhouse and furnished it with plants. This firm, in addition, show their specialties in boilers. The most pretentious exhibit is a rock-garden with waterfall, arranged by Messrs. PULHAM, LTD., 71, Newman Street, London. Massive stones are disposed with good effect, and from the top water pours down in great volume and flows past a stone bridge and between stepping-stones, afterwards forming a small pool. Messrs. RANSOM, SIMS & JEFFERIES, Ipswich, show garden rollers and lawn mowers. Mr. WALTER VOSS displays garden implements, insecticides, chemicals for horticultural use, hose and other sundries. There are also appliances for bee-keeping, poultry and rabbit housing, incubators, fencing, and other things of use on an estate.

GOLDEN WEDDING.—Mr. and Mrs. HENRY WRIGHT, The Gardens, Southfield, Hurley, Leeds, writes a correspondent, celebrated their golden wedding on the 5th inst. Mr. WRIGHT is 76 and his wife 72 years of age. Mr. WRIGHT has served his present employer (Mr. GROSVENOR TALBOT) and his late father for almost 48 years. He has been a very successful exhibitor at the Leeds, York and Newcastle shows. Mr. HENRY WRIGHT was one of the founders of the Leeds Professional Gardeners' Benefit Friendly Society, and for more than 40 years has been an energetic and trustworthy member, having passed through the chair. He is held in high esteem as a successful gardener in the northern counties. Mr. and Mrs. WRIGHT have had 12 children. Two sons and four daughters are now living. They have 14 grandchildren.

SILVER WEDDING.—On the 30th ult., writes Mr. JOHN MCKERCHAR, Mr. and Mrs. F. CAPP, The Gardens, Charters, Ascot, entertained a party of friends to celebrate their silver wedding. The party inspected the well-kept gardens and pleasure grounds. Among the numerous presents was one from E. IYVESON, Esq., as an appreciation of the esteem in which he holds Mr. CAPP. Mr. CAPP has held several appointments as head gardener. Under his direction Sir WETTMAN PARSONS's gardens at Paddockhurst, Sussex, were renovated and a very fine range of new glass erected. Later he formed the new garden at Cavenham Hall.

THE FRUITERERS' COMPANY.—The annual dinner given by the LORD MAYOR and the LADY MAYRESS to the Fruiterers' Company was held on the night of the 8th inst. at the Mansion House. Before the dinner the Master of the Fruiterers' Company, Mr. A. J. BARBER, presented the LORD MAYOR with a fine collection of British-grown fruit. He stated that formerly the Corporation possessed the right of taking toll in kind of all fruit brought into the City. The difficulties of collection led to the toll being commuted to an annual gift of English-grown fruit to the LORD MAYOR. Sir JOHN BELL expressed his thanks. After dinner the LORD MAYOR, in proposing the health of the Fruiterers' Company, said that by their energy they had called the attention of the agriculturists of this country to the fact that there was still an industry which had been neglected. The guild had offered prizes to both small and large growers and had stimulated the movement for fruit-growing on commercial lines. Mr. BARBER, in responding, said the guild re-

ceived its charter in 1515, but there was evidence to show that its inception dated from a period long anterior to that time. He regretted that more fruit was not grown in this country to meet the requirements of the markets, and said that 90 per cent. of the trees in English orchards had never been touched with the pruning knife. If they received proper attention they would amply repay the labour spent upon them. In these days of lack of employment such matters should be considered.

NOTES FROM THE NORTH-WEST.—We have received the following notes by Sir HERBERT MAXWELL, Bart., from Manchester:—"Flowers of the waning season being always prized, it is useful to note any desirable additions to the list of better-known, but invaluable, autumnal plants, such as Japanese Anemone, Torch Lilies, Asters, &c. A recent notable acquisition is *Geranium Wallachianum*. I believe there is some doubt about the correct name. I obtained it two or three years ago from Mr. T. SMITH, of Newry. It begins to flower in June, but reserves its chief display for autumn, being now (October 12) sheeted with flowers of a charming clear blue, with white centres. Of low, spreading habit, it climbs into neighbouring shrubs to the height of 2 or 3 feet. *Artemisia lactiflora*, one of Mr. WILSON'S acquisitions from China, is a fine bold plant, growing 3 feet high, with Spiræa-like white plumes. Cuttings rooted in the previous autumn flower late, and make a nice group with seedlings of *Astilbe Davidiana* which come into bloom several weeks later than older plants. *Hemerocallis aurantiaca* major strikes a different note of colour, producing large blossoms of rich, soft orange hues, rising from very handsome foliage. We have not enough sun in the north to make it worth while growing *Plumbago Larpenze*; it flowers too late, putting out in early October just enough brilliant blue sparks to make us wish for more. The Knot-weeds—a genus of endless variety and extraordinary diversity—afford a beautiful late flowerer in *Polygonum polystachyum*, which is at present a mass of feathery spray of a charming pearly-white, 2 feet high. The Groundsels are as variable in form as the Knot-weeds. Their bloom has all passed away, except the rose-coloured *Senecio pulcher*, which continues to open its gay flowers till it is cut down by frost. It is rather a fickle plant, difficult to establish and apt to disappear without apparent cause; but when suited with a cool soil, with a little peat and a sunny exposure, it spreads into a respectable clump. It will not ripen seeds on our northerly coast. Among the *Laulas* the latest is *L. Hookeri*, which still displays its lemon-coloured rays. The name of the *Asplenium* of British botanists is also attached to the most beautiful shrub at present in flower, namely, *Hypericum Hookerianum* (oblongifolium); no novelty, indeed, but too seldom seen in good condition; disliking hot soils and dry climate, it luxuriates in the moist climate of the west. It is taller and far finer plant than *H. patulum*, which is sometimes supplied in its place. Closely resembling it in its flowers, but of humbler stature, is *H. triflorum*, all three species being at their best at the end of September, as is also the hybrid *H. Mozerianum*. They all like a deep, light soil consisting of peat and loam, and strike readily from cuttings. The white *Escallonia exoniensis* flowers more freely in autumn than the prettier *E. grandiflora*. Of all the shrubby *Veronicas* the most continuous bloomer is *V. parviflora*, which I confess I cannot distinguish from *V. salicifolia*. The former has been sent to me by nurserymen when I tried to get the latter. *V. parviflora* naturalises itself very freely by seed, and is altogether a desirable shrub. Can anybody tell me why I can get no satisfaction out of *Kalmia latifolia*? *Rhododendrons* luxuriate here, but coddle *Kalmias* as I may, I cannot get more than a niggardly allowance of flower,

just enough to swear by—and *et. Young* Laburnums seem to have gone mad this autumn, several of them being covered with blossom. *Arundo conspicua* has failed to send up flower-spikes this year, perhaps owing to the cold, wet summer of 1907; but the *Pampas Grass* is doing as usual."

HISTORIC FOREST FIRES.—In a circular issued by the Forest Service of the United States Department of Agriculture a condensed history is given of some of the great forest fires which have occurred on this continent. The Miramichi (New Brunswick) fire of October 7, 1825, in nine hours destroyed a belt of forest 80 miles long and 25 miles wide. One hundred and sixty persons perished; nearly a thousand head of stock and 590 buildings were burned. The Peshigo (Wis.) fire of October, 1871, was even more severe; it covered an area of more than 2,000 square miles. Between 1,200 and 1,500 persons lost their lives. Other fires which occurred about the same time in Michigan were most destructive, the estimated loss in timber being about four billion feet board measure and in money value over \$10,000,000. The most destructive fire of more recent years was that which started near Hinckley, Minn., September 1, 1894. The town of Hinckley and six other towns were destroyed; about 500 lives were lost and more than 2,000 persons left destitute. The estimated loss in property was \$25,000,000. *Weekly Florists' Exchange.*

AMERICAN FORESTRY.—Harvard College, says *Horticulture*, has recently made another addition to the land it is acquiring in Worcester County for forestry purposes, having purchased the Dexter estate of 43 acres.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

FLOWERS OF SPENSER.—The title of Miss Kent's book is *Flora Domestica*. What I wrote of the Ash was that one of its names was "Ebony," not Heben, and that spear shafts were made of that wood. I did not dispute that the Heben of Spenser is, in some instances, the Yew; but I think it is a case for differentiation. Hazel, Elm, and other woods, as well as Ash, were used for a cheaper class of bows, and much curious information on the subject will be found in the early issues of *Archologia*. Beyond to space rather than lack of material was the cause for condensing the former notes, which, however, I thought were sufficiently full. I am very much obliged to Canon Ellacombe for his kind words regarding myself, which I appreciate very highly indeed. *K. P. Brotherton.*

TRAINED FRUIT TREES.—Some four or five years ago I planted some horizontally-trained Plum trees that I had from Messrs. J. R. Pearson and Sons, the originators, I believe, of this system of training. Though the time that has elapsed is probably too short in which to form definite conclusions, I have learnt something from my experience, and, having had fan-trained and horizontally-trained trees growing on a wall side by side, I have been able to compare results. To speak generally, if I had unbaited wall space and wanted to cover it quickly, I should adopt the fan shape. If a comparatively narrow space required covering on a wall 11 feet high—the horizontally-trained shape. The latter shape diminishes the flow of sap towards the extension shoots, and it is difficult to get them to grow more than 6 feet from the main stem, especially the lower tiers, unless the ends are turned up as in the Verrier palmette shape. At the same time, if not pinched short in May, a good deal of strong breast wood will grow from the middle of the tree, further weakening the extension shoots. I think the chief defect lies in the difficulty of renewing branches. Occasionally it will happen that a weak extension shoot bears only fruit blossoms, and after bearing dies. The only way then is to train in the shoot nearest to the

end, and one suitable is not always easy to find. Pruning is easily done if pinching the laterals in late spring is carried out, and cut back to 4 or 5 inches in winter to make them break back. In my case this plan seems to induce heavy bearing, and the tree does not become crowded with foliage. *L. Fotherbrooke, Ravenstone Hall, Ashby-de-la-Zouch.*

—There needs no more difficulty in training Plum trees fan-shaped on a wall, than in training Peaches and Nectarines in the same manner. Plum trees are liable to lose a branch occasionally through gumming or other cause, and on a fan-shaped tree that vacancy can be speedily filled. With an horizontally-trained tree it is very difficult, if not impossible. That Pears generally are grown horizontally is probably as much due to nurserymen's recommendations as to any other cause. I have seen in years past superb fan-shaped Pear trees growing and cropping well. Horizontal training owes very much of its popularity to its neat aspect, and gardeners are often proud of the martinet-like appearance of their trees, each branch being arranged in mathematical order. But how often one sees such trees with only a few fruits on them? How commonly, with such trees, are the fruit on the younger wood, the spurs on the old wood, near to the vertical centre, being too weak to bear fruits. *D.*

THE SPARROW PLAGUE.—That an influential society has at last been formed, with the object of exterminating rats, mice, and sparrows, does not give cause for so much surprise as the fact that such a society has not been formed years previously. True, since the plague scare of a few years ago, a desultory campaign has been carried on against the rat in some of our larger seaports, but no really systematic or concerted action has been inaugurated in the country as a whole. Organised action cannot well be taken in any movement having for its object the destruction of noxious animals except under the auspices of a Government Department, or a powerful and well-advised society, working on thoroughly scientific lines. No doubt, in so far as rats are concerned, very few persons will be inclined to question the advisability of exterminating them. When, however, the sparrow is considered—with which the horticulturist and agriculturist are more nearly concerned—a few may be found to raise some kind of protest. We shall no doubt be reminded that the damage it does is readily seen, whereas the good offices it performs are not so easily appreciated, and may only be discerned when it is too late to rectify the mistake committed by its extermination. There are those who are ever ready to point out the folly of upsetting what they are pleased to term the "balance of nature." If this argument should be advanced in the present case, it may be pointed out with much truth that the existence of the sparrow plague itself is the result of interference with the balance of nature. Had not such a general destruction of hawks, owls, and other birds of prey taken place during the past 40 or 50 years, sparrows would not have been nearly so plentiful as they are to-day. I well remember the "sparrow-pie" as a dish much relished by country people, and have vivid recollections of the night attacks made by villagers (armed with nets, and with torches and lanterns) upon the roosting-places of sparrows. This culinary delicacy no doubt accounted for many thousands of birds in a year, but, apparently, its preparation means too much labour for the housewife of to-day, and thus what was once used, though on a small scale, as food, has gradually become a pest. Those best acquainted with the destructive habits of our native sparrow, together with its remarkable fecundity, have good reason to fear that, in the question of its extermination, it is fraught with "energy" and determination; very serious times lie before the gardener and farmer. Hardly any garden produce is free from its attacks; flowers, fruit, and seeds are all alike destroyed by it. During a recent visit paid to Scotland I noticed great breadths of the outer edges of fields of Oats quite denuded of its grain—all the work of the ubiquitous little sparrow! While it is so easy to recognise the damage done by this bird, it is quite another matter to devise cheap and efficacious methods of exterminating it, or of even taking successful precautionary measures against its attacks. In the case of cereal crops, farmers are finding that the less cover afforded by birds

the less is their loss of grain; hence they cut down all hedges as low as possible. In the ordinary garden every tree and bush provides more or less suitable cover, from which sparrows are enabled to inflict damage upon growing crops with but little chance of their being interfered with. It is generally admitted that the use of thread, paper, rags, or broken looking-glasses invariably represent so much wasted time, as such devices are little better than useless. Rats and even mice may be destroyed in great numbers by a virus, or by specially-prepared bait, either of which method is, for obvious reasons, entirely the question of dealing with the sparrow. Apparently the only safe and feasible method of eradicating this pest is by the formation of branches of the Anti-Vermin Society throughout the country, where payment—from funds possibly augmented by a grant from the Board of Agriculture—may be made for eggs and dead sparrows at so much per gross. This is a repulsive method of dealing with the question, and one that will undoubtedly tend to the undoing of much good teaching inculcated in our schools during recent years; but no other course seems open. Even should this drastic step be followed, the question of bird migration has still to be reckoned with. *P.*

BULBS IN HOLLAND.—We have read with interest the article on p. 243, and note that you remark upon the enormous increase in the export of bulbs from that country. We would draw attention to the fact that British enterprise has not allowed this enormous trade with Holland to be entirely in the hands of the Dutch, as we have freehold bulb farms at Akersloot in North Holland, and there are other English firms who have farms in that country. *James Murray & Sons.*

SOWING SEEDS OF PERENNIAL PLANTS.—In sowing seeds of perennials, especially of hardy perennials, which are difficult to germinate, and which normally take several months to germinate, I have found it an excellent practice to cover the soil after sowing, with loose moss. In seed pans so covered, Liverwort never appears on the surface of the soil, even when kept for 18 months or longer. Other advantages are that the moss prevents the watering from beating down the soil, and so, when necessary, enables it to be done freely and without any special care. It also keeps the surface of the soil in a state of equable moisture for a much longer time than when exposed to the air, and so obviates the need of close attention and frequent waterings. I sow a good many Daffodil and Iris seed every year in July and August, which, normally, do not germinate—at least, the majority of the seedlings do not appear above the soil—until January to April. The pans are sunk in frames, and, if covered with moss, I never have any trouble with Liverwort, the soil never needs loosening up, and the seeds germinate in due course with practically no further attention than an occasional watering in August, till about February. The best moss for the purpose is the common green moss that can generally be found in plenty on the north side of the bank and hedge in country lanes in early spring. Sphagnum moss will do, and, where used in an emergency, but it is heavy and "heavy" and less "spring," and so does not protect the soil so well from an occasional heavy watering or rain, and it is also more difficult to remove when the seedlings appear. A layer of from one quarter to one half an inch of moss is sufficient, spread evenly and loosely immediately after the seed is sown and before watering. To prevent the moss from being blown off in a high wind, when the seed pans are in frames or in the open, it is well to lay pieces of 1-inch mesh wire netting across the top of the pans or pots. Though this use of moss as a covering is especially advantageous in the case of hardy perennials, it is equally good for all seeds of perennials sown under glass, as well as for half-hardy annuals, &c., and I have used it successfully with fine seed such as *Gloxinia*, *Begonia*, and *Streptocarpus*. It is far preferable to the usual plan of covering the pan with glass and brown paper; there is much less damping off, for it allows a freer circulation of air while giving sufficient and yet not too dense shading. If the moss is used fairly fresh it is easily taken off when the seedlings appear, as it clings together, and can be peeled off in one layer. *A. J. Bliss.*

* PRONUNCIATION OF PLANT NAMES.

PRONUNCIATION.—In the first word in each line the accent (´) is short; (˘) is long.

In the second word vowels are to be pronounced as—

arise, á, áge, árt, áir, áll end, égg, cáil, crí, éwo in, í, íre, sír on, ótter, ówe, ór, ód, ówl, óil us, útter, úse, úrn "ch," as in chin; "th," as in thin "s," as in soft; "f," as in far "g" as in go.

All other letters are unmistakable.

(To be continued.)

SOCIETIES.

ROYAL HORTICULTURAL.

OCTOBER 13.—The Hall was well filled with exhibits on the occasion of the fortnightly meeting held on this date, and although hardy garden flowers predominated, there were many good displays of Orchids, greenhouse plants, ornamental shrubs and trees, and hardy ferns, especially those being the collection of Apples staged by **Lt. Col. Buxton, Cheveney.**

The members of the **FLORAL COMMITTEE** had many novelties brought to their notice, and of these they recognised seven as worthy of Awards of Merit.

The **ORCHID COMMITTEE** granted two First-Class Certificates, three Awards of Merit, and two Botanical Certificates.

At the afternoon meeting of the Fellows a lecture was delivered by **Mr. Cecil Hooper, F.S.L.**, on "The Influence of Geology on Horticulture."

Floral Committee.

Present: H. B. May, Esq. (in the chair), and Messrs. Chas. T. Drury, T. W. Turner, G. Reuther, Chas. Dixon, Arthur Turner, II. J. Jones, Herbert J. Cutbush, W. P. Thomson, W. J. James, E. H. Jenkins, George Paul, Ed. Mawley, J. T. Bennett-Poe, John Green, Jas. Walker, E. J. Bowles, Chas. E. Pearson, Chas. E. Shea, F. Page Roberts, W. Howse, R. Hooper Pearson, J. F. McLeod, J. Jennings, Walter T. Ware, and George Gordon.

Messrs. **CUTBUSH & SONS**, Highgate, London, N., showed beautiful *Caryophyllus* in vases, staged with great skill, also on another table a large exhibit of *Pernettya mucronata* of the white-berried variety; a batch of *Shimimia japonica* finely in berry, and examples of the Otaheite Orange—*Citrus sinensis*, with several dozen fruits on miniature trees. (Silver Flora Medal.)

Messrs. **H. B. MAY & SONS**, The Nurseries, Upper Edmonton, made a fine exhibit with hardy Ferns in about 100 varieties, and all of evergreen species. There were many beautiful varietal forms with pluinose, crested and other variations, in addition to the types. Some of the finer were *Polystichum angulare divisiolum* magnificent, the name being descriptive of the plant; *Polypodium Schneideri*, *Polystichum aculeatum acutolobum*, *Scopolopendrum vulgare crispum*, *S. v. digitata*, and other varieties, *Lomaria chilense*, *Polystichum aculeatum cruciatum*, and *Ceterach officinarum*. (Silver Flora Medal.)

A few Ferns were arranged by Messrs. **EGGETT & SONS**, Thames Ditton, amongst species of tuft, a porous stone that is suitable for constructing fountains.

Messrs. **HEATH & SONS**, Cheltenham, showed a collection of several *Leucodactylotomus*, and a Carnation named *Lady Audley Neel* (earmine and white); the variety is said to be a hybrid between *Souvenir de la Malmaison* and a variety of *Tree Carnation*.

Messrs. **JAMES VETCH & SONS, LTD.**, King's Road, Chelsea, filled the table they usually occupy at these meetings with tiny plants of *Citrus japonicus*, all with abundant fruits; and a batch of the winter-blooming *Begonia Elatior*, a very effective variety having large, rose-coloured inflorescences and a compact habit of growth. As a separate exhibit Messrs. Vetch showed curious plants, including many new and rare species. They were very ornamental in character, and the shape, colouring, habit, &c., varied greatly in the different subjects. Among the more interesting were *Pinus Armandii*, a new Chinese species having triangular leaves, six in the spur, the foliage bearing a glaucous tint; *Abies Veitchii*, an elegant plant with a silver reverse to the leaves; *Sciadopitys verticillata*, represented by several fine plants; *Pinus ponderosa*, *Cryptomeria japonica elegans*, *Cedrus atlantica glauca*, *Cupressus arizonica*, *C. lusitanica glauca*, the rare *Torreya myristica*, *Pinus Laricina pygmaea*, a finely-coloured specimen of *Retinospora filifera aurea*, *Abies pungens glauca pendula*, *Pinus Sabimana*, a rare species, *Libocedrus macrolepis* with glaucous habit, and *Abies (Tsuga) canadensis pendula*. (Silver-Gilt Bankian Medal.)

Another large group of coniferous plants was presented by Messrs. **JEFFERIES & SON**, Cirencester, who showed finely-formed plants of *Abies*

pungens glauca, *Cryptomeria elegans*, *Cupressus Lawsoniana* in great variety, *Cupressus nootkaensis* (syn.), *Thuopsis borealis*, *Cupressus filiformis elegans*, *Cedrus atlantica glauca*, *Abies Veitchii*, and many others. (Silver Flora Medal.)

Messrs. **PAUL & SONS**, Old Nurseries, Cheshunt, displayed sprays of shrubs and trees having autumn-tinted foliage, brightly coloured berries, also variegated foliage, and a few were in flower. The various species of Oaks and Maples were especially pleasing, *Quercus palustris* being remarkably finely coloured. We may also mention *Sambucus nigra marmorata*, with silver variegation; *Rosa sericea patercantha*, with large red-coloured spines; *Liquidambar styraciflua*, *Paul's Purple Peach*, *Aronia floribunda*, showing brilliant autumn tints; *Cornusaster nummularifolia*, a dark purple-berried species; *Pernettya mucronata*, crowded with its pretty berries, *Hamamelis arborea* and *Calycanthus occidentalis*, both these being in flower.

Messrs. **R. HARKNESS & Co.**, Hitchin, made a pretty show with Roses having, considering the late season, excellent blooms of *Maman Cochet*, a variety that has done remarkably well this year; Betty (rose and citron shades), *Frau Karl Druschki*, *Mme. Abel Chatenay*, *Corallina*, *White Maman Cochet* and other well-known kinds. (Silver-Gilt Bankian Medal.)

Messrs. **H. LANE & SON**, Great Berkhamsted, showed a small exhibit of Roses and a mauve-coloured Carnation named the *Mikado*.

An exhibit of Roses was also made by Messrs. **FRANK CANT & Co.**, Colchester. The blooms were mainly of garden varieties, there being brightly-coloured examples of *Queen Mab*, *Sunset* (a small yellow Tea Rose), *Countess of Derby*, *Gustave Regis*, *Hugh Dickson* (a fine dark Rose with perfume), *Mrs. E. Mawley*, and others. (Silver Bankian Medal.)

Messrs. **W. WELLS & Co.**, Merstham, Surrey, arranged a pleasing group of *Chrysanthemums*, *Penstemons* and border *Phloxes*. The back of the group was composed of tall *eperges* arranged in three clumps, the central one having at the base large blooms of Japanese varieties of *Chrysanthemums*, very fine being blooms of *Mrs. A. T. Miller* (white), and *Henry Perkins* (reddish suffusion on a yellow ground). The border varieties of *Chrysanthemums* were in great assortment, some of the finer being *Mrs. A. Thomson* (dark yellow), *Diana (Gonzel)*, *Mrs. J. W. Scott*, and *Blue Boy* (a shade of bronze mingled with rose). *Mrs. J. W. Scott* (a white bloom of medium size), and *Ernest Daudet* (yellowish bronze) are other pleasing *Chrysanthemums*. The *Penstemons* represented a good strain of these useful bedding plants, and the exhibit was staged with excellent taste. (Silver-Gilt Bankian Medal.)

Dahlias in great variety were well shown by **Mr. M. V. SEALE**, Sevenoaks, Kent, among a setting of GRASSES, sprays of coloured foliage, and berries. The collection was replete with all the choicer kinds, principally of the Cactus-flowered type. A row of *Ceanothus* varieties was in the foreground of the group, some of the kinds having rose-coloured inflorescences. *Dahlia Mauve Perfection* is a very charming flower. (Silver Bankian Medal.)

Messrs. **JOSEPH CHEAL & SONS**, Crawley, Sussex, showed many excellent blooms of Cactus and single-flowered *Dahlias*, also some of the small-flowered Cactus type, of which the varieties *Goldfinch* (yellow, tipped with rose), *The Bride* (white), *Mary* (white and red) are desirable kinds. The single *Dahlias* were very bright, *Flora Peggy*, *Miss Moreland*, *Fugi San*, *Columbine* and *Formosa* being especially good.

Messrs. **DOBIE & Co.**, Rothsay, N.B., and **Mark's Tey, Essex**, showed brightly-coloured blooms of *Dahlias* of the Cactus-flowered section, all of the choicer kinds and effectively staged.

A table was filled with berried and ornamental-leaved plants by **Mr. L. R. RUSSELL**, Richmond. The specimens were of a size suitable for table decoration, and embraced *Shimimia Fortunei*, *Aruba japonica*, *Flegmus Simoni*, *Ives* in variety, *Eurya latifolia*, *Veronica Andersonii* variegata and numerous *Coufers*.

Mr. H. J. JONES, Hither Green, Lewisham, showed blooms of the white *Chrysanthemum Money-maker*, and a large number of perennial Asters (Michaelmas Daisies). The latter flowers were shown in great variety, some of the best

being those labelled *Ryecroft Pink*, *Calliope* (a fine bold spike of large pale blue flowers), *May Crum*, *Thora*, *Ihrza*, *F. W. Burbidge*, *Précocité* (purplish), *Diana*, &c. (Silver Bankian Medal.)

Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. E. Beckett), made a magnificent display with perennial Asters (Michaelmas Daisies), many of the varieties being seedlings of worth; two of the best are described below under awards. The exhibit extended across the building at the end opposite the clock, and merited much praise from the artistic and effective manner in which the sprays were displayed. There was no overcrowding, but each stand of blooms was seen to advantage in bold, brightly-flowered sprays. A selection of the varieties includes *cordifolius albus*, bearing innumerable starry blossoms faintly tinted with rose; *H. J. Cutbush*, of the *Amellus* strain, with rose flowers; *Star Shower*, tiny white blossoms set in abundance on the tall sprays; *Wm. Marshall* (blue), and *Mrs. Raynor* (deep rose). (Silver-Gilt Flora Medal.)

Mr. FRANK BRAZIER, Caterham, Surrey, showed perennial Asters, border *Phloxes*, and *Chrysanthemums* set up in a pleasing style with tall *Pampas Grass* (*Cortaderia*) at the back. The bronze-coloured *Nina Blitch* *Chrysanthemum* and the paler *Polly* were noticeable in this pretty group. (Silver Bankian Medal.)

Mr. G. REUTHER, Keston, Kent, had a small but select group of hardy plants. A batch of *Nerines* included many new hybrids of merit, but the finest was *N. Corsica major*, although *N. Prince of Orange* ranks very high as a good decorative flower. In addition to the *Nerines* were bulbous plants, *Lapaerias*, *Berberidopsis corallina* in fruit, *Tropaeolum tuberosum*, *Escallonia oreogensis*, &c.

Messrs. **BARR & SONS**, King Street, Covent Garden, London, W.C., exhibited seasonable garden flowers, including many border varieties of *Chrysanthemums*, *Tritonias*, perennial Asters, *Phlox decussata*, the rose-coloured *Lupin*, *Cortaderia argentea*, and the rose-coloured variety *Cimicifuga simplex*, *Glaadiolus prinnifolius*, and several autumn-flowering bulbous plants.

Messrs. **GEO. EUNYARD & Co.**, LTD., Maidstone, Kent, showed many fine garden flowers, having good examples of the best species in season. A prominent position was afforded sprays of their new *Physalis* with its brilliantly-coloured calyxes.

Messrs. **G. & A. CLARK, LTD.**, Dover, Kent, had hardy flowers in variety, amongst which compound flowers such as *Chrysanthemums*, Asters, *Gaillardias*, *Rudbeckias*, *Helianthus*, &c., predominated. They showed a fine white *Cimicifuga*, labelled *C. simplex Clark's* variety, that is stated to have been already recognised by award under another name.

Messrs. **T. S. WARE, LTD.**, Feltham, showed boxes of Alpine plants, and at the back an assortment of hardy flowers.

The **Misses HARKINS**, Shepperton-on-Thames, showed a few Alpine plants and hardy garden flowers.

Messrs. **HUGH LOW & Co.**, Bush Hill Park, Enfield, showed *Carnations*, small Orange trees in fruit, freely-flowered plants of *Chironia exifera*, and a row of the handsome *Dracena de Grootii*.

A novelty of much interest was seen in small fountains staged by Messrs. **W. WOOD & SONS**, Wood Green. The water is thrown up by a small electric motor concealed in the base of the fountain, and is thus used over and over again. Some were small enough to place upon a dining table.

Nerine Bowdenii was displayed by Messrs. **R. VETCH & SONS**, Exeter, the plants having been continually grown in the open for three years. The species has already been granted an Award of Merit under the name of *N. excellens major* (see fig. in *Gardeners' Chronicle*, November 26, 1904, p. 365). The Award of Merit was on this occasion confirmed. This was also done in the case of *Cimicifuga simplex*, shown by Messrs. **G. & A. CLARK, LTD.**, Dover.

AWARDS OF MERIT

Aster Climax.—A new variety of Michaelmas Daisy, with exceptionally large blue flowers. The growth is tall, and in the herbaceous border the bright flowers would show to

advantage, being rendered more conspicuous by a bright-yellow centre.

Aster Mastenbiod.—A variety of the Ericoides section having large sheaves of starry-white flowers, each shoot having numerous axillary growths crowded with the pretty blossoms. The variety is a tall grower. Both were shown by the Hon. VICARY GIBBS, Elstree (gr. Mr. Ed. Beckett).

Dracena Bruantii variegata.—The handsome foliage is heavily variegated with rich, golden colour, and in the younger leaves tinted with rose. The plant is as robust in habit as the type, the specimen exhibited being about 2 feet in height and furnished with foliage to the pot level. (Shown by Messrs. CUTSHAW & SONS.)

Prince of Orange or *N. Corsica major*.—It blooms very freely. (Shown by F. D. GUDMAN, Esq., Horsham.)

Rose Mrs. Edward J. Holland.—A Hybrid Tea variety of pleasing form, the buds being coloured a deep rose-pink, but in the older flower the petals are paler. The foliage and shoots are robust, indicating a strong growth.

Rose Mrs. Alfred Tate.—A variety of the Hybrid Tea section, with rather few petals, so that the older blossoms open almost like a single Rose. The buds are exquisite both in colour and shape: the general tone is coppery-red, formed by a band of yellow suffused with red-dish pink.

Rose Mrs. Walsfield Christie Miller.—This is also of the H.T. class, and the largest of the three. The blooms are globose, the centre petals being rose-pink, but as they fall back they assume a silvery sheen. The coloring is very bright. (These Roses were shown by S. MACGREY & SONS, Portadown, Ireland.)

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the chair), and Messrs. Harry J. Veitch, de B. Crawshaw, H. Little, W. Boxall, R. G. Thwaites, F. J. Hanbury, Stuart H. Low, A. A. McBean, C. H. Curtis, J. Forster Alcock, J. Cypher, J. Charlesworth, H. C. Alexander, A. Dyer, W. H. White, H. A. Tracy, H. Ballantine, Gurney Wilson, W. Bolton, and Sir Jeremiah Colman, Bart. H. S. GOODSON, Esq., Fairlawne, Putney (gr. Mr. G. E. Day), staged a good group, for which a Silver Flora Medal was voted, and in which, among a good selection of *Odontoglossums*, were a fine blotched variety of *O. crispum*, flowering for the first time, and a large specimen of a hybrid of *O. Rolfeae* well flowered and splendidly grown. Specially noteworthy were *Laelio-Cattleya St. Gotthard* (see Awards), *Brasso-Cattleya Digbyano-Warneri*, large in size and delicately coloured; varieties of *Cattleya Iris* and other hybrids; three strong plants of *Cypripedium insigne* Harefield Hall, and *Cypripediums*.

HENRY LITTLE, Esq., Baronshill, Twickenham (gr. Mr. Howard), staged a group, for which a Silver Flora Medal was awarded. The plants were finely grown and well illustrated the beauties of the crosses of *Cattleya Bowringiana*, as it included a noble specimen of *Cattleya Mantinii inversa*, with five spikes of over 30 flowers; *C. Mrs. J. W. Whiteley*, *C. Portia*, *C. Wendlandiana*, *Laelio-Cattleya Tenos*, and other hybrids of *C. Bowringiana*.

MESSRS. SANDER & SONS, St. Albans, secured a Silver Flora Medal for a fine group, in which were some good novelties (see Awards). The back of the group was composed of splendid examples of the blue *Vanda cœrulea* of the best type. With them were some showy hybrid *Cattleyas* and *Laelio-Cattleyas*, including a very large and finely-coloured form of *C. Lord Rothschild magnifica*, a pretty new *Laelio-Cattleya* with Indian yellow sepals and petals and ruby-coloured lip; *C. Venus*, "Sander's variety," a fine product of *C. Iris* and *C. aurea*; *C. conspicua* (*Gaskelliana* × *bi-color*), a pretty hybrid of the *C. Iris* class; a strong plant of *Cypripedium Niobe* Excelsior with several handsome flowers; *C. Acteus auriferum*, and an interesting selection of curious species of *Orchids*.

MESSRS. CHARLESWORTH & CO., Haywards Heath, Sussex, were awarded a Silver Flora Medal for a select group, in which were several dark-coloured forms of *Laelio-Cattleya luminosa*, *L. C. Golden Oriole*, and other *Laelio-Cattleyas*;

Oncidium incurvum album, *Trichopilia nobilis* alba, *Phaius flavus* variety albus, with clear white flowers having brown lines on the lip; good *Vanda Kimballiana*, hybrid *Miltonias*, *Cycnoches Egertonianum* of the dark-purple type; *Odontoglossum Lambeauanum* and other *Odontoglossums*, *Zygo-Colax Wigamianus*; a very fine form of *Cymbidium Gammieanum*, and the singular and rare *Chondrorhyncha Ledyana* with white flowers.

MESSRS. JAS. CYPER & SONS, Cheltenham, were awarded a Silver Hora Medal for a well-arranged group, at each end of which were a number of *Cypripedium Faircraeanum*. In the group were a fine selection of varieties of *Dendrobium Phalaenopsis Schröderianum*, and some good hybrid *Cypripediums*, of which *C. Milo*, "Westonbirt variety," was the darkest and best. *Phaio-Calanthe Chardwarensis* had bright-yellow flowers with red-brown markings on the lip. *Cattleya Mantinii nobilior* was well represented.

MESSRS. MOORE, LTD., Rawdon, Leeds, were awarded a Silver Banksian Medal for a good group, including *Cattleya Venetia*, a pretty hybrid of *C. maxima* with bluish-white flowers, the labellum being veined with purple; varieties of *C. Armstrongiana* and *C. Iris*; a very finely-coloured cross between *Laelio-Cattleya Cappel* and *C. Iris*, with orange-coloured sepals and petals and elongated ruby-red lip with a yellow line down the centre; *Cypripedium Miss Louisa Fowler*, a very dark form of *C. Faircraeanum*, *C. insigne* Harefield Hall, and other *Cypripediums*.

MESSRS. STANLEY & CO., Southgate, secured a Silver Banksian Medal for a group of good varieties of *Cattleya labiata* and *C. Minucia*, together with a few botanical Orchids.

MESSRS. J. & A. McBEAN, Cooksbridge, were awarded a Silver Banksian Medal for a very fine group, in which the magnificent specimen of *Cattleya fulvescens* with 14 flowers and the fine mass of *Cattleya Bowringiana* with nine very strong spikes each secured a well-merited Cultural Commendation for the grower. The finely-grown selection of *Odontoglossums* included good *O. crispum* and *O. Lambeauanum*; and the *Cypripediums* the very fine yellow and white *C. Rossetti*; a good *C. Memoria Moensis* with a showy purple and white dorsal sepal; *C. Albertianum*, a dark form of the *C. triumphans* class; *C. Martine*, and several fine *C. insigne* *Sanderæ* with five to seven flowers.

MONSIEUR MERTENS, Mont St. Amand, Ghent, secured a Silver Banksian Medal for a selection of good hybrid *Odontoglossums*, a finely-coloured seedling *O. crispum*, and a good *Miltonia Bleuana*.

MESSRS. HUGH LOW & CO., Enfield, received a Silver Banksian Medal for a group containing *Vanda Kimballiana*, *Cymbidium erythrostylum*, a good *Cattleya Gaskelliana alba*, *Cypripedium Milo Westonbirt* variety, *C. A. de Laiteuse* Low's variety, a dark and massive form; *C. Thalia giganteum*, with a very large dorsal sepal; *Cycnoches peruvianum*, *Miltonia vexillaria* Leopoldii, *Oncidium incurvum album*, *O. longipes*, and two plants of the rare white *Laelia Perrinii nivea*, with a pale-pink front to the lip.

LT.-COL. G. L. HOLFORD, C.I.E., C.V.O., Westonbirt (gr. Mr. H. G. Alexander), sent *Sophro-Laelio-Cattleya Danae aurea*, a pretty variety, with yellowish sepals and petals tinged with rose, and bright-yellow lip with purple apex; *Brasso-Cattleya Heatonense* variegata, with a finely-formed white flower tinged and veined with lilac on the fringed lip.

C. J. LUCAS, Esq., Warnham Court, Horsham (gr. Mr. Duncan), sent *Laelio-Cattleya Dorothy Strachan* (L. Dayana × *C. Eldorado*), a pretty dwarf hybrid with silver-white sepals and petals, the former tinged and the latter veined with lilac and bearing purple marks on the margins, the lip being purple.

MESSRS. HEATH & SONS, Cheltenham, staged a group, including *Cypripediums*, *Dendrobium formosum giganteum*, and *D. Phalaenopsis Schröderianum*.

The Committee inspected a number of paintings of Orchids executed by Miss M. WALTER ANSON, Dovedale, Lewin Road, Streatham, and recommended a Silver Flora Medal. The drawings were very faithful, but exception was taken to the unsuitable backgrounds of some of the pictures. This was explained by the artist stating that the pictures were painted thus to order.

AWARDS.

FIRST-CLASS CERTIFICATES.

Laelio-Cattleya St. Gotthard (L.-C. *Gottoiana* × *C. Hardyana*), from H. S. GOODSON, Esq., Fairlawne, Putney (gr. Mr. G. E. Day). A noble *Cattleya*, and among the largest and best in shape. The broad sepals and petals are bright purplish-rose; the very large labellum deep ruby-crimson.

Cypripedium Charlesworthii Bromeliosanum, from H. J. BROMILOW, Esq., Rann Lea, Rainhill, Lancashire (gr. Mr. W. J. Morgan). A true albino of the good type of *C. Charlesworthii*, and a very remarkable and beautiful plant. The flower is of *C. Charlesworthii* form, the petals and lip pale green, without any trace of the brown and purple tinting of the ordinary form; the dorsal sepal being snow white, with the slightest marking of green at the base, the stammode also white.

AWARD OF MERIT.

Laelio-Cattleya Cornelia Westonbirt variety (L. *punctata* × *C. labiata*), from LT.-COL. G. L. HOLFORD, C.I.E., C.V.O. (gr. Mr. H. G. Alexander). A showy hybrid, with flowers equal in size to those of *C. labiata*, but of firmer substance. Sepals and petals rose colour; lip ruby-crimson with light-rose margin.

Odontoglossum Pescatorei Sanderæ, from MESSRS. SANDER & SON. An unique variety, for among the many thousands of plants imported nothing similar has appeared. The flowers are large and very broad in all the segments. The sepals are white with light-brown blotches on the lower halves, some smaller spots extending to the middle. The petals are white with a ray of light brown spots in the lower half, the spotting in both sepals and petals having a slight purple tinge. The lip is large and flat, pure white, with yellow crest and some fine purple lines at the base.

Cypripedium Lord Ossulston Sander's variety (*Lecanum Clinkaberyanum* × *Charlesworthii*). The dorsal sepal is white with a slight rose tinge and a small green base, the rest of the flower being light green. From MESSRS. SANDER & SONS.

BOTANICAL CERTIFICATES.

Cymbidium Dayanum, from MESSRS. SANDER & SONS. A graceful species, described by the late Professor Reichenbach in the *Gardener's Chronicle*, 1869, p. 710, from a specimen received by the late Mr. John Day from Assam. The specimen shown by MESSRS. SANDER was sent by their collector Micholitz from Annam. It has slender, arching, green leaves and racemes of white flowers with purple lines on the petals and dark purple sides to the labellum. It has been figured in the *Botanical Magazine*, t. 7, No. 63, in the King and Pantliff's *Orchids of the Sikkim Himalayas* as *C. Simonsianum*, and the C. pulcherrimum of gardens is probably a form of it.

Megalium calabrinum, from MESSRS. SANDER & SONS. A singular species, with flattened dull-purple rachis bearing on each side a row of small flowers of the same colour.

Fruit and Vegetable Committee.

Present: George Bunyard, Esq. (in the chair), and Messrs. Jos. Cheal, Owen Thomas, P. W. Tuckett, John Harrison, Joseph Davis, G. Reynolds, John Basham, P. C. M. Veitch, Alex. Dean, J. Willard, Geo. Wythes, A. H. Pearson, and Edwin Beckett.

The usual array of seedling Apples was seen, but none met with the approval of the Committee, neither did a variety of Melon. A magnificent sample of *Chas. Ross Apple* was presented by Mr. JAS. WEBBER, Minehead, Somerset, and for these fruits a Cultural Commendation was awarded.

Apples of exceptionally fine quality were shown by LT.-COL. BENTON, Chavenage, Hunton (gr. Mr. James Whittle). Not only were the fruits large and of fine colour, but they were regular in sample and free from blemish or stain. The varieties were numerous, the exhibit extending around one end of the south annex. Varieties that were especially fine were *Chas. Ross*, Allington Pippin, Wealthy, Baumann's Red Winter Reinette, Bismark (exceptionally fine), Gascon's Scarlet Seedling, Metz de M. nage, Belle Dubois, Barlack Beauty, Warner's King, Salsingham,

Peargood Nonsuch, and Emperor Alexander. (Silver-Gilt Hogg Medal.)

Messrs. HUGH LOW & Co., Enfield, London, N., showed a few varieties of Apples, for which a Silver Gilt Medal was awarded.

A basket of small Black Cluster Grapes was shown by Mr. JAMES DEAKER, 14, Newlands Park, Sydenham, under the name of Brandt Grapes.

Mrs. MILLER, Moyleen, Marlow, showed Moyleen Chutney, a delicacy of very agreeable taste; also jams, Elderberry syrup, and other preserves.

A Cucumber seedling from Worthing Telegraph was shown by Mr. JAS. DUTTON, Ham Arch Nurseries, Worthing.

BRITISH GARDENERS' ASSOCIATION. (LEEDS BRANCH.)

OCTOBER 3.—The Leeds members of the above association held their first meeting for the new session on the above date. Mr. Donoghue presided over a moderate attendance. Mr. Mansell, managing director of Messrs. Moore, Ltd., Orchid nurserymen, was the lecturer, his subject being "Orchids." Mr. Mansell condemned the old practice of severe drying at the resting season in order to produce flowering-spikes, such treatment being detrimental to the constitution of the plants. The resting season is best brought about by a slightly lower temperature and a reduction of water, but at no time should the plants be allowed to shrivel for lack of moisture. Mr. Mansell exhibited a group of Orchids in bloom consisting of *Dendrobium Phalenopsis Schroderianum*, *Vanda cœrulea*, *Odontoglossum Harryanum*, *Oncidium tigrinum*, seedling *Lælio-Cattleyas*, *Cypripedium insigne* varieties, and species of botanical interest. J. D.

SCOTTISH HORTICULTURAL.

OCTOBER 6.—The monthly meeting of the above association was held at 5, St. Andrew Square, Edinburgh, on this date. Mr. Whytock, the president, occupied the chair, and there was a good attendance of the members. Professor R. Stewart MacDougall, M.A., D.Sc., delivered a lecture on "Insecticides: Sprays and Spraying." Professor MacDougall first gave a general outline of the structure and methods of feeding of insects which prey on plants, and he impressed upon his audience the necessity for distinguishing between biting insects and sucking insects in applying insecticides, also for properly timing their application so as to catch the stage in the life-history of the insect at which the specific would be most effective. The same treatment would not do for combating a gnawing weevil as applied for a sucking aphid, and in the case of a leaf-rolling larva it is of little use in applying a spray after the grub had wrapped the leaf-bud around its body. The various kinds of insecticides and winter washes were dealt with.

There was a fine exhibit of early-flowering Chrysanthemums from the open border shown by Mr. A. THOMSON, Dean Gardens, Edinburgh. The group consisted of 110 varieties, most of which were of recent introduction, and some of them were new. A First-Class Certificate was awarded to a new early-flowering Chrysanthemum of a bronzy-yellow colour, named Miss Balfour Melville, raised by Mr. WM. ROBERTSON, Pirig House, Edinburgh. There were also exhibited new early-flowering white Chrysanthemums "Hecuba" and "Cassandra," raised by Mr. J. C. YORNG, Edinburgh; a seedling early Potato raised by Mr. D. AKKLEY, Woodlea, Auchterarder; fruits of *Cratægea pyracantha* Lelandii and spikes of perennial Asters from Mr. C. COMFORT, Broomfield, Davidson's Tains; dwarf Polyantha Roses from Messrs. MOIR & Co.; and flowers of *Justicia carneae* from Mr. A. JOHNSTONE, Hay Lodge, Edinburgh.

Four new members were elected. The paper for the next monthly meeting, to be held on November 3rd, will be by Mr. David Nicoll, Rossie, Forganenny, the subject being "Chrysanthemums: The Growing and Showing of Large Brooms."

HORTICULTURAL CLUB.

"A HOLIDAY ON THE NILE."

OCTOBER 13.—At the Hotel Windsor, on this date, the house dinners of the Horticultural Club were resumed. Mr. Harry J. Veitch presided, and between forty and fifty members and guests were present to hear Mr. Arthur W. Sutton's promised description of "A Holiday on the Nile," illustrated by a large number of beautifully coloured lantern slides from photographs taken by Mr. Sutton during his travels. His previous lecture on "A Camping Tour from Damascus to Petra in Arabia" had evoked great expectations, which were in every way realised, the brilliancy, sharpness, and artistic effect of many of the photographs exciting admiration, coupled with surprise when Mr. Sutton explained that many of them were snapshots taken whilst riding horse, donkey, or camel. The interest of the lecture, however, was largely enhanced by the lecturer's allusions to the political, historical, and artistic lore of ancient and modern Egypt. A splendid view of Cairo, for instance, gave occasion for an allusion to its conquest by a small body of exhausted British soldiers, barely 150 in number, under the command of Major Watson. A previous set of slides gave a series of charming pictures of the Suez Canal starting from Port

and walls of the ancient Temples, views of which were presented, possess interest to the antiquarian apart from their merely artistic merits. Several views were given of the great dam at Assouan, designed to control the water supply of the Nile and so reduce the risks of periodical famine to which ancient Egypt was subject as the Egypt of later date. The slides illustrating this magnificent specimen of engineering design and skill formed a fitting conclusion to the lecture. A very hearty vote of thanks to Mr. Sutton concluded the meeting.

Obituary.

ALEXANDER CROMBIE.—On October 2 this well-known Scottish gardener passed away at the ripe age of 82 years. Deceased started as gardener at Crumond House, near Edinburgh; from there he went to Dunlop House, Ayrshire, at that time famous for exotic plants and Orchids. From that place he moved to Caldwell and The Kilns, Falkirk. At The Kilns Orchids were a great feature, and Mr. Crombie was very successful in their cultivation. For 30 years he had charge of the gardens and grounds at the Royal Asylum, Edinburgh, where garden operations were carried out on an extensive scale. Nine years ago Mr. Crombie retired from this position on a pension, and he has spent his latter years in comparative ease. Deceased possessed a striking personality and never made an enemy. In his early days he was a keen and successful exhibitor, and could relate many stories of the earlier flower shows held in Edinburgh. His eldest son, David, is gardener to the Marquis of Waterford, at Curraghmore. Robert Laird.

DR. DOUGLAS L. FREELAND.—It is with regret we announce the death of Dr. Douglas L. Freeland, of Delamere, Snodland, Kent. The deceased was one of the best known of the rising generation of rosarians, for he was an excellent judge, a keen and successful exhibitor, and an enthusiastic grower. The larger portion of his charming garden was devoted to the flower he loved so well, and his arches and pillars of Roses were at once the delight and glory of his many friends. Dr. Freeland was still in the prime of life, and he leaves a widow and a wide circle of friends to mourn his loss. He died on Saturday, 10th inst., and was laid to rest at Snodland on Wednesday last.

GARDENING APPOINTMENTS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.]

- Mr. JAMES HUGHES, for 2 years Foreman under Mr. GRO. BURROWS, at Sheshday Gardens, Hemel Hempstead, as Gardener to Lord Elcho, Stanway House, Winchester, R.S.O., Glas.
- Mr. W. HARRISON, late Gardener to F. S. BRICE, Esq., J.P., Middlemead, Leicester, as Gardener to R. H. RIMINGTON VICKERY, Esq., Broomfield Hall, Bolterstone, near Sheffield.
- Mr. W. S. SHARP, for the past 54 years Gardener to H. N. GLADSTONE, Esq., as Gardener to Mrs. PARK-YATES, The Hall, Leamington.
- Mr. F. CHAPMAN, for 5 years and 9 months Gardener to A. FRANCIS, Esq., Hernewood, Sevenoaks, Kent, as Gardener and Manager to H. BROSELY, Esq., Hernewood, Bolton, Lake George, N.Y., U.S.A.
- Mr. J. H. PUCKERING, for 51 years Gardener at Bookham Lodge, Cobham, Surrey, and for 4 years and 3 months in the service of R. C. ADAMS BUCK, Esq., as Gardener to J. COLLARD VICKERY, Esq., Leigh Holme, Streatham, S.W.
- Mr. F. QUANTRILL, previously at Southwood, Bickley, as Gardener to R. T. SCOTT, Esq., Carrick Grange, Southwood.
- Mr. G. W. CHAPMAN, late Gardener at Garston House, Watford, as Gardener to C. GREENWAY, Esq., Straiton Chase, Chalfont St. Giles, Bucks.
- Mr. B. NICHOLS, for the past 2 years, Foreman at Halston Hall Gardens, as Gardener to JOHN BARROW, Esq., Oldfields Hall, Uxotter, Staffordshire.
- Mr. W. READ, late Foreman at Chatsworth, as Gardener to Mr. F. A. ANSWRIGHT, LL.D., J.P., Willersley, Cromford, Matlock.
- Mr. W. BAILLIE, late of Beeston Hall, Norwich, and previously at Holly Grove, Windsor Park, as Gardener to J. ROLLESTON BARRETT, Esq., J.P., Llangibby Castle, Newport, Monmouthshire. (Thanks for your donation of 2s. for the R.G.O.F. Box.)

THE LATE ALEXANDER CROMBIE.

Said, particular allusion being made to the admirable service established by Messrs. Thomas Cook & Sons for Oriental trips. Views of the Pyramids followed, including the oldest of all, the step-pyramid at Sakkara supposed to have been built about 6200 years ago. The largest Pyramid is estimated as having been about 70 feet higher than St. Paul's Cathedral, with a base as large as Lincoln's Inn Fields. The immense blocks of stone composing it had to be conveyed some 600 miles from the quarries at Assouan. The tombs of the kings, although of later date, being estimated at only some 3,000 years, are remarkable for being entirely excavated on hill-sides. Externally nothing is seen but small cave-like apertures in the soil, and yet penetrating these a series of great halls is reached after passing through a long and spacious corridor. Every inch of the surface of the walls and the ceilings is occupied by brilliantly-coloured mural paintings of hieroglyphic and pictorial character, the colours being evidently as bright to-day as when first applied. By means of flash-lights a number of photographs were obtained, but it is not known what system of lighting was used by the artists, since nowhere is there a trace of smoke, such as primitive torches or other illuminants would presumably produce. These pictures, as do most of the carvings covering the gigantic columns

MARKETS.

COVENT GARDEN, October 14.

(We cannot accept any responsibility for the unjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of our salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate not only from day to day, but occasionally several times in one day.—Ed.)

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices, including Aster, Bovanidia, Calla, Carnations, Chrysanthemums, Cocks, and Dahlias.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and their prices, including Adiantum, Asparagus, Berberis, and Ceanothus.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various plants in pots and their prices, including Ampelopsis, Aralia, Araticaria, and Aspidistra.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices, including Apples, Lemons, Melons, Mangoes, and Peaches.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices, including Artichokes, Beans, Brussels Sprouts, Carrots, and Cauliflowers.

Potatoes.

Table listing various potato varieties and their prices, including Ken's Wonder, Shropshire, and Spicers.

COVENT GARDEN FLOWER MARKET.

Formerly the assembling of Parliament brought a revival in the flower trade, but now it makes little difference. Supplies all around are abundant, and prices are generally low.

CUT FLOWERS.

Chrysanthemums of all qualities are plentiful; the fine weather has favoured the flowers growing in the open, but they are not so good as those which have been grown in glass. Large blooms on single stems are now selling better. Mrs. Scott and Countess are the best white varieties; Market Red is good in its shade; of yellow kinds, Soleil d'October is one of the best. There is very little variation to record in Carnations; the American sorts are the favourites. The stale blooms are sold to hawkers, and these causes dissatisfaction amongst the public, for they are sold in the streets at less value than the flowers have to pay wholesale for the fresh blooms. Roses are still over plentiful, and those from the open are remarkably good. When the variety Frau Karl Druscak was first seen in the market, the blooms were from plants which had been forced, and were in consequence very soft. This led me to believe the variety would not be of much value for market, but it has become a general favourite. Madame Abel Chateau is another Rose which required some considerable time to the most popular of a market kind, and it is now one of about 100 varieties of roses in Covent Garden. It was different in the case of Mrs. J. Laing, for this variety was in favour as soon as it appeared. Violets are good, and are selling better, but they do not realise satisfactory prices. Michaelmas Daisies are over abundant; the fine of the most useful varieties is A. ericoides Clio; the type is also appreciated. Supplies of other hardy flowers are holding out later than usual this season.

POT PLANTS.

Ericas of the best quality are abundant, consequently their value is small; the white variety of E. gracilis is particularly fine and is very useful for use as cut bloom. Chrysanthemums are plentiful, but their quality varies very much. White Marguerites are well-flowered, but since good white Chrysanthemums have been available there has not been much demand for them. Lilliums have been selling rather better. Good Bourdians are sought for by Miss Willmott is now practically over for the season. Zonal Pelargoniums are well-flowered, but Fuchsias are of doubtful quality. Ferns are still offered at low prices. A. H., Covent Garden, Wednesday, October 14, 1908.

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending October 14. "St. Luke's" little summer.—Throughout the last 17 days there has not occurred a single unseasonably cold day, and only two cold nights. On as many as five days during that period the highest temperature in the thermometer screen has exceeded 75°, while the thermometer exposed on the lawn has on no night fallen below 50°. At 2 feet deep the ground is at the present time 5° warmer, and at 1 foot deep as much as 7° warmer, than is reasonable. With the exception of about 4 inches of rain, which was deposited on the 9th, no rain worth mentioning has now fallen for more than three weeks. Since the present month began no rainwater at all has passed through the percolation gauge on which short grass is growing, and no measurable quantity for nearly three weeks through the bare soil gauge. The sun shone on an average for 3 1/2 hours a day during the week, which is about a reasonable duration at this period of the year. For the fifth week in succession clouds and light airs have prevailed. The mean amount of moisture in the air at 3 o'clock in the afternoon exceeded a reasonable quantity for that hour by 5 per cent. E. M., Berkhamstead, October 14, 1908.

McCulloch & Co., Castle-Town, Isle of Man.—Bulls, Dicksons, Chester.—Koss Trees.

TRADE NOTICE.

JOSEPH SHOESMITH & Co., LTD.—The above named company has been re-registered with a capital of £17,000 in £1 shares, to acquire the business carried on at Hildes and Bidbouche by J. SHOESMITH, Market Gardener. Private company. Registered offices, Silverdale Green Road, Silverdale, Hildes.

REMARKS.—English Tomatos have risen considerably in value, and as much as 4s. per dozen lbs. has been realised for fruits of special quality, but as to 3s. 6d. is an average price. Cucumbers also are more valuable than of late, on account of the colder weather, but they are a slow trade. Vegetable Marrows are somewhat scarce, but there is little demand for them. Cabalets are selling freely, the supply being smaller than the demand. This week there is a good trade for English dessert Apples, but most of the home-grown fruit is being brought over very early, and consequently almost unsaleable. From this fact foreign fruits are preferred to home grown by buyers. Kent Fruits are arriving in very small quantities, being practically finished. America Grapes are realising good prices, notwithstanding that both English and Guiney Grapes are cheap. Figs are at a poor trade, although small consignments are still arriving. Mushrooms are coming in small quantities, Is. to 1s. 3d. per lb. being an average price for these excellent. Trade generally is quiet. E. H. K., Covent Garden, Wednesday, October 14, 1908.

DEBATING SOCIETIES.

BRISTOL AND DISTRICT GARDENERS.—

The first meeting for the season 1908-1909, was held on Thursday, October 8, at St. John's, Fishpond Rooms. Dr. Barclay Eaton presided over a large attendance to hear Mr. Cooling, of Bath, read a paper on "Autumn Flowering Roses." The lecturer said beds of one variety rose had the best effect upon the eye, and grouping the varieties in borders was preferable to indiscriminate planting. Matching the beds in the spring and in the autumn was advised; spent hops being the best material for a spring dressing. Mr. Cooling said the term Hybrid Perpetual was somewhat a misnomer, and the newer varieties of Hybrid Teas were more properly described as perpetual bloomers, for they continue to flower until cut down by frost. Varieties that withstand midweek are Souvenir de Pierre Notting, Dainty, Queen Mab, Rainbow, Pops Goulter, and Grus on a Tepee. H. W.

CARDIFF GARDENERS.—

The opening meeting for the new season of the above association was held at St. John's Schools, Queen Street, on October 6. Dr. H. K. Farmer presiding. An address was given by Mr. F. G. Treseder on "Seed Culture and the Countries which Produce the Greatest Quantities of Exhibitors." He stated that California and Germany were the two largest seed producing countries in the world and from these countries we obtained our largest supplies.

HAYWARDS HEATH GARDENERS.—

A meeting was held on Wednesday, October 7, at which Mr. Geo. Porter (gardener to Lieut.-Col. Dudley Sampson, D.L.) read a paper on "Criteria for Exhibitors." The lecturer's course of the discussion which followed the Rev. T. G. Wyatt raised the important question of a fixed standard for judging at shows. He pointed out what a help it would be to exhibitors if all judges acted on the same principles. Exhibitors should know beforehand what standard they had to work to and by what standard they were to be judged. What was required was a common standard to bind both exhibitors and judges. This was provided by the Royal Horticultural Society in their Rules for Judging, which, he thought, should be followed and accepted as the rules for all. Gardeners' associations and societies ought to press this matter forward continually, and he suggested that secretaries of shows when inviting anyone to act as judge, should state that the R.H.S. book was to be followed. To put this in the schedule was insufficient; it should be made a condition of entry, and this was done generally it would greatly help and encourage exhibitors.

READING AND DISTRICT GARDENERS.—

The opening meeting of the autumn session of the above Society was held in the Abbey Hall, Reading, on October 5. The president of the association (Mr. Alderman F. B. Parritt) occupied the chair. About 100 members assembled, and a paper on "Perennials" was given by Mr. F. Lamb-bridge, who illustrated his remarks by a collection of these flowers. At the close of the lecture a discussion was invited, and an instructive debate ensued. A group of seedling *Cryptomeria gracilis* was staged by Mr. A. F. Bailey, and a collection of fruit was exhibited by Mr. G. Tovey. Several new members were elected.

REDHILL, REIGATE, AND DISTRICT GARDENERS.—

On Monday, October 5, the members of this association held their second meeting of the season in the Newbyn Hall. Mr. Round presided, supported by Mr. W. Rose. Three new members were enrolled. Mr. Horace Wright gave a lecture on "Sweet Peas."

West, M.A., F.L.S. (Calcutta: Printed at the Bengal Secretariat Library.) Price 15s.

ENQUIRY.

TELEPHONE WIRES AND BOWLING-GREEN.—Over our bowling-green there is a line of telephone wires, about 12 in number. These have been there for 10 years. Underneath these wires, and in line with them, the grass shows signs of exhaustion. In dry weather it gets bare before the other parts of the green, and generally shows a yellowish appearance. There is nothing wrong with the drainage of that part, nor is there anything peculiar in the nature of the soil. The only theory we can form about the exhaustion of the grass is the drip from the wires. The wires are made of copper. Has any reader had similar experience? R. M.

CARNATIONS. G. F. The plants you refer to as being full of flower-buds should not be reported now, but left undisturbed till after the blooms have developed and passed. The plants, having been specially prepared for winter blooming, have filled the pots with roots, and these roots must on no account be allowed to suffer from dryness during the flowering stage, or the blooms will suffer in consequence. When the flowers are past, the plants should be potted firmly into pots 6 inches in diameter, and kept slowly growing in a well-ventilated house. They must not be subjected to a close, damp atmosphere; fresh, dry air being an absolute necessity to Carnations. A maximum temperature of 50° to 55° suits them admirably, but during severe weather the heat may be allowed to fall to 45° or 40°. A good potting compost should consist of three parts turfy loam to one part partially-decomposed leaf-mould and a little old mortar rubble, the whole to be thoroughly mixed with plenty of sharp sand, and one 5-inch potful of soot to each barrowful of compost. No dung is required, Carnations preferring a sweet, firm soil as a rooting medium. As a stimulant for the plants when the pots are full of roots, use one of the specially-prepared Carnation manures advertised by reliable firms.

CAULIFLOWER. T. G. The head you send is too far advanced to be at its best condition. It should have been cut earlier. The green colour you will observe, is not present on parts that are overlapped by others. It is for this reason that cultivators bend some of the leaves over the curd in order that it may become blanched. Try this practice another season.

CLEMATIS. DAN. Do not prune either of the varieties you send very severely, but merely thin out the useless shoots.

COLEUS (P. ROTOS) WITH BROWN TIPS. A. H. There is no disease present in the leaves. The damage is due to some cultural error, probably in watering.

CYCLAMEN INJURED BY GRUBS. E. S. The insects you send are the larvae of the weevil, a pest to plants, in both the adult and the larval stage. See reply to A. K., p. 271, in the last issue.

FUNGUS ON ROSE LEAVES. H. M. This is the autumn stage of the Orange rust fungus (*Uredo rose*). Gather and burn all diseased foliage, and spray the plants with dilute Bordeaux Mixture or ammoniated carbonate of copper solution. It will also be necessary to spray the plants next spring before the buds expand with a solution of copper sulphate at the strength of 2 ounces of sulphate in 3 gallons of water.

PARTI-COLOURED CHRYSANTHEMUM. C. Chesters. This abnormality is frequently seen. An illustration of a parti-coloured Chrysanthemum appeared in our issue for December 22, 1906, p. 436.

POTATO. *Senex, Devon*. The correct spelling is *Devanbia* Seedling, as printed on p. 269.

ROOT FROM PALM HOUSE. J. L. This is a form of fungus-mycelium known as Rhizomorpha. It is produced by the weaving together of the fungal filaments into a root-like structure, and it forms a very efficient method of spreading the plant. It occurs very characteristically in the agaric known as *Armillaria mellea*, which does great damage in Pine woods, the fungus spreading through the soil in the rhizomorpha state and attacking the trees that happen to be near one that has been already infected.

SWANS. A. K. In reply to your enquiry, printed on p. 272, we have forwarded a letter from a gentleman who has birds for disposal.

VINES ATTACKED BY THRIP. *A Constant Reader*. Now that the fruit has been gathered, fumigate the vinery with tobacco paper, or vaporise it with one of the vaporising compounds. This should be done thoroughly and carefully in the evening of a calm day, when the vines are dry and the ventilators and doors tightly closed. Repeat the operation, if necessary, until all the insects have been killed, keep the smoke cool, and on no account let the fumigating material become ignited. Afterwards syringe the vines each day until the leaves fall. When the vines have been pruned, clean the rods and sprays of all loose bark, and wash them with a hot and moderately strong solution of the Gishurst Compound, working it well into the crevices with a stiff brush; a part of a half-worn spoke-brush will answer very well. Repeat the washing before the rods get quite dry. Cleanse the woodwork in the house, and remove the surface of the inside border, replacing it with fresh compost. Next season, should thrips reappear, sponge the leaves with a weak solution of soft soap and warm, soft water. A dry atmosphere and much fire-heat during the season the vines make their growth is favourable to the spread of this pest.

under glass on January 1; the plants are afterwards transferred to boxes and placed in rows in their permanent site about the middle of April. They are watered freely in dry weather, adding soot as a leading stimulant. The aim is to produce large, shapely, well-matured bulbs, without a semblance of undue "neck," and these may be seen at Aldenham, not by the dozen, but by the hundred.

Runner Beans in late years have quite ousted Kidney or French Beans from all but the early shows. It is not unusual to see Beans quite straight, even in width, and of a deep green colour 14 inches in length. Scarlet Emperor is one of the best varieties. The

cultivated than formerly. Duke of York, Windsor Castle, Factor, Satisfaction, and May Queen as an early sort, are favourites at Aldenham. Tubers from 20z. to 30z. are preferred for seed purposes. Thorough preparation of the soil is important, and space not less than 4 feet by 2 feet should be allowed the strongest-growing sorts. The development of haulm is limited by the removal of surplus sprouts. *E. Molyneux.*

PLATYTHECA GALIODES.

This fine greenhouse flowering plant is not often met with in gardens, although it is deserv-

ROOT-PRUNING.

ROOT-PRUNING usually brings before the mind the checking of a too exuberant growth, followed by, or combined with, a degree of fertility that previously had been unknown. But that is by no means all, nor, indeed, the most important effect that root-pruning, when carried out with judgment, produces. Nor ought the operation to be confined to fruit trees. The gardener long ago discovered in root-pruning an efficacious method of preserving his plants in health and vigour, when without it the soil receptacles would have to be increased to an unwieldy size. Many shrubs when young respond to careful restriction of their roots; but when once they are established, it is not impossible to produce considerable harm by a too close cutting in. The great majority of hardy herbaceous flowering plants submit with a good grace to a not too rigorous course of root shortening, displaying in the succeeding flowering season their charms enhanced as a result of the operation. It is also obvious that some vegetables are not averse from being root-pruned. The finest Parsley, Lettuces, Leeks, and Onions are produced by transplanting, which implies root-shortening, whilst working the soil deeply between the rows of Cabbages and their near allies is well known to improve them.

But it is in fruit culture that the beneficial effects of root-pruning are most apparent. Nor should its employment be confined to a few species, e.g., Apples and Pears, few, if any, fruit producers being incapable of improvement by its means. Consider what follows its application. All healthy young trees planted in fertile soil (as a primary condition) naturally endeavour to rush into size and to extend roots in proportion, fruit production succeeding only when a kind of exhaustion has set in. The fruit cultivator, on the other hand, is in no hurry for a tree to attain to large proportions. In private gardens it is not wanted at all. Judicious shortening of roots lessens exuberance of growth, but not to an injurious extent, gives it a bias to fruit production, and maintains the condition thus set up. But that is by no means all that accompanies root-pruning. At fruit exhibitions it is easy to distinguish the hardy fruits that were produced by trees the roots of which are under control; and such fruits, though perhaps less in size, are more solid, better flavoured, and keep longer in good condition than those from trees whose roots are not, or have not been regularly attended to when young.

Root-pruning should form part of the treatment of fruit trees from the beginning. A maiden tree, planted in autumn, pruned in spring, and allowed to push the desired number of shoots in the season of growth will, if lifted the succeeding autumn and replanted after slightly shortening the roots, make a growth during the second summer as satisfactory as the tree left to itself. But the growth will be harder and more inclined to fertility. The same treatment may be applied during the next autumn, and in the subsequent years the tips of the outer roots may be shortened and fed as required from the surface. Root-pruning when systematically carried out, is altogether different in its results from those produced by it after a long period of unrestricted growth. In the latter case the tree may be seriously crippled or even killed. Even in successful cases, the fruit that follows such violent cutting is inferior to that produced by trees which have been root-pruned regularly when young. The reason is not obscure. The naturally-rooted trees have elaborated a root system, mainly characterised by its wide-spreading nature, accompanied by a relatively small formation of fibrous roots. Root-pruning carried out with judgment acts, in the first place,

FIG. 123.—PLATYTHECA GALIODES. FLOWERS BLUE.

seed is sown in slight warmth in boxes, and the plants are put out in prepared trenches about June 1 at 15 inches apart. They make remarkable growth, reaching a height of 14 feet.

Turnips are a desirable dish in an adverse season, especially for a large collection. No better variety is grown for the summer than Snowball, with Milan, Criterion, and Early Forcing for the earlier shows. Frequent sowings on well-prepared soil is the important point to observe.

Potatoes I have left until the last. No collection, no matter how small, is perfect without them. Nowadays, fewer varieties are

ing of culture on account of the great freedom with which the pretty blue flowers are developed. The plant has a Heath-like appearance, but it belongs to the Nat. Ord. Tremandreae, and is the only species of the genus. The second name is derived from the resemblance the shoots bear to those of a Galium, the leaves being arranged in a verticillate manner, about eight to a whorl. The plants require care in their culture, and succeed best in a compost of fibrous peat, with which has been mixed plenty of silver sand. Watering needs to be performed with soft rain-water only. Propagation is effected by cuttings of the young wood inserted in sand under a bell-glass. The cuttings should be kept shaded from strong sunshine.

[Photograph by C. F. Raffin.]

as a check to growth, and secondly, it stimulates production of an increased number of fibrous roots, thus altering the growth and increasing the fertility of a tree otherwise inclined to be sterile. A tree not so treated never suffers a check to its growth, though I daresay there are some who will challenge that statement as being not quite correct. The root-pruning of a neglected tree is an endeavour to repair an omission, and so far is to be commended; but it cannot, nor does it, yield results by any means equal to those obtained by an early exercise of the practice.

Still, there are cases in which a tardy falling back on root-pruning is followed by remarkable results. One such case occurred in my experience in connection with certain vines long past their half-century, which had their outside roots all severed close to the wall of the vinery. These plants, after the first year, exhibited a marked improvement, and when after some years a falling off was apparent, a second cutting of the roots several feet further out had a truly marvellous effect in the succeeding season.

The fear entertained by many cultivators that a disturbance of the roots of Raspberries and Strawberries may prove harmful has really no foundation in fact. It is, of course, unreasonable to dig too close to the canes of Raspberries, as it is to Currants and Gooseberries; but anyone who chuses to experiment, especially with newly-planted stock, will be led to acknowledge that root-pruning provides a method of preserving them in a vigorous and fruitful condition which cannot be surpassed by surface feeding. With regard to Strawberries, it may be pointed out that the practice of non-digging is of modern growth, and arises from the desire to have extra large fruits, which can only be successfully obtained from young plants. But it is erroneous to assume that Strawberries cannot be cultivated successfully over a number of years by means of systematically digging between the rows as early as convenient after the crop has been gathered. Fruits of a large size would follow this old system were the crowns to be thinned, but, perhaps, it would hardly repay the trouble. *R. P. Brotherton.*

ORCHID NOTES AND GLEANINGS.

BRASSOLA-LÆLIA ROSSLYN

(BRASSAVOLA DIGBYANA × LÆLIA LATONA).

A FLOWER of a pretty though not showy hybrid of the above-named parentage is sent by H. T. Pitt, Esq., Rosslyn, Stamford Hill (gr. Mr. Thurgood), in whose collection it was raised. Lælia Latona being the result of crossing *L. cinnabarina* and *L. purpurata*, the combination *Brassavola Digbyana* gives interesting features, in which all the species used can, by careful examination, readily be traced. The pedicel and ovary is 3 in. in length. The lanceolate sepals, 2½ inches long, are sulphur-yellow tinged with green, and the ovate acuminate petals are similarly coloured, the veining being slightly tinged with rose. The lip has a tubular base 1 inch long, the front being trumpet-shaped, the lower part elongated and turned down, and the whole tinted pale yellow with a beautiful rose veining extending to the fringed margin.

FOREIGN CORRESPONDENCE.

CROSSANDRA UNDULÆFOLIA.

REFERRING to a note on p. 106, I may say that *Crossandra undulæfolia* is growing well here. I shall be glad to send seeds of it to anyone in exchange for seeds of other interesting plants. *M. Buysman, Hortus Tonggerensis, Lawang, Java.*

THE ROSARY.

NOTES UPON NEW VARIETIES.

(Continued from p. 267.)

MME. JULES GRAVEAUX (*Tea-scented, Soufert et Nolting, 1907*).—This beautiful Rose, which was the winner of the Nickerson Award for the best Tea in general cultivation, was introduced in 1900 or subsequent years. Although I felt constrained to say in my previous note that I wish Mrs. Myles Kennedy had been given this award, I do not want it to be thought that I do not, with every other rosarian, greatly admire this beautiful variety named after the wife of the president of the Rose Society of France. Although called a Tea, it is the result of a cross with a Naisette and a Hybrid Tea. From the first (Rêve d'Or) it gets its extra vigorous growth. I was not successful with it the first two years, but this year it has done very much better, particularly where trained against a fence treated as a semi-climber. The colour is flesh shaded yellow and a rose-peach centre. The buds are fairly long and pointed, and this year the plants have flowered freely. There is no doubt it is a sort that does much better when thoroughly established. Many rosarians confuse this Rose with Mme. Jules Grolez (H.T., Guillot, 1887), a beautiful silvery-rose coloured Hybrid Tea, exceptionally free blooming, and quite one of our best garden Roses.

MME. CONSTANT SOUFERT (*Tea, Soufert et Nolting, 1905*).—Another glorious Tea-scented Rose that is one of the very best, and will be near the top of the list amongst exhibition Teas before long. It is also a gem for the garden owing to its vigorous growth and its carrying its beautiful flowers on such stiff stems. It is a very free bloomer. This year it has been grand here, reveling in the dry heat, as the blooms open very slowly. The colour is a dark golden-yellow, strongly tinted with a peach-pink; very large flowers, full and perfectly formed, and they last a long time in perfection.

W. E. LIPPITT (*H.T., Alex. Dickson & Sons, 1907*).—In regard to red Roses, I start with this first for one reason, and that is its scent is delicious. No H.P. scent can beat it. Not even Alfred Colomb, Ben. Cant, Chas. LeFebvre, Beauty of Waltham, Comte de Raimboud, Dupuy Jamain, Earl of Dufferin, General Jacqueminot, Horace Vernet, Louis Van Houtte, Marquise Litta, Mrs. John Laing, Prince Camille de Rohan, Sénateur Vaisse, Tom Wood, Ulrich Brunner, Victor Hugo, or Xavier Ohbo. How many of our lovely recent varieties fail in this respect! In growth it is almost as vigorous as Mme. Isaac Pereire, consequently in pruning the shoots require to be left longer than is usual in the case of most H.T.s. The colour is a brilliant velvety-crimson shaded maroon. The flowers are large, very full and symmetrically formed, with a nice, high-pointed centre.

HUGH DICKSON (*H.P., Hugh Dickson, 1904*).—I have already in previous notes written most highly of this acquisition. It is undoubtedly the finest addition to our H.P.s of recent introduction. At least it is as perfect a red as Frau Karl Druschki is a perfect white, and it surpasses that lovely Rose inasmuch as it has the most delicious perfume. This year with me it has bloomed as freely as any H.T.; it stood the heat and glare of the sun splendidly and is as strong as any of our best autumn Roses. It is an intense brilliant crimson, shaded scarlet, and has large blooms somewhat cup-shaped and slightly reflexed at the edges. The petals are large and smooth, and they are very numerous. The flower has a nice centre and it keeps its form fairly well.

WARRIOR (*H.T., Wm. Paul & Son, 1906*).—This Rose has during this summer proved itself a splendid decorative or garden sort. In the bud stage it is most striking, having quite the longest and handsomest buds of any Rose I ever saw, and a real blood-red colour. Its buds are

its beauty, as when the flower opens it becomes not only very thin, but loose and of poor shape. When expanded the colour is a deep scarlet-crimson. The plant has good foliage, a free habit, and is very suitable for bedding.

THE DANDY (*H.T., Paul & Son, 1905*).—I mention this for those who like a small Rose for button-holes. The colour is a glowing maroon-crimson; it is quite a small flower but is exquisitely formed, and a very free bloomer and of a delicious scent.

GEORGE LAING PAUL (*H.T., Soufert et Nolting, 1904*).—This Rose only attains a medium size, but is of perfect shape in the centre and possesses a pleasing fragrance. In colour it is deep crimson. The plants have been very free this season.

CHARLES J. GRAHAME (*H.T., Alex. Dickson & Sons, 1905*).—The exceptional drought we had here in July and August tried this Rose severely, it being one of the cool weather varieties. We were greatly disappointed with it, as last year we could not speak too highly of it. It did not maintain its extraordinarily dazzling orange-crimson colour, in fact it came more in colour like Dupuy Jamain does at this season. However, since the rains it has quite made up for lost time. It is very free, and its most strikingly dazzling colour is superb. Fine blooms they are too, so large and of such splendid form, great fine petals and a grand stiff shape. It is a most vigorous grower on the seedling Briar. I saw some plants on the Manetti stock, very sickly things; personally, I do not like the Manetti for anything, though some still will use it, especially many of our American friends. *Leonard Petrie, Gayton, Cheltenham.*

(To be continued.)

PLANT NOTES.

MEDINILLA MAGNIFICA.

THIS is one of the most ornamental of show shrubs. It is seen at its best as a large specimen, and as such, when covered with its pendulous racemes, is a magnificent sight. The flowers are produced about May in dense terminal racemes. The individual flowers are of themselves small. The flowers, flower-stalks, and bracts are, in the typical species, of a uniform, rosy-pink colour, and remain in perfection on the plant for two months or longer. It is useless as a cut flower, and as a plant for house decoration it cannot be recommended. It is most conveniently grown in a large pot or tub in a compost of fibrous loam and peat with the addition of charcoal and rough grit; the soil should be made firm as the work of potting proceeds. With large plants an annual top dressing is sufficient to keep them in good condition. It is naturally of slow growth, and branching dichotomously, little artificial training is required to produce an even specimen, which, out of flower, is a handsome plant, with the large leathery leaves and conspicuous venation. Cuttings root readily if plunged in a bush bottom heat. *Ernest W. Jeffrey, Woodend Gardens, N.B.*

POLYANTHES TUBEROSA.

THE double-flowered *Tuberose* is one of the commonest plants in gardens, but the single-flowered, original species of this fragrant *Amaryllid* is rarely seen. A plant of it in a small pot bearing fine spikes of its pretty, wax-like, white flowers has been in bloom for a long time in an unheated house in the nurseries of Messrs. Jas. Naylor & Sons, Roxeth, Harlow, where it has been much admired, and pronounced by some to be a prettier flower than the double form. It is doubtless in bloom in other places, as Messrs. Moore, Ltd., imported a quantity of it early this year from India, where the species is a cultivated plant, as it is in most warm countries. It is a native of *Madagascar*. *J. O'R.*

THE HAY CROP AT ROTHAMSTED.

THE meteorological returns at the Rothamsted Experimental Station, Herts., for the first three months of the present year show a total rainfall of 6.3 inches, equal to 32½ tons of water per acre in excess of the average of 54 years at this station; while the five months January to May, which practically comprises the whole growing period of the Hay crop, gave 11½ inches of rain, or 106 tons of water per acre in excess of the usual average. The two months March and April each gave an excess of rain of 1½ inch, while January, February, and May showed a deficiency.

showed a deficiency, April being particularly gloomy, with a record of 21½ hours deficient. Thus the first five months taken together gave a total of 394 hours of bright sunshine, or 10½ hours less than the average for this period.

Under these climatic conditions, the experimental Hay crop at Rothamsted was, under all conditions of manuring, less than the average amount, ranging from 5 to 18 cwt. per acre deficient, and considerably below the yield of 1907.

As a set-off against the bulky crop of 1907, which was badly harvested, the crop of the present year was cut and carried with very little trouble, well-cured Hay being the rule for 1908

again the yield was 7½ cwt. per acre less than the average and 9½ cwt. below last year's record.

Sulphate of ammonia at the rate of 2 cwt. per acre added to the superphosphate yielded 30½ cwt. of Hay per acre, being double that produced by superphosphate alone. This fact shows that superphosphate, when applied alone year after year uses up the nitrogen of the soil and impoverishes the land, so that if this practice is continued for any considerable length of time the yield of Hay will be little better than that grown without any manure at all. Hence the advisability of applying every few years a small dressing of farmyard dung to keep up the fertility of the soil.

FIG. 124.—NEW CULINARY APPLE "RENOUN," RAISED BY MR. ROSS, AND GRANTED AN AWARD OF MERIT ON SEPTEMBER 29. (For text see p. 293.)

The beneficial effects of this abundant rainfall in the growth of the grass crop at Rothamsted was hindered by a very low temperature. January, March, and April each gave a much lower than average record, while February and May showed an excess of warmth.

The bright sunshine for the first three months of the year was 6½ hours in excess of the average for this district. January was characterised by quite an abnormal amount of sunshine, 14½ hours in excess of the usual average being recorded. February, March, and April each

The experimental Hay crop at Rothamsted was this year cut on June 12th, while last year the date of cutting was as late as July 13th, a month behind that of the present year.

The plot of land which has received no manure of any kind for a period of 54 years has this year produced 9½ cwt. of Hay per acre only, being 12½ cwt. less than the average quantity for this plot and 12½ cwt. below the yield of last year.

Superphosphate alone increased the crop over the unmanured by 6½ cwt. per acre. Here

Dung tends to encourage luxuriance and to decrease the proportion of the nutritious Clovers, while the application of such manures as superphosphate, basic slag, kaimt, and bonemeal may not greatly increase the yield per acre, yet will largely encourage the growth of the leguminous plants, Clovers and Vetchlings, &c., and so give a superior quality of Hay.

It is very remarkable in the Rothamsted experimental grass plot which has for so many years received superphosphate and sulphate of ammonia as manure, that the effect has been to

increase the produce, chiefly of the grasses proper, greatly to diminish the Clovers, and to cause a relative absence of weedy plants. The crop is usually later in ripening than is the case of that to which superphosphate alone is applied, and with more dark green, leafy herbage and less stem, the herbage being of poor quality.

Superphosphate and sulphate of potash, when applied together, but without nitrogen, gave slightly more produce than superphosphate and ammonia salts. This fact is due to the extensive growth of the Clovers and Vetching plants, which comprise more than one-half of the whole crops, and is the result of the continuous application of potash for so many years.

The Clovers obtain the necessary nitrogen for their growth from atmospheric sources, brought about through the agency of the micro-organisms of the soil, which are encouraged in their beneficial work by the phosphates and potash applied as manure.

Another of the Rothamsted experimental plots shows that neither magnesia nor soda, nor even lime, can take the place in the soil of a sufficient supply of available potash.

The plots receiving superphosphate, potash, and 400 lbs. of sulphate ammonia per acre, yielded 46½ cwt. of Hay, being 7½ cwt. less than the average product, and 18½ cwt. below that of last year. Under these manurial conditions, that is, with an excessive supply of nitrogen as ammonia salts, the produce of Hay is bulky, and consists to a very large extent of grasses, a few of the coarser varieties making up the greater proportion of the weight. Clovers are absent, and weeds form a very small proportion of the crop.

The heaviest produce of Hay per acre was produced by 600 lbs. sulphate of ammonia, combined with superphosphate and potash. This plot yielded 3½ tons per acre, but the Hay obtained is coarse and stemmy, largely consisting of false oat-grass, Yorkshire Fog, Foxtail Grass, and common Bent. This plot affords a very striking illustration to the grass farmer of how "not to manure" his pastures if he wants to keep up the quality of herbage.

The Hay yielded under the influence of phosphates and potash, combined with nitrate of soda, is much superior to that grown where sulphate of ammonia takes the place of nitrate of soda.

The lasting effect of farmyard dung is shown on the plot to which this manure was applied 45 years ago, and has been left entirely without manure since. There is, even now, after this long period of time an increase of about 3 cwt. of Hay per acre over the plot which has received no manure at all for 54 years.

The effect of ground burnt lime, which was applied at the rate of 1,000 lbs. per acre, in January, 1907, is exceedingly marked, a gain of Hay ranging from 4 cwt. to 13 cwt. per acre being obtained, and of superior quality. *J. J. Willis, Harpenden.*

NOTICES OF BOOKS.

* HOW TO MAKE THE MOST OF LITTLE GARDENS.

In this small volume the floral parts of small gardens is fully dealt with, and the lists of flowering and other plants suitable for a variety of purposes, sites, and aspects are good ones; moreover, many of the so-called "old-fashioned plants" are kept well within view. A man who has never tried to construct a rockery on fairly level land, and therefore does not understand the difficulties confronting him, will be grateful for the hints and directions afforded in the chapter, "How to Make a Small Rockery." Only such species of rock plants as

* *Little Gardens and How to Make the Most of Them*, by H. H. Thomas. Published by Cassell & Co., Ltd.; price 1s. 6d. net.

will thrive in the ordinary mixture of loam and peat are advised for planting; but this list will suffice for affording pleasing effects at all seasons. The making of walks should have included advice in reference to the depth of the foundations in order to secure dryness at all seasons, and upon the materials to be used, drainage, width, &c. Very frequently too much money and labour are expended on garden path-making, whereas a foundation of 6 inches in depth is all that is required, if a drain at each side be laid in. Chinkers from the gas-works, brick ends, broken stone, and very coarse sittings from gravel, are suitable materials. Rustic adornments, such as arches, seats, supports for climbing plants, and trellises come in for appropriate remarks and illustration. The illustrations of flower beds are, on the whole, pleasing, and modes of planting are shown. There are remarks on Rose growing, and the processes of planting, pruning, and budding are easily understandable from the illustrations given. The lists of varieties are very apposite, one list being given of fragrant varieties, in which many old acquaintances are met with. Sweet Peas have a long chapter to themselves, as have Violets, Carnations, Begonias, Grape vines, and hardy fruits. *M.*

* SCHOOL, COTTAGE AND ALLOTMENT GARDENING.

MANY people who happened to notice the modest title of this excellent book might easily fail to form a correct appreciation of its value. It is not too much to say that it is one of the very best of its type, and will be found of great service to anyone who wants to work a garden either for amusement or profit. The field which it covers is a large one, but Mr. Weathers knows what he is writing about, and he is clear, incisive, and practical. The directions for laying out and planting a small garden or plot are just those which are wanted, the details of both cultivation and cropping being admirably discussed. The fruit, flower, and vegetable garden each receive separate treatment, and the author selects just those subjects for cultivation which are most likely to be wanted by the circle of readers to whom he desires to appeal. Naturally, in a little book which contains so much information, complete freedom from errors is hardly possible, but they are seldom, so far as we have discovered them, of a serious character. There is, however, a statement on page 41 relating to the testing for the presence of lime in the soil which seems to need alteration. The addition of hydrochloric acid most certainly will not precipitate lime from a solution containing it; perhaps oxalic acid was meant. The calendar of gardening operations will be found useful, and possibly the examination questions at the end of the volume may be serviceable to those who desire to sit for the examinations of the Royal Horticultural Society. In conclusion, we may say that the book, as a whole, thoroughly justifies its claim to be regarded as a practical guide to gardening.

APPLE RENOWN.

THIS new variety was raised by Mr. Chas. Ross, Welford Park Gardens, Newbury, from the same cross that resulted in the Charles Ross variety. The tree has desirable qualities in the matters of cropping and habit, and the flesh is solid, crisp, juicy, and of pleasing flavour. In consideration of these good points, the variety was granted an Award of Merit by the Fruit and Vegetable Committee of the R.H.S. when shown by the raiser at the meeting held on September 29.

* *A Practical Guide to School, Cottage, and Allotment Gardening*, by John Weathers. Longmans, Green & Co. Price 2s. 6d.

The Week's Work.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to THE DOWAGER LADY NUNBURGHOLME, WATERBURY, YORKSHIRE.

Peach and Nectarine trees.—These trees, as they become cleared of fruits, should be pruned and have the r-shoots regulated in order that they will be exposed as much as possible to the light and air. Outdoor Peaches in cold localities still hanging upon the trees will not be of much value, but they may be improved a little by affording the trees some protection at night from frost and damp. Should the weather still continue dry the borders will need to be watered copiously. It is not yet too late to apply liquid manures to any trees that have borne heavy crops, or to other trees that require a stimulant.

Root-pruning and tree lifting.—Trees that have failed to bear satisfactorily may still be lifted or root-pruned. In many cases the affording of fresh soil or the planting in a more favourable position suffices to convert a more or less barren tree into a fruitful specimen. Recent weather has been very favourable for lifting or root-pruning trees against walls, in the manner recommended in the Calendar printed in the issue for September 19. Trees that were thus treated early will now be making fresh roots in the new compost. Other wall trees than Peaches and Nectarines, such, for instance, as Plums, Cherries, and Pears, may be benefited by similar treatment. Almost any fresh soil that does not contain an excessive amount of manure will benefit trees that have been neglected for a number of years, but where it is possible soil of a calcareous nature should be chosen. In many gardens where Peaches and Nectarines are given satisfactory attention in this respect Cherries, Plums and Pears are neglected. For this kind of work plenty of good loam is the chief requirement, but road scrapings, old lime rubble, charred garden refuse, and similar materials, when incorporated together, are all of great value. By looking ahead one may often prepare a large heap of such materials for use when required.

Monthly Cherries.—The trees may now be pruned, cleansed and trained, making every effort to push forward this work as far as possible before severe weather sets in, for in spite of the best arrangements a considerable amount of the nailing and tying on out-of-door walls will have to be performed under conditions that impose discomfort upon those engaged on the task. Cherry trees should be completely detached from the walls. Each shoot being well washed before being again secured with nails and shreds. Prune away all shoots that have borne fruits this season, and any others which will not be required for extending the trees. The shoots of young trees will necessarily be required for extension. Tie or nail in the growths at distances of not less than 4 inches apart, and use nothing but clean shreds and nails. When pruning has been completed gather up all the prunings and place them on the garden fire, in order to destroy any pests there may be upon them.

THE FLOWER GARDEN.

By W. FYFE, Gardener to Lady WASTAGE, Lockinge Park, Berkshire.

Planting of Roses.—Although Roses may be successfully planted at any time from late October to the end of February, the last fortnight of October and the whole of November generally give the best results. If the soil is sufficiently deep it should be well trenched, and if poor, a liberal dressing of manure must be added, but in such a manner that the manure will not come into direct contact with the roots of the plants immediately after the planting has been done. The most suitable soil for Rose culture is a rich, deep loam, resting on gravel. Should the soil be unusually heavy and stiff in working, it will be well to mix leaf-mould and gravel freely with the staple at the time of planting. On the contrary, if the soil is of the opposite description, heavy loam may be added, but in either case care must be taken to see that the drainage is good. Before planting Roses of any description, remove all sward-like growths that proceed from the root, or from the stock below the point of union. Shorten any strong roots that possess but few

fibres. Planting should be done during fine weather, if possible, in order that the soil may be broken and made moderately firm, which would be injurious in wet weather. Roses on the briar or Manetti stock should be planted at least 3 inches deep above the point of union. In the case of tea-scented Roses, this is especially necessary, as they are naturally less hardy than other sorts, and if the plants are cut down by frost they will usually make fresh growths from buds below the ground surface. For planting in beds, Roses upon their own roots and that have therefore been raised from cuttings are satisfactory, provided only the stronger-growing varieties are selected. Such varieties are as follows:—*Hybrid Perpetuals*: Frau Karl Druschki, Mrs. John Laing, Margaret Dickson, Hugh Dickson, Ulrich Brunner, and Paul Neron. *Hybrid Teas*: Caroline Testout, Liberty, Killarney, Captain

trees will now cause much work, but they must not be allowed to accumulate in large quantities upon the lawn, otherwise they will cause considerable injury to the grass. The mildness of the season necessitates the repeated use of the mowing machine to keep the grass in the best possible condition, as it is expected to be at this season.

THE ORCHID HOUSES.

By H. G. ADAMS, Orchid Grower to Lt.-Col. G. I. Herbert, C.V.O., C.B.E., Westbury, Gloucestershire.

Cleaning the houses.—The present time is most suitable for a thorough overhauling of the houses in every part. Having the re-jointing operations well forward, this work of cleansing should receive prompt attention, because delay would result in depriving the plants of sunlight, which is so necessary for their well-being during

stages is not to be recommended, as the luxuriant growth usually made under the favourable atmospheric conditions that generally exist in Orchid houses is apt to prevent the proper circulation of air about the plants. Where such plants are present, the growths should be thinned out considerably at this season. If rubbish of any kind has accumulated beneath the stages it should be removed, for it forms a hiding place for many pests that infest these houses. All dirty pots should be thoroughly scrubbed. Arrange the plants in such a manner that each will be exposed equally to the light, but at the same time do not put them too near the roof glass, where they would be likely to suffer injury from cold during severe weather. The use of top ventilators must also be considered, and all hanging plants kept at a greater distance

FIG. 125.—ALBATROSS PEACH, AN EXCELLENT VARIETY RIPENING AT ABOUT THE END OF SEPTEMBER. THE FLOWERS ARE LARGE AND THE LEAVES HAVE NO GLANDS.

Christy, Mildred Grant, Viscountess Folkestone, and La France. *Polypetala and Wichuriana varieties*: Dorothy Perkins, Crimson Rambler, Leuchstea, Lady Gay, Clair-Jaquier, and Hawthath.

Perennial Asters.—During the present month the *M. inaequalis* Daisies are a great attraction. The stock of particular varieties may be increased by division as soon as the plants have flowered, or they may be propagated from the young growths which the daisies so freely produce in spring. Make an examination of the plants while they are in flower, selecting the best and most distinct varieties, and marking others that are not worth retaining.

General work.—Fallen leaves from deciduous

the most trying period of winter. In these gardens, whenever possible, each house as it is taken in hand is cleared of its occupants, and afterwards the glass and woodwork are thoroughly washed both inside and out, the house being thrown open for a few hours afterwards to admit all the air possible to thoroughly sweeten the atmosphere before the plants are replaced. Where shingle, sparre or coke is used for holding moisture, it should be turned to destroy the slimy growths that are almost sure to be present after exposure during the seasons of growth, with the attendant dampness, especially in the case in the hottest districts. The growing of *Zebra* *Tridax* and such plants about Orchid

from these during winter than at any other season.

Cleaning the plants.—There are many troublesome insects that will make their appearance upon the plants, even if the cultivator is most careful and observant, and these multiply rapidly if not kept under by the use of one of the many safe insecticides now on the market. The worst insect enemy to Cattleyas and other pseudo-bulbous Orchids is the soft, white scale. These conceal themselves under the outer sheaths of the growths, and more than ordinary spraying is necessary to dislodge them. In the presence of a bad infestation these sheaths must be stripped off, and, after some insecticide has been applied, a small pointed stick should

be used to remove the insects. Needless to say, such work should be entrusted to careful and reliable men only, as there are some plants whose leaves, if roughly handled, become cracked and broken, and sometimes the centre leaf of a growth is pulled out, whilst newly-potted plants are easily loosened in their material if only ordinary care is exercised in handling them.

Fumigating.—Thrips are often troublesome during the shorter days, and especially in the warmer divisions if much fire heat has to be used. In order to keep these in check, employ a safe vaporising compound at regular intervals of two to four weeks. Preceding the operation damp down the house, closing it early in the day and allow the temperature to rise. This induces the thrips to come out of such hiding places as the vapour cannot readily reach. If the scale is troublesome, these periodical fumigations will keep it in check. It is always well to remember when using these compounds that two mild applications with an interval of a few hours between them are safer than one of greater strength.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICAR GRIBBS,
5, Aldenham House, Elstree, Hertfordshire.

Asparagus.—The growths should now be cut close to the ground by means of a sharp pair of hedge shears. Remove all the rubbish and weeds from the beds and alleys, and when this has been done apply a good dressing of half-decayed farmyard manure. When the manure has been spread, this may be covered with a layer of soil obtained from the alleys. Though many cultivators prefer to grow their Asparagus entirely in level ground, this appears to me to be advantageous only on light, well-drained land. Wherever the soil is soft and retains the wet, it is much better to have slightly raised beds, which will have the effect of keeping the roots in a less wet condition during winter. The work I have described should be done neatly, and afterwards the beds will not need any more attention until the spring.

Forcing Asparagus.—Few vegetables can be more easily forced, and none are more welcome than Asparagus. If there is a plentiful supply of roots for forcing, Asparagus can be had in good condition from November until the season for out-of-door Asparagus again comes round. The roots may be forced in an ordinary forcing house, or in heated pits, or upon mild hot-beds; but the forcing house is the most suitable place at this early season. A moderate degree of bottom heat in some form is necessary, and as light a position as possible should be selected for planting. Asparagus suffers very much if its roots are exposed to the atmosphere for any considerable length of time. Therefore, every care must be taken to lift and replant them with as little delay as possible during the operation. In addition to the ordinary hot-water pipes, it is advisable to have a mild hot-bed, composed principally of fresh leaves, and on this may be placed about 4 inches deep of soil of a light nature. The roots should be covered to a depth of 3 inches, and a good watering should be applied as soon as the roots have been planted. Spraying may be done frequently, and the waterings must be applied as often as necessary.

Horseradish.—It is a good practice to trench half the bed annually and take out all the serviceable roots, storing them in sand or ashes under a north wall, or in some cool place, where they can be easily obtained when required for use. Plant the smaller roots again at a good depth from the surface, and during this operation apply a liberal quantity of farmyard manure in each trench. I have found this system answer perfectly. Two years are quite long enough for horseradish to produce roots of sufficient size for use. One of the best roots is much superior to those of longer growth. The remaining half of the bed should be cleaned of weeds and be given a dressing of good farmyard manure, which should be covered with a little soil.

French Beans.—Sowings will have to be made to maintain a regular supply of French Beans during winter. Well-drained pots, 7 inches in diameter, are recommended for use at this season, and they may be filled with a light compost consisting of two parts leaf-mould, one

part loam, and one part road grit. Attend to the staking and top-dressing of Beans raised from earlier sowings. Place any plants that are coming into flower as near to the glass as possible in a house having an intermediate temperature.

Runner Beans.—The supply of these is practically exhausted. Any young pods that may still be left upon the plants and are fit for use should be picked and preserved by placing the ends in a little water. Any pods that have been saved for seed purposes should be stored carefully in a place where they will dry under the best conditions.

PLANTS UNDER GLASS.

By THOMAS LUNT, Gardener to A. STIRLING, Esq.,
Kent, Postlebury, N.B.

Cinerarias.—Plants that are intended for forcing large specimens should now be given their final shift, employing a rich compost of loam, leaf-mould, sand, and a sprinkling of some favourite artificial manure. Manure of this nature can be best used by mixing it amongst the soil for use in the last potting, as the plants have by this time made plenty of roots, and during the winter season not much feeding can be done by means of liquid manure.

Schizanthus.—Plants which are expected to flower early in spring should now be ready for potting into 8-inch pots. Use a strong but porous soil of much the same character as that recommended for Cinerarias, and, as in that case, adding a little artificial manure. In the process of potting, ram the soil moderately firm around the inside of the pot, as this will cause the plants to make close-jointed growth. After the potting has been done, place the plants in a dry position in a light, well-ventilated structure, keeping them near to the glass and as cool as possible without incurring risk of frost reaching them. The growths will now need some support. Therefore, thin bamboo tips may be used, placing one at the centre of the plant and four round the sides, attaching each of these side stakes to the centre one. If the work is neatly done these stakes will be completely hidden when the plant is in bloom.

Rhododendron Nobleanum, &c.—Plants of this species that are grown each year for winter forcing should now be selected, choosing those that are well set with flower-buds. Pot them up into pots as small as can be safely used, employing peat and sand only, unless the loam is of a very sandy nature. After potting they should be placed in an unheated frame and be given a thorough soaking with water. Good plants of this Rhododendron in 8 or 9-inch pots are exceedingly useful for house decoration during the winter, and may be easily had in bloom by Christmas. Deutzias, Lilacs, Spiræas, Staphylea colchica, and similar plants should also be potted up ready for forcing.

Hard-wooded plants.—Such plants as *Chorizanthe* Lowii that have made their flowering growths should now be tied into shape, always keeping the shoots so that the flow of sap will be on a level, or slightly on the incline. Regulate the growths so as to cover the plant evenly with flowering shoots. *Acacia cordata* and *Polygalas* should also receive similar treatment in the way of training.

Rhododendron indicum (Azalea indica).—What are termed Indian Azaleas should now have all the old ties removed, and, after affording fresh stakes, be newly-trained, tying them in a loose, free-looking manner, so that the flowers will be shown to the best advantage. For pyramidal training, place a strong stake in the centre of the plant, and five or six round the sides, attaching all these with fine twine to the centre stake at half its height. Azalea shoots are very brittle and may easily be broken unless the greatest care is taken. Regulate the shoots evenly, and do not tie them too closely or the effect will be to give the plants a formal appearance that is undesirable.

FRUITS UNDER GLASS.

By T. COOMER, Gardener to LORD LANGRATOCK.

Peaches and Nectarines.—The season has arrived for the planting of young trees of Peaches and Nectarines, and if preparations were made as advised in the Calendar for August 8 they need now be no delay. It is very useful to

have young trees growing upon outside walls, and to prune their roots annually, for trees can be safely replanted some weeks earlier than those that have to be conveyed a distance, and if this is done carefully, and they are not forced early, there need be no sacrifice of fruit as a result of the operation. In removing a tree of this description, first liberate the branches from the wall, then take out a trench round the roots, from which the soil should be carefully worked away, except such as can be conveniently worked with the roots. Next make an opening beneath them to receive a strong opened mat, upon which the tree should be taken to the new position already prepared at it. Secure the branches to the wall or wall, cleanly cut away the jagged ends of roots and arrange them through the upper part of the border, making the compost quite firm about them. Complete the work by mulching the border with stable litter and applying a thorough watering. Until the leaves fall the trees should not be subjected to severe draughts, but they need shade from bright sunshine, and should be syringed several times each day. In cases where young trees are planted direct from the nursery the shoots are carefully unpacked as soon as they are received and the roots steeped in water, and the rough end of the roots cut off smoothly. They should then be planted in a similar manner to that advised for older trees. The following varieties may be usually depended upon to give satisfaction:—*Peaches*: Hale's Early, Early Gros Michelonne, Royal George, Dymond, Noblesse, Bellegarde, Violette Hative, Barrington, Raymackers, Late Devonian, James Bank and Exquisite. The two last names are good late-fruiting, yellow-fleshed varieties. *Nectarines*: Cardinal, Dryden, Violette Hative, Humboldt, Pineapple, and, if a very late one is required, Victoria. Humboldt and Pineapple are the best of those mentioned.

Late Peach house.—As soon as the leaves have fallen from the trees (and this process may be assisted when they are matured, by lightly drawing a new birch broom over them from base to top), lose no time in thoroughly cleansing the house and trees. If the trees are to be pruned have been carried out there will be very little pruning to be done at the present time, but in any case the shoots must be left in a crowded condition. After the pruning has been done, carefully wash the old wood of the trees with a solution of Gishurst compound, dissolving five or six ounces to each gallon of warm water. For removing brown scale from the young wood, use either a diluted solution of the Gishurst compound or a milder wash of soft soap and warm water. For the purpose of applying wash use a small stiff brush, and in doing this be careful not to injure the buds. Any root-pruning that has to be done may be carried out at once, and the borders may be top-dressed as was previously described for earlier trees. Let the ventilators be kept fully open at the present time in order to keep the trees at rest.

THE APIARY.

By CHILDS.

Flowers for bees.—All flowers are not of great use to the honey bee as a source of nectar for several reasons: (1) Because some blooms produce no nectar at all; (2) because some blooms yield only pollen; (3) because of the peculiar construction of the bloom. Some flowers producing a quantity of nectar, are beyond the reach of the hive bee. To really be of any value to the beekeeper, good breeds of honey-producing plants must be cultivated. The following alphabetic list is by no means exhaustive, but contains some of the best-known nectar-bearing blooms visited by hive bees:—*Acacia*, Apricot, Apple, *Anchusa italica*, Alyssum, Arabis, Asparagus, Bean, Borage, Blackberry, Cherry, Crocus, Cytisus, Currant, *Cheranthus*, Clover (white), Cornflower, Cucumber, *Clarkia*, Cerinthe, *Collinsia*, Genista, Galanthus, Gooseberry, Ground Ivy, Grape, Godetia, Gilia, Heather, Iberis, Ivy, *Cercis Siliquastrum*, Lepto-siphon, Lupin, *Limnanthes*, Lime, Magnolia, Mignonne, *Larajorum*, Maple, Malope, Melon, Onion, Phlox Drummondii, *Platanus*, Peach, Pear, Raspberry, *Silvia*, Sage, Sunflower, Scabiosa, Strawberry, *Syrmone*, Thyme, *Tropeolum majus* and minus, *Verbena*, Violet, *Wistaria*, Winter Acacia, and *Yuliflora*

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the PAPER sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unsolicited communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.

TUESDAY—
Clearance sale of Nursery Stock, at Bury Road Nursery, Gosport, Hants, by Protheroe & Morris, at 12.

WEDNESDAY—
Sale of Nursery Stock, at the Nurseries, Richmond Road, Twickenham, by order of Mr. H. E. Fordham, by Protheroe & Morris, at 1.30.

Azaleas, Rhododendrons, and Camellias, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.

THURSDAY AND FRIDAY—
Holland's Great Annual Sale of Nursery Stock at the Nurseries, Greenbridge, near Tunbridge Wells, by Protheroe & Morris, at 11.30.

The important collection of Orchids formed by J. Bradshaw, Esq., of Southgate, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 1.

The principal functions of the Events of past week have been the holding of the annual show of British-grown fruits in the Royal Horticultural Society's Hall, and the concurrent conference on the subject of spraying fruit trees. The exhibition may, we suppose, be described as successful, inasmuch as sufficient fruit was forthcoming to furnish all the available table space in the hall. It was very similar to previous fruit shows, and the slight differences observed could easily be explained by the variation in the seasons. The Reports we published in these pages in August proved that the Pear crop was decidedly under the average, and therefore it was not surprising that fewer Pears were exhibited than usual.

Possibly some of those who visited the Hall were disappointed in the general display of Apples. The fruits were abundant, but the development of colour was rather under than over the average. There is much to be learned before it can be stated with any degree of exactitude what are the

precise conditions that cause colour development in fruits, or even in flowers, and although the presence of frequent bright sunshine is generally considered to have considerable influence in this direction, practical fruit cultivators are not likely to admit that this alone may be accepted as the only factor concerned in the production of high colour. Especially is this the case when a spell of sunshine occurs at the wrong moment. In the present season the Apple crop entered on a period of ungenial weather at the end of August, and this lasted until past the middle of September, when the skies again brightened and the weather became unseasonably warm. A week or two ago we referred to the effect of this change upon the Apple crop. It appeared to cause a sudden increase in the circulation of the sap in the trees, and the partially-withered stems by which the fruits were still attached to the shoots, were probably insufficiently fitted for conveying the sap fast enough to the fruits and thus to adapt themselves to the new conditions. The result of this was seen in most gardens, and in a lesser degree in orchards, for the fruits were shed by the trees in numbers as are usually seen after a storm of high wind and rain. This circumstance proved that none but the later-ripening sorts could derive much benefit from the almost tropical weather that characterised the early part of the present month. The fruit-grower, however, has the satisfaction of knowing that its influence upon the trees themselves is likely to favour the development of a fruitful condition next year.

We hardly expected to witness a satisfactory display of soft or stone fruits at this show. These are not often procurable in appreciable numbers in the middle of October, least of all in a season like the present. Peaches, Nectarines, and Plums, therefore, were few and insignificant. It may be that the Council will consider it advisable to arrange the event for an earlier date next year in order to favour the exhibition of such fruits, and thus alter in some slight degree the make-up of the show. Indoor Grapes included some first-rate examples of Muscat of Alexandria, and, apart from these, most of the varieties were represented by satisfactory fruits that can hardly be described as above the average quality. In another column a correspondent has drawn attention to some excellent Grapes that were presented for exhibition with a thick coating of sulphur or sulphur compound upon them. These were so unmistakably out of place, that it may be hoped the criticism they provoked will prevent anyone again showing fruits of any description in a similar condition.

It has been remarked that this annual fruit show fails in a lamentable degree to attract the general public. Such attendance as there was last week consisted almost exclusively of professional gardeners or other persons having some duties connected with the show. Notwithstanding all past experience, no attempt is yet made to stage the fruit in a manner calculated to present a spectacular effect, and, in attempting to explain the difference of the public, this circumstance is at least entitled to some consideration. At a competitive exhibition such as this, it is undoubtedly necessary that the conditions governing each class must be exactly the same for each exhibitor, even in the matter of stag-

ing his fruits, but, granting this much, it is still possible to vary the conditions as between one class and another! There might also be a special class with liberal prizes offered for the most decorative exhibit of hardy fruits, and the arrangement left entirely to the discretion of the exhibitor, for the purpose of encouraging someone to present a scheme that would impart fresh interest. The recent display was even more monotonous than previous shows, inasmuch as the leading fruit-tree nurserymen were not able to make the accustomed exhibit of fruit trees in pots that on former occasions have relieved to some extent, at any rate, the long rows of tables.

The Council is to be heartily congratulated on having inaugurated a conference which met on the second day of the exhibition. We freely acknowledge the importance of all properly-managed horticultural shows; they have a stimulating influence which tends to the spread of gardening practice, but at the same time their usefulness is increased tenfold if accompanied by an exchange of ideas such as takes place during a conference. Many of the conferences that were held in the old Chiswick gardens were the means of collecting and publishing information of the greatest value to cultivators, and they will remain to posterity one of the principal contributions the Society made to practical gardening during the Chiswick period. The subject of the recent meeting was the spraying of fruit trees to preserve them from insect and fungus pests. No one can read the correspondence from week to week in these pages, or the numerous questions on this subject that are sent to this office, without realising what a serious menace these pests threaten to the fruit industry of this country. As we consider this subject as one of the highest importance, we have taken steps to present our readers with a somewhat detailed report of the proceedings. The fact that experts appear to differ in their views upon some of the details that were discussed merely goes to show that more complete and accurate information is required, and such information can best be obtained by repeated trials carried out by practical men who adopt scientific methods for applying the remedies and measuring their results. In the case of the complaints made of the Bordeaux mixture, for instance, it will probably be found that they arise from the fact that its composition is not always perfect, or it may be that the means of applying the liquid leave something to be desired. The comparative value of summer and winter spraying may vary according to the circumstances in which the spraying is carried out and the particular pests that have chiefly to be combated. There appears, however, to be a general agreement that whilst fungicides may be rightly regarded as preventives, insecticides can only be effectively employed as remedial measures. In these matters horticulture may well claim assistance from the Government, and the proposal that a sub-department of the Board of Agriculture should be established for this purpose has the sympathy of all engaged in the fruit-growing industry.

On Thursday evening, being the first day of the fruit exhibition, the members and friends of the United Horticultural Benefit and Provident Institution assembled for the annual dinner at the Waldorf Hotel. This Institution should not be confused with such

gardening charities as the Gardeners' Royal Benevolent Institution and Royal Gardeners' Orphan Fund. It is not a charity, but a Benefit Society, and one that may be cordially recommended to young gardeners who have a desire to provide for periods of sickness and, incidentally, for old age. The expenses of management are unusually low for an institution of this character, and the returns upon the invested contributions from the members are correspondingly liberal. The recent meeting was very successful, and the proceedings were characterised with enthusiasm.

On the afternoon of Friday the annual

meeting of the "R.H.S. Union of Horticultural Mutual Improvement Societies" was held in one of the committee rooms at the Hall. The Rev. W. Wilks, M.A., presided, and during the proceedings presented some specimen rules and regulations for the organisation and direction of horticultural debating societies. In these rules an attempt has been made to define what shall constitute an "amateur" at the local shows, and we hope it may prove successful. Any effort that is made to settle this question, so far as the winning of prize money at a particular show is concerned, deserves consideration, and we therefore publish an excerpt from the Rules

on another page. It depends where an exhibitor is exhibiting at the moment whether he may consider himself an amateur or not. At the great open shows it is customary to consider all as amateurs who cannot be classed as traders, but in the case of local exhibitions the grading has to be carried to a further degree, and the amateur must be separated from professional gardeners and from those who employ professional gardeners. It is these facts that have contributed to make the question "What is an amateur?" an eternal problem. An exhibitor who was freely admitted last week as an amateur at a certain show, if rejected this week at another exhibi-

tion held in quite contrary circumstances, will need a great deal of explanation before he can see the justice of the latter ruling.

Mr. ALEXANDER HISLOP, formerly a member of the gardening staff at the Royal Botanic Gardens, Kew, and afterwards successively assistant superintendent of the Municipal Gardens, Queenstown, Cape Colony, and curator of the Pietermaritzburg Botanic Society's Gardens, we learn from the *Kew Bulletin*, has been appointed by the Secretary of State for the Colonies, on the recommendation of Kew, curator in the Agricultural Department of Southern Nigeria.

THE DAHLIA SOCIETIES.—A few weeks since, when commenting on the National Dahlia Society's September show, we referred to two London societies being in existence, "one starving the other." A correspondent now informs

FIG. 126.—APPLE RED VICTORIA. (For text see p. 298.)

meeting of the "R.H.S. Union of Horticultural Mutual Improvement Societies" was held in one of the committee rooms at the Hall. The Rev. W. Wilks, M.A., presided, and during the proceedings presented some specimen rules and regulations for the organisation and direction of horticultural debating societies. In these rules an attempt has been made to define what shall constitute an "amateur" at the local shows, and we hope it may prove successful. Any effort that is made to settle this question, so far as the winning of prize money at a particular show is concerned, deserves consideration, and we therefore publish an excerpt from the Rules

held in quite contrary circumstances, will need a great deal of explanation before he can see the justice of the latter ruling.

In other respects, the report for the first year showed that some progress has been made, and there is every prospect that the Union will find greater opportunities for usefulness as it becomes better known.

THE WOMEN'S AGRICULTURAL AND HORTICULTURAL INTERNATIONAL UNION.—The annual meeting will be held at the Royal Botanic Gardens, on the afternoon of Friday, November 13. The council meeting will be held at 2.30; the annual meeting at 3.15.

us that there seems to be every probability that the National Dahlia Society and the London Dahlia Union will combine. There has been no antagonism between the two bodies; indeed, their committees have largely been composed of the same persons. But keeping up two organisations has of necessity been more costly than would be the maintaining of one only. It is quite easy for one society to hold two September shows at intervals of a fortnight if needful, as in that way the interests of early and late varieties would be well served. If the coalition is brought about, it is to be hoped that the garden Dahlia will be given as much attention as is now devoted to the mere show Dahlia. Such a matter would help to popularise the newly-constructed society or union.

FATALITY AT WELBECK.—An accident occurred on Monday the 12th inst., and terminated fatally in the Workshop Hospital on the following Wednesday evening, the unfortunate victim being PETER FAIRGRIEVE, the foreman under Mr. GIBSON in the Welbeck Abbey Gardens. Deceased, who was very fond of animals, offered an Apple to one of the horses attached to a cart. In order to facilitate the animal eating the fruit, FAIRGRIEVE loosed the bit, with the result that the horse bolted. The unfortunate man tried to stop it but was knocked down, the wheel passing over the lower part of his body. He was removed to the hospital, where he died on the 14th inst. His remains were interred in Culkney churchyard the following Saturday. FAIRGRIEVE was much respected by all who knew him.

HOUSING AND TOWN PLANTING BILL.—Lord EVERSLEY presided over a conference held on October 15 at the offices of the Commons and Footpaths Preservation Society, to consider the position of the Open Space Societies in view of the proposals of the Local Government Board to clothe local authorities with power to alienate common lands, village greens, recreation grounds, disused burial grounds, and other open spaces, under Clauses 7 and 8 of the Housing and Town Planning Bill. Other societies represented were the Kyrle Society, the Metropolitan Public Gardens Association, and the National Trust for Places of Historic Interest or Natural Beauty. It was pointed out that no open space in the country, when vested in a local authority or other body corporate, would be safe from partial or even complete appropriation for building purposes if the Bill passes into law in its present form. The societies expressed their readiness to endeavour to meet the views of Mr. BURNS, so far as might be expedient, to enable the exchange, under reasonable safeguards, of outlying parts of open spaces. If no satisfactory agreement could be come to on this basis, it was unanimously decided to press at every stage of the Bill for the insertion of the amendment put down by Mr. COWAN, to provide that the clauses to which exception is taken shall not apply to commons and open spaces. It was also determined to press for a similar understanding in regard to the Irish Housing and Town Planning Bill now before the House of Lords, and Lord MEATH promised to put down an amendment, which the Open Space Societies agreed to jointly support. At a subsequent committee meeting of the Commons and Footpaths Preservation Society, 86 new members were elected, and it was reported that, since its last meeting, the Society had dealt with 56 cases of enclosure of common land, 216 cases of the obstruction of footpaths, bridle ways, carriage roads, and ferries, 15 cases of roadside waste, and three of foreshore enclosure, and seven open space schemes. It was also reported that a large number of resolutions had been received in support of the Society's Public Rights of Way Bill, now awaiting its report stage in the House of Commons.

"BEAUTIFUL FLOWERS AND HOW TO GROW THEM."—The first part of this work is devoted to Roses, and contains 24 pages of text. The writer approaches the subject from the point of view of the garden decorator rather than that of the exhibitor, and in a bright and pleasant manner discusses the various sections or types of Roses as they are seen in gardens. He offers some very pertinent advice on matters of cultivation, such as selection of site, operations of planting, budding, pruning, and selections are

Edited by Horace J. Wright and Walter P. Wright. Illustrated with 100 plates in colours, and others in black and white. Complete in 47 parts, price 1s. each. (Published by T. C. and E. C. JACK.)

given of choice varieties of Roses recommended for particular purposes. There are six full-page illustrations in colour in this issue, and several of them are satisfactory, particularly those representing flowering sprays of Lady Gay Rose, "Roses with Yucca and Delphiniums," and "A Bed of La France Roses." The least satisfactory is one which is said to represent Dorothy Perkins Rose on old trees. One can see something of the stems of the old trees, and round about these stems are numerous splashes of crimson colour, but their attachment to the Rose plant and the Rose foliage itself are not discernible. This fault, however, is present in more or less degree in most of the modern books illustrated with coloured drawings from impressionist artists. There is every reason to anticipate future issues with pleasure, and doubtless they will not be exclusively devoted to one kind of flower, as is the part now before us.

PRODUCE OF HOPS.—The Board of Agriculture and Fisheries has issued a preliminary statement showing the estimated total production of Hops in the years 1908 and 1907, with the acreage and

FIG. 127.—AN ELECTRIC FOUNTAIN.

estimated average yield per statute acre in each county of England in which Hops were grown. In Kent the yield for 1908 is estimated at 311,315 cwt.s., as against 221,860 cwt.s. in 1907. The acreage for 1908, as returned on June 4, was 23,975 acres, as against 28,169 acres in 1907. The estimated yield per acre, therefore, this year is very much higher than that of last year, being 12.98 instead of 7.88 in 1907. The next county in importance to Kent in regard to the production of Hops is Herefordshire, and, curiously enough, the results are altogether different from those in Kent, as they show that the yield in 1907 per acre is almost equal to that of this year. The total yield is estimated to be 54,554 cwt.s., as against 58,268 cwt.s. in 1907. The acreage under Hops, as declared on June 4, is 5,572 acres, as against 6,143 acres in 1907, the estimated yield per acre being 9.79, as against 9.48 last year. The other counties specified are Gloucester, 221 acres, and an estimated yield of 4.91 per acre; Hants, which has 21,176 acres, and an estimated yield per acre of 12.94; Salop,

with 1,615 acres, and an average yield per acre of 8.98; Surrey, with 8,621 acres, and an average yield of 12.38; Sussex, with 40,203 acres, and an average acreage of 11.23; and Worcester, with an acreage of 34,256, and an estimated yield of 10.22 per acre. The whole country, therefore, shows an estimated total production this year of 470,761 cwt.s., as against 374,129 cwt.s. last year. The total acreage is 38,921, as against 44,988 in 1907; whilst the yield per acre is extremely favourable, being 12.10, as against 8.33 last year.

THE FRANCO-BRITISH EXHIBITION.—Messrs. SUTTON & SONS, Reading, in a report of exhibits and floral decorations they have made at this exhibition, state, in reference to the lawns, that it was impossible to sow seeds before the middle of April, and yet, by May 14, when the opening took place, beautiful lawns were to be seen on all sides. Among the flowering plants that were bedded out in the grounds near to the Court of Honour, and which proved most satisfactory, were blue and white Violas, dark blue Lobelia, Tom Thumb Antirrhinum (including Crimson King, White Queen, and Yellow Prince), white, crimson, and pink Stocks, Giant White and Giant Yellow Polyanthus, Cineraria stellata, Perfection Pansy, Nemesia strumosa Suttonii, striped Petunias, Salvia splendens var. Fireball, double and single tuberous-rooted Begonias, Chinese Asters, and Godetias (including dwarf pink, dwarf white, and Scarlet Queen).

Publications Received.—*The Case for the Goat*, with the practical experience of 24 experts. Second edition. By "Home Counties." (London: George Routledge & Sons, Ltd.) APPLE RED VICTORIA.

This Apple was shown at a meeting of the Royal Horticultural Society on September 1, and on that occasion its resemblance to Gascoyne's Scarlet Seedling caused the Fruit and Vegetable Committee to hesitate in granting it an award. Fresh examples, however, were shown at a meeting held on September 15, together with a branch carrying some fruits, to show its remarkable cropping quality. On this latter occasion an Award of Merit was given to "Red Victoria" on its being found to be distinct and earlier than Gascoyne's Scarlet Seedling. The variety has all the qualities of a first-rate market Apple. The fruits were exhibited by Mr. G. W. Miller, Clarkson Nursery, Wisbech.

ELECTRIC FOUNTAINS.

At the last meeting of the Royal Horticultural Society, Messrs. Wm. Wood & Sons, Wood Green, London, N., exhibited three small fountains, one in antique bronze, designed by the chief art decorator of the Vienna National Museum, and the casing manufactured by the Royal Imperial Bronze Works of the same city; another of Doulton ware (see fig. 127), and the third made of plated silver. These fountains are worked by a small electric engine concealed in their bases, and when the fountains are once charged with water they become independent of any further water supply. They are said to be used for ornamenting dinner tables, drawing-rooms and winter gardens.

GRAPE PRINCE OF WALES.

This Grape, having now received a First-Class Certificate, after having been given a fair trial in the Royal Horticultural Society's Gardens at Wisley, may be expected to become a standard favourite on account of its handsome appearance, flavour, and keeping qualities. It will be remembered that I was awarded a Knightian Medal and Cultural Commendation for four bunches of this Grape on September 26, 1906 [see figure in *Gardeners' Chronicle*, October 14, 1906], as shown from the Warren House Gardens, Stanmore, from vines planted 18 months previous to that date.

Having tried this Grape in various ways, I may state to intending planters that the vines do best when planted alternately with Black Alicante and Appley Towers, as these two varieties supply abundant pollen. Although "Prince of Wales" may not require much artificial pollination, it is a good plan to distribute plenty of pollen, if shapely, well-shouldered, exhibition bunches are required, and this cannot always be done when one variety alone is cultivated in the house. That noted Grape grower, Mr. T. Lunt, of Kier House Gardens, Dunblane, whilst congratulating me on the above-mentioned bunches, told me he could not succeed with it as a pot vine, and I may say that I do not think it suitable for pots, as it is such a vigorous grower. Good canes should be selected, as a short-jointed as possible, and the roots should be spread out on a carefully-made, but not too deep a border, thus allowing for frequent surface dressings. This Grape was distributed by Messrs. Jas. Veitch and Sons. *C. J. Ellis, Nurseries, Weston-super-Mare.*

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

PARASITIC PESTS AND DISEASES.—In a recent article in the *Gardeners' Chronicle* the writer said, referring to an insect, "I cannot say that unhealthy trees are more likely to be attacked than vigorous ones." Now taking this for a text, I should much like to raise a question. Is there any reason for the very common opinion that unhealthy plants are more liable to the attack of insects and fungi than are those which are healthy and vigorous? I see no reason why they should be. We are fond of our own foot in a healthy and sound condition, and surely there is no reason why the lower forms of life, to the extent of the power of perception, should not have the same preference. Healthy tissue is often likely to be the softer and unhealthy tissue frequently the harder and least easily attacked. Very often indeed one finds the fattest insects upon the most vigorous vegetation. Who, for instance, has not seen fine healthy green fly upon the vigorous shoot of a Rose? I have just observed that the heaviest of Gerberas are liable to the attacks of mite as any of the weaker ones could be. Of course it must be a fact that unhealthy plants suffer more from a given measure of attack than do healthy and strong specimens. But that is another matter. As to fungi I do not refer to cases where they are, for instance, saprophytic, but when they naturally feed on living tissue they are as well able to deal with it in a healthy state (conditions being favourable) as a cat is to eat a healthy mouse. Why should a cat require unhealthy mice? A cat is perfectly fitted to catch mice, and parasites are perfectly fitted for their own special mode of existence. I believe we lose sight of the fact that parasitism, and consequently disease, as we call it, is perfectly natural—hence a mixing of ideas. *R. Irwin Lynch, Botanic Gardens, Cambridge.*

SMALL HOLDINGS.—The Croydon Allotments and Small Holdings Co-operative Society, Limited, registered under the Provident and Friendly Societies Act, has for its object the securing of land for those who feel that a good living is to be made by proper cultivation of the soil. The membership is already large, considering that the Society has only been in existence about three months, and comprises many

gardeners, greengrocers, poultry farmers, fruit growers, beekeepers and others who have been connected with agriculture for a number of years. Application has been made to the Borough Council, on behalf of 31 of the Society's members, for 109 acres of land, and the writer was interviewed, with other prospective small holders, by the Small Holdings Sub-Committee on the 7th instant. So far as can be judged, every effort will be made by that body to procure the land, and as near as possible to Croydon. It is essential that it should not be more than five or six miles away, as it is the intention to supply the town with all kinds of fruits, vegetables and dairy produce. The Society will do its own carting, and, naturally, the local greengrocers and poultryers will patronise the local growers as, by so doing, they will get their produce quicker, fresher and better than they do at present, and be saved the expense of carting. There will be a horticultural department in connection with the Society, the special business of which will be the study of what is best suited to the soil of each small holding (this is important, as there are considerable variations even in a very small plot); lectures will be organised, and specialists invited from different parts of the country to give the small holders the benefit of the latest scientific knowledge in all that relates to agriculture. The project is the result of much careful thought, and those who have put their hand to the plough

things. The Japanese Maples hardly, as a rule, do more than maintain a miserable existence. I know of a few fair examples in sheltered spots, but anyone planting them freely in this district should be warned that acute disappointment will probably follow. *Chas. E. Pearson, Levensham, Nottinghamshire.*

RETIREMENT OF MR. CHARLES ROSS.

MR. CHARLES ROSS, now in his 84th year, has retired from the Welford Park Gardens, Berkshire. For several years past he ceased to have charge of the pleasure grounds, his services being limited to the kitchen and fruit gardens, including those seedling Apples and Pears with which his name is associated. These Gardens have now been taken over by Mr. W. Pope, formerly of Highgate Gardens, for purely commercial purposes, although Mr. Ross will remain in his garden house till the spring. In his successor, an old and valued friend, Mr. Ross has one who will care for his seedlings, and he himself will have the freest access to them. Born on the Dalmeny Estate, Midlothian, where his father was head gardener to a former Earl of Rosebery, Mr. Ross in course of time passed through Messrs. Dickson & Sons' nursery, Edinburgh, and several private gardens, notably, that of Dalkeith, then under the care of Charles McIntosh, the predecessor of William Thompson. His first place as head gardener was at Fairlawn, Tonbridge, Kent, where he remained six years. Mr. Ross recalls the fact that, in celebration of the peace proclaimed in 1856, at the close of the Crimean War, he planted a *Sequoia gigantea* at Fairlawn. In 1860 he came to Welford Park, then occupied by Mr. Eyre, where he remained as gardener till the end of last month. Mr. Ross refers in the warmest terms to the generous conditions under which he continued service with Mr. Eyre's son, now known as Colonel Archer Houlton, who resides at Hallingbury Place, Essex. Mr. Ross has obtained wide fame, chiefly in association with new Apples, for as long since as 1892 he raised Welford Park Nonesuch, the parents of which were Golden Harvey and Lamb Abbey Pearmain. Then came Bella, of which Golden Reinette was the seed parent, followed by Alalanta, from Scarlet Nonpareil, and Mrs. Phillimore from Lord Burghley & Mr. Gladstone. It was about 1890 that his famous cross between Cox's Orange Pippin and Peasgood's Nonesuch was effected, and from that cross has come several very fine varieties, inclusive of Charles Ross, a beautiful Apple, which thus so worthily perpetuates its raiser's name. Its original name was Thomas Andrew Knight, and it secured an Award of Merit, but later, having been, by special request, changed to Charles Ross, it obtained a First-Class Certificate. Just prior to that award the variety took first prize for flavour in the class for any other dessert Apple at the R.H.S. fruit show. From the same cross came the Houlton, Rival, and Renown (see fig. 124)—three other superb Apples, the last-named variety having only recently received an Award of Merit. Others from diverse crosses include Paroquet, so named for its beautiful colour. The first-named Apple did not thrive well, and a seedling from it was raised having a good constitution and finer fruit. That is the Paroquet of to-day. A superb Apple is Hector Macdonald, which is a seedling from Lane's Prince Albert. An excellent Apple is Encore, from Warner's King and Old Northern Greening. Excelster was obtained from Peasgood's Nonesuch & Duke of Devonshire, a superb, roundish, conical Apple, having a small curl at the stem, not unlike that seen on Lemon Pippin. It is a long keeper and a grand cropper. Altogether Mr. Ross has had awarded to his seedlings three First-Class Certificates and ten Awards of Merit—a remarkable record.

In the kitchen gardens at Welford Park there are many other seedlings of both Apple and Pear, and Mr. Ross showed us young trees raised from seeds sown on his 80th birthday four years ago, and now from 3 to 4 feet in height. Besides these, there is a large collection of popular Apples and Pears. Mr. Ross, though now somewhat feeble, remains the mentally vigorous man of earlier days.

MR. CHARLES ROSS, RAISER OF MOST OF THE NEWER APPLES.

will not look back—they are men who have been hard workers all their lives, their interest is in the land, and while they know that the task before them is not a light one, they will enter upon it with a light heart, knowing that by wise and intelligent co-operation success is certain. Any further information relative to the Society will be gladly furnished to those interested by *Henry R. Clifton, Hon. Sec., 35, Grant Road, Croydon, October 15, 1908.*

ACONITUM WILSONII.—This Monkshood is truly a charming plant for brightening up the borders in September, when many of the regular occupants are past, especially those with blue flowers. It grows 7 feet high, and displays its deep blue flowers for a long period. *E. M.*

JAPANESE MAPLES.—Referring to Mr. Clark's remarks on Japanese Maples on p. 279, I think he rather allows his enthusiasm for his subject to carry him away when he states that they are equal to the Laurel in hardness. The Laurel, though occasionally cut in the Midlands, thrives sufficiently to often become a trouble in shrubberies by smothering better

SOCIETIES.

ROYAL HORTICULTURAL.

CONFERENCE ON SPRAYING.

OCTOBER 16.—Under the auspices of the R.H.S., a conference on "Spraying" was held on the above date at Vincent Square. There were two sessions. That in the morning was presided over by Colonel Warde, M.P., the chairman at the afternoon session being Colonel Long, M.P. Two papers were read at each session; in the morning by Mr. Geo. Massee, V.M.H., and Mr. H. F. Getting, and in the afternoon by Professor F. V. Theobald, M.A., and Mr. G. Holland. There was an excellent attendance throughout the day.

Col. Warde, M.P., said that, coming from the country of Kent, he was especially interested in fruit cultures, as nearly all the land of that county not under Hops was under fruit cultivation. Although Hopper-washing or spraying had long been practised in Kent, as far as he had been able to gather, the subject was in its infancy, and they would no doubt learn much from that conference.

MR. MASSEE'S PAPER.

MR. MASSEE said his remarks would apply entirely to spraying for fungi and not for insects. Some people expected too much from spraying. There was an idea that when a plant was sprayed it was practically covered all over, that was it the work is well done. That was a mistake. He would show them slides from which they would see how only a percentage of the surface was covered. In the case of insects, it was practically immaterial. The caterpillar moved along and brought itself in contact with something which caused its death. That was not the case with the fungus. Often a large proportion of the fungus escaped and went on developing as before. Another point of importance was that many people thought that so long as the spraying solution was on the leaf, it was free from infection. That was a most misleading conception. He had repeatedly seen fungi germinating perfectly freely on Bordeaux mixture. (Quite recently an American had been devoting a considerable time to the subject of Apple scab, the one disease they most desired to prevent, and the one about which they were the least successful. He had covered Apples attacked by the scab with Bordeaux mixture, and had found by actual measurement that the spots extended at exactly the same rate as on the Apples that were not sprayed. Therefore, they could not place so much reliance on spraying as they had been led to believe was justified. In the ordinary course, they expected some result. The only result they could possibly expect was prevention, to a certain extent, of the extension of the disease. Theoretically, it was imagined that when a leaf was sprayed any life on it would be destroyed during germination. That was generally true, so long as the Bordeaux mixture or other remedy remained effective; but no one quite knew how long it remained effective. Climatic conditions were an ill-important consideration, as, through chemical changes, the effectiveness of the spray might entirely disappear at a very early stage. Undoubtedly epidemics had been prevented, but the benefits were very much lower than they were generally led to expect. He was sorry to say that the preparation of spray had become largely a shop business. When a man made his own spray it was generally most effective; but when they got the ready-made stuff—well, it did not exterminate at all. He was not condemning any particular specific; but, speaking in general terms, the ready-made stuff was not as good as that a man made himself—that was if he made it properly. But some one might write: "I have sprayed my orchard and have no trace of disease." That might be perfectly true; but there might not have been any if it had not been sprayed. Evidence of that kind was of no value unless they had some sort of control. If they had a control, they might—other things being equal—take it for granted that the sprayed portion of the orchard would, in the first instance, be less likely diseased as the unsprayed. If the whole of the orchard was sprayed there would be no check whatever. But there was another aspect of spraying, and that was that, apart from the fungicidal properties,

the plant itself has been stated to be benefited by spraying, though in what way had not been explained. Some people said that spraying made the foliage last longer, and that the crop was better. That might be true; he had no evidence. He accepted it as a statement; but certainly, so far as Potatoes were concerned, it was doubtful whether any real benefit could be derived. The disease appeared on the foliage, and one portion of the foliage. Spraying was of value in preventing the spread of that disease, but he was firmly convinced that there was no tuber in Great Britain that was free from the ordinary Potato disease as they knew it. A certain Continental scientist had gone so far as to say that there was no tuber in Europe that was free. They might have seasons without the Potato disease, but that did not prove that the mycelium was not in the tuber; it only showed that some condition of the host-plant checked the growth of the fungus. It might only need three muggy days to bring about the Potato disease. He thought the Bordeaux mixture was not the success it might be. It was least successful during a wet season, when epidemic was most in evidence. Speaking generally, he would say that, although there was a certain amount of good to be derived from summer spraying, still, it was reduced to a minimum, and he would advocate winter spraying. The treatment could be more drastic, and there was no fear of killing anything during the winter. During the summer something was certain to be scorched if drastic means were adopted. No amount of spraying would atone for want of cleanliness. He could not say whether disease was greater than formerly, in proportion to the area cultivated. Of course, the area extended every year, so that if the disease remained the same we should get a greater amount of the disease. We neglected certain primary points that were carried out by our forefathers. They seemed to have had very much more time than we had. They got a lot more in; probably they neglected something. They must have done, or they could not have had their conditions so good. If they looked at orchards in this country at the present day, it would be found that pruning was neglected. When the scab began to appear on the fruit it appeared to the grower's pocket. He did not realise it before. No amount of spraying on the dead branch would kill the living mycelium. If these things had been removed by cleanliness of the foliage, epidemic would be impossible. The fungus had a perfect right to be there; it was a one-sided view to object to it because it affected their interests. Cleanliness was the thing; winter was the time. If they left the spraying until the tree was in bloom, in nine times out of ten it would prove a failure. And then the spray must be such that every grower could apply it. It should be as simple as sowing a seed or planting a tree. If an ordinary workman could not do the work, it must be a complete failure. He believed winter work to be more effective than summer work. He recommended a spray 1 lb. of sulphate of copper to 25 gallons of water. Everything should be sprayed, not only the tree, but the surrounding ground, because the spores might lodge anywhere. Trees properly pruned, with all the bag parts cut away, and twice sprayed in the winter with this sulphate of copper, had been more free from scab than those sprayed in the orthodox manner. As to spraying machines, those on the market sent the spray in drops, which had, unfortunately, a tendency to run together, and thus the leaf did not get equally sprayed. The longer the spraying was done the worse it became. The lumps were more concentrated, and less of the surface of the leaf was covered. It was important to remember that the water did not wash. If it was the water in the water, and it was important to know when to cease spraying. What was wanted was a spray which resembled a London fog. There would then be some hope that the leaves would be reached all over, both top and bottom.

A number of photographs were then thrown on a screen, and these clearly bore out the lecturer's statement as to only portions of the leaf and fruit being reached by the spray. In regard to Strawberries, the lecturer said these should, in the winter, be covered with straw to start to grow more. It did the plants good, and was safer and more effective than any other remedy known in connection with the various diseases that troubled Strawberries.

MR. GETTING'S PAPER.

MR. H. F. GETTING, of Hollington, Glestow Fruit Plantation, near Ross, said that each year we felt more strongly the necessity of spraying regularly, not waiting until a severe fungus or insect attack was apparent, for it was impossible on a fruit plantation of any size to sufficiently carefully examine the fruit trees or bushes to see if an attack was present in the early stages. There might be exceptions to this general rule, and they must be guided to some extent during the pruning by the number of Psylla or Winter Moth eggs, or signs of the water form of scab on the young growth; but, as a rule, when the attack of an insect or fungus was discovered on the trees by the ordinary fruit-grower, it was in an advanced stage, which rendered it far more difficult, if not impossible, to deal with. For instance, spraying to destroy aphids was generally commenced far too late. The Plum aphid should be sprayed at least once—better twice—when the bloom buds were swelling, so as to destroy as many of the mother aphids as possible. Each surviving mother aphid might then multiply of descendants during the year. The Apple aphid should also be sprayed before the blossom buds burst. It was money wasted to spray when the leaves were curled. Then, again, with Apple scab, unless the trees were sprayed before coming into blossom, the chances were very much against effectively checking an attack. Apple sucker, or Psylla mali, was a pest that was becoming more troublesome from year to year. He had not been able to find a wash that was really effective against this pest. A fairly strong paraffin and soft soap emulsion, nicotine wash, and McDougall's wash all killed some, but they left by far too large a proportion alive. He had not yet come across a wash that killed the eggs. The question arose, was it worth the annual expense of spraying? Yes, it was, under certain conditions. The principal conditions were: 1st, That the spray fluid was capable of destroying a large proportion of the insects, or keeping in check the fungus against which it was used. He had wasted thousands of gallons of wash on account of its ineffectiveness. 2nd, That the spraying machines and those who used them were capable of rapidly and efficiently doing their work. As to the first point, English fruit-growers were labouring under immense disadvantages as compared with growers in most other civilised countries, more particularly as compared with the United States of America and Canada, where practical and scientific advice and ocular demonstrations could be had for the mere asking. If it were not for the Duke of Bedford, and a few men of science actuated by a like spirit, they should have to learn what they could from abroad, or from individual experience. Until there was a properly constituted sub-committee of the Board of Agriculture to deal with all matters of interest to fruit-growers, and one or more Government experimental fruit stations, managed by practical men, assisted by the best scientific advice, it would continue to be a very uphill fight for fruit-growers. To have utterly ignored the recommendations of the Government Departmental Committee of 1904 was, to speak mildly, not business-like. Returning to the subject of spraying, he said they must not for a moment expect that any wash would destroy more than a large proportion, and keep the pest in check. He wished that some of the fairy tales which were sometimes advertised were facts. Such advertisements did an immense amount of harm.

The next point was the efficiency of spraying machines and nozzles. Many of the spraying machines had insufficient capacity and pressure. The same nozzles did not appear suitable for damping all parts of a tree. In spraying trees properly more knowledge was required as to the quantity of wash needed to thoroughly spray a tree of a given size. To stop spraying when the fluid commenced to drip from the leaves might be very misleading. A part of the tree, especially the lower branches or the portion nearest the operator might be drenched and the remainder left practically untouched. Consequently, spraying was liable to be condemned simply because trees had only been half sprayed.

WASHES IN USE.

Now as to a few washes in use. First, Bordeaux mixture. This appeared to be generally acknowledged as the wash above all others to be

used against certain very destructive fungi, notably Apple and Pear scab and brown rot, which were doing untold damage and were rapidly increasing. He knew it was very beneficial. At times he had secured first-rate results, but at other times the results had been lamentable, there being badly scorched foliage and sickly trees for a long period afterwards. Why he could not tell. Was it the fault of the lime, the copper, or the operator? There was no expert to inspect the trees and say where the fault lay.

Liver of sulphur was generally looked upon as a fungicide only, but he had found it in one instance to be an excellent insecticide, namely, against the mealy aphid on Plum trees. A solution of soft soap and 12 ounces of liver of sulphur to the 100 gallons would effectually destroy this troublesome pest. Nicotine and tobacco washes might prove of great service if the cost could be considerably reduced. Pure nicotine, 98 per cent. purity, was admitted free

Psylla that one wash (McDougal's) appeared to penetrate more than others, i.e., the fluid seemed to have the power of running between the flower-buds, whilst other washes remained more on the upper surface or tops of buds. This was worthy of attention.

ADHESIVENESS OF WASHES.

It was desirable with certain washes (Bordeaux Mixture and others) that they should remain in the trees as long as possible. If some improvements could be made in this direction it would be a gain. It was important to growers that the cost should be kept as low as possible, hence the necessity of ascertaining the lowest effective strength of washes. As some washes were difficult for growers to make, he suggested to vendors that they should be sold in as concentrated a form as possible, obviating the necessity of paying unnecessary railway carriage.

pipe were fitted four 60-foot lengths of indiarubber hose with spraying arms and nozzles. This enabled them to spray 12 rows of trees (say 500 trees) without shifting the iron pipes, so that they could easily spray 2,000 to 2,500 trees a day. The disadvantages were: First, amount of wash held in pipes; second, wear on indiarubber hose through dragging on ground; third, settlement of insoluble material in pipes. Could anyone suggest an improvement on this system? He suggested that at one of the Society's shows there should be a representative exhibition of spraying machines and nozzles; and that a representative body of fruit growers should visit the United States and Canada and study the question of fruit-tree spraying and kindred subjects. His concluding advice was: "Spray regularly, spray thoroughly, spray systematical, or don't spray at all."

DISCUSSION.

Mr. MASSEE was asked whether the scab spore could be got at during the winter? He replied that he believed the spores were not in existence, or, at any rate, they were at a discount. The fungus was present in the dead shoots. During the spring the fungus produced fruit just as the young leaves were developing, so that the only hope was to cut off bad portions.

The CHAIRMAN said that Mr. Massee seemed to have a sneaking affection for the fungus, as he said it had a right to be there. Perhaps he looked upon the fighting fungus as a sport! He imagined if they did away with the fungus there would be no disease. That was how it appeared to his lay mind.

Dr. GATHURGOON (Wisbech) said he had come a long way, and he felt a little disappointed in the papers in regard to the information they were seeking. During the last ten years he had spent hundreds, perhaps thousands, of pounds on spraying without much result. The damage from fungus diseases was very great, and was increasing rapidly. The recommendation as to winter work ought to be fully carried out in respect of removing the dead branches; but he was of opinion that they suffered more damage in Wisbech from insects, the aphid, the Apple sucker, and the caterpillar. They also had the Apple blossom weevil. This latter pest was working great havoc in his district. He did not think there would be much trouble in getting rid of the Apple sucker by his method. He had sprayed with ordinary caustic wash with a considerable proportion of petroleum and soft soap. With his first dressing he cleared off, perhaps, 50 or 70 per cent. in the first year of the Apple sucker. Last year he finished the Apple sucker, and he could not find any trace of it to-day in his orchards. If they could not stop the ravages of these insects, they must close their orchards and give up growing fruit. He hoped remedies would be found to prevent such a calamity.

Answering to a question, Dr. GATHURGOON said he used 3 lbs. of caustic soda, 3 lbs. caustic potash, about a gallon of petroleum, and 30 gallons of water. The caustic soda was 98 per cent. strength.

Mr. E. S. SALMON said the cardinal point was the way in which they put the spray on the leaf. Some nozzles put on a spray as fine as impalpable dust. That was what they should aim at. He would like to announce that a conference was to be held at Wye College on Friday, November 27 next, at 11 o'clock, to consider the question of machinery and nozzles, and Mr. Dunstan, the principal, invited all interested in commercial fruit-growing to attend. When spores and Apple scab germinated after Bordeaux mixture was used, that should not be an argument against the mixture. Mr. Massee had said that the Bordeaux mixture must be looked upon only as a preventive. Bordeaux mixture was the best fungicide that had been invented, and evidence against it should be carefully examined. He was glad Mr. Massee emphasised the importance of the grower making his own fungicide. They could only hope for good results by making it themselves. He had found Bordeaux mixture very effective in Potato growing. As to the spraying of Peach leaves, the Agricultural Department of the United States recommended self-bulb sulphur mixture as perfectly safe to use both as an insecticide and a fungicide. He was absolutely certain no commercial grower of Apples could

FIG. 129.—GRAPE PRINCE OF WALES, BEING THE BUNCHES EXHIBITED FROM THE R.H.S. GARDENS AT WISLEY ON SEPTEMBER 29 LAST (FIRST-CLASS CERTIFICATE).

(For text see p. 299.)

of duty, but it was expensive, costing about 10s. per lb. Denaturised tobacco was also admitted duty free, but there was a good deal of foreign matter in it, and the strength of the tobacco might vary immensely. The importation of tobacco juice was prohibited, though if it were practicable to denaturise the same and admit strong tobacco juice not containing less than a fixed percentage of nicotine, it might be useful to fruit-growers.

Paraffin and caustic soda were sometimes recommended to be used very strong. He would caution users to try the spray on a small scale first and carefully watch results, bearing in mind that the damage done by paraffin did not always show quickly.

PENETRATION OF WASHES.

He had observed this year in spraying for

As to chemicals, a guaranteed strength should be stated on invoices, and insisted on by purchasers, or trouble was likely to occur through variation of strength.

SPRAYING INSTALLATIONS.

It would be interesting to know what was the best system for a fair-sized plantation. At Gleston Fruit Plantation, for an area of about 25 acres, the system was as follows:—They had a small house near a stream with a 1½-h.p. Crossley oil engine and a 600-gallon tank sunk below the level of the stream which could thus be rapidly filled. There was an iron underground main pipe from this tank along the principal headland with taps at intervals. To these taps, at right angles, were connected 15-foot lengths of iron piping on the surface of the ground along a row of trees. To this iron

ever hope to combat the scab without spraying in summer. Spraying in winter alone was no use, and pruning would never keep down Apple scab.

Apples would never be grown permanently clean in this country without continual spraying. He agreed with Mr. Getting as to the formation of a sub-department of the Board of Agriculture. Perhaps a body of influential fruit-growers might go to the States for information, or they might share the Government in doing something for home growers. In this connection he would urge them to support the National Fruit Growers' Federation, one of whose objects was to get a sub-department appointed. It was through the efforts of that federation that they last year got the Destructive Insects and Pests Act.

Mr. BAKER said there was no doubt that the home mixing of Bordeaux mixture, as well as other fungicides, was the best, especially when there was access to a laboratory. In theory it was quite easy to get pure copper sulphate soluble, but in practice it was well nigh impossible. The solution should be taken direct from the bin, as if left in contact with the air it lost its original properties. Even when they had the lime they could not rely on the workman to hydrate it when necessary. That was one of the chief causes of the failure of Bordeaux mixture, which, when properly made and used with the best machinery, was, no doubt, the best spraying fungicide.

Mr. PERCY BUNYARD, who said he held no brief for his firm, large manufacturers of insecticides, warned those present that to make their own insecticides would be a great mistake. Paraffin and petroleum, being oils, were not sufficiently penetrative in their action. Nicotine was by far the most penetrating insecticide in the world. Being a vegetable alcohol, it was not oily, and would get to those parts where oil emulsions could not penetrate. He would undertake to kill every insect, including red spider and mealy bug, with nicotine preparations. Pure nicotine—92 per cent.—was a very dangerous thing to handle. The greatest bugbear was that it was scheduled by the Pharmaceutical Society. That made it extremely difficult to get, but, fortunately, legislation had stepped in, and they hoped soon to be able to obtain nicotine preparations in the usual course, and not as a monopoly which chemists had tried to make it.

Mr. NEAME said that five or six years ago he used the Bordeaux mixture on a few trees. Before that he could hardly get any sound fruit, but for the last three years he had had a good, sound crop, with hardly any scab. Spraying, as far as his experience went, was certainly better done in the summer. If he had a very bad attack he should try winter spraying. The first spraying should be done just before the trees bloom, and the next as soon as the bloom had fallen.

Rev. C. H. ENGLEHART gave his experience with the Apple spot. He said he lived a few miles west of Salisbury, and the whole of that county suffered the greatest damage—and a progressive damage—from this Apple-leaf spot. The spot fungus was excellently described by Mr. Chittenden in the last issue but one of the Society's Journal. He had had a great deal of correspondence with Mr. Chittenden, whose paper was such an excellent one as regards the diagnosis of the disease, that in itself it justified the existence of the Wisley Laboratory. Seven years ago he planted some young Cox's Orange Pippin trees on a new ground. They were beautiful trees, and when they first came into bearing he casually brought up two dishes of fruit to the R.H.S. show. He got the first prize with his first dish, and could have got the second prize with the second dish. Four years later the leaf spot began to appear in the neighbourhood. No piece of land could have been more scrupulously clean. Now he wanted to get some practical help with regard to this leaf spot. He had tried winter spraying and summer spraying, and had been unable to find a remedy at all. He had sprayed with Bordeaux mixture, with sulphur, and with liver of sulphur, and one or two other things, including a very much advertised summer wash. He made his own Bordeaux mixture, and he did not think he made it too strong. He found, whether he covered the surface of the leaf entirely or not, the spores germinated very freely on the surface. He wrote

to Mr. Chittenden, who replied that he ought to have sprayed the entire under surface of the leaf. He did not know how this was to be done. He thought if the leaf were completely covered it would be choked. Like the gilded children in religious processions in ancient times, they looked very pretty as golden cherubs, but, unfortunately, they died.

Mr. COLLINGS said after many experiments with different Bordeaux mixtures he agreed with certain chemists to whom they had been submitted that, so far as the fruit grower was concerned, they were practically useless. He did not wish to wholly condemn Bordeaux mixture, but there was something radically wrong with the Bordeaux mixture on the market. A small committee should be formed to go into the matter and recommend to growers something better. The two leaves thrown on the screen were not well sprayed. The material should have been much finer.

Mr. CROOKE considered that success in fruit growing largely depended on using the application early. He had found that, if he used a wash somewhat weakly before there was any trace of insects, it was easy to keep the plant clean by one or two applications during the year.

Mr. MASSEE, in reply, said he was dealing with fungi, and he could not criticise nicotine in regard to insects. As to winter work of course, if there were no fungus spores there would be no disease. In an orchard at Mortlake he had the trees pruned. It was found that a man could do 200 trees in a day. If they paid the man 5s. a day it worked out at 3d. a tree. That was not much to pay to keep down an epidemic.

The Rev. G. H. ENGLEHART asked where the spores of the Apple spot disease rested in the winter?

Mr. MASSEE could not say where they came from, but he would say that winter spraying was not capable of touching them.

(To be continued.)

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

OCTOBER 15.—On this date the 22nd anniversary dinner of the United Horticultural Benefit and Provident Society was held at the Waldorf Hotel, under the chairmanship of Dr. Robert Boxall, of Ingleside, Abinger. Among the visitors were the Hon. William Fawcett, late superintendent of the famous Hope Gardens, Jamaica, and Dr. Mason, also of Jamaica, Mr. A. E. Bowles, chairman of the R.H.S. Scientific Committee, Mr. Phipps Lucas, and Messrs. J. MacDonald, T. Bevan, J. Anderson, J. Mckerchar, and others represented the honorary and benefit members. This is the first dinner of horticulturists that has been held at the Waldorf, and, judging from the excellent manner in which the dinner and all arrangements were carried out, it should be the forerunner of many others. In proposing the toast "Success to the United Horticultural Benefit and Provident Institution," the Chairman aptly compared the Society to a complete body, and proceeded to dissect its anatomy. The head consisted of the trustees and committee of management, and was an extremely well-balanced one, as evidenced by the satisfactory and economic working. The Benefit Fund was compared with the trust, and the Benevolent, Convalescent, and Management Funds with the limbs, each carrying out its respective functions in complete accord for the benefit of the gardener. On studying the financial report and rules of the Society, he had come to the conclusion that no benefit society at the present time offered greater assistance during sickness and old age than the "United," and concluded with an urgent appeal to all gardeners, and especially the younger ones, to join the Society. The toast was responded to by Mr. C. H. Curtis, who stated that the Society had evidently antedated the Old Age Pensions Act.

Mr. A. J. Brown proposed the toast of "The Honorary and Life Members," and this was responded to by Mr. Cox. Mr. J. Harrison Dick proposed "The Visitors," and Mr. A. E. Bowles, in response, expressed his intention of not coming again as a visitor but as a honorary member.

The toast of "The Chairman" was proposed by Mr. E. F. Hawes, and it was received with musical honours.

UNION OF HORTICULTURAL MUTUAL IMPROVEMENT SOCIETIES.

OCTOBER 16.—A meeting of the delegates from the several branches assembled under the auspices of the Royal Horticultural Society on the second day of the Autumn Fruit Show. It will be remembered that the Union was inaugurated at last year's Fruit Show; thus, the present meeting represented the first annual gathering, and it was presided over by the Rev. W. Wilks, M.A., who presented the report as follows:—

"There is but little to report on the progress of the 'Union' of Horticultural Mutual Improvement Societies during the past year, the first of the society's existence. Since the inaugural conference, held on October 18, 1907, the promised help offered by the parent—the Royal Horticultural Society—has been carried into effect, and some 20 lectures on various subjects prepared; five complete sets of lantern slides obtained; a list of these lectures, together with a very fair list of lecturers, and their subjects printed and issued; a draft set of rules and regulations drawn up for the assistance of newly starting societies; and considerable advertising, expense and time devoted, in the attempt to make the scheme a success. Only 23 societies have, however, joined the Union, whilst but six applications for printed lectures have been received. Too much importance should not be attached to these diminutive figures, inasmuch as the scheme is in its infancy; and as regards the lectures, it will be remembered their object is not to supplant lecturers, but rather to fill the gap when a lecturer fails, or in the rare event of a lecturer being unobtainable. We may, therefore, take it that the small demand for lectures is not an indication (as might at first sight be supposed) of the utility of the Union, but rather proves the fidelity of horticultural lecturers to keep their appointments. At the same time, it is well for secretaries to know that there is still relief ready at hand should their programme become unavoidably upset. It will be interesting to those present to know that the Royal Horticultural Society have spent £25 on printing and postages alone during the past year on behalf of the Union, for which it has received in return only £7 2s. 6d.

Considerable time was occupied in discussing what the term "amateur" means at flower shows. Whilst this very thorny problem was being discussed, the Rev. Wilks announced that he had already drawn up a set of rules for the guidance of these societies, and in these rules he had defined an amateur as follows:—

"An amateur is a person who grows plants, fruits or vegetables (either personally or by paid labour) solely for the enjoyment or for the domestic use of the produce, and not with the object of pecuniarily benefiting by it. Neither a nurseryman (nor his assistants), a gardener who receives wages (or is paid in kind), or any lady or gentleman who grows garden or orchard produce for the purpose of sale is an amateur.

"This rule does not necessarily exclude a person who sells surplus produce arising from an over-abundant crop or from exuberant natural increase, but who the officials of the show at which the question arises are satisfied does not intentionally grow for sale.

"Whenever any person is recognised by the officials of a show as coming under the definition of 'amateur' in their particular district or under their show rules, the judges must make their awards without any reference as to whether such recognition is right. The duty of deciding who is and who is not an amateur in any particular district lies with the officials of the show, and not with the judges."

It was resolved that Mr. Wilks should send a copy of the rules, including this definition of an amateur, to all the societies in the Union, with the hope that the several committees would adopt the proposals contained therein.

A paper was introduced by Mr. P. C. H. Jay, hon. secretary of the St. Barnabas Society, on the conduct of exhibitions, with several suggestions for obtaining greater good from them. It was generally considered by the meeting that Mr. Jay's suggestions were unworkable and that many of them had already been tried.

* * * Owing to great pressure on our space the next instalment of "Pronunciation of Plant Names" is held over.

APPLE SCAB: *S. H.* The most important point is to remove all dead tips of twigs from the trees.

BEGONIA RUST: *Anxious.* The leaves are attacked by a mite, which causes the rusty appearance on the undersurface. Dip the plants in tobacco water.

CHRYSANTHEMUM SPORTING: *H. R.* Your specimen is somewhat similar to the one sent by *C. Chesters* last week. See p. 285. It is not uncommon, but no satisfactory reason has been given for its occurrence.

FLOWERS SUITABLE FOR BUTTERFLIES: *E. G. R.* Amongst flowers which are known to be especially attractive to butterflies are those following—*Borago officinalis*; *Sedum spectabile*, *S. Sieboldii*, *Cistus ladaniferus*, *Mignonette*, *Sunflowers*, *Sweet Violets*, *Gilia tricolor* and *G. nivalis*, *Phacelia tanacetifolia*, *Alyssum maritimum*, *Limnathes Douglasii*, and *Eriochloa*. Generally speaking, it may be said that all nectar or honey-producing flowers which are attractive to the hive bee are also attractive to butterflies. In some cases the construction of a flower does not allow either the bee or the butterfly to obtain the nectar, but the butterfly has a better chance than the hive bee, because its proboscis is so much longer. A list of bee plants is published on page 295 in the *Apiary* article. It may be added that certain birds are prone to eat the butterflies even as perfect insects.

GRAPES: *P. C.* and *F. S. D., Ringwood.* The leaves are scorched. The grapes are attacked by a fungus, causing black rot. All diseased parts should be removed, including young wood, on which the fungus winters. Spray the plants next spring, just when the leaf-buds are expanding, with the Bordeaux mixture. Every portion of the vine should be sprayed.

IVY PLANTS FOR A GRAVE: *Hortulanus.* *Hedera Helix* "Emerald Green" is the best Ivy plant on a grave, as it is of compact growth and appears always bright. The number of plants required will depend upon the size of the specimens employed and whether it is desired to completely cover the area for immediate effect. Under ordinary circumstances six plants, each having growths about 20 inches in length and pegged down, should be ample. Any tree and shrub nurseryman may be expected to supply plants of the variety named above at a reasonable price. Plants are easily propagated from cuttings inserted in the open ground in autumn.

NAMES OF FLOWERS, FRUITS AND PLANTS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to disorganise the preparations for the weekly issue, or to encroach upon the "require" for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time; they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the variety of the fruit. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. Correspondents not answered in one issue are requested to be so good as to consult the following numbers.

FRUITS: *J. K. B.* 1, *Pile's Russels*; 2, *Kewick Codlin*; 3, decayed; 4, *Chelmsford Wonder*; 5, *Annie Elizabeth*; 6, *Queen Caroline*.—*Y. V. Z.* 1, *White Nonpareil*; 2, *Small's Admirable*; 3, *Tower of Glamis*; 4, *Castle Major*.—*Murray.* 1, *Manks Codlin*; 2, *Northern Greening*; 3, *Summer Golden Pippin*; 4, *Hawthornden*.—*H. Ribston.* *Cox's Pomona*—*Miss Mathews.* 1, *Rickson Pippin*; 2, *Cox's Orange*

Pippin; 3, *Clygate Pearmain*; 4, *Beauty of Hants*; 6, *Tyler's Kernel*; 7, *Round Winter Nonesuch*; 8, *Lady Henniker*; 9, *Cellini*; 10, *Emperor Alexander*; 11, *Striped B-eating*; 12, *Golden Noble*—*H. A. Powell.* *Catillac*.—*G. H. B.* *Burré Superfin*; 2, *Fondante d'Autonne*; 3, not recognised—*A. F. Chapman.* *Allen's Everlasting*.—*R. Smith.* 1, *Fearn's Pippin*; 2, *King of Tompkins's County*; 3, *Beauty of Kent*—*E. S. Nield.* 1, *Henry Manning*; 2, *Gascosy's Scarce Seedling*; 3, *Newton Wonder*; 4, *Bramley's Seedling* (highly coloured); 5, *Cox's Pomona*; 6, *Annie Elizabeth*; 7, *Dumelow's Seedling*.—*In Clark's candle box.* 1, *Sturmer Pippin*; 2, *Blenheim Pippin*; 3, *Cockle Pippin*; 4, *Melon Apple*; 5, *Tyler's Kernel*; 6, decayed—*A. Jan s.* 1, *Fondante de l'Ansel*; 2, *Winter Nels*; 3, *Doyenne Grise*; 4, not recognised—*J. P. R.* 1, not recognised; 2 and 5, *Warner's King*; 3, *Boscher's Pearmain*; 4, *Tower of Glamis*; 6, *White Nonpareil*; 7, *Cox's Orange Pippin*—*Hilbush.* *Beurré Superfin*—*E. H. G.* 1, *Alfriston*; 2, *Stone's Pippin*; 3, *Gillflower* (not *Cousin*); 4, *Horned Pearmain*; 5, *Beurré Ducl*; 6, *Vicar of Winkfield*—*Anxius.* 1, *Emperor Alexander*; *Peach* decayed. The other fruits received were inferior, and we cannot attempt to name them.—*Justin & Mar.* The Plums had decayed, and most of the numbers were detached and disfigured by the Plum Juice. You should send only six fruits at one time, and soft fruits should be packed separately.—*F. E. Davidson.* 2, *Hawthornden*; 4, *Greening*; 6, *Warner's King*; 7, *Blenheim Pippin*; 8 and 10, *Dumelow's Seedling*; 9, *Potts's Seedling*; 12, *Bradick's Nonpareil*; 13, *Alfriston*—*H. T. Hay, Her's.* 1, *Peasgood's Nonesuch*; 2 and 3, *Cox's Pomona*; 4 and 7, *Lord Derby*; 5, *Lane's Prince Albert*; 6, *Blenheim Pippin*; 8, *Hawthornden*; 9, *Small's Admirable*; 10, *Lord Grosvenor*; 11, deformed, not recognised; 12, *White Nonpareil*; 13, *Calville St Sauveur*; 14, *Northern Greening*; 15, *Adams's Pearmain*; 16, *Mabbott's Pearmain*; 17, *White Virgin*; 18, *Doyenne du Commerce*; 19, *Beurré Rance*; 20, decayed; 21, *Drockworth Park*; 22, *Beurré Ducl*; 23, *Marie Louise*; 24 and 27, *Fondante de l'Ansel*; 25, *Autumn Nels*; 26, *Beurré Bachelier*; 28, *Glou Morceau*; 29, *Josephine de Malines*. You have very largely exceeded the usual number that should be sent at one time, and a contribution to the Gardeners' Orphan Fund would be appropriate in the circumstances.—*H. Wicken.* 1, a deformed fruit, not recognised; 2, *Calville St Sauveur*; 3, *Franklin's Pippin*.—*Groves & Son.* *Corford's Seedling*.—*A. H.* 1, *Golden Nettle*; 2, *Sandrichman*—*F. D.* 1, *Green Fouquet*; 2, *Tower of Glamis*; 3, *Waltham Abbey Seedling*; 4, *Lady Henniker*; 5, *Fearn's Pippin*; 6, *Peasgood's Nonesuch*.—*E. J. S.* *Glou Morceau*.

PLANTS: *S. H. T.* *Rhus Toxicodendron* (the "Poison Ivy")—*E. H. S.* *Cyripedium Charlesworthii*. It is a very good variety, but there is no trace of the hybridity you suggest.—*Young Gardeners.* *Lonicera combricifera*, *Frit*—*Seabrook.* 1, *Muehlenbeckia platyclada*, sometimes known as *Coccoloba platyclada*; 2, a *Rhipsalis* sp., but cannot name with any degree of certainty without flowers.—*F. S. B.* *Senecio canalicus*, a climbing species from South Africa.—*T. B. Somerset.* 1, *Asplenium rhizophorum*; 2, *Pteris longifolia*; 3, *Gymnogramma chrysophylla*; 4, *Lastrea filix-mas*; 5, *Asplenium lucidum*; 6, *Nephrodium molle*—*S. S.* 1, *Hex species*; 2, *Cedrus libanus*; 3, *Cedrus atlantica glauca*; 4, *Weigela roseo-variegata*; 5, *Enkiah japonica zebra*; 6, *Weigela hortensis alba*; 7, *Arbutus Unedo*; 8, *Benthiana fragrans*; 9, *Skimmia japonica*; 10, *Andromea japonica*; 11, *Hippoboa rhomboides*; 12, *Cedrus deodara*; 13, *Ruscus hypoglossus*; 14, *Leycesteria formosa*; 15, *Buddleia varianalis*; 16, *Cryptomeria japonica*; 17, *Swainsona galegifolia*; 18, *Lasiandra macrantha*; 19, *Abutilon Savitzi*; 20, *Begonia fuchsoides*; 21, *Begonia Drezeri*; 22, *Pavilionium viviparum*. You send more than the proper number, a small donation to the R.G.O.F. box would be appropriate. The specimens sent are imperfect as they lack flowers, and the *Comfers* are wanting cones.—*Ben.* 1, *Adiantum cuneatum mundulum*; 2, *Adiantum concinnum laurum*; 3, *Adiantum fragrantissimum*; 4, *Adiantum formosum*, 5, *Adiantum Capillus-veneris*.—*A. C.* *Trachelium caruleum*.—*S. P.* 1, *Stenotaphrum*

americanum; 2, *Cyrtodeira fulgida*; 3, *Pellionia pulchra*; 4, not recognised, probably *Origanum species*—*H. C. S.* *Acampe papillosa*—*E. H.* 1, *Helianthus rigidus*; 2, *Helianthus multiflorus* *flor. pleno*; 3, *Aster Novi-Belgii* *John Parker*; 4, *Polygonum variegatum*.

NOTICE TO TERMINATE EMPLOYMENT. *J. E. (1)* It is a question of custom, but if you are in private employment and not an under-gardener, we consider that a month's notice would be reasonable in your case. (2) There is no such Act as you suggest. Probably you have in your mind the Workmen's Compensation Act of 1906, which gives a right to compensation in the case of injuries sustained through accidents arising out of, or in the course of, employment.—*Alba pleva, F. Smith and C. F. Smith.* See above reply, p. 7, B.

PEAR LEAVES. *J. G.* The leaves are injured by the Pear-leaf blister mite (*Eriophyes pyri*). The leaves should have been picked off in July. Under present circumstances collect and burn all that have fallen, and spray the trees early in spring with the liver of sulphur solution.

PEARS CRACKING. *T. S.* You do not read your *Chronicle* carefully. On p. 572, in the issue for October 10, was given an illustration and a note on Pears cracking similar to those you send.

PLUM LEAVES. *T. H., Swain Stoke.* The little blisters are galls formed by the Plum-leaf mite (*Eriophyes similis*). Diseased leaves should be gathered and burned. The ground under the trees should be dug over in winter to bury fallen leaves.

PROTECTION FOR ORCHID HOUSES: *M. J., Devon.* Of the three materials you send the cocoon netting is the best for the purpose you mention.

SHRUBS FOR A NORTH WALL: *Cydonia.* *Ampelopsis Vetchin* is the best of all self-clinging plants. *A. quinquefolia* (*A.hederacea*) is of rapid growth, and *A. muralis* is an excellent variety. Of ornamental vines *Vitis Coignetia* grows freely, but requires sun heat to develop its best leaf colours in autumn. *Aristolochia Sipho* is of vigorous growth and remarkable for its large, heart-shaped leaves and pipe-shaped flowers. The small-leaved *Cotoneaster* (*C. microphylla*), an evergreen species from Nepal, is quite hardy, of good growth, and very ornamental. *Periploca graeca*, the silk vine, bears glossy green leaves and clusters of purple-brown flowers. *Jasminum nudiflorum* flowers in January in partial shade. *Berberis Darwini*, *Cydonia japonica* and its varieties, *Crateagus pyracantha* (Evergreen Fire Thorn), and *Lycium chinense* (*Box Thorn*), may be tried. The Ivy (*Hedera Helix*) is an excellent shade plant, especially the forms known as *Canariensis*, *Emerald Green*, *Poetica* and *rægnariana*.

SPECIES OF HIDEAESTRUM: *Amarth.* We are unable to advise you where to get the species of *Hippaestrum* (*Amaryllis*). Some of the leading bulb merchants catalogue two or three species, and you may find some by consulting their lists. If by the term *Amaryllis* you mean *Amaryllids*, a much larger number can be obtained, including some pretty species of *Cyrtanthus* and *Nerines*.

VARIATED MAIDENHAIR FERN: *Query.* There is a variegated form of *Adiantum cuneatum* in cultivation, but the one referred to by your friend in South Africa, if indigenous there, would be the variegated form of the South African *A. capillars-venosus*. The variegated Maidenhair Fern known in gardens has an irregular variegation, and is often not attractive.

COMMUNICATIONS RECEIVED.—*Rev. C. E. T. H. B.* *M. M.*—*I. G.* *A. P. S.* *E. A.* *R. F. A. M.* *R. J. B.* *Bones*—*J. K.*—*A. Sans*—*B. D.*—*E. W. P.*—*A. E.*—*C. H. H.*—*T. S.*—*W. W.*—*E. B.*—*G. Exhibition of British-Grown Fruits.

OCTOBER 15-16.

THE great autumn exhibition of fruits by the Royal Horticultural Society was held on the foregoing dates in a sunnily weather, at the Royal Horticultural Hall, Vincent Square, Westminster. There is a great similarity in these annual exhibitions, and they cannot lay claim to any spectacular effect, owing to the great sameness of dishes of fruits repeated almost in every class. In this connection it was regrettable that the one class that has formerly provided a distinct feature, namely, that for fruit trees in pots, was not represented by any exhibit, owing to the fruits having fallen from the trees before the date of the show, due to the exceptionally fine weather of the past few weeks.

High quality generally obtained in the Apple classes, which constituted the major portion of the show. Such fruits as Plums, Cherries, and Peaches are practically over in October, and it is not surprising that they are poorly represented at these exhibitions. In the Grape classes some choice bunches of Muscat of Alexandria were seen, but the other Grapes did not rise above good average quality.

The management was, as usual, admirable, and the thanks of all concerned are due to the secretaries, the superintendent, Mr. S. T. Wright, who performs his task with commendable tact, the office staff, including Mr. Frank Reader, Mr. Plowman, and others, upon whom much extra labour is entailed. During the process of the show, several meetings and a conference on spraying were conducted; whilst a demonstration of fruit bottling was given in one of the upper rooms.

DIVISION I.

COLLECTIONS OF HOTHOUSE AND HARDY FRUITS. (OPEN TO GARDENERS AND AMATEURS ONLY.)

There were two classes for collections of fruits grown under glass or in the open—one for a display of nine dishes to embrace at least six kinds and not more than one Pineapple, one Melon, and one bunch each of white and black Grapes; and the other for six dishes, with similar restrictions, and no Pineapple was admitted.

Collection of nine dishes.—In the larger class the contest was between two exhibitors only, the Earl of HARRINGTON, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre), and C. R. ADEANE, Esq., Babraham, Cambridge (gr. Mr. R. Alderman). The 1st prize was made in favour of the first-named exhibitor, who staged a choice collection of fruits, the Muscat of Alexandria Grapes being amongst the best in the show. There were also two small, but perfectly-shaped bunches of Madresfield Court, the berries being finished to perfection, shape, and with bloom spread over a deep black skin. The other dishes were Ribston Pippin and Cox's Orange Pippin Apples, the latter coloured to a high degree, such as is seen in Worcester Pearmain; rather small Victoria Nectarines; a yellow-skinned seedling Melon; very big Princess Peaches, also Golden Eagle Peach; and large, well-matched Pears of the Doyenne du Comice variety, that only needed a flush of colouring to improve them. The 2nd prize was worthily awarded to Mr. ADEANE, his dishes being Muscat of Alexandria and Black Alicante Grapes, the latter being two shapely bunches, rather small in the berry but of good finish; a Melon of the Hero of Lochkeige type; Ribston Pippin Apples; superb Pitmaston Duchess Pears; rather poor Barrington Peaches; and Cox's Golden Drop Plum.

Collection of six dishes.—In the smaller class for six dishes there was a greater competition, for eight growers brought of their best, and the contest was a good one. The judges decided in favour of the exhibit from W. PEARSON, Esq., The Node, Codicote, Welwyn (gr. Mr. T. Pateman), and awarded the 2nd prize to Lord HOWARD DE WALDEN, Audley End, Saffron Walden (gr. Mr. J. Veit). It was

more difficult to approximate the 3rd prize winner, for there were two displays that were equal in point of merit, and the judges placed them equal. These exhibitors were Lord BELGATE, Kingston, Derby, and J. NIX, Esq., Tilgate, Crawley (gr. Mr. E. Neal). In the premier collection there were two good bunches of Muscat of Alexandria Grapes, the one a heavily-shouldered bunch, and the other long and tapering. The berries had good finish, including abundant "bloom." Other Grapes were Black Alicante. Probably his best dish was Cox's Orange Pippin Apples, the fruits being large and magnificently coloured. There were also Lady Palmerston Peaches, a green-skinned Melon, Royalty, of small size and not attractive. In the 2nd prize exhibit, Lord WALDEN showed small but well-finished Muscat of Alexandria Grapes; Black Alicante Grapes; a very fine fruit of Golden Wedding Melon; good fruits of Sea Eagle Peach, Pitmaston Duchess Pears, and choice Ribston Pippin Apples.

Apple Chas. Ross was remarkably good in Mr. NIX's collection.

GRAPE CLASSES.

The most important class was for five distinct varieties, and the prizes were given by the Veitch Memorial Trustees. The schedule required at least two kinds of white Grapes, and of each variety three bunches were to be shown. Three growers contested, the 1st prize being taken by the Earl of HARRINGTON (gr. Mr. Goodacre), with fine examples of Muscat of Alexandria, three shapely bunches of Gros Maroc, having well-finished berries, Golden Queen, of medium size and rather irregular in berry, and Madresfield Court, in three choice bunches, with well-finished berries; 2nd, H. J. KING, Esq., Eastwell Park, Ashford, Kent (gr. Mr. J. G. Weston), who showed fine bunches of Lady Downe's, a Grape requiring much skill to cultivate well; Chasselas Napoleon, not an interesting variety for the show board; Black Alicante, of good shape; Muscat Hamburgh and Muscat of Alexandria, of commendable size, but unevenly finished, some berries being rather green. 3rd, Sir W. D. PEARSON, Bart., Goddocks, Worth, Sussex (gr. Mr. A. B. Wadds).

There were no entries in a class for four varieties of Grapes.

Black Hamburgh.—Much the best bunches of this popular Grape were shown by Lord SAVILE, K.C.V.O., Rufford Abbey, Olferton, Notts. (gr. Mr. J. Doe). Amongst the three other contestants, J. NIX, Esq., Tilgate, Crawley, Sussex (gr. Mr. Neal), was placed 2nd; and the Marquis of SALISBURY, Hatfield (gr. Mr. H. H. Prime), 3rd. Mr. NEAL's examples were nicely finished, but lacked size. Mr. Prime had Grapes in many of the classes, but they had a bluish in the shape of a deposit, probably sulphur from some vapouriser.

Mrs. Pinc.—There were half-a-dozen entries in this class, and the 1st prize was given, not to the largest bunches, but to the largest berried ones, and these were shown by Mr. DOE on the same stand as his winning bunches of Black Hamburgh. The largest examples were shown by O. E. D'AVIGNOR GOLDSMID, Esq., Tonbridge, Kent (gr. Mr. C. Earl). They required a little longer time to perfect them, for some of the berries were green at the stalk ends. 3rd, Earl of HARRINGTON (gr. Mr. Goodacre) with small berried bunches. There was a great discrepancy in the quality of the various exhibits in this class.

Black Alicante.—This proved a very strongly contested class, no fewer than 10 exhibits being staged. The 1st prize was won by W. G. RAPHAEL, Esq., Castle Hill, Englefield Green (gr. Mr. H. H. Brown), whose right-hand bunch was the finer, although together they were not much in advance of those shown by the 2nd prize winner, C. F. CAYLEY, Esq., Tunbridge Wells, Kent (gr. Mr. H. Poulton), his bunches being better matched but inferior in size of berry. 3rd, H. J. ANDREWS, Esq., Todington Manor, Gloucestershire (gr. Mr. J. Tooley).

Madresfield Court.—Amongst four exhibits the prize was awarded to Lord SAVILE (gr. Mr.

Doe), who had much the finest bunches, that only required a little longer time to ripen, when they would have been perfect samples. 2nd, F. R. DODD, Esq., Lancington (gr. Mr. Billings). 3rd, Marquis of SALISBURY (gr. Mr. H. Prime).

Any other black Grape.—This class brought forth 14 exhibits, of which five were of Gros Maroc, three of Lady Downe's, three of Gros Colmar, two of Alwinck Sedding, and one of Prince of Wales (see fig. 129). The 1st prize was given to Gros Maroc, shown by Col. Hon. C. HARBOARD, Guntun Park, Norwich (gr. Mr. W. Allen). 2nd, W. G. RAPHAEL, Esq., Castle Hill, Englefield Green (gr. Mr. H. H. Brown), with what appeared to be Lady Downe's, but they were not labelled. 3rd, Prince of Wales.

Muscat of Alexandria.—This class is always a popular one, and on this occasion there were 12 contestants. The judges decided in favour of those shown by the Earl of HARRINGTON (gr. Mr. J. H. Goodacre), who had undoubtedly the finest Muscats in the exhibition. 2nd, Sir E. DUNNING LAURENCE, King's Ride, Ascot (gr. Mr. W. Lane), whose bunches were admirable in finish, but on the small side. 3rd, W. G. RAPHAEL, Esq., Castle Hill, Englefield Green (gr. Mr. H. H. Brown).

Any other white Grape.—There were only two exhibits, viz., Mrs. Pearson and Lady Hutu, shown by A. BENSON, Esq., Merstham, Surrey (gr. Mr. H. Cornish), and Sir W. D. PEARSON, Bart. (gr. Mr. A. B. Wadds); the prizes were awarded in this order.

There were no entries for Grapes of the Froonian type.

COLLECTIONS OF HARDY FRUITS.

There was a class for a collection of 30 varieties of hardy fruits, including not more than 12 varieties of Apples nor eight of Pears. The class was a good one, for although no more than three exhibits were staged, they were all good collections and together made a big show. By far the largest fruits were shown by Lt.-Col. BORTON, Cheveney, Hinton (gr. Mr. J. Whittle), who received the 1st prize. He showed exceptionally fine culinary Apples, including Mere de Monage, Peasgood's Nonesuch, Sandringham (a noteworthy dish), Bismarck, Warner's King, and Emperor Alexander (with high colouring). Of dessert Apples we met, amongst others, Chas. Ross, American Mother and Allington Pippin. The best Pears were Doyenne du Comice, Durondeau, Peuric Diez, Beuric Superfin, Marie Benoit, and President d'Osmonville. There were also Plum Monarch, Peaches Stirling Castle and Golden Eagle; Cherries, Damsuns, Walnuts, and Gobnins. 2nd, Sir M. SAMUEL, Maidstone (gr. Mr. W. H. Bacon), with smaller fruits, but of good quality and of rather more variety. Very fine were Emperor Alexander, Chas. Ross, Harvey's Wiltshire Defiance, Lord Derby, and Peasgood's Nonesuch Apples and Monarch Plums. There were dishes of White Curants, Pears, Medlars, Quinces, Damsuns, Peaches, &c. 3rd, Major POWELL COTTON, Birchington (gr. Mr. J. Cornford), the best dish being the beautiful Charles Ross Apple.

DIVISION II.

NURSERYMEN'S CLASSES.

FRUIT GROWN ENTIRELY OUT-OF-DOORS.

The class for a display of hardy fruits occupied an area of 24 feet by 6 feet was the most important in the nurserymen's exhibition, and it enabled the larger growers to display their skill and resources in hardy fruit growing. There were, however, only three entries, viz., Messrs. Geo. BUNYARD & Co., Ltd., Maidstone, Kent, Messrs. R. CANNELL & SOXS, Swanley, Kent, and Messrs. JOS. CHALM & SOXS, Crawley, Sussex. The contest for the 1st prize was between the Kent firms, with the result that Messrs. BUNYARD were placed first. Both Messrs. CANNELL were in a fair position. Although firms staged excellently, and their fruits possessed that degree of colouring which is associated with a sunny climate, and intensified by the exceptionally fine weather of the past weeks.

Messrs. BUNYARD showed 175 distinct varieties and arranged their dishes in four tiers on either side, the central one being broken with three epergnes decorated with fruits of the common Berberis, and coloured foliage. The large culinary Apples occupied the higher rows, and dessert kinds were towards the foreground. Prominent amongst the Apples were Mere de Ménage, Belle Dubois, Gascoyne's Scarlet Seedling (fine in colour), Cox's Pomona, Lord Derby (fine samples of this choice culinary Apple), King of Tompkins's County, Lane's Prince Albert, The Queen, Royal Jubilee, Emperor Alexander and Baumann's Red Winter Reineette (both intensely red). Then, amongst dessert kinds, were such excellent varieties as Cox's Orange Pippin, Egremont Russet, Allington Pippin, Maltster, Christmas Pearmain (a useful variety), Mabbott's Pearmain, Evargil, Parquet (a small but pretty fruit), Duchess's Favourite and St. Edmund's Russet. There were 24 dishes of Pears, including Pitmaston Duchess, Fondante de Thiriot, Beurré Rosé, and Vertalant. The remaining dishes were Medlars, Quinces, Damsons, Plums, and Nuts.

In the 2nd prize group, which was arranged somewhat similarly, but not quite so tall, we noticed good dishes of Apples:—Emperor Alexander, Warner's King, Chas. Ross (very choice in quality), Lord Derby, Peasegood's Nonesuch, Bietheimer Red, Wealthy (a pretty Apple of high colour), Gloria Mundi, Adams's Pearmain, Egremont Russet, Mrs. Barron, Baumann's Red Winter Reineette, Bedfordshire Seedling, Yorkshshire Beauty, Maltster, Bramley's Seedling, Beauty of Kent, The Queen (excellent samples), James Grieve (a dessert kind of attractive appearance), Allington Pippin, Lady Sudeley (of intense red colour), Chelmsford Wonder, Tom Puit, Rival, and Golden Spire. Of Pears, mention may be made of Pitmaston Duchess, Marchal de Cour, Conference, Vicar of Wilkfield, Doyenne Boussoch and Beurré Alexander Lucas. MESSRS. CANNELL also showed Bullaces, Medlars, Nuts, Plums, Quinces, and Grabs. 3rd, MESSRS. JONES & SONS with a very pleasingly arranged exhibit of somewhat small but well finished fruit.

There was greater competition in the class for a display of fruits occupying an area of 16 feet by 6 feet, no fewer than eight exhibits being staged. A collection of exceptional quality, staged by Mr. WILL TAYLOR, Hampton, won the 1st prize, the fruits being noticeable for their brilliancy of colouring and general high quality. It was good throughout, and no weak dish was noticed.

Nearly all the fruits were Apples, and of these many may be made into Pears. Baumann's Cox's Orange Pippin, remarkably fine fruits; Bleenheim Pippin, Beauty of Kent, Byford Wonder, King of the Pippins, Lord Derby, Annie Elizabeth, Bismarck, Emperor Alexander, The Queen, Lady Sudeley, Clavette Pearmain, and Allington Pippin. Some very choice Pears were also included in this exhibit, and a pleasing edging was formed by bunches of Quinces and Quince foliage. 2nd, MESSRS. W. SEABROOK & SONS, The Nurseries, Chelmsford, with very similar varieties, especially fine being the culinary Apples of large sorts: The Queen, Bismarck, Jubilee, Cox's Pomona, Warner's King, and Peasegood's Nonesuch may be instanced in this connection. 3rd, MESSRS. LAXTON, BROS., Bedford.

DIVISION III

(OPEN TO MARKET GROWERS ONLY.)

There were three classes provided in this section, viz., one for a display of fruits occupying a table space of 18 feet by 6 feet, another for a display measuring 12 feet by 6 feet, and a third for an exhibit of 12 dishes of Apples in equal numbers of dessert and culinary varieties.

Combinations of individuals or firms was not allowed, nor collections of produce from districts. No duplicate dishes or baskets of fruit were permitted, but the use of berries and foliage was allowed to brighten the exhibit, flowers being debarred. The highest prize awarded in the largest class was a second, and it fell to the HORTICULTURAL COLLEGE, Swaley, the principal of which establishment is Mrs. Wilkinson. The fruits, consisting mainly of Apples and a few varieties of Pears, were shown in large and small flat baskets, arranged in pyramidal fashion. The dessert varieties of Apples were small in size, and for Kentish fruit not fine as regards colour; but, on the contrary, the culinary varieties were large, clear in the skin, and generally

well coloured. The finer examples were Peasegood's Nonesuch, Bismarck, Golden Noble, The Queen, Newton Wonder, Alfrinton, and Tyler's Kernel. Ross Nonpareil, Scarlet Nonpareil, Worcester Pearmain, Cockle's Pippin, and Cox's Orange Pippin were the choicer examples among dessert Apples. Du-hesse d'Angoulême, Pitmaston Duchess, and Beurré Diel were the finest examples of Pears.

Exhibit measuring 12 feet by 6 feet.—In this competition the 1st prize was worthily taken by G. H. DEAN, Esq. (gr. Mr. W. Stowers), 80, Harold Road, Sittingbourne, the fruit, arranged in flat baskets and plates, being of great excellence. We noticed Allington Pippin, Rambour Papelin, a fine, large, dark crimson and yellowish green and slightly conical fruit, Mere de Ménage, splendid in colouring; Peasegood's Nonesuch, Stone's or Loddington, Bismarck, Tyler's Kernel, Coronation, Blenheim Pippin, Twenty Ounce, Charles Ross, Emperor Alexander, Glory of England, a fine, showy fruit; Chelmsford Wonder, Annie Elizabeth, Belle de Pontoise, The Queen, Ribston Pippin, Hohenzollern, a flat, green fruit; Royal Jubilee, Lane's Prince Albert, and a plate of finely coloured fruits of Rival. The finer Pears were Doyenne du Comice, Beurré Alex. Lucas, Conference, Marie Benoist, Chaumontel, Durondeau, Comtesse de Paris, and Pitmaston Duchess. This was one of the most striking exhibits of fruit in the hall. 2nd, Mr. OWEN G. S. CROFT, of the Pomona Fruit Farm, Wokington, Hereford. The fruit from this exhibitor was arranged in boxes stood on end, also in small, flat baskets, and the remainder in plates. The boxes were as packed for transit to distant places. Of Apples there were noted examples fine in colour or size of the following varieties:—Hero of the Nile, Gascoyne's Seedling, Worcester Pearmain, Evargil, Blenheim Pippin, Tower of Glamis, Leek's Kernel, a small, handsome fruit of high colour; Golden Noble, The Queen, Maltster, Loddington, Duchess of Gloucester, Lord Lennox, Newton Wonder, Mere de Ménage, Cox's Orange Pippin, Rosseter, Russet, Cox's Pomona, and Bramley's Seedling. Fine specimens of Pears were Beurré Ballet Pire. Plum Weald and Quinces were also shown by Mr. CROFT. 3rd, MESSRS. W. J. LOBBETT & SON, Heston, Middlesex, who showed fine, large, pale-coloured fruits in flat baskets.

Fewer dishes of Apples, six cooking and six dessert.—This class brought a capital exhibit from Mr. H. T. MASON, Hampton Hill, Middlesex, who was awarded the 1st prize. The fruit was shown in flat baskets, holding from 15 to 30 specimens each. The best varieties for size, colouring, and general good appearance were The Queen, Dumelow's Seedling, Bismarck, Peasegood's Nonesuch, Newton Wonder, Lady Sudeley, Golden Noble, Cox's Orange Pippin, Ribston Pippin, Allington Pippin, and King of the Pippins. 2nd, Mr. A. F. MASON, Rectory Farm, Hampton Hill. This exhibitor showed well, but generally the fruits were smaller than in the preceding exhibit. Of Apples, The Queen, Bismarck, Peasegood's Nonesuch, and Beauty of Kent were unexcelled for large size, freedom from blemishes and good appearance; whilst Ribston Pippin, Jefferson, King of the Pippins, Allington Pippin, Cox's Orange Pippin, and Yellow Ingestre were of a size suitable for dessert purposes.

DIVISION IV.

FRUITS GROWN EXCLUSIVELY IN THE OPEN AIR.
(EXHIBITING CLASS 22.)

(OPEN TO GARDENERS AND AMATEURS ONLY.)

APPLES.

Twenty-four dishes distinct.—The schedule required 16 cooking and 8 dessert varieties, the latter to form the front row. The winner of the 1st prize was the same gentleman as won last year, Lt.-Col. BORTON, Hutton, Kent (gr. Mr. J. Whittle). The best of the culinary Apples in regard to size and general appearance were Peasegood's Nonesuch, The Queen, Newton Wonder, Emperor Alexander, Belle de Pontoise, Mere de Ménage, Warner's King, Lady Becher, Bismarck, Bramley's Seedling, and Lane's Prince Albert. The dessert varieties included handsome specimens of Ribston Pippin, Allington Pippin, Rival, Christmas Pearmain, American Mother, King of the Pippins, Wealthy, and Cox's Orange Pippin. 2nd, Sir MARCUS SAMUEL, Bart., Mote Park, Maidstone (gr. Mr. J. W. H. Bacon), with very large fruits of Emperor Alex-

ander, Warner's King, Gloria Mundi, and Mere de Ménage. Nice specimens of dessert varieties were noted in Cox's Orange and Ribston Pippins, Wealthy, Christmas Pearmain, Chas. Ross, and Egremont Russet. 3rd, J. E. WILLIAMS, Esq., Penley Manor, Tring (gr. F. G. Gerrish). This exhibitor of fine fruits from off the chalky soil of the Chilterns, had fruits mostly above the average in size and colour and quite free from blemishes caused by insects or fungi.

Eighteen dishes of Apples, distinct, twelve cooking and six dessert.—The 1st prize in this class was taken by C. R. ADEANE, Esq., Babraham, Cambridge (gr. Mr. R. Alderman), with a collection of even-sized fruits. Very fine examples were Emperor Alexander, The Queen, Gascoyne's Scarlet Seedling, Peasegood's Nonesuch, Lane's Prince Albert, Bramley's Seedling, and Hambling's Seedling. Particularly resplendent in colour were the dessert varieties American Mother, Wealthy, Baumann's Winter Reineette, and King of the Pippins. 2nd, Major POWELL CORTON, Quex Park, Isle of Thanet (gr. Mr. J. Cornford). The fruits were not over large nor were they very high in colour. We observed good examples of Peasegood's Nonesuch, Prince Albert, The Queen, Golden Noble, Mere de Ménage, Chas. Ross, The Houblon, Wealthy, and Ribston Pippin. 3rd, O. E. D'AVIGNOR GOLDSMID, Esq., Tonbridge, Kent (gr. Mr. C. Earl), with a collection of culinary varieties, among which Beauty of Kent showed up, conspicuously for bright tints. Worcester Pearmain, Mabbott's Pearmain, and American Mother were also of high colour as compared with the culinary varieties. In this class Mr. J. NIX, Tilgate, Crawley, showed the Apples Jas. Grieve and that fine-flavoured variety Egremont Russet.

Twelve dishes, distinct, to include eight cooking and four dessert varieties.—The 1st prize was awarded to Rev. THOS. McMURDIE, Woburn Park, Weybridge (gr. Mr. A. Basile), for a superior lot of fruit. The varieties Gloria Mundi, Peasegood's Nonesuch, Emperor Alexander, and Bismarck were the finer cooking fruits; and among dessert varieties Cornish Aromatic, a variety not often observed, Rival, and Calville Rouge Précoce were well exhibited.

Six dishes of culinary Apples distinct.—The 1st prize was won by Lt.-Col. BORTON (gr. Mr. J. Whittle). Varieties remarkable for either size or colouring included Mere de Ménage, Peasegood's Nonesuch, Warner's King, and Emperor Alexander. 2nd, Sir MARCUS SAMUEL, Bart., Maidstone (gr. Mr. W. H. Bacon), with very fine examples of Peasegood's Nonesuch, the finest probably in the hall; Emperor Alexander and Bramley's Seedling. C. R. ADEANE, Esq., was awarded the 3rd prize for creditable specimens. The competition was keen in this class.

Six dishes of dessert Apples distinct.—The 1st prize was won by Lt.-Col. BORTON (gr. Mr. J. Whittle) with King of the Pippins, Wealthy, Charles Ross, Cox's Orange Pippin, Allington Pippin, &c. Sir MARCUS SAMUEL, Bart., was awarded the 2nd prize for fruits of Chas. Ross, Wealthy, Cox's Orange Pippin, Allington Pippin, Ribston Pippin, Mother, and Allingtho.

PEARS

Eighteen dishes of dessert Pears distinct.—The 1st prize was awarded to F. A. WHITE, Esq., East Grinstead (gr. Mr. W. J. Finch), for grand examples of which we may name Thompson's, Beurré Superfin, Doyenne du Comice, Pitmaston Duchess (extremely large), Durondeau, Alexander Lucas, Beurré Bachelier, and Princess. 2nd, Sir MARCUS SAMUEL, Bart., with very fine examples, the largest of which were Princess, Durondeau, Fondante de Thiriot, Beurré Superfin, Pitmaston Duchess, and Jean Van Geert. 3rd, Lt.-Col. BORTON, with Beurré Diel, very fine; Marie Benoist, Durondeau, Le Lecteur, and Beurré Fonqueray.

Twelve dishes of dessert Pears distinct.—The 1st prize in this competition was awarded to Rev. THOS. McMURDIE, in whose collection fine fruits of Durondeau, Beurré Ballet Pire, Pitmaston Duchess, Charles Ernest, Beurré Bachelier, Beurré Fonqueray, and Beurré Hardy were seen. 2nd, M. W. PRICE, Esq., The Nook, Colchester, Welwyn (gr. J. Pateman), who showed very fine fruits of Marchal de Cour, Marie Louise, Beurré Alexander Lucas, Chas. Ernest, Marie Louise d'Uccle, Josephine de Malines, and Emile d'Heyst.

Six dishes of Pears distinct.—1st, the Hon. WHITLAW REID, West Park, Anphilth, Beds. (gr. Mr. G. MacKinlay), who showed Pears that were mostly in a ripe state and fit, therefore, for the table. There were Pitmaston Duchess, Beurré Superfin, Marie Louise d'Uccle, Louise Bonne of Jersey, Maréchal de Cour, and Beurré Diel. 2nd, A. BESSON, Esq., Merstham, Surrey (gr. Mr. H. Cornish), with good examples.

Steeping Pears.—The best three dishes of distinct varieties were shown by Major BOWELL COTTON, his examples being Uvedale's St. Germain, Catillac, and Gillogi.

DIVISION V.

SPECIAL COUNTY CLASSES.

These classes were for fruits grown entirely in the open, and were arranged so that counties having similar meteorological conditions were grouped together. In the case of Kent, a class was allotted to this county by itself. There was in each instance a class for Apples, of which four were to be culinary and two dessert varieties, and another for Pears of dessert varieties, the dishes being limited to six.

KENT.—*Apples.*—There were only two exhibits of Apples from this county, those shown by W. E. S. E. DRAX, Esq., Olantigh Towers, Wye, Kent (gr. Mr. J. Bond), being by far the finer, the varieties being Peasgood's Nonesuch, Hambledon Seedling, Mere de Ménage, The Queen, and the King of the South. *Pears.*—Pearmain, 2nd, C. A. MORRIS FIELD, Esq., Beechy Lees, Sevenoaks (gr. Mr. R. Edwards), with Chas. Ross as his best dish.

Pears.—Three growers contested in the class for these fruits, the 1st prize being won by the Dowager Lady HILLINGDON, Wilderness Park, Sevenoaks (gr. Mr. J. Skelton), with a fine collection, embracing Durondeau, Beurré-Bosc, Beurré Superfin (very choice samples), Doyenné du Comice, Emile d'Heyst, and Pitmaston Duchess. 2nd, C. A. MORRIS FIELD, Esq. (gr. Mr. R. Edwards), with smaller but rather better coloured fruits. Doyenné du Comice being noteworthy in this respect.

SURREY, SUSSEX, HANTS, DORSET, SOMERSET, DEVON, AND CORNWALL.—*Apples.*—There were six entries, not quite one for each county. Hants, Somerset, and Cornwall were unrepresented. The premier fruits came from Devonshire, being shown by H. H. HILL, Esq., Newcombe, Crediton (gr. Mr. G. Lock), and they formed a magnificent collection, Alfriston, Peasgood's Nonesuch, Emperor Alexander, Loddington Pippin, Cox's Orange Pippin, and Ribston Pippin being the varieties. They all showed that delicacy of coloring—red underlying orange—that is associated with high quality, and this quality was combined with large size. 2nd, F. J. B. WINGFIELD DIGNY, Esq., Sherborne Castle, Dorset (gr. Mr. Turton), American Mother and Lord Derby being his finest examples.

Pears.—There were five exhibits of Pears, and they were generally deficient in colouring; large, rather green fruits of Beurré Alexander Lucas, Beurré Baltet Père, Doyenné du Comice, Charles Ernest, Doyenné Boussouch (the best dish), and Durondeau won the 1st prize for F. J. B. WINGFIELD DIGNY, Esq. (gr. Mr. Turton). 2nd, SIR EDMUND LOTT, Bart., Leonardisle, Horsham, Sussex (gr. Mr. W. A. Cook); Durondeau and Beurré Baltet Père may be instanced in this group, for they were choice fruits.

WILTS, GLOUCESTER, OXFORD, BUCKS, BERKS, BEDS, HERTS, AND MIDDLESEX.—*Apples.*—Nine growers contested the class for Apples, the majority of the fruits being of mediocre quality, although the winning fruits shown by C. GURNEY, Esq., Henlow Grange, Biggleswade (gr. Mr. A. Carlisle), left little to be desired. His sample of Gascoyne's Scarlet Seedling was remarkably good and the best dish we have so far instanced in these classes. Peasgood's Nonesuch, Bramley's Seedling, Emperor Alexander, King of the Pippins, and Cox's Orange Pippin were the remaining varieties. The 2nd prize exhibit contained some fine fruits of Cox's Orange Pippin Apples.

Pears.—The winning dishes were shown by J. B. FORTESCUE, Esq., Dropmore (gr. Mr. Page). Doyenné Boussouch was very fine, but the examples of Pitmaston Duchess were quite past their best condition, although these fruits formed the strongest dish in the 2nd prize group, shown by TUDOR ANDREWS, Esq., Toddington

Manor, Winchcombe (gr. Mr. J. R. Tooley), and this gentleman had also a good dish of Doyenné du Comice.

ESEX, SUFFOLK, NORFOLK, CAMBRIDGESHIRE, HUNTS, AND RUTLAND.—*Apples.*—It was easy to pick out the winning fruits, for they were as fine as any Apples shown in the county classes. The varieties were Peasgood's Nonesuch, Mere de Ménage (with intense colouring), Gascoyne's Scarlet Seedling, Bismarck, Allington Pippin (a grand dish), and Cox's Orange Pippin. The exhibitor was Major PETRE, Westwick House, Norwich (gr. Mr. G. D. Davison). 2nd, Hon. W. LOWTHER, Wickham Market (gr. Mr. A. Andrews), with fine fruits of Cox's Orange Pippin, Peasgood's Nonesuch, and Bramley's Seedling. Mr. ANDREWS had an exceptionally difficult task to match the excellence of his rival's fruits, but in any other of the county classes he would probably have taken the 1st prize.

Pears.—Major PETRE (gr. Mr. Davison) also surpassed all other competitors in these counties for Pears. 2nd, Col. the Hon. C. HARBOLD, Gunton Park, Norwich (gr. Mr. W. Allan), both exhibitors showing well-known varieties.

LINCOLN, NORTHAMPTON, WARWICK, LEICESTER, NORTHAMPTON, DURBY, STAFFORDSHIRE, SHROPSHIRE, AND CHESHIRE.—*Apples.*—This did not attract more than three exhibitors from these nine counties, which must be regarded as unsatisfactory. The premier collection was shown by Mr. JOHN LEE, King's Croft, Higher Bebington, Cheshire. The fruit was not exceptional. Chas. Ross, Cox's Orange Pippin, and Byford Wonder being the best samples. 2nd, Duke of RUTLAND, Belvoir Castle, Grantham (gr. Mr. Divers).

Pears.—The Marquis of NORTHAMPTON (gr. Mr. Scoble) secured 1st place for these fruits with not over-large but choice samples, showing the rich, mellow skin that gives to fruit an attractive appearance. Beurré Superfin, Marie Louise, Souvenir du Congrès, Pitmaston Duchess, Beurré de Mortillet, and Beurré d'Amanlis constituted the selection. 2nd, Duke of RUTLAND, Belvoir Castle (gr. Mr. Divers), whose best dish was of Doyenné Boussouch. Competition in these counties was not keen.

WORCESTER, HEREFORD, MONMOUTH, GLOUCESTER, CARMARTHEN, AND PEMBROKE.—*Apples.*—They were represented by three exhibits, some good fruits being displayed, especially fine being Cox's Orange Pippin, Worcester Pearmain, Lord Derby, and Warner's King, shown by DENIS BEST, Esq., Temple Langherne, Worcester, in the 1st prize collection. A magnificent dish of Chas. Ross was shown by PAGET NORBURY, Esq., The Norrest, Malvern, who won the 2nd prize.

Pears.—Only one display of Pears, and that of moderate quality, was shown from these counties. The exhibitor was R. M. WHITING, Esq., Credenhall, Hereford, who staged Durondeau, Beurré Superfin, Beurré Diel, &c.

WELSH COUNTIES OTHER THAN THOSE NAMED.—*Apples.*—There was a marked falling off in these Welsh counties, the Apples being poor and with little colouring. The prize was awarded to P. YORKE, Esq., Erdrigg Park, Wrexham (gr. Mr. Geo. Atkins).

Pears.—This exhibitor also took the 1st prize for Pears.

SIX NORTHERN COUNTIES OF ENGLAND AND THE ISLE OF MAN.—*Apples.*—We observed only one display of Apples, and this was from the gardens that furnished last year's winning fruits in this class, viz., Baldersby Park, Thirsk, Yorkshire, the residence of JOHN BRENNAND, Esq. (gr. Mr. J. E. Hathaway). The varieties were Rival (good), Chas. Ross, Warner's King, Peasgood's Nonesuch, &c.

Pears.—Mr. BRENNAND (gr. Mr. J. E. Hathaway) had no competitor and was awarded the 1st prize.

SCOTTISH COUNTIES.—Scotland only furnished one exhibitor in both Apple and Pear classes. This was the Earl of GALLOWAY, Galloway House, Gartiestown (gr. Mr. James Day), and he was awarded the 1st prize in both cases; the fruits suffered in comparison with those from more southern gardens.

IRISH COUNTIES.—There were a few good exhibits of Apples from Ireland, but none of Pears. Mr. BLACKMORE, Piltown, Co. Kilkenny, showed commendable examples of Alling-

ton Pippin, Cox's Orange Pippin, Lane's Prince Albert, and Lord Derby Apples, for which she received the 1st prize. In the 2nd prize exhibit we noticed a fine dish of Chas. Ross.

DIVISION VI.

SINGLE DISH CLASSES.

DESSERT APPLES.

Adam's Pearmain.—Of this excellent late variety there were 15 dishes. The 1st prize fell to Lord HILLINGDON, Uxbridge (gr. Mr. A. R. Allan), his samples being very superior. 2nd, B. H. HILL, Esq., Crediton, Devon (gr. Mr. G. Lock). The whole of the fruits staged in this class showed good quality.—*Allington Pippin* was represented by 22 dishes, thus showing its popularity as a handsome but by no means high-class table variety. Mr. R. M. WHITING, Credenhall, Hereford, won the 1st prize, having very handsome fruits; Mr. W. BARNES, Bearwood Gardens, Wokingham, was placed 2nd. In this class were several other handsome dishes of fruit, but some others were too large.—*American Mother.*—This class brought 12 exhibits, the fruits generally showing good colour, and they were of medium size. J. WINGFIELD DIGNY, Esq., Sherborne Castle (gr. Mr. T. Turton), was a good 1st prize winner. C. A. COOMBE, Esq., Cobham Park, Surrey (gr. Mr. A. Tidy), was 2nd.—*Ben's Red.*—This new Apple was represented by only two dishes, a poor show for a specially-scheduled Apple. The fruits are flattish in shape, red, and somewhat resembling those of Red Quarrenden. H. J. KING, Esq., Eastwell Park, Kent (gr. Mr. J. G. Weston), was awarded the 1st prize, and J. C. FORTESCUE, Esq., Dropmore, Bucks (gr. Mr. C. Page), the 2nd prize.—*Bleuhen Pippin.*—This popular Apple was seen in 16 dishes, though they were very uneven samples. The Earl NELSON, Trafalgar, Salisbury (gr. Mr. T. Beesley), had somewhat large, highly-coloured samples, but by far the most even and beautiful fruits were those shown by Mr. WALTER, Wantage, Berks. A more perfect dessert sample than his is rarely seen.—*Charles Ross.*—That this Apple is now becoming widely grown was evidenced in this class, resulting in 11 dishes all of exceeding beauty, and none of undue size. The 1st prize fell to Mr. F. PAGET, Norbury, Malvern, for one of the handsomest samples of this beautiful Apple we have seen. 2nd, W. E. T. E. DRAX, Esq., Wye, Kent (gr. Mr. J. Bond), with rather larger fruits.—*Christmas Pearmain* is a handsome Apple of distinct appearance. The 1st prize was won by Mr. G. LOCK, Mr. C. ROSS, Welford Park Gardens, being placed second in this class.—*Earl's variety* brought 10 dishes, Mr. W. BARNES having the best fruits, and he was followed by the Earl of DEVON, Powderham Castle (gr. Mr. T. H. Bottom).—*Cox's Orange Pippin.*—The premier dessert variety was represented by no fewer than 34 dishes. Lord HILLINGDON, Uxbridge (gr. Mr. A. R. Allan), was given the 1st prize for clean, handsome fruits but moderately coloured. Mrs. M. KNOX, Alton, Hants. (gr. Mr. W. Weston), won the 2nd prize.—*Esperanza* brought 10 dishes. Mr. TURTON winning with fine clean fruits, Mr. JOHN SPEER, Belmont, Swanley, being 2nd.—*Fearn's Pippin.*—This variety was represented by 15 dishes, Mr. W. BARNES taking the 1st prize with superbly-coloured examples. Mr. G. LOCK was awarded the 2nd prize for fruits more than usually conical.—*Golden Reinette.*—Only two lots were staged, and one proved to be King of the Pippins. The other dish was a small sample from Col. BINGHAM, Havant, Surrey (gr. Mr. E. Montague).—*The Houbton.*—This variety was included in these classes for the first time this year, and it brought Mr. W. BARNES again to the fore with medium-sized, richly-coloured fruits, the raiser, Mr. C. ROSS, being placed 2nd.—*James Grieve.*—This also is fast becoming a popular Apple. The class brought 12 dishes, and the 1st prize was awarded to Mr. J. S. ATKINSON, Caversham, Reading, with rather large samples, none too bright in colour. Mr. C. GURNEY, Esq., Biggleswade (gr. Mr. A. Carlisle).—*King of the Pippins* was represented by no fewer than 17 dishes, Mr. A. R. ALLAN taking the 1st prize with very pretty and bright samples. Mr. TURTON won the 2nd prize with scarcely less handsome fruits.—*King of Tompkins' County* was represented by eight exhibits, Mr. TIDY being placed 1st with fruits rather too large for dessert purposes. Mr. J. G. WESTON won the 2nd prize in this class.—*Lord Huntley.*—Five dishes only of this variety were staged; one of moderate

quality won the 1st prize for the Rev. BARING GOULD, Lew Trenchard, Devon (gr. Mr. H. Hockin); Mr. B. KING being 2nd.—*Alargil*: Among eight competitors Mr. LOCK took the 1st prize, with a sample of medium quality. Mr. CARLISLE was placed 2nd.—*Ribston Pippin*: This brought 17 exhibits, the 1st prize falling to Lord HOWARD DE WALDEN, Saffron Walden (gr. Mr. J. Vert), whose samples were excellent in every respect; 2nd, G. W. GREENWELL, Esq., Marden Park, Caterham (gr. Mr. J. Lintott).—*Rival*: This comparatively new variety was seen in 10 dishes. Mr. R. M. TURTON was awarded the 2nd prize; and Mr. WHITING was awarded the 2nd prize.—*Magnan Bonum*: This large, ungainly-looking Apple, so unfitted for dessert purposes, was represented by four dishes only, all green and of large size. Earl STANHOPE, Sevenoaks (gr. Mr. C. Sutton), was awarded the 1st prize, and Mr. C. PAGE the 2nd prize.—*Scarlet Nonpareil*: Nine exhibitors staged medium-sized fruits, that were unattractive in appearance. Mr. LOCK was placed 1st, and Mr. WHITING 2nd.—*St. Edmund's Pippin*: Only four dishes were presented. Mr. BARNES having exceptionally large fruits, for which he was granted the 1st prize. Mr. TURTON followed with a pretty, medium sample.—*Wealthy*, a handsome striped Apple, brought 14 lots, Messrs. J. G. WESTON and G. LOCK taking the prizes in the order of their names.—*Any other variety*: No fewer than 28 dishes, of which eight were Worcester Pearmain, were entered in this class. Extra Apples were included in each dish for the judges to taste. Not one fruit gave the fine, floury, shagreened skin that did last year. The best on this occasion were Mabbott's Pearmain, from Lord HILLINGDON (gr. Mr. A. R. Allan); Gravenstein, from Mr. A. TIDY, rather green; Mabbott's Pearmain again from Mr. J. SKELTON, Sevenoaks; and the same variety from W. H. MYERS, Esq., Swanmore Park (gr. Mr. Elwood), in the order named, there being four prizes.

CULINARY VARIETIES.

Afriston: This variety was represented by six very fine samples. Specially good were those staged by Mr. TURTON, who was awarded the 1st prize, and those from Mr. J. LEE, Higher Bebbington, Cheshire, the 2nd.—*Lonic Elizabeth*: This class brought 10 dishes, though none was so fine as we have seen this variety in previous years. Mr. BRESLEY was given the 1st prize for rather dull fruits, Mr. W. BARNES coming 2nd with brighter samples.—*Beauty of Kent*: This name seems somewhat a misnomer, as the nine dishes staged were not, as Apples are now known, by any means beautiful. Mr. LOCK was 1st with large green fruits, Mr. CALDICK being 2nd with partially speckled fruits.—*Bismack*: This variety was also shown by nine exhibitors. The judges placed Captain FARWELL, Burnham, Bucks. (gr. Mr. V. Lintott), and Mr. W. BARNES 2nd; but the referees later disqualified Mr. HUTT on the grounds that his samples were of the Emperor Alexander variety. They therefore gave the 1st prize to Mr. BARNES, and placed Mr. DENNIS BEST, Worcester, 2nd.—*Bramley's Seedling*: This Apple brought 19 dishes of generally very large fruits. Those shown by Mr. W. BARNES were placed 1st, being really huge samples, although some showed splitting at the base. Mr. C. ROSS was awarded the 2nd prize for good clean examples.—*Dumet's Seedling*: Amongst eight exhibits none showed special merit. Mr. PAGE was placed 1st, and Mr. J. SPER 2nd.—*Ecklinville*: There were seven competitors, all having deep yellow examples, generally past their best condition and much speckled. Mr. BRESLEY won the 1st prize; 2nd, the Rev. H. A. BULL, Westgate-on-Sea (gr. Mr. F. King).—*King Edward VII.*: Only one dish of this green, conical Apple was shown, Mr. WHITING being the exhibitor. It is difficult to understand why varieties little known in England should thus have classes allotted to them.—*Emperor Alexander*: This old favourite variety, which is of some 100 years' introduction, was and originally known as Alexander only, was seen in 11 dishes. The best samples were very handsome; they were shown by Mr. A. A. VOSS, Rayleigh, Essex; 2nd, Mr. J. BOND.—*Gascoyne's Scarlet Seedling*: This richly-coloured variety was shown by nine exhibitors, Mr. J. BOND winning the 1st prize with exceedingly handsome fruits; 2nd, H. J. KING, Esq. (gr. Mr. J. G. Weston).—*Golden Noble*: This superb Apple was seen in 12 dishes, none of the

samples large or ungainly. Mr. TURTON was 1st with beautiful fruits, Mr. BULLOCK being placed 2nd.—*Golden Spire*, a very conical, ribbed, and therefore wasteful Apple, brought six exhibits only. Mr. J. LEE won the 1st prize, and Mr. J. BOND the 2nd.—*Grenadier*, another over-rated Apple, was seen in four lots only, generally much speckled. Mr. PAGE and Mr. BOND won the prizes in the order of their names.—*Humbly's Seedling*: Of this really fine cooking Apple there were 10 dishes. W. F. DRAX, Esq. (gr. Mr. J. Bond), was awarded the 1st prize for superb fruits; 2nd, Col. ARCHER HOUBLON. Bishop's Stortford.—*Hector Macdonald*: This new Apple, for which Messrs. J. R. Pearson, of Notts., offered very liberal money prizes in two classes, found one representative only, a nice dish from its raiser, Mr. C. ROSS.—*Hereward Pearmain*: A capital Apple, but shown by not more than three exhibitors, Mr. TURTON and Mr. WHITING taking the 1st and 2nd prizes respectively.—*Lady Henrick*: Only five dishes were staged. Mr. G. LOCK won the 1st and Mr. T. H. BOLTON, Powderham Castle, the 2nd prize.—*Lane's Prince Albert*: This variety is certainly one of the most popular Apples, and the class brought no fewer than 20 dishes, all of superb samples. Mr. TURTON won with very handsome fruits, and Mr. CALDICK was 2nd.—*Lord Derby*: Amongst 15 dishes the 1st prize was won by a new exhibitor, Mr. DENNIS BEST, of Worcester, for wonderful fruits; 2nd Mr. TURTON, also with grand samples.—*Mere de Monage*, with its high colouring, was also very finely shown. Mr. G. LOCK was given the 1st prize for gigantic fruits, but he was closely followed by Mr. TURTON.—*Newton Wonder*: Messrs. J. R. Pearson & Sons offered prizes for this fine Apple, both to northern and southern growers. In the northern section six dishes were seen, Mr. CARLISLE having the best fruits from Bedfordshire; 2nd, Col. ARCHER HOUBLON; 3rd, Marquis of NORTHAMPTON, Castle Ashby (gr. Mr. A. R. Searle). In the southern section 13 dishes were shown, Mr. W. BARNES being 1st, Mr. TURTON 2nd, and Mr. BOND 3rd, all with beautiful samples.—*Pearl of Devon*: This large, soft, show Apple brought no fewer than 16 dishes, all large, some exceptionally so. Huge samples from Mr. CARLISLE had begun to split beneath, but they were placed 1st. Mr. BOND's samples, which won the 2nd prize, were firmer.—*Pott's Seedling*: No more than five dishes were displayed, the variety being nearly over. F. W. PLAIT, Esq., Highgate (gr. Mr. C. Turner), was awarded the 1st prize; and Mr. CALDICK the 2nd.—*Royal Jubilee* was represented by six exhibits. Mr. LOCK had the finest examples, but we noticed in the afternoon that one fruit was quite soft; 2nd, Mr. PAGE.—*Sandringham*: The class for this variety brought seven dishes. The samples did not seem at all attractive. 1st, Mr. BARNES; 2nd, Mr. WHITING.—*Stirling Castle* found only six representatives. Mr. CALDICK's samples, put 1st, were exceptionally large; 2nd, Mr. TURTON, with fruits more in character with the variety.—*The Queen*: No fewer than 16 lots represented this prettily-marked but rather flat Apple. Mr. TURTON won, having very fine specimens; 2nd, Mr. BARNES.—*Tower of Glamis*: Among 13 competitors Mr. WESTON was placed 1st, and Mr. TURTON 2nd.—*Warner's King*: Of this popular Apple there were 13 dishes. Here Mr. DENNIS BEST was again 1st with huge yellow fruits, Mr. LOCK being 2nd.—*Any other variety*: This class was represented by 17 dishes, a very miscellaneous lot, but including many very fine fruits. Here Mr. CHARLES ROSS was placed 1st with his splendid new conical late variety, Encore, a glorified Prince Albert; J. P. HARRISON, Esq., Nutfield, Surrey (gr. Mr. Herbert), was 2nd with Chestnut Wonder.

PEARS.

CHOICE DESSERT VARIETIES.

Beurré Alexander Lucas: There were three very even samples of this variety shown, and the judges awarded the 1st prize in favour of J. B. WINGFIELD DIGBY, Esq., Sherborne (gr. Mr. T. Turton); 2nd, Mr. R. M. WHITING.—*Beurré d'Amaluz*: The fruits were quite rotten, therefore no prizes were given.—*Beurré Bosc*: The 1st prize was given to the largest fruits, shown by Sir C. HAMILTON, Harley Park, Sandy (gr. Mr. W. Birkinshaw); 2nd, Capt. FARWELL, Burnham, Bucks. (gr. Mr. W. Hutt), for excellent

pretty fruits.—*Beurré Dumont*: Not much difference was seen in the only two exhibits of this variety displayed. The prizes were given in the following order: 1st, Dowager Lady HILLINGDON, Sevenoaks (gr. Mr. J. Shelton); 2nd, Lord HILLINGDON, Cuxbridge (gr. Mr. A. R. Allan).—*Beurré Hardy*: There were four exhibits of this early Pear, and they were all very mature save one, which was evidently of the Beurré Diel variety. The judges made the 1st prize in favour of Col. ARCHER HOUBLON (gr. Mr. Thos. Ross), and gave the 2nd prize to Rev. H. BULL, Westgate (gr. Mr. F. King).—*Beurré Superfin*: Of the four exhibits, three were very close in point of merit, but those shown by Dowager Lady HILLINGDON (gr. Mr. J. Shelton) were slightly superior, and were given the 1st prize, those shown by Mrs. FORD, Parkside, Ravenscourt Park, W. (gr. Mr. W. F. Blachitt), being awarded the 2nd.—*Chas. Ernest*: The 1st prize was won by F. J. B. WINGFIELD DIGBY, Esq., Sherborne (gr. Mr. Turton); 2nd, Mr. R. M. WHITING, Hereford.—*Comte de Lamy*: There were three dishes of this small variety, and the largest fruits, shown by Dowager Lady HILLINGDON (gr. Mr. J. Shelton), were given the 1st prize; 2nd, J. C. CHARLESWORTH, Esq., Nutfield (gr. Mr. T. W. Herbert).—*Conference*: Amongst four competitors, Major PETRE (gr. Mr. Davison) won easily; 2nd, A. P. BRANDT, Esq., Bletchingley Castle, Surrey (gr. Mr. J. W. Barks).—*Doyenné du Comice*: This excellent Pear was shown by nine exhibitors, and generally the fruits were inferior to those seen in some former years. The 1st prize went to a large sample, but they were deficient in that reddish, mellow colouring so much admired. The exhibitor was F. B. WINGFIELD DIGBY, Esq. (gr. Mr. Turton); 2nd, Col. ARCHER HOUBLON (gr. Mr. C. ROSS).—*Durondeau*: This is a very brightly-coloured Pear, and a fine sample shown by Major PETRE (gr. Mr. Davison) was given the premier prize; 2nd, F. J. B. WINGFIELD DIGBY, Esq. (gr. Mr. Turton).—*Emile D'Hayat*: There were five exhibits, and the ripier fruits won the 1st prize for Mrs. FORD, Ravenscourt Park, W. (gr. Mr. F. Blachitt); 2nd, Col. the Hon. HARRIBOND, Norwich (gr. Mr. W. Allan).—*Gen. Harbord*: This well-known variety was shown by seven growers, but it is scarcely in season, and it was not surprising to see large green fruits in the 1st prize exhibit, shown by Major PETRE (gr. Mr. G. Davison); 2nd, Capt. FARWELL, Burnham, Bucks. (gr. Mr. W. Hutt).—*Joséphine de Malines*: There were no fewer than 13 exhibits. F. J. B. WINGFIELD DIGBY, Esq., won the 1st prize, and he was followed by F. R. RODD, Esq., Frebartha Hall, Launceston (gr. Mr. F. Billings).—*Le Lecter*: A big green Pear, best shown among the low exhibitors, was by Lord HOWARD DE WALDEN, Saffron Walden (gr. Mr. Vert); 2nd, Lord FOLEY, Ruxley Lodge, Claygate (gr. Mr. H. Gardener).—*Louise Bonne of Jersey*: We only noticed two dishes of this excellent Pear, and both were pleasingly coloured. The 1st prize was won by W. E. DRAX, Esq. *Marie Benoit*: There were only two dishes of this variety, and B. H. HILL, Esq., Crediton (gr. Mr. G. Lock), won easily.—*Martie Louise*: This variety was displayed by seven competitors, and all appeared mature. Much the largest fruit was the 1st prize, for Col. the Hon. HARRIBOND; 2nd, F. E. CROFT, Esq., Stanstead Abbots, Ware (gr. Mr. G. Longhurst).—*Nouvelle Fautie*: Among eight contestants, F. J. B. WINGFIELD DIGBY, Esq., won the 1st prize. *Pitman's Duchess*: This is always an interesting class, as the large fruits attract much attention. There were nine exhibits, and the biggest, but not the best-finished, fruits won the 1st prize. These were shown by Major PETRE (gr. Mr. Davison); 2nd, Rev. H. BULL.—*President Sarah*: Col. the Hon. HARRIBOND won the 1st prize in a condition with two other growers. *Sir Luke*: Only one exhibit of this brown, russet Pear was seen. It was from the gardens of J. B. FORBESQUE, Esq., and secured the 1st prize.—*Thompson's*: There was not a good dish of this excellent Pear amongst the four staged.—*Triomphe de Vienne*: Only one dish, and that worthy only of the 2nd prize, was shown.—*Winter Nellis*: This very fine, although small, Pear was shown by five exhibitors. The best were from the gardens of B. H. HILL, Esq., Crediton (gr. Mr. Lock); 2nd, J. B. WINGFIELD DIGBY, Esq. *Any other variety*: No more than six competitors, and the 1st prize went to the small Seckle variety, the 2nd to Gratoli de Jersey.

Platanus, July, 1909.

CATALPA BIGNONIOIDES FRUITING AT WESTONERT, THE RESIDENCE OF
LT.-COL. HOLFORD, C.I.E., C.N.O.

ORCHIDS AT FAIRLAWN, PUTNEY.

THE collection of Orchids in the gardens of H. S. Goodson, Esq., at Fairlawn, West Hill, Putney (gr. Mr. G. E. Day), has rapidly increased in importance, partly in consequence of the large number of remarkable varieties which have bloomed in it, but more especially by reason of the fine condition of the plants. This is all the more noteworthy as the collection is situated in the London district with all its attendant adverse conditions. Hybrid Cattleyas, Laeli-Cattleyas, Brasso-Cattleyas, and fine varieties of important species share with the Odontoglossums the position of favourites at Fairlawn, and the collection may be said to be principally composed of them. Two large span-roofed houses are filled with a fine collection of Hybrid Cattleyas and Laelias, and among them are several very handsome hybrids in bloom, notably the beautiful Cattleya Fabii Goodsonii, which received a First-Class Certificate in 1906 and now bears two spikes each having four handsome and fragrant flowers. C. Alicia (labiata x Iris), also a certificated plant, with three flowers of fine colour, Cattleya Venus, Laelio-Cattleya St. Gothard, and Odontodia x Charlesworthii Goodson's variety, all recently distinguished by First-Class Certificates, are thriving well, the last-mentioned plant, which has been in flower for about three months, is still showing its reddish-scarlet flowers on the cut spike which was removed from the plant after it had been exhibited. The roof of each

house is made to accommodate a large number of suspended plants, this being the most favourable position for the best things. Mr. Day attributes the improvement and condition of all the plants to the fact that, whereas formerly he used the sprayer more frequently and kept the plants much drier at the roots, he now sprays but gives a thorough watering to all such plants as Cattleya and Laelia and their hybrids when water is needed at the root, allowing the plants to get tolerably dry before again watering them. This method is far preferable to giving a little water at the root at short intervals, which usually results in the compost in some of the pots becoming sodden, while in others it has not been made sufficiently wet.

In the first house, among innumerable special Orchids noted were the handsome Brasso-Catt. Laelia Veitchii, certificated in April, 1907, which has doubled in size but not bloomed since; two good specimens of the white Brasso-Cattleya Queen Alexandra, together with a large number of other Brasso-Cattleyas and Brasso-Laelias, including B.-L. Digbyano-purpurata, King Edward VII., and Laelio-Cattleya Golden Oriole Goodson's variety, the richest in colour of this fine hybrid. A fine batch of Cattleya Portia with many in flower showed the great variation in a batch of seedlings, some resembling closely C. labiata, while a few have the many-flowered inflorescence of smaller blooms like C. Bowringiana. Cattleya Warscewiczii has a few in bloom, one flowering for the first time having pearly-white sepals and petals, as in the variety Frau Melanie Beyrodt.

Miltonia vexillaria, M. Bleuana, M. Roezlii, and M. Thalenopsis, of which there are some fine masses, thrive well on the shady side of this house. M. Bleuana "Our Queen" has a strong spike, and, late though it is, a few plants of M. vexillaria are in bloom, one specimen bearing four large spikes. M. spectabilis Moreliana, M. Regnellii, and some hybrid Miltonias are also in flower. On one side is a batch of showy Cypripediums, those in bloom being C. insigne varieties, including the yellow C. i. Sanderæ; C. i. Harfield Hall and a promising hybrid of C. Beekmannii in bud.

The adjoining house with similar large span-roof also contains a fine collection of hybrids and a number of albinos of imported species, the white forms of Cattleya intermedia being represented by scores of good specimens. Overhead are suspended white forms of Cattleya Mossie and other rare kinds, including the remarkable parti-coloured white and rose C. Mossie Mrs. A. Goodson. C. Iris, C. Adula, and other hybrids of C. bicolor have made a fine show, a few still remaining in good condition.

Propagation by division of the rhizomes, as originally advocated in the *Gardeners' Chronicle*, is carried out with great success, and duplicates of many rare and beautiful plants have been secured in this way, while, where it has not been desired to make separate plants of the divisions, the severance of the rhizomes by increasing the number of leads has greatly added to the flowering capacity of some of the specimens. A remarkable instance of the advantages of cutting off the back pseudobulbs is seen in the case of a plant of a fine form of Cattleya Gaskelliana alba made from

a couple of apparently useless back pseudobulbs from the original plant. They were removed because they were detrimental to the old specimen, but, having not a sign of an "eye" or growth bud, they were not expected to grow. Nevertheless, they were potted and suspended, and in due time a growth proceeded from the upper side of the rhizome in quite a different position to normal growth, and a healthy young plant is the result.

The large Odontoglossum house contains on the centre stage a wealth of hybrid Odontoglossums and blotched varieties of O. crispum. A few are in bloom, and in the study the walls are hung with paintings of all the best things, together with the Royal Horticultural Society's award cards. Here are portraits of O. crispum Lily Bourdas, which has improved every time it has flowered; O. crispum The Rajah, O. crispum H. S. Goodson, and other handsome blotched O. crispums; O. ardentissimum Herbert Goodson (First-Class Certificate last year), O. cœruleum King of England, Mr. Goodson's fine exhibit which was shown at Holland House this year, and numerous others, the beauty of which explains why these Odontoglossums are prized by lovers of beautiful flowers.

Until recently the Odontoglossum house had no means of artificial heat, and even at present it is kept very cool and the plants, one and all, are in grand condition. In this cool house are also suspended a fine lot of Pleione lagenaria, a quantity of Oncidium cucullatum, some bearing their rose and purple flowers; Cochlioda Noezliana and some of its hybrids. Oncidium macranthum, some of the best Cymbidium, including varieties of C. eburneum, the best being the unique C. eburneum Goodsonianum, are also flourishing. They were formerly in a warmer house, but have improved in vigour since their removal to colder quarters.

The older houses contain a collection of Dendrobiums, a varied lot of Cypripediums, some of which are in flower, besides many other interesting and uncommon plants.

The glasshouses attached to the dwelling-house are also used as Orchid houses, the central one being for plants in flower, the present show being of Cattleya labiata, C. Warscewiczii, C. Portia, C. Mrs. J. W. Whiteley, Odontoglossum crispum, Lycaste Skinneri and its white variety; Laelio-Cattleya blancheyensis, and various Cypripediums arranged with Ferns and foliage plants. J. O'B.

HOYA CARNOSA.

THE Asclepiadaceæ, to which the genus Hoya belongs, is characterised by a remarkably uniform structure of fruit and seed, standing in these respects in marked contrast to the Apocynaceæ, the only order with which it shows a very strong affinity. Our illustration (fig. 120) depicts the long, pod-like follicles, which on dehiscence emit the characteristic seeds, each surmounted with a tuft of hairs which enables the dispersion to be effectively accomplished by wind. Many of the Asclepiads possess hairs of this nature that are of a beautiful, silky appearance, but, unfortunately, they are brittle, and in other ways unsuitable for textile purposes. The common milk-weed of America, Asclepias Coraniti, has seeds with glistening white hairs, and attempts have been made to utilise them for weaving, but, we believe, without success, owing to their lack of toughness.

THE ROSARY.

NOTES UPON NEW VARIETIES.

(Continued from page 298).

J. B. CLARK (H.T., Hugh Dickson, 1905).—Much disappointment has been caused by growing this much talked-of Rose in the wrong way, i.e., by over-pruning it. It should be grown as a pillar Rose, or against a fence; and when by a little pinching the top growth, you get it to throw out laterals all the way up the stem, these give the most beautiful fine-petaled flowers. It is a sort that when established will stand heavy manuring; then it yields the best colour, though I have never succeeded in quite getting any of the heavily-shaded blackish-crimson the raiser says it ought to develop. A bowl of it arranged with Frau Karl Druschki makes a wonderful contrast.

AVOCA (H.T., Alex. Dickson & Sons, 1907).—This, I believe, is a real acquisition, but expect to be able to report very much more favourably of it next year, as I think there is no doubt that it is essentially a Rose that wants to be thoroughly established before it repays one. It makes a very large bush as an established cut-back, but it is no good as a maiden. Nearly all Roses have their season, and I should say that this is a cool season sort. I have only two plants of it, but hope for the best from them next year. It has very handsome, large, dark green foliage, and the flowers are crimson-scarlet and very fragrant. The buds are long and pointed.

REINE MARGUERITE D'ITALIE (H.T., Souper et Nolting, 1905).—This is a capital Rose for bedding. It certainly is one of the most floriferous sorts I know. It makes a nice bushy growth and has pretty foliage. The blooms are only of medium size with me, but they are of beautiful form and full. Colour, bright carmine-red with a vermilion centre.

GENERAL MACARTHUR (H.T., Hill, 1906).—Just one more red variety before we leave that colour, and though I mention it last it is a grand novelty. Were a whole bed of this planted down in a valley one could easily identify it from the top of a hill. "Free" or even "floriferous" are words that quite fail to describe the great quantity of blooms. Cut a branch or two of it, and you at once have the most gorgeous decoration for the house. The raiser describes the colour as bright crimson. Well, put a big accent on the "bright" and you've got its colour. It is simply intense. The flowers are of no particular shape or style, but they are highly perfumed. The foliage is the most beautiful of any new introduction, if not of any Rose known. I have seen it surrounded by mildew and yet perfectly clean itself. It is a glorious decorative garden sort. Leonard Petrie, Gayton, Cheltenham.

(To be continued.)

CULTURAL HINTS FOR NOVEMBER.

The hot weather experienced during September and the first half of October put a temporary check to planting operations. At the time of writing we are waiting for a downpour of rain, it being necessary that the soil should be moistened some considerable distance below the surface before the work is again taken up. It will be found that the land which has been properly trenched and manured will allow the rains to pass very readily into it. In some districts there has been plenty of rain, and in such cases the work can be continued and all standard and half-standard briars planted without delay. It may be necessary again to emphasise the fact that careful selections should be made of these briars, rejecting any that are of a green and sappy nature as these are usually suckers one year old only, and, therefore, insufficiently mature for the purpose for which they are wanted. Any that are black and

hidebound should also be rejected. A stiff loam answers best for all briar stocks. After planting, put a good mulch of half-rotted manure over the surface of the ground. The planting of standard briars may be followed by the seedling briar Manetti and Multiflora stocks, planting these two latter types firmly up to half their depths, and the seedling briars right up to the collar of the plant. Allow from 2 to 3 feet space between the rows, and put the stocks at distances of 9 inches from each other. These stocks are intended for budding next summer, and their treatment must not be confused with that of cuttings, which should be as follows.—

The briar cuttings can be procured from the hedgerows; the Manetti and Multiflora cuttings are usually procured from stools several years old, which furnish an abundance of growth

small quantity of seed be sown annually, a successive supply of stocks will be forthcoming.

All Rose trees and bushes should be carefully examined before they are planted, and any thick growths or suckers proceeding from the roots should be removed. Some burnt earth, decayed manure and river sand should be added to the soil which is placed about the roots, in order to encourage their growth. Be careful not to plant them more deeply than they were inserted previously, as deep planting must be avoided. In the case of standards, they should be fixed to a stake as soon as they are put into the ground, and all newly-planted Roses should have their roots top-dressed with a mulch of manure.

The early flowering pot Roses which have been recently placed indoors may be kept growing very slowly, but do not raise the temperature of the house during the day beyond 50°, and a little top ventilation may be allowed at this heat. On bright days damp the surfaces in the house and close the ventilators early. At the end of the month a few more plants can be lightly pruned and placed in gentle warmth. Roses planted out in borders under glass will now be starting into growth, especially the tea-scented varieties at the warmer end of the house. The temperature must not be allowed to rise more than 50° at present, unless it be for the purpose of prevent-

FIG. 130.—FOLLICLES OF HOYA CARNOSEA EMITTING THE SEEDS. (For text see p. 305.)

every year. It is best to choose good, firm wood without any pithy growth, and cut them into lengths of 9 inches, making the cut immediately under a node or point of leaf axil. In preparing cuttings of any of these stocks all the buds or eyes on the portion that will be inserted below the ground level must be cut out, leaving three or four at the top, which will be above the ground surface. It is a good plan to plant them in 4-foot beds, allowing 1 foot between each row and a few inches between each cutting in the row. Mark the beds out with a line and make a sloping trench 10 inches deep. Put some river sand or grit at the base and place the cuttings against it, afterwards filling in the trench and making the ground firm by treading. The soil taken out of the first trench can be wheeled to the far end of the bed to be used for filling up and levelling the last trench.

Briar seedlings are raised from the "hips" found on the hedgerows during autumn. They are laid in a heap and mixed with sand or fine ashes during winter; this causes the outer husk to decay. After the seeds have been separated and cleaned, they may be sown in drills in March on previously prepared ground. They will not be fit for budding until several years afterwards, but the quantity of stocks thus obtainable from a small piece of ground amply repays for occupying the ground so long. If a

ing excessive dampness, which may be dispelled by a free circulation of air.

The flowers and buds on the pot Roses plunged under glass out-of-doors may show signs of damping. These plants should be removed to a light, dry, and cool house, placing them on a stage covered with ashes, where they may finish their flowering. Any that are doing very well may remain out another month if the lights are opened at the top as well as at the sides during favourable weather.

The middle of November is a good time for the grafting of dormant Roses under glass, provided Manetti and briar stocks have been well established in 3-inch pots and cultivated out-of-doors during the summer for this purpose.

It is always best to use established stocks for what is known as dormant grafting. The best position for the graft is under glass frames in a light house on slate benches covered with fine ashes, the whole being placed immediately over two rows of 4-inch hot-water pipes. The frames can be 18 inches high at the back and 15 inches at the front. The stocks may be brought into the house a week or so before grafting is commenced, as, being well established, they will easily be excited into growth, and it is better to have the stock a little in advance of the scion. The stock and scion should be as nearly as possible of equal size and strength. Make a sloping cut in each, bring the two faces together, and carefully tie them with soft bast or raffia, afterwards putting a little grafting wax around the graft. I have found "L'homme le fort," a French preparation, to answer best for the purpose. A temperature of 50° will be sufficient at the commencement. Keep the frames closed for one week after the grafting is done, but admit a little air for a few hours each day when that period is passed. As the plant begins to callus at the union and there are signs of growth, which will be after the second week, more heat and air can be given, and later, when an inch or more of top growth has been made, they may be moved from the frame into the house, putting them well up to the light. When these grafted stocks have been taken out of the frames, other stocks can take their place to be treated in the same manner as I have described. Careful watering is an absolute necessity in all stages of growth of these plants. An occasional vapouring for green fly may be necessary, and it should be carried out at the time when the plants are dry. J. D. G., *Southsea*.

NURSERY NOTES.

W. H. ROGERS & SON, LTD., SOUTHAMPTON.

This old-established nursery is situated just outside the town of Southampton, at Bassett, near to where the famous avenue that was described in our issue for September 12 terminates. The business was established by Mr. William Rogers in the early part of the 19th century. At his death in 1856, Mr. W. H. Rogers succeeded to the business, and carried it on until 1898, when it was acquired by a limited liability company (W. H. Rogers & Son, Ltd.), in whose hands it is at present. Mr. W. H. Rogers was a person of some prominence in the town of Southampton, serving for many years on the Town Council; he was Sheriff in 1875 and Mayor in 1879. He presented many trees and shrubs for planting in the public parks. The present joint managers for the company are Messrs. C. J. Porter and George Verdon—both of whom have been in the service of the company ever since its commencement in 1858. The visitor from Southampton can ride to within 20 minutes' walk of the nursery by tram, but the walk along the avenue and past the beautiful common is most enjoyable, especially on a summer's day, such as that in July when our visit of inspection was made. The nursery itself is in a most picturesque spot, and most of it occupies the side of a hill facing south and west, sheltered from the east by a wood, and enclosed all round by tall hedges and belts of trees. The nursery contains many rare and interesting shrubs and trees, and the firm specialises in Rhododendrons, hardy trees and shrubs, and fruit trees. Many Roses also are cultivated. In one quarter we saw growing about 20,000 Rose bushes, of which about 9,000 were standards. A cursory view of the soil gave us the impression that it was calcareous, and we wondered how Rhododendrons and other American plants appeared so flourishing; but we were informed that no lime, or very little,

was present. The soil, however, contains much iron, and *Hydrangea hortensis* develops beautiful blue coloured flowers. This, however, may be due in a large measure to the specially genial climate of the district. Generally the winters are mild, and the season early; but last winter was one that will long be remembered, for on April 24 several inches of snow fell in three hours. It commenced at 6.30 in the morning, and the worst was over by about 9.30; but during that time enough fell to break large shoots and branches, the effects of which were apparent everywhere at the time of our visit in July. Big Rhododendrons were snapped off, and coniferous trees broken or uprooted by the weight of the snow, which was caught on the branches, where it continued to accumulate. Some of the Rhododendrons have reached a great size, one specimen of *R. arboreum*—a white-flowered variety—is 18 feet high and as far through. Near by this we noticed some big specimens of *Magnolia conspicua*. Other fine trees are of *Cunninghamia sinensis*, *Araucaria imbricata*, *Sequoia gigantea*, and several beautiful Weeping and Copper Beeches. Hardy Ericas grow with especial freedom, which is not to be wondered at, for all around the district, on the common and in numerous waste places and woods, the ground is carpeted with Heather. In the nursery we noticed many varieties of *E. vulgaris*, including *E. v. rigida*. *Azalea mollis* is represented by about 8,000 plants, and amongst other Ericaceous plants which are grown in numbers are *Andromeda floribunda*, *Arbutus* in variety, *Pernettyas*, as well as *Berberis* and other shrubs. As stated Rhododendrons constitute a speciality of this nursery, the firm having a large business with American houses. We saw one breadth containing 10,000 plants, recently worked, and another batch of more than 10,000 three-year-old plants. There are quarters containing these plants in all sizes, most hardy species and varieties being represented in the collection. Conifers are raised in great numbers. *Pinus insignis* is largely cultivated, as it succeeds well in the district. *Thuja Lobbi* is also grown in very large numbers, as it is in great demand for forming hedges, for which it is well suited, and plants 12 feet in height can be shifted with perfect success. *Pinus Laricio*—the Corsican Pine—was seen in numbers, also *Thuja gigantea*, *Cupressus Lawsoniana*, *Abies Morinda*, *Cupressus nootkatensis*, and many other cone-bearing trees.

The stock of fruit trees is very extensive, Apples, Pears, Peaches, Plums, Cherries, and other hardy fruits being grown in large numbers. The soil of the district especially suits the Apple, as it is a good loam on clay, the loam being 3 feet in depth before the clay is reached. We noticed some splendid little specimens of Apple trees only two years from the graft, with fruit spurs already formed and bearing. The variety Bassett Beauty was raised in these nurseries: it is somewhat like Stirling Castle, and a very heavy cropper, the fruits keeping well until Christmas. New Hawthorned, Lord Grosvenor, Cox's Orange Pippin, Beauty of Bath, and Bismarck, are other favourite kinds grown here. The John Downie Crab is also cultivated extensively, the plants being in demand for ornamental purposes, and the fruits are excellent for making jelly. We noticed one plantation with 4,000 trees of Apples. Near one of the paths is a silver form of *Quercus Cerris*. The Gurnsey Elm is in demand for seaside planting, as it withstands strong winds. We noticed a considerable area planted with *Arbutus Uuedo*. There is a fine stock of *Ilex crenata* also *Olearia Hastii* in plenty. A large plant of *Magnolia purpurea* is used for inarching choicer kinds. There are some very fine specimens of *Desfontainia spinosa*, which flowers freely here in the open. The stock plants are about 30 years old; but we were informed that there were formerly much larger plants, probably the finest specimens in the

country. *Pernettya mucronata* forms hedges in part of this nursery, and there are long rows of *Skimmia fragrantissima*. In one of the dells is a fine specimen of *Sequoia sempervirens*, about 70 feet high. There is a very peculiar tree of *Abies monstrosa*; but probably the gem of all is a magnificent plant of *Hedera*, the Himalayan Holly. It forms a tree of spreading habit, and, at the time of our visit, was crowded with its fruits still green. We have enumerated a few only of the many plants which this interesting nursery contains, but there are Roses and hardy perennial plants in abundance, and also the usual stock of a nursery firm that has a considerable local trade. When the Rhododendrons are in flower the nurseries are thrown open to the public, and the date is always looked forward to by the Southampton public. There is a wood which belongs to the nursery containing many interesting trees, including some very large Rhododendrons. In one spot is a clearance, and this is in great demand for garden parties. The house, formerly occupied by Mr. Rogers, who founded the nurseries, is now let, but about it the grounds are most enchanting. There is a remarkable plant of *Sciadopitys verticillata*, which has reached the fruiting stage, there being several cones on it when we saw it. One giant Rhododendron was especially noticeable. It is about the oldest Rhododendron on the place, and it is known as Early Scarlet. There are several handsome specimens of *Trachycarpus Fortunei*, which is a perfectly hardy Palm here.

PLANT NOTES.

IXORAS.

Of the numerous flowering shrubs that require the temperature of a stove for their successful culture a foremost place must be assigned the *Ixoras*, whose period of blooming extends throughout the summer and often into the autumn months.

In the days when specimen stove and greenhouse plants were largely grown and appeared at every horticultural show, *Ixoras* were extremely popular for the purpose, but with the decline in favour of this branch of plant culture they rapidly dropped out of cultivation. Within the last few years, however, there are signs of a revival in their favour, not in the shape of large bushes as of old, but as neat little flowering specimens in pots from 5 to 8 inches in diameter.

That there is a demand for them is evident by the fact that very attractive groups of the best forms are often exhibited by Messrs. H. B. May & Sons, of Edmonton, from which one cannot fail to infer that such results must warrant their extended culture.

From my point of view, *Ixoras* have much to recommend them as decorative plants, for they are neat in growth and form. Even when out of bloom they form effective evergreens, while with reasonable care in their culture they can be depended upon to flower well. *Ixoras* can be readily struck from cuttings of the half-ripened shoots taken during the late spring and early summer months. Shoots of medium vigour rather than the very stout ones form the most desirable cuttings. For their reception clean well-drained pots, 4 to 5 inches in diameter, should be filled with a mixture of equal parts of peat and silver sand, pressed down firmly. Into this the cuttings must be dibbled around the side of the pot, taking care that the compost is closed securely around the base of each cutting.

Then, when a thorough watering has been given in order to settle the cuttings in their place, the pots may be plunged in a close propagating case in the stove, and if there is a

gentle bottom heat so much the better. Under such conditions they quickly root, and when this happens they may be innued to the ordinary atmosphere of the stove. As soon as possible after this stage the cuttings should be potted off, using for this purpose a mixture of one part good yellow loam to two parts of peat and about half a part of silver sand. For later pottings equal parts of loam and peat may be employed.

The treatment ordinarily given to stove plants will suit *Ixoras* well, for though they have the reputation of being rather subject to the attacks of insect pests, such is not my experience. If the atmosphere is too dry thrips are liable to attack the foliage, but they can be kept under by a liberal use of the syringe. The first signs of scale must be quickly cleared off, while mealy bug can be kept under without difficulty. A good plan is to keep a bottle

of methylated spirit with a small brush handy, as a drop of the spirit will wet the obnoxious woolly substance and destroy the bug without injuring the foliage in any way. When the *Ixoras* are in sufficiently large pots annual re-potting is by no means necessary, but the plants are then greatly benefited by an occasional dose of weak liquid manure mixed with soot water.

The *New Zealand List* mentions ten species of *Ixora*, not all of which are worthy of general cultivation, but in addition to these there is an almost endless list of garden varieties; many of them, however, resemble each other very closely. A selection of a few of the best would include *Ixora coccinea*, one of the oldest of the original species with orange-red flowers. Many of those bearing varietal names are but mere forms of this, but there is one recognised variety which is totally distinct from all other *Ixoras*. I allude to *Ixora coccinea lutea*, which was sent to Kew from India a few years since, and though occasionally to be seen now, it is still very scarce. The flowers are of a clear soft yellow.

A very distinct species both in flower and habit is the stately *Ixora macrothyrsa*, formerly known as *I. Duffii*. This is of strong growth and forms an upright sparsely-branched specimen, with leaves nearly a foot in length and of a particularly deep green colour. The rich crimson coloured flowers are borne in closely-packed terminal heads, considerably more than a foot in diameter. It cannot be grown into a neat bushy plant, but is very effective when carrying three shoots, each about 4 feet in height and terminated by a cluster of its magnificent blossoms.

Beside these a few of the best garden varieties are *Colei* (white), *Fraseri* (salmon, tinged carmine), *Prince of Orange* (very bright orange), *Pultrini* (orange-scarlet, shaded crimson), *sanguinea* (bright crimson, shaded violet), *Westii* (pale rose, deepening in colour after expansion), and *Williamsii* (reddish salmon). W.

LAVATERA TRIMESTRIS.

In the multitude of newer hardy annuals there seems a risk of this beautiful plant being overlooked. Like most of the Malvaceae family, it does not require a rich soil; in fact, generous treatment leads to the production of gross foliage at the expense of the flowers. The rose-coloured variety is most valuable for supplying cut flowers, and is especially suitable for filling large vases. In a cut state it lasts for a considerable period, as the flowers open readily in water, but those opening later gradually lose some of their bright colour. A large, solitary flower-bed in these gardens, composed of rose-coloured *Lavatera trimestris*, planted at intervals of 3 feet, with a groundwork of *Godetia Double Rose*, and bordered with rose-coloured *Begonia semperflorens*, has gained much notice. Except that the flowers seem to lack something of the substance of the rose-coloured ones, the white variety is also very desirable. For supplying early flowers, seeds should be sown in the open at the present time; while spring-sown plants will yield a good supply of flowers throughout the late summer and autumn months. A. C. Bartlett, *Penarth Gardens*.

NEW ASTER NOVI BELGII "CLIMAX."

This variety is a seedling raised at Aldenham House Gardens, and it flowered for the first time last year. It is a rather tall and erect grower, and produces very freely fine spikes of very large, beautiful, pale blue flowers. The plants come into full flower at about the middle of October, and the variety is very effective when planted at the back of a wide border or in the shrubberies. The flowers are much larger than any known to me of this type. The leaves also are very large. *Edwin Bickett*.

FIG. 131.—ASTER NOVI BELGII "CLIMAX."

* PRONUNCIATION OF PLANT

NAMES.

PRONUNCIATION.—In the first word in each line the accent (') is short; (ˈ) is long.

In the second word vowels are to be pronounced as—

arise, ät, äge, art, air, äll end, ägg, äat, ärr, äwe in, ät, äe, äir
 on, ötter, öwe, öf, dö, öwl, öll us, ötter, öse, örn
 "ch," as in chin; "th," as in thin
 "s," as in soft; "f," as in far
 "g" as in go.

All other letters are unmistakable.

(To be continued.)

The Week's Work.

THE FLOWER GARDEN.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Berks.

Pampas Grass.—At this season few plants produce so fine an effect in the pleasure grounds as that afforded by the Pampas Grass. It is a plant requiring much moisture during the summer, and it never appears better than when cultivated by the water side. Considerable variation may be noticed in the plumes and habits of the plants, but the varieties are all commendable. Planting should be done in the spring, when growth is about to commence, but the ground may be prepared at the present time with advantage. If poor, it should be removed to the depth of 2 feet, replacing it with light, but rich loam. The plants may be expected to grow rapidly, making fine clumps in the first season. Fresh stock is easily obtainable by division of the roots at the time of planting, and following this process a liberal mulch should be afforded and a thorough watering. Protection from frost is necessary if the temperature falls below 12° F.

Dahlia.—I have never seen Cactus Dahlias more effective than they are at the time of writing, but such a display can only be produced by varieties that carry their flowers on erect stems sufficiently long to be well above the foliage. As soon as the growths have been cut down by frost the tubers should be lifted, leaving about 6 inches of the old stem attached to the tubers, and affixing thereto a label denoting the name and the colour of the variety. They should be stored away in a dry, but cool place, where frost is excluded. Examine them occasionally during winter, and remove any decayed portions.

Spring bedding.—If advantage has been taken of the recent favourable weather for transplanting the plants used in spring bedding, the garden will now present a furnished and cheerful appearance. Encourage as much root action as possible amongst such plants as Polyanthus, Aubrietias, and Violas. We have found it necessary to apply waterings, which, of course, is not usual at this season. Some of the plants are already showing bloom, and if the weather remains open they will appear gay though the early winter months. When planting Polyanthus in distinct colours, Tulips to harmonise or contrast with them are also planted in distinct varieties at 1 foot apart; but if the Polyanthus are mixed, the Tulips are mixed also. Wallflowers are planted upon the same principle. Aubrietias are considered best suited for the rock-garden or for planting near to running water, but intermixed with Tulips they are also much admired, and Aubrietia purpurea with Tulip Murillo, and Aubrietia Leichtlinii with Tulip Cottage Maid look well. Silenes flower so late that they are excluded from the flower garden, and may be planted in conjunction with late-flowering Tulips in exposed situations in the pleasure ground. Alyssum saxatile compactum is a valuable hardy perennial for spring-bedding, producing bright-yellow flowers 6 inches high, and the variety Silver Queen, with flowers of the same height, but of the palest lemon colour, when intermixed with Tulip Prince of Austria is very attractive.

THE KITCHEN GARDEN.

By E. BUCKETT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Broccoli.—Any Broccoli which is "turning in" should be very closely watched, it being necessary to protect them from frost by covering the curds with leaves and by tying up closely together the outer leaves. Excepting in some of the most favourable counties, this vegetable is liable to suffer much injury during severe winters, and to prevent this, especially on heavy and low-lying lands, the whole of the crop should be layered early in November, laying the heads over with an incline to the north. If this work is carefully done, the plants will benefit from the operation rather than be injured thereby. The most tender part of the stem is that immediately near the head of the plant, being less matured than the rest; therefore plenty of soil should be planted over this part, breaking the soil up finely and treading it very firm. Under this treatment 90 per cent. of the crop may generally be expected to pass

through the winter safely, but on the approach of extra severe weather a little Bracken or Wheat straw may be placed over the crop as an extra protection.

Cauliflowers.—Very late plants of the Autumn: Giant type should be lifted with a good ball of earth attached to the roots, and planted fairly close together in unheated pits, frames, or in an orchard house, applying a good watering immediately after the planting has been done. During favourable weather admit all the air possible to the plants. Under this treatment good Cauliflowers may often be obtained until the middle of winter. Plants raised from the latest sowings for producing heads during next spring should be pricked out in unheated frames as near to the glass as possible. Earlier plants which were pricked out some little time ago must not be forced, but they should be encouraged to make sturdy growth by applying abundant ventilation whenever possible.

Spring Cabbage.—Examine the quarters planted with Spring Cabbage, and make good any gaps there may be in the rows by plants obtainable from the seed beds. Select a fine day and mould up the plants, placing the soil firmly about the stems right up to the leaves; this treatment will do much to ensure the plants passing through a severe winter without injury.

best caught at night. In order to maintain a regular supply of Mushrooms, fresh beds should be made up at intervals of four or five weeks.

Alterations.—Any alterations or extensions of the kitchen garden which have been contemplated during the past year may now be carried out, remembering that ground intended for vegetable culture must have ample drainage, whether natural or artificial, and the soil ought to be thoroughly trenched.

PLANTS UNDER GLASS.

By THOMAS LUNT, Gardener to A. STIRLING, Esq., Keir, Perthshire N.B.

Primula × Kewensis.—Plants of this hybrid should now be removed from the unheated frame to a cool, dry greenhouse, or the flowers will be liable to suffer from damp. This Primula makes very strong growth, and requires a rich soil and a pot of liberal size. Applications of liquid manure may be afforded all through the winter. If a number of plants are placed together in a group their bright yellow flowers are most effective.

Agathia celestis.—This plant should also be fed liberally with liquid manure and given similar conditions to those recommended for P. × Kewensis.

FIG. 132.—CYPRIPEDIUM CHARLESWORTHII BROMIOWIANUM, AWARDED A FIRST-CLASS CERTIFICATE AT THE R.H.S. MEETING ON OCTOBER 13, WHEN SHOWN BY H. J. BROMIOW, ESQ.; COLOUR PALE GREEN AND WHITE. (See ante p. 285.)

Any spare plants should be pricked off into skeleton frames or in some sheltered position, placing the plants at distances of 3 or 4 inches from each other. Such plants will be useful for making good any vacancies that may appear in the permanent beds in the spring.

Leeks.—Although this is probably one of the hardest vegetables, it will be wise to complete the blanching of the latest plants as soon as possible. If they are planted in trenches the soil should be banked up to the point at which the foliage commences. Any specimens that were blanched early may be lifted and stored under the shade of a wall in sand or ashes, leaving the foliage exposed to the weather.

Mushrooms.—Maintain the atmospheric temperature in the Mushroom house as evenly as possible, at about 55°, never allowing it to exceed 60°. Do not employ more fire heat than is necessary, nor allow the paths or walls to become dry. The surfaces in the house may be syringed twice each day with tepid water. Take every means to entrap slugs and woodlice, which can be

Bourbardia and Salvia.—These and other plants that were lifted from the open ground some time ago and potted up are now flowering freely. They require liquid manure, and should be kept in the warm greenhouse or conservatory.

Humex elegans.—This species has grown very freely during the recent mild weather, and the plants are ready to be potted into pots 8 or 9 inches in diameter. The roots grow all through the winter, and it is of the greatest importance to prevent them becoming pot-bound. A suitable compost for use at this potting is one consisting of turfy loam, leaf-mould, wood-ashes, and sand, with a few bones broken moderately small, which will supply all the manurial properties needed during winter. If the loam is inclined to be of a heavy nature, rather less of this material must be used, and more leaf-mould and wood-ashes, it being necessary that the compost should be exceedingly porous in order that it may be made moderately firm without rendering it a difficult medium for the roots. Care should be taken to see that the ball of

the plant is not put too low in the pot. The surface soil should not extend higher up the stem of the plant than it did at the previous potting, or decay may set in at the "collar." The greatest care must be exercised in watering plants that have been recently potted, more than ordinary discretion being required in respect to this species all through the winter. The pots will have become filled with roots by the spring, and the plants may then be fed liberally with liquid manure. The plants can be wintered safely in a cool, light, well-ventilated house, such as an early Peach house where the foliage of the Peach trees is undeveloped, there being generally just sufficient moisture in the house to prevent red spider. Should green fly appear upon the plants, fumigate the house at once, exercising extreme care, for if the operation is too severe the foliage will suffer injury, as they are very susceptible to tobacco smoke.

Roses in pots.—A number of plants should now be removed from an unheated frame to a structure in which the atmospheric temperature is about 50° or 55° at night, allowing these temperatures to rise a little during the day, but not to an extent that would be considered hard forcing, which would be very injurious to the plants at this stage. Fumigate the house on the first appearance of green fly, and if any mildew appears upon the leaves let them be dusted at once with flowers of sulphur.

Chrysanthemums.—Plants now in bloom should be neatly arranged according to their height and the colours of the flowers, in a house which is most suitable for making an impressive effect. Endeavour should be made to place each plant so that every large bloom may be perfectly seen from the path. Do not overcrowd the plants, and in bright weather take means to shade the flowers, as a little bright sunshine will soon cause the darker-coloured varieties to depreciate. Remove any florets that have dampened, and any leaves showing decay, as early as possible. Employ sufficient ventilation to cause a circulation of air, and maintain the atmosphere as dry as possible. Top and bottom ventilators should be opened to a slight degree during the night, and a little heat may be maintained in the water pipes. Watering operations must be severely confined to the earlier part of the day.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Director to Lt. Col. G. L. Hartoun, C.V.O., C.I.E., Westonbirt, Gloucestershire.

Lælia anceps.—No more useful winter flowering Orchid exists than this beautiful and well-known species. The flowering season embraces a period of several of the dullest and most cheerless months in the year. The flowers are produced after the plants have quite completed their season of growth; therefore the maintaining of a dry atmosphere, necessary to preserve the inflorescences, is not greatly harmful to the plants, such as is the case of an Orchid flowering and growing actively at the same time. The past season has been most favourable for the cultivation of *Lælia anceps*, and the plants have their flower-spikes well advanced, especially in this case with the coloured forms, which are always the first to expand their flowers. As the flowering stems develop, there is often a gummy exudation from their apices. This matter should be frequently removed with a wet sponge; otherwise the upper bracts will stick to the flower-buds and prevent the blossoms from properly opening. While the roots and shoots of these plants have been actively growing, a plentiful supply of moisture, both in the pots and in the atmosphere, will have been afforded. This amount of moisture should be gradually reduced, and after the pseudo-bulbs are properly matured very little water at the roots will be needed. The rooting material, however, must be kept sufficiently wet to enable the proper development of the flower-spikes. The plants are best accommodated in a structure having an intermediate temperature, they should be placed where they will receive an abundance of fresh air from open ventilators whenever the outside conditions permit.

Lælia autumnalis, L. Galdiana, L. albida, and their varieties.—Plants of these similar to the foregoing are developing their flower-spikes. Their requirements are very similar to those of *L. anceps*. After the flowering is over, and the growth of the pseudo-bulbs completed, afford the plants a long rest in a cool,

well-ventilated house. Any of these *Lælias* which have not strong pseudo-bulbs will be benefited by the removal of their flower-spikes.

Lælia harpophylla and L. Cowanii.—These are handsome spring-flowering species, from which the beautiful hybrids *L. C. Davis, L. Coronet, L. C. Ariel, L. Gwendine*, and many others have been derived. They are mostly winter and spring-flowering plants. Culturally their requirements are similar to those of *Cattleyas*. The plants are rapidly developing their growth, and the amount of moisture needed at the root is greater than at any other period. *L. Cowanii* and its hybrids prefer slightly warmer conditions than *L. harpophylla*. During the resting season these, in common with all other *Lælias* having thin pseudo-bulbs, should not be allowed to become excessively dry at the roots.

Lælia majalis.—Plants of this species, if treated since flowering as advised in a former Calendar, will now have completed their season of growth. The pseudo-bulbs having been fully matured afford the plants a long rest in a cool, airy house, where they are best suspended from the roof rafters exposed to full sunlight. Very little water will suffice during the resting season; enough only should be given to keep the pseudo-bulbs plump.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to The Downer Lodge, Newnham, Vinterbury, Yorkshire.

The planting of bush fruits.—In a recent Calendar I recommended that advantage should be taken of the fine weather for preparing the ground for planting these and other kinds of fruit. Seldom has there been a finer autumn for such work, and the heaviest soils have been sufficiently dry to be trodden without being pressed into a severely water-holding condition. Many planters have no doubt taken advantage of the favourable circumstances, but others who may not have had an opportunity to do so should press this work forward, remembering that trees planted now will give little or no trouble next season, and that any which may be planted later will sure to be less satisfactory. Although the trees still retain their foliage, the wood is well matured, and the trees being in the best condition for moving, the work can be better carried out than at a later date when the soil may be expected to be in a wet and cold condition. Any fairly exposed position, with deep, well-drained soil, is suitable for fruit trees; but a sheltered or even partly shaded position may be employed with good results. Good varieties of Red Currants include *Fay's Prolific, The Comet, and Ruby Case*. White Grape and Transparent are two good white-fruited varieties. The planting of Gooseberry and Black Currant bushes should be given attention next. Black Currants succeed well in a moist, shady position. Gooseberries and Red and White Currants should always be grown on clean, single stems, as there will then be less suckers. All of these bushes should be selected distances at least equal to 5 feet apart. Varieties of Gooseberries are very numerous, but some of the best for general use include *Crown Bob, Whinham's Industry, Whitesmith, and Keepsake*. *Boskoop Giant* is undoubtedly the best Black Currant, and although it is not proof against the mite, it appears to suffer less from an attack than other varieties.

Pruning.—The pruning of these bushes may be undertaken at once, especially in gardens where the ground is liable to become very wet, and consequently a condition when much treading would be injurious. If early pruning is carried out, care must be taken to provide the bushes with ample protection from birds, or they may destroy the buds which would be required for fruiting next season. If netting is not available for this purpose, the bushes must be protected by the well-known method of threading, there being several valuable threading apparatuses obtainable from the sundry men. By the use of such a number of meshes can be conveniently threaded in a short time. There are several methods of pruning Gooseberry bushes, but, in any case, it is necessary that the centre of each bush should be kept well thinned that light and air may freely circulate among the shoots, and that the hand may be conveniently passed through for the gathering of the fruits. Any shoots that are inclined to

hang towards the ground in such a manner that the fruits will become splashed should be removed. Dessert varieties, as a general rule, are best thinned a little more severely than culinary varieties. Red and White Currants should be kept to single stems by pruning the side shoots to three buds, and the leading shoots to 6 or 8 inches. All bush fruits, excepting Black Currants, should be kept perfectly free from suckers. Black Currants, however, produce the best fruits upon suckers, therefore they need only some of the old wood removing to make room for younger and more vigorous growths. If caterpillars have been troublesome, dust the bushes over with quicklime, and gather the leaves and prunings carefully and burn them. A little of the surface soil may also be taken away, replacing it with fresh soil, and applying a dressing of thoroughly decomposed manure if it is considered necessary, digging the manure lightly into the soil, but taking care not to damage the roots.

FRUITS UNDER GLASS.

By T. COOMBER, Gardener to Lord Llangatock, The Hendre, Monmouthshire.

Early-fruited vines in borders.—If ripe Grapes are required in May from permanently planted vines according to directions in a previous Calendar, the house should be closed early in November. It is not good practice to allow the roots of vines subjected to early forcing to extend into an outside border; but in cases where these conditions exist, that part of the border situated outside the house should at once be covered with a liberal coating of tree-leaves or dry litter, and further protected with glass sashes or something of that kind. If the soil of the inside borders is fairly moist, it will be better not to apply any water until the vines have made some amount of growth, for until that stage is reached there is very little root action; but, whether or not, a soil tester (see fig. 22 in the issue for January 18, 1908) should be used before determining whether water is needed. If water is supplied it should first be heated to a temperature of about 85°. The atmospheric temperature of the house should be about 50° at night, and 55° or 60° by day, allowing for a rise of 6° by sun heat, and employing a small amount of ventilation to raise the temperature. In each case, however, these temperatures must not be insisted upon, but varied a little in accordance with the conditions prevailing out-of-doors. Maintain a considerable amount of moisture in the atmosphere, and, in order to assist the buds to unfold with ease, syringe the vines two or three times each day with tepid water, allowing them to become dry before nightfall.

Orchard house.—In most cases this house is now occupied by Chrysanthemum plants, the fruit trees being plunged out-of-doors in a bed of ash or in cocanut fibre refuse. No time should be lost before re-potting any trees that have ripened late crops, and that have not already received this attention. The re-potting should be done in the manner recommended for earlier trees in the Calendar published on September 19. Trees not requiring to be re-potted should be top-dressed, first removing the top soil by working down the sides of the pots to one-fourth of their depth, or even more in particular cases. This will involve the sacrifice of many fibrous roots, but the trees will suffer no injury, and the roots will quickly produce fresh fibres, which, entering the new compost, will be best suited to supplying the trees with the necessary food. The compost should be used in a moderately dry state, and be rammed firmly. It will be necessary to protect the trees from bud devouring birds during winter. The present time is a favourable one for obtaining young trees from a nursery. Such trees may be purchased as maiden or 4-year-old specimens. In the potting of these young trees, shorten the roots sufficiently to allow of them being placed in pots of about 10 inches in diameter. Provide each pot with liberal drainage material, and, during the potting, carefully work the compost amongst the roots, making it firm by means of a wooden rammer. When the trees have been potted, place them either in a cool house, or plunge them out-of-doors, and take measures to prevent the soil from becoming injuriously dry.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Appointments for November.

- TUESDAY, NOVEMBER 3**—Brighton Chrys. Sh. (2 days). Nat. Amateur Gard. Assoc. meet. **Omaha** Chrys. Sh. (2 days). Farnham & Frat. Chrys. Sh. (2 days). Stratton, Kingston and Dist. Chrys. Sh. (2 days). Bournemouth Chrys. Sh. (2 days).
- WEDNESDAY, NOVEMBER 4**—Nat. Chrys. Soc. Autumn Exh. at Crystal Palace (3 days). Cardiff Chrys. Sh. Hayward's Heath Hort. Soc. Exh. (2 days). Guildford and Dist. Chrys. Sh. (2 days). Bromley Chrys. Sh. (2 days). Bath Gardeners' Soc. Chrys. Sh. (2 days).
- THURSDAY, NOVEMBER 5**—Newport (Mon.) Chrys. Sh. Torquay Chrys. Sh. Putney, Wandsworth and Dist. Chrys. Sh. (2 days). Linnæan Soc. meet.
- FRIDAY, NOVEMBER 6**—Raterra, Clapham and Wandsworth Chrys. Sh. (2 days). Atrincham and Dist. Chrys. Sh. (2 days).
- SATURDAY, NOVEMBER 7**—Soc. Franc. d'Hort. de Londres meet. German Gard. Soc. meet.
- MONDAY, NOVEMBER 9**—United Hort. Ben. and Prov. Soc. Com. meet.
- TUESDAY, NOVEMBER 10**—Roy. Hort. Soc. Coms. meet. Nat. Rose Soc. Com. meet. Plymouth Chrys. Sh. (2 days). British Gard. Assoc. Ex. Council meet. Devizes Chrys. Sh.
- WEDNESDAY, NOVEMBER 11**—Chester Chrys. Sh. (2 days). Cambridgeshire Hort. Soc. Sh. (2 days). York Chrys. Sh. South Shields and Northern Counties Soc. Chrys. Sh. (2 days). Pongaster and Dist. Chrys. Sh. (2 days). Burton Chrys. Sh. Corn Exchange Chrys. Sh. Mark Lane, London.
- THURSDAY, NOVEMBER 12**—Western-super-Mare Chrys. Sh. Barnsley Chrys. Sh. (2 days) (provisional).
- FRIDAY, NOVEMBER 13**—Liverpool Chrys. and Fruit Sh. (2 days). Bradford Chrys. Sh. (2 days). Sheffield Chrys. Soc. Ex. (2 days). Nottingham Chrys. Sh. (2 days). Leeds Parkon Soc. Chrys. Sh. (2 days). Huddersfield Chrys. Sh. (2 days).
- SATURDAY, NOVEMBER 14**—Burton-on-Trent and Shobnall Chrys. Soc. Ex. at Burton-on-Trent.
- MONDAY, NOVEMBER 16**—Nat. Chrys. Soc. Com. meet.
- TUESDAY, NOVEMBER 17**—Windsor Chrys. Sh. (2 days).
- WEDNESDAY, NOVEMBER 18**—Darlington Chrys. Sh.
- THURSDAY, NOVEMBER 19**—Edinburgh Chrys. Sh. (3 days). Linnæan Soc. meet.
- SATURDAY, NOVEMBER 21**—German Gard. Soc. meet.
- TUESDAY, NOVEMBER 24**—Roy. Hort. Soc. Coms. meet.
- THURSDAY, NOVEMBER 26**—Roy. Hort. Soc. Ex. of Colonial Products and Preserved Fruits (2 days).
- FRIDAY, NOVEMBER 27**—Aberdeen Chrys. Sh. (2 days). Dundee Chrys. Sh. (2 days).

AVERAGE MEAN TEMPERATURE for the closing week, deduced from observations during the last Fifty Years at Greenwich.—46°.

ACTUAL TEMPERATURES.—LONDON.—(Hobson's, Oct. 28 (6 a.m.)) Max. 62°, Min. 42°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—(Thursday, October 29 (10 a.m.)) Bar. 30.2; Temp. 59°; Weather—Sunshine.

PROVING.—(Hobson's, Oct. 28 (6 a.m.)) Max. 59° Aylesbury; Min. 49° Thirsk.

SALES FOR THE ENSUING WEEK.

- MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY**—Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 10.30.
- MONDAY AND TUESDAY**—Nursery Stock in variety at Carl House Lane, Horsell, Woking, by order of Mr. K. Collyer, by Protheroe & Morris, at 12.
- WEDNESDAY**—Tenth Annual Sale of Nursery Stock at Shortlands Nursery, Shortlands, Kent, by order of Mr. J. E. Bryant, by Protheroe & Morris, at 11.
- THURSDAY**—Narcissus, Iris, Lily of the Valley, &c., at 11.30; 758 cases Japanese Linnæus at 1; 2,650 Roses, at 3.30; Palms, Platanus, Azaleas, &c., at 5; at 67 & 68, Cheapside, E.C., by Protheroe & Morris.
- THURSDAY**—Sale of surplus Nursery Stock at Burnt Ash Hill Nurseries, Lee, S.E., by order of Messrs. B. Maller & Sons, by Protheroe & Morris, at 11.
- THURSDAY AND FRIDAY**—Important unreserved sale of the whole of the collection of Orchids formed by Wm. Appleton, Esq., at Tyne-coed, Hill Road, Weston-super-Mare, by Protheroe & Morris, at 12.30.

Some Relation of Leaves to Light.

Every one who has kept plants under observation is well aware of the fact that under the influence of light they dispose their leaves in such a manner as to utilise it to the best advantage. The way in which a *Pelargonium* grown in a window turns the blades of its leaves towards the source of light and away from the relatively dark interior of the room affords an example of this, and in a lean-to glasshouse the gardener knows how the plants at the back of the structure, if left to themselves, tend to develop their foliage on one side, and to become naked towards the wall.

This obvious response to the influence of light is, however, far from being a simple matter, and it results from the combined effect of several different, and even partially antagonistic, factors. Limitations of space will, of course, only allow us at the moment to discuss the problem in a few of its numerous aspects, but we hope to be able to return to it on a future occasion.

In the first place, light of suitable intensity acts directly as a stimulus which encourages the growth and development of foliage exposed to its influence, whilst in the second place the leaves thus favourably situated are enabled, by utilising certain of the rays that go to make up a beam of white light, to elaborate the largest amount of food, and this circumstance also tends to favour their growth as compared with that of the mere shaded ones. A practical illustration of this fact is afforded by the dying of the shaded leaves, which is so familiar a spectacle in overwooded shrubberies.

A somewhat closer examination of the matter, however, soon drives home the conviction that what has just been said can by no means be regarded as of universal application. Excessive illumination usually produces the effect of diminishing the size of leaves, and we find, moreover, that different plants interpret excess according to different measures. The so-called shade plants—many Ferns for example—by no means produce the largest leaves under the conditions of bright illumination, that is to say, the measure of light intensity which suits them best is below that which proves the best (or optimum) for many other plants. If we pursue our investigation still further, we discover that there are other circumstances not only in addition, but often acting in opposition, to that of light, which exert an independent influence upon growth. One of the most important of these is connected with the supply of water within the leaves.

Many of the shade plants, accustomed as they are to a sheltered and moist habitat, part with water far too readily under the ordinary conditions attending a full exposure to light. This reacts on their development, and tends towards the production of leaves of smaller size. That this is actually true may be readily seen by the manner in which such plants thrive, even in strong light, provided that evaporation is checked by keeping the surrounding atmosphere sufficiently damp. In such examples we may truly say that the relations of the water supply within the tissues are among the chief factors which limit the power of the leaf to enlarge itself in response to the complex stimuli given by light.

But once again we are confronted by instances which serve to illustrate the many-

sidedness of the plant, and to emphasise at the same time the rashness of indulging in over-hasty generalisation. Let us consider the case of the succulents. The plants of this class at first sight may appear merely to confirm the conclusions drawn from the behaviour of the shade-loving species, but they further accentuate another aspect of the whole matter. Under the natural conditions in which the succulent plants ordinarily flourish in nature, abundance of light is the rule. They are thoroughly accustomed to it, and, indeed, require it in order to attain to their maximal excellence. But the urgent need of economising water has been, so to speak, drilled into them for so many generations—and only those which have become sufficiently "adapted" in this respect have lived to be the parents of the present-day forms—that they hardly respond to light at all in the direction of increasing the size of their leaves, but do exhibit this character, in a more or less obvious degree, if the atmosphere happens to be sufficiently humid. Thus *Senecio* (*Kleinia*) articulatus produces and retains its leaves in a damp house both more freely and for a longer time than it does in a dry atmosphere, even if better illuminated. This same reaction may be witnessed in the case of the cactus-like *Euphorbias*, and in many other succulent types. The centre of gravity of response in these plants has been shifted, so to speak, from the light to the water stimulus. But, on the other hand, the leaf-like *Epiphyllums*, which possess flattened stems, enjoy all the advantages conferred by the leaf-like form, without the attendant risk of too rapid a loss of water, and they only produce this characteristic form in response to the stimulus of light. Those which have developed in darkness do not exhibit the flattened appearance, but only the cylindrical form to be expected in a stem.

In still another group the leaves exhibit an even more radical divergence from the behaviour we are accustomed to encounter. There are plants like *Onions* and *Iris*s which possess foliage as peculiar in form as it is remarkable in its physiological attributes. Such leaves, and we may add those of the *Maize* plant also, instead of becoming smaller or even rudimentary in the dark, grow out into long stem or strap-like structures when light is deficient in intensity; that is to say, under conditions in which a sprouting *Potato*, for example, would only produce shoots the leaves of which are quite rudimentary in size and structure. Such facts as these emphasise the importance of bearing in mind the individual nature of a plant—in other words its *hereditary* nature. This it is which really determines the form of the response which it will make to any given stimulus or set of external conditions. It does not really help matters much to argue that the elongating stem and small leaves of the *Potato* may be useful, inasmuch as the shoots are thereby enabled ultimately to emerge to the light after having expended as little as possible of the food previously stored in the *Potato*, whilst the rhizome of an *Iris*, on the contrary, owing to its peculiar fashion of growth, is better fitted to delegate this light-seeking business to the leaves. What we really want to know is just why the one should behave in the way that it actually does, whilst the other should express an analogous adaptedness

to external conditions in a totally different manner.

Such questions, like all others that touch the fundamentally important matters of nature, are more easily asked than answered. But it is well to put them, and to keep them constantly in mind. For it is only by careful observation of the natural phenomena themselves that our questions become sufficiently precise to suggest definite experiments which may one day put us in possession of the solution of the riddle. In the meantime, no one except a purblind, or merely unintelligent person is likely to imagine himself to be so familiar with plants that he can afford to regard their ways with indifference or contempt.

OUR SUPPLEMENTARY ILLUSTRATION—On July 4 last a photograph of the fine specimen of *Catalpa bignonioides* in Lieut. Col. HOLFORD'S garden at Westonbirt, Gloucestershire, was reproduced as a supplementary illustration. The tree was then in full bloom. Our present illustration depicts the tree in fruit, the long pod-like capsules being very numerous. The species is an excellent-flowering tree in favourable localities, but it is seldom we have seen a specimen fruit so abundantly as the tree at Westonbirt.

TRIALS AT WISLEY IN 1909-10.—We are informed that the Council of the Royal Horticultural Society have arranged for trials at the Wisley gardens of the following fruits, flowers, and vegetables during 1909.—*Fruits*: Autumnal Raspberries, 15 canes of each variety to be sent at once. *Flowers*: Tree Carnations, two plants of each variety. *Dahlia*: Seed to be sent in January. *Garden Dahlias*: (Show and Cactus excluded), two plants of each to be sent in April. *Early-flowering outdoor Chrysanthemums*: Two plants of each to be sent in April. *Pentstemons*: Two plants of each variety to be sent in April. *Vegetables*—Potatoes: Twenty tubers of each variety to be sent by February. Also experiments with the same variety of Potatoes secured from as many varying sources as possible, under different soil and climatic conditions. *Cauliflower*: 4oz. of each variety. *Lettuce*: 4oz. of each variety. *Kidney Beans*: ½ pint of each variety. Everything sent for trial must be named, and the name and address of the sender attached. Each variety must be labelled as being "early," "mid-season," or "late." *Autumn-fruiting Raspberries*: Fifteen canes of each variety of named autumn-fruiting Raspberries, of which a trial is desired, should be sent at once to Wisley. All parcels must be addressed, if sent by post: The Superintendent, R.H.S. Gardens, Wisley, Ripley, Surrey; if by rail: The Superintendent, R.H.S. Gardens, Wisley, Horsley Station, L. and S.W.R., with advice by post to the superintendent.

NATIONAL CHRYSANTHEMUM SOCIETY.—The annual dinner and presentation of prizes will take place in the Throne Room, Holborn Restaurant, High Holborn, W. C., on Thursday, November 26, at 6.15 p.m. for 6.30 p.m. Sir ALBERT ROLLIT, D.C.L., LL.D., president of the society, will preside. The challenge trophy, the Holmes memorial cups and medals will be presented to the winners during the evening.

FRENCH NATIONAL CHRYSANTHEMUM SOCIETY.—The 13th annual show and conference of this society will be held at Tours on November 3 to 5. The gathering will be held in conjunction with the Sociéte Tourangelle d'Horticulture. On the first day there will be a meeting of the jury and the Floral Committee, the

judges' luncheon, opening ceremony, the first meeting of the conference, and a banquet. On the second day a meeting of the General Committee and the second meeting of the conference, an afternoon excursion in motorcars to see some of the historic sights of the town and its environs, and in the evening a performance at the theatre. The third day comprises visits to interesting places in the town.

PARIS AUTUMN SHOW.—The last of the horticultural shows to be held in the greenhouses at the Cours la Reine, Paris, will take place on November 6 to 15, under the auspices of the National Horticultural Society of France. This show is for Chrysanthemums, fruit, and vegetables and promises to be an exceptionally good one. There is every prospect of an interesting exhibit being provided in the section specially devoted to the art and literature of the Chrysanthemum. This section will include old books, prints, engravings, pictures, photographs, and catalogues. There will also be interesting groups of old Chrysanthemums grown anterior to 1895.

BERLIN INTERNATIONAL SHOW, 1909.—The programme has been received for the International Horticultural Show of the Society for Promoting Horticulture in the Royal Prussian States, which will be held from April 2 to 13, 1909, in the Exhibition Halls, Zoological Gardens. In addition to Government medals and diplomas, prizes of the total value of 70,000 marks are available for nearly 700 single competitions dealing with horticulture and its allied branches. No charge will be made for space to exhibit flowers, plants, fruit and vegetables, nor for exhibitions of scientific and artistic objects. A committee of experts and artists will be appointed to attend to the proper staging of the plants, so as to produce the best spectacular effects. Those who intend to exhibit are requested to send in their applications in good time, thereby ensuring at all events a good and favourable space for the objects to be shown. All enquiries are to be addressed to the general secretary of the society, Herr SIEGFRIED BRAUN, No. 42, Invalidenstrasse, Berlin, N. 4.

*** A BIBLIOGRAPHY OF FLORISTS' FLOWERS.**—We welcome a copy of *The Florist's Bibliography*, by C. HARMAN PAYNE, a valued correspondent to these pages. Mr. PAYNE is well known among amateurs for his admiration of florists' flowers, more particularly of the Chrysanthemum. Being also an enthusiastic bibliophile, he has devoted much time for many years past in collecting English and foreign books and pamphlets, both old and new, relating to floriculture. In the preface to the present work he tells us that it was intended for the use of a few personal friends, and was to have been a list of the books on the subject contained in his own library. It became evident, however, that a much wider sphere of usefulness would be opened up for the book if some attempt were made to include other works on floriculture than those which Mr. PAYNE himself possessed. With that object in view, additions have been made from PRITZEL, JOHNSON, The Library Catalogues of the Massachusetts Horticultural Society, and of the National Horticultural Society of France and a few other sources. We have, therefore, a list which may be regarded as fairly exhaustive. It may be mentioned, however, that, whilst the book is divided up into portions under the headings of the different plants, the Rose is not included. Roses have been omitted, as the author explains, for the reason that Senor VARGARA issued a bibliography upon the flower, and it seemed unnecessary to go over the ground again, although a

* *The Florist's Bibliography*, by C. Harman Payne; price 3s. 6d.

supplement to Senor VARGARA'S *Bibliographia della Rosa* might now be reasonably considered desirable. We think, however, that Mr. PAYNE would do well to include Roses in the next edition. A few blank pages interleaved would be useful for adding fresh publications. The work is published privately by Mr. HARMAN PAYNE, and we can thoroughly recommend it to those who wish to study the literature bearing upon a particular flower or section of flowers, as, for instance, "Alpine flowers," "Bulbs" and "Sweet Pea."

FRESH WATER ALGÆ FROM BURMA.—The second part of Vol. 6 of the *Annals of the Royal Botanic Garden, Calcutta*, contains an account of a number of Burmese and Indian fresh-water Algae, which have been worked out by Messrs. W. WEST and E. S. WEST. Some new genera and species are described and figured.

AN UNSEASONABLE LABURNUM.—On the Queen's Promenade and close to the Portsmouth Road, Kingston-on-Thames, may be seen a common Laburnum tree in full bloom. The racemes are short but apparently fully developed. Naturally, such an unusual object attracts much attention just now, although the shells of the seed vessels left on the tree from the bloom of last spring detracts very much from the beauty of the flowers. The position, being a sloping bank, is a dry one, and probably the tree ripened its huds prematurely in the summer, and the recent October warmth caused them to develop into flowers.

Publications Received.—*Elementary Botany*, by Percy Groom. Eighth edition. (London: George Bell & Sons, York House, Portugal Street, W.C.) Price 3s. 6d.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

R.H.S. SHOWS ON TUESDAYS FOLLOWING BANK HOLIDAYS.—At the annual meeting of the Royal Horticultural Society Mr. William Cuthbertson brought up this question, and pointed out the injustice of the arrangement to garden and nursery employees. As the time for making arrangements for 1909 is at hand, it is to be hoped that the Council will avoid fixing shows on those days in 1909. Surely the influence of Mr. Geo. Bancard, Mr. James Hudson, Mr. H. B. May, Mr. A. H. Pearson, and Mr. Harry J. Veitch, who are members of the Council, will be sufficient to obtain this little reform in the interests of—*Employees*

THE ROYAL HORTICULTURAL SOCIETY'S FRUIT SHOW.—I join in your expressed suggestion that the Council of the R.H.S. should vary the time of holding the annual fruit show by having it next year fully a month earlier. A repetition from year to year of the same classes and fruits on or about the same date becomes very monotonous and unattractive. The general absence of the Fellows and the public from the show was markedly noticeable. By an earlier show we should have a much finer display of soft fruits, especially Grapes and stone fruits, and we should see what are good in early Apples and Pears. The Apples and Pears, perhaps, would be presented in more desirable table size than was the case with many at the recent show, and this is very desirable. Of what value are overfed, soft and sappy Apples and Pears, that decay so soon after being gathered? They are the fat oxen of the exhibitions, but not the average cattle of the market which furnish the best beef. The rage to obtain giant Apples and Pears is more a fetish than a desirable result.

VEGETABLE POINTING AT EXHIBITIONS.—I quite agree with Mr. Dean (see p. 269), it is time the R.H.S. Code of judging was altered, in so far as it relates to the pointing of vegetables at shows. True there is some excuse for the Code as drawn up in 1896, because many of the vegetables as cultivated at the present time can

scarcely be compared with those in existence when the Code was prepared. For example, Leeks, Celery, Onions, Runner Beans, and Carrots are now presented in so much better condition. So great an advance has been made by present-day exhibitors that the quality of these calls for a rearrangement of points. Difficulty of culture should be the dominating feature in arranging the points, just as Muscat of Alexandria and Mrs. Pince Grapes always obtain a higher standard of value than many other varieties. Few vegetable growers or judges agree with the Shrewsbury system of allowing a maximum of seven points for all. A perfect brace of Vegetable Marrows or Cucumbers, or a dish of Runner Beans can score as many points as Leeks, Celery, or Onions. A code based on graduation of maximum values according to difficulty of production, is distinctly what is required, not only at Shrewsbury, but at every other show that looks to Shrewsbury or the R.H.S. for example. Few cultivators, however, will agree with Mr. Dean's proposed classification as enumerated on p. 269.

To begin with, they would cut out Asparagus and sea-kale from the higher division. Longpod and French Beans from the second class, White Cabbages and Mushrooms from the next, and all but Brussels Sprouts from the last section. All of those named are so unimportant in vegetable collections that the scale of points suggested by Mr. Dean needs much rearrangement. In my opinion, Cauliflowers should be placed with Carrots, Celery, Onions, Leeks, and Peas, each of which should receive seven points; Potatoes, Tomatoes, Runner Beans, six points; Cucumbers, Parsnips, Beet, Turnips, and picked Brussels Sprouts, five points; and Marrows, four points. These are the vegetables about which so much controversy arises from time to time. It is only in exceptional circumstances that the other vegetables named and classified by Mr. Dean are seen on the exhibition tables. It seems then hardly necessary to discuss them, but rather to consider the kinds that are displayed most frequently. *E. Moynaux.*

—Permit me to say, in reply to *Inquirer* (page 268), that I was always in favour of making the Shrewsbury Society's class for 12 dishes the Champion class by largely increasing the prizes allotted it. I have held that, however liberal may be the prizes offered by the trade in their respective classes for nine dishes, the Society's class should be larger, and more richly endowed. I would make it a condition, however, that all who compete in the Society's class must also enter in at least one of the trade classes. What *Inquirer* proposes in reference to excluding certain vegetables from a class of 10 kinds would not do at all. I much prefer to see greater inclusion of kinds on the exhibition table. With respect to the question as to whether the Shrewsbury rule of having a maximum of seven points for all vegetables is satisfactory, I answered that in the scale of pointing I proposed on page 269. If that scale does not please all, in any case it may form the basis for arranging one that will do so. I have no other objection to proposing it. With respect to the pointing of Mr. Beckett's and Mr. Gibson's collections in the Society's class competition, I made it clear on page 173 that, irrespective of any pointing done by the six judges, myself and colleague, Mr. H. W. Ward, did point them on the Society's scale, to satisfy ourselves as to which of those two collections was the better, and we made Mr. Beckett's to give 60½ points and Mr. Gibson's 69; hence Mr. Beckett's was placed first, although by so narrow a margin. We had the advantage in having them close together, and took 15½ by dish. When the six judges pointed Mr. Beckett's collection as the one having the first prize in the class, the total was made 61 points, not as against Mr. Gibson's, but as against several other first-prize collections in other parts of the tent. *A. Dean.*

—Would it not be better if the R.H.S. modified the number of points for certain vegetables according to the month of the year in which they are shown? According to the pointing of the R.H.S. code, the number for a good dish of Carrots is only the same as for Cabbage and Lettuce. Dwarf Beans have the same number of points as Peas, which is one more than Leeks and two more than

Carrots. Many have grown these vegetables would not compare either Cabbage or Lettuce during July or August with a dish of Carrots, nor yet a dish of Dwarf Beans with one of Peas during August, especially in some seasons when mildew and thrips are prevalent. The difficulties experienced in growing one kind of vegetable with another should be given a little more consideration, and points awarded accordingly. It does not seem worth the labour to bore deep holes and prepare soil for Carrots, Parsnips, and Beetroot if one is only to get the same number of points for these as for Cabbages, Lettuce, and Turnips. *F. Lock.*

A PROPOSED BRITISH FERN SOCIETY.—Although the British Peridological Society, established at Kendal, has done good service as a centre of the British Fern Club for many years, there is no doubt that its purely local character militates against its wider usefulness, and now that beautiful and in many cases unique British Ferns are becoming popular, a society on a more extended basis is desirable. The object of such a society should embrace a periodical publication describing and illustrating new finds and fresh developments in cultural selection, and also providing such general data as may assist the amateur in growing and propagating and acquiring a knowledge of what is being done generally in this particular direction. In the United States, there are several societies devoted to indigenous Ferns, and their varietal forms and periodical publications are issued with contributions from inside and outside sources, which are very interesting. In Great Britain, the only periodical issued is the brief annual report of the above-named society, although the amount of material in the British Press is from the varietal point of view, inexhaustible, the comparatively few species having yielded several thousand distinct varieties, which are constantly being added to by fresh discoveries of wild "sports" or new developments under culture. Under these circumstances, the writer who, for fully thirty years, has been practically the champion of British Ferns in the British Horticultural Press, and in his two published volumes, *Choice British Ferns* and *The Book of British Ferns*, would be glad to hear from their admirers by a simple postcard in order to judge whether such a society is practicable on the basis of a moderate subscription sufficient to cover printing and other expenses incidental to the programme indicated. *Chas. T. Drury, V.L.H., F.L.S., 11, Shaft Road, Acton, London, W.*

COLD WEATHER IN NORTH CORNWALL.—The first frost of the season occurred in the early hours of October 22; it increased in severity with the daylight, and the thermometer fell as low as 26° Fahr. On Friday morning one degree of frost was registered, but the next day saw 7°, and this morning (October 25) we had 10°. Hence the lowest night temperature of the month was 40°, and many summer-dwelling plants, and all autumn bloomers, were in full beauty. As in most gardens this year, the Dahlias were a wonderful sight, but now all these tender subjects are black and present a dismal contrast to the harder Snapdragon, the tall Lobelias and Phlox Drummondii. *A. C. Bartlett, Penarrow Gardens, Cornwall, October 25.*

HARDINESS OF JAPANESE MAPLES.—Mr. Pearson (p. 259) calls in question Mr. Clark's statement on p. 273 that Japanese Maples are "as hardy as the Laurel," a statement which I think, however, is quite correct. Some time ago, in the Royal Nurseries at Handsworth, Sheffield, which is one of the most exposed nurseries in England, I noticed some specimens from 6 to 8 feet high, thriving splendidly in the open, and all these trees were in good health. *A. S.*

TRADE NOTICE.

Messrs. GEE & SONS, Seedsmen and Nurserymen, Piggleswade, Bedfordshire, inform us that they have been granted by the Royal Warrant of Appointment as Royal Merchants to the Royal Maestry of Appointments as Royal Farms for the last 30 years.

SOCIETIES.

ROYAL HORTICULTURAL.

OCTOBER 27.—The usual fortnightly meeting was held on this date, in very wet weather. The Hall was not so well filled with exhibits as on recent occasions, but there was plenty of interest in all sections, and especially fine was a group of Orchids from the noted Westonbirt collection. There were also choice exhibits of Ferns, Chrysanthemums, and hardy garden flowers. In the Fruit and Vegetable section was seen a good exhibit of orchard-house fruits, including Apple and Pear trees in bearing in pots. The FLORAL COMMITTEE granted Awards of Merit to six Chrysanthemums; the ORCHID COMMITTEE conferred one First-Class Certificate, five Awards of Merit, and two Botanical Certificates.

At the three o'clock meeting of the Fellows, 22 new members were elected and a lecture on "The Modification of Leaves and Stipules for Special Purposes" was delivered by the Rev. Prof. Geo. Henslow, M.A.

Floral Committee.

Present: W. Marshall, Esq. (chairman); Chas. T. Drury, H. B. May, John Green, E. A. Bowles, Geo. Reuther, W. Bain, Chas. Dixon, A. Turner, J. T. Bennett-Poe, Chas. E. Shea, Chas. E. Pearson, W. Cuthbertson, W. P. Thomson, E. H. Jenkins, M. J. James, Jas. Douglas, Jas. Hudson, R. W. Wallace, J. Jennings, J. F. McLeod, Chas. Bick, W. Howe, R. Hooper Pearson, H. J. Jones, Walter T. Ware, H. J. Cuthish, George Gordon, and R. C. Notcutt.

Messrs. J. HILL & SON, Barrowfield Nurseries, Lower Edmonton, showed a batch of *Gleichenias* in 12 species and varieties, the majority being large specimen plants. They were all in excellent health, and arranged so as to show the individuals to advantage, a couple of plants of *Dicksonia antarctica* and several plants of crested *Nephrolepis* being arranged at the back for relief. Among the choicer of the *Gleichenias* were *G. Mendolii*, rather fine in the pinnae; *G. rupestris glaucescens*, the blue tint being found on the under-surface of the fronds; *G. spluncæ*; *G. flabellata*, with branched fronds, the growth continuing again from the centre of the whorl; *G. semivestita*, and *G. dichotoma*, which produces the fronds in pairs on the rachis, and this continuing, there are sometimes four pairs of leaves. (Silver-Gilt Bankian Medal.)

Messrs. W. WELLS & CO., Mersham, Surrey, showed a large exhibit of Chrysanthemums, principally of border, pompon, and single varieties. There were also several large blooms of exhibition kinds in the foreground of the display, these being in batches. The group also contained vases of finely-flowered Pentstemons of seedling varieties, and Michaelmas Daisies. Amongst the large Japanese Chrysanthemums we noticed Leslie Morrison, of reddish tint, with paler reverse; Algernon Davis, rich yellow; Rose G. Pockett; Mrs. N. Davis; Lucy Talbot, soft yellow; Brandy; Beech; a seedling of pale pink colour; Mrs. H. Barnes; Pockett's Crimson (new), a big bloom; the tips of the florets of this variety recurve and are silver beneath; Mrs. L. Thorn, a yellow variety; and Mrs. A. T. Miller (very fine blooms). Among the singles we noticed Jessie Curtis, a new variety of deep-crimson colour with broad, flat florets; Nellie Riding, from the open ground; Laurie, a large single variety of plum or purple colour with a fine yellow centre; Florie Stevens, a single flower of Source d'Or colour (this variety does well as a pot plant); Kathleen Thompson, a border Chrysanthemum of deep-bronze colour, and from this has sported a white, a salmon, and a purple variety. Freda Bedford is a decorative variety of reddish-orange shade, of much merit. (Silver-Gilt Flora Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, exhibited a selection of *Zonal Pelargoniums* in pyramidal bunches, in white, mauve, salmon, scarlet, and other varieties. New York is a fine new scarlet variety large in flower and intense in colouring; and amongst others of merit were Berlin, a clear scarlet with no trace of white in the eye, also new; Paris, white suffused with pink; Cygni, this is not new this year, but was sent out in 1907; it has a very

large flower of magenta purple; the upper petal is shot with scarlet. Some of the "pips" measured 2 inches across. (Silver Banksian Medal.)

Messrs. JAMES VEITCH & SONS, LTD., Chelsea, S.W., showed varieties of single-flowering *Chrysanthemum* in 6-inch pots; also winter-flowering Begonias, including beautiful light specimens of the variety Mrs. Heal, raised from cuttings rooted in August; these were also in semi-perpetual. Agatha, of rich, rose-pink colour; and *N. elata*, a floriferous variety with smaller flowers than those of Mrs. Heal. At the back was a batch of the blue-flowered *Salvia* *Pitcheri*, the whole being relieved with *Palmis* and *Ferns*. (Silver Banksian Medal.)

Messrs. H. B. MAY & SONS, The Nurseries, Edinonton, showed admirable plants of Begonias of the Gloire de Lorraine type, including the white Turnford Hall and the pale-rose colouroured Mrs. L. de Rothschild varieties, both of which are so floriferous as the type, which was also represented in excellently-flowered, healthy specimens. Messrs. MAY also showed greenhouse Veronicas, a selection of Carnations, *Statis* profusa, and *Bouvardias* in pink, red, and white varieties. The group gave an opportunity for exhibiting *Ferns*, which afforded relief to the flowering subjects, two beautifully coloured species being *Adiantum macrophyllum* and *Fernis argyrea*. (Silver Banksian Medal.)

Messrs. W. CUTBUSH & SONS, Highgate, London, N., showed a selection of berried plants suitable for the embellishment of dwelling rooms; also *Ericas* in variety, *Daphne indica rubra* in flower, and an assortment of Carnations of the winter-flowering type. The Carnations were exceptionally fine, and included the scarlet Victory, Countess of Portland, a deeper and rather better-shaped Mrs. T. W. Lawson, White Perfection, Helen M. Gould (a sport from Eichen-tress, deep rose in colour and with darker flakings), Red, and Craig (scarlet), and a new variety of the same shade named Lady Nora Brassey. Among the berried plants were heavily-fruited, although small, specimens of *Skimmia japonica*, *Pernettya mucronata*, *Citrus sinensis*, and *Vaccinium Vitis Idæa*. (Silver-Gilt Banksian Medal.)

Messrs. HUGH LOW & CO., Bush Hill Park, Enfield, London, N., staged vases of Carnations over a white groundwork, arranged with sprays of *Smilax* (Medeola). Some of the finer varieties were Rose Enchantress (bright pink), White Perfection, Mrs. Burnett (pale salmon-pink), and Britannia (scarlet). Messrs. Low also displayed their pink or salmon-flowered *Cyclamen* named Low's Salmon King. (Silver Banksian Medal.)

Messrs. JOHN PEED & SONS, West Norwood, London, S.E., had a batch of plants of the brilliant scarlet *Salvia splendens* var. *grandiflora*, also boxes of Alpine plants, including species of *Saxifraga* (both mossy and crested), *Primula obconica*, *Milla uniflora*, *Senecio pulcher*; also many plants of succulents, &c.

Mr. L. R. RUSSELL, Nurseryman, Richmond, Surrey, again exhibited a display of berried and ornamental-leaved shrubs in small pots, as at the last meeting. (Bronze Banksian Medal.)

Mr. FRANK BRAZIER, Hardy Plant Nursery, Caterham, showed a selection of garden flowers including *Phlox decussata* in variety, Michaelmas Daisies, and border *Chrysanthemum*, with *Conifers* as a background. (Silver Banksian Medal.)

Mr. G. REUTHE, hardy plant nurseryman, Keston, Kent, showed hybrid *Nerines* in about two dozen varieties, the colours of the flowers varying greatly in the degree of red; also *Parochetus communis*, a trailing leguminous plant with pretty blue flowers, autumn-flowering *Crocuses*, *Galanthus* *Olgae*, forms of *Tropæolum tuberosum*, and *Aster grandiflora*.

The Misses HOPKINS, mere Gardens, Shepperton-on-Thames, staged a small rock-garden exhibit planted with suitable subjects. A similar exhibit was put up by the Misses KIPPING, Hutton, Essex.

Sprays of *Pernettya mucronata* carrying large bunches of berries were shown by ANDREW KINGSMILL, Esq., Harrow Weald (gr. Mr. W. Taplin).

Lady MARCUS BEESFORD, Englefield Green, Surrey (gr. Mr. E. Markham), showed a handsome *Nicotiana* labelled *N. Colosse* var. The large leaves are beautifully variegated with green and gold, the decurrent petioles being similarly variegated. The stems are reddish.

A number of shoots of a variety of *Cornus*

alba named Gibbsii was shown by the Hon. VICARY GIBBS, Aldenham House, Elstree (gr. Mr. Ed. Beckett). The foliage is broad and handsomely-coloured green, golden, and in the older leaves brown; the shoots are reddish.

Miss L. FARRER, Acton, W., showed paintings of floral subjects, all faithfully executed. (Silver Flora Medal.)

AWARDS OF MERIT.

Chrysanthemum Felton's Favorite.—This was granted an Award of Merit as a market variety. It is a decorative flower of Japanese type with smooth florets. The colour is palest lemon, approaching white. Shown by Mr. PHILIP LADDIS, Swanley Junction.

C. Hilda Lawrence.—A single variety of excellent habit about 3 feet or 3½ feet high. Colour violet-rose, with large yellow centre. The flowers have several rows of florets. The plants were shown in a perfectly natural condition, without thinning, and the flowers were about 3 inches in diameter. Shown by Mrs. R. GREGORY, Shoreham (gr. Mr. L. Lawrence).

C. H. W. Thorpe.—A large incurved bloom of palest lemon tint approaching white. It is described as a seedling from Buncerum. Shown by H. W. THORPE, Esq., Dunnington, Worthing.

C. Mrs. R. H. B. Marsham.—A very large, white Japanese flower with lemon centre. The florets are long, and when the flower is put on the exhibition stand it appears very large. It is described as a seedling from F. S. Vallis. Shown by R. H. B. MARSHAM, Esq., Bifrons, Canterbury.

C. Master David.—This flower has good broad florets of maroon crimson, the buff reverse just showing in the centre of partially-developed flowers. The colour is exceedingly attractive. Shown by Mr. HENRY PERKINS, Greenlands, Henley-on-Thames.

C. Sir Frank Crisp.—A large Japanese flower of reddish-crimson colour and bronze reverse, which is displayed in the centre. Shown by Mr. HENRY PERKINS, Greenlands, Henley-on-Thames.

Orchid Committee.

Present: J. Gunney Fowler, Esq. (in the chair); and Messrs. Jas. O'Brien (hon. sec.), Dr. B. Crawshaw, Harry J. Veitch, H. Little, W. Boxall, F. J. Thorne, C. H. Curtis, R. G. Thwaites, F. J. Hanbury, G. F. Moore, Stuart H. Low, W. Cobb, J. Charlesworth, A. A. McBean, H. G. Alexander, A. Dye, J. Cypher, W. H. White, H. A. Tracy, H. Ballantine, Gunney Wilson, C. J. Lucas, J. Wilson Potter, N. C. Cookson and R. Brooman-White.

Many groups of Orchids were staged, but the centre of attraction was the grand display made by Lt.-Col. G. L. HOLFORD, C.I.E., C.V.O., Westonbirt (gr. Mr. H. G. Alexander), and for which the Committee recommended the Council to accord the highest possible award, and they awarded a Gold Medal. This group is the fifth and best which has been staged by Mr. Alexander in various parts this year, viz., at the Royal Horticultural Society meeting in March, the Ghent Quinquennial in April, and the Temple in May, and York in June.

These exhibits not only demonstrate the results of the excellent culture at Westonbirt, but the great variety and beauty in the subjects treated, and their adaptability for producing flowers at all seasons. *Cattleya Dowiana aurea*, C. *Bowringiana* and C. *labiata* and the hybrids of them play an important part in autumn and winter displays, and each season produces its different set of hybrids, though the hybrids of C. *Dowiana aurea* and a few others are represented nearly all the year round. The same applies to the fine white *Cattleya Dusseldorferi* Undine raised at Westonbirt, and which was well represented in the group on Tuesday last. Plants of it have also appeared in all the displays from Westonbirt this year. The well-arranged group was composed principally of hybrids raised at Westonbirt, but the fine yellow sprays of *Onidium varicosum*, of which there were about 40; the two splendid specimens of *Vanda Kimballiana*, with 14 and 12 spikes respectively; the heavily-flowered *Odontoglossum crispum*, the specimen of the new *Cymbidium erythrostylum*, showy plants of *Cattleya labiata*, C. *Warsewiczii*, C. *Dowiana aurea*, and other species indicate that the species

are equally well cared for. For fine colour and good showy flowers the hybrid *Cattleyas* and *Lælio-Cattleyas* were the most noticeable, and the plants of the Westonbirt strain of C. Lord Rothschild being very beautiful; their fragrant light rose-coloured flowers, with claret-crimson lips, having deep golden discs. The equally bright C. *Fabia*, the delicately-tinted C. *Fulvescens*, the deep claret-crimson C. *Mantini*, Westonbirt variety, and the fine tints of *Lælio-Cattleya Læstro gigantea*, L.-C. *Elva*, L.-C. *Berthe Bourrier*, the bright yellow of L.-C. *Ophir*, and others of the large-flowered kinds left nothing to be desired. A plant of L.-C. *Ortrude* (L. *anceps* × C. *aurea*); good L.-C. *Arcthusa*, L.-C. *luminosa*, *Cattleya mollis*, C. *Mrs. Pitt*, C. *Herode*, C. *Mrs. J. W. Whiteley* and others were noted. Among the albos were the beautiful *Cattleya Hardyana alba*, and C. *labiata* *Kate Brazier*. *Brasso-Cattleyas* included B.-C. *Thorntonii*, B.-C. *Cordelia*, B.-C. *Madame Hye superba*, B.-C. *Digbyano-Warsewiczii*, B.-C. *Digbyano-Warneri*, and B.-C. *Siren* (B. *Digbyana* × C. *Skinneri*), a charming rose-coloured variety raised at Westonbirt. *Odontoglossum crispum-larynyum* and O. *Andersonianum* bore five fine spikes each; *Sophr-Cattleya* *Nydia* were brightly-coloured dwarf plants, and the set of *Cypripediums* included several C. *insigne* *Harefield Hall*, one plant bearing 11 flowers; several C. *insigne* *Sandera*, the largest having 15 blooms, C. *i. Chantii Lendunii*, C. *i. Dorothea*, two fine forms of C. *Dante*, C. *Hitchinsiae*, C. *Maudie*, the new yellow C. *Rossetti*, C. *Titus superbum*, C. *Milo* Westonbirt variety, C. *Niobe* Westonbirt variety, varieties of C. *Leacum*, C. *Germane* *Ophex* Westonbirt variety, the fine C. *nitens*-*Leacum* var. *Haunhalt*, raised at Westonbirt and which secured a First-Class Certificate last year. The dominant feature in the whole group was given by the magnificent Westonbirt hybrid *Cattleyas* and *Lælio-Cattleyas*.

Messrs. CHARLESWORTH & Co., Haywards Heath, staged a very fine group, in which the principal varieties were massed, and for which a Silver-Gilt Flora Medal was voted. In the centre were a fine lot of varieties of *Cattleya albiflora* *luminosa*, with which were the beautiful *Odontoglossum crispum* *xanthos* Charlesworthii, a model pure white flower with orange-yellow markings; the new pure white *Vanda corulea* Charlesworthii (see Awards), and white varieties of *Cattleya labiata*. Another batch was composed of *Cattleya Mantinii* *nobilior*, with white *Cattleyas* and rare *Cypripediums*. At the end were massed a selection of fine blue *Vanda corulea*, with which were *Vanda* *Coleoglossum maximum*, *Thropetalum Fascinatum*, and C. *ornatissimum*. A selection of *Brasso-Cattleyas* included the pure white B.-C. *Queen Alexandra*, and other special things noted were the fine red *Odontioda* Charlesworthii, the rare *Coleogyne* *Veitchii*, with a long drooping raceme of 32 pure white flowers; *Cymbidium longifolium* and other rare species.

H. S. GOOSDON, Esq., Fairlawn, West Hill, Putney (gr. Mr. G. E. Day), was awarded Silver Flora Medal for a group of *Cattleyas*; Hybrid *Lælio-Cattleyas*, &c., including *Cattleya Fabia* *Goodsonii*, C. *Alicia*, C. *Mantini*, and others mentioned in the note upon Fairlawn at page 305. The clear yellow *Odontoglossum grande* *Pittianum*, *Cypripedium Charlesianum*, varieties of *Miltonia* *Bleuana*, and others were also remarked.

Messrs. HUGH LOW & Co., Enfield, secured a Silver Flora Medal for a group in the centre of which was a selection of white forms of *Cattleya labiata*, C. *alba* *Purity* being a pure white form with a pale lemon-yellow disc to the lip. Others noted were C. *l. Goulouria*, C. *l. R. L.* *Measures* and another of the same class, and C. *l. Redleyensis*. With them was a selection of good, dark C. *labiata*, C. *Dowiana aurea*, *Brasso-Lælia Digbyano-purpurata*, &c.

E. ASHFORD, Esq., The Broadlands, Camden Park, Tunbridge Wells (gr. Mr. W. Young), was awarded a Silver Flora Medal for a group of well-grown *Cattleyas*, &c., among which were several very fine plants of C. *Bowringiana* and C. *labiata*, one grand specimen of the latter bearing 20 flowers. With them were good C. *albata*, *Odontoglossum grande*, O. *crispum*, *Dendrobium Phalaenopsis*, *Lælio-Cattleya blechleyensis*, the large and handsome L.-C. *Smimia Broadlands* variety, &c. The large specimens of

Cattleyas were said to have been grown from small plants, and, therefore, are specially noteworthy.

J. S. MOSS, Esq., Wintershill, Bishop's Waltham, staged a group of well-flowered Cattleya *Dowiana aurea*, for which a Silver Banksian Medal was awarded. Also the new *Laelio-Cattleya* Mrs. Hood (L. *Iona* × C. *Dowiana aurea*), a fine rose flower with deep carlet-crimson labellum.

CLEMENT MOORE, Esq., Hackersack, New Jersey, U.S.A. was awarded a Silver Banksian Medal for a selection of cut spikes of white and coloured varieties of *Cattleya labiata* of excellent quality, and which, notwithstanding their long journey, were still in good condition. The largest spike of dark-coloured C. *labiata* bore six fine flowers.

SIR TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White), sent *Laelia pumila* Margaritara, a pretty bluish-white form with rose-pink markings on the lip; *Masdevallia* triads, and others, for two of which are awards.

MR. A. W. JENSEN, Lindfield, Haywards Heath, showed good varieties of *Cattleya Dowiana aurea*.

MONSIEUR MERLENS, Ghent, showed several hybrid *Odontoglossums*.

W. WATERS BUTLER, Esq., Southfield, Edgbaston, sent *Cattleya Hardyana* alba, Southfield variety, with white sepals and petals, and the ordinary yellow and ruby-red C. *Hardyana* lip. Also C. *labiata* Southfield variety, fine in shape and colour.

MESSRS. JAS. CYPRIER & SONS, Cheltenham, staged a group in which *Cattleya Portia gigantea* was very remarkable, its fine, rose-purple flowers resembling C. *labiata*, but with a better shape. Also many fine *Cypripediums*, including C. *Milo* Westcott variety, C. *triumphans*, C. *Maudie*, C. *Bingleyense*, &c.

R. G. THWALFES, Esq., Chessington, Streatham (gr. Mr. Black), staged a small group of good varieties of *Cattleya Faba*, two of the yellow-petalled *Laelio-Cattleya* Ophir, and two plants of *Cattleya labiata* from a batch obtained by crossing two white forms, and nevertheless the progeny were rose-coloured, like typical C. *labiata*. Mr. THWALFES also showed *Brassia-Laelia Cecilia* (L. *pumila* × B. *Digbyana*).

Mrs. JOAB, Worthing (gr. Mr. Flack), sent the fine red *Renanthra coccinea* with a large, branched spike of red flowers.

NORMAN C. COOKSON, Esq., Oakwood, Wyham (gr. Mr. Chapman), sent *Calanthe Angela* (burfordensis × *Oakwood Ruby*), a very handsome ruby-crimson flower near to C. *Chapmani*, also raised at Oakwood.

H. SPICER, Esq., Aberdeen Park, Highbury (gr. Mr. Lovogrove), showed a group of *Cypripedium Spicarianum*.

MESSRS. STANLEY & Co., Southgate, staged a group in which were good *Cattleya labiata*, the variety ignescens being of very rich colour and without the usual yellow tint in the tube of the lip. Various *Cypripediums*, *Laelio-Cattleyas*, &c., were also included.

A. WARBURTON, Esq., Vine House, Haslingden, sent *Cypripedium insigne excelsa*, a large flower resembling C. *insigne* *Harefield* Hall, and of fine substance.

G. F. MOORE, Esq., Chardward, Bourton-on-the-Water (gr. Mr. Page), showed *Cypripedium A. touts* Millmaid, a light form with large, white dorsal sepals having pale-rose markings.

AWARDS.

FIRST-CLASS CERTIFICATE.

Vanda cœrulea *Charlesworthii*, from Messrs. CHARLESWORTH & Co., Haywards Heath.—The first true, wholly pure white albino of the species to be shown. Flowers as in typical *V. cœrulea*, but without the slightest trace of colour, even in the labellum. This is remarkable, as the colour of the lip is very pronounced in the species.

AWARD OF MERIT.

Laelio-Cattleya Lustre gigantea (C. *Ludlowiana* × L.-C. *callistoglossa*), from Lt.-Col. G. L. HOLFORD, C.I.E., C.V.O. (gr. Mr. H. G. Alexander),—A dwarf plant bearing large and handsome flowers, as in L.-C. *callistoglossa*, but thicker in texture. Sepals white tinged with rose. Petals very broad, crimped and decurved, tinged and flecked with bright rose, the white

ground colour showing through in places. Lip large and of peculiar form, carlet purple, lighter towards the front, and with gold lines from the base.

Laelio-Cattleya Ortrube superba (L. *anceps* × C. *Dowiana aurea*), from Lt.-Col. G. L. HOLFORD. A showy flower. Sepals and petals cream-white, tinged with rose; lip deep ruby red with yellow lines from the base.

Brasso-Cattleya Madame Hye superba (B. *Digbyana* × C. *Harrisoniana*), from Lt.-Col. G. L. HOLFORD.—A finely-formed white flower tinged with rosy-lilac.

Dendrobium Calceyge maximum, from Messrs. CHARLESWORTH & Co., Haywards Heath.—A very large form, measuring 8 inches from tip to tip of the sepals. Sepals and petals yellow striped with purple, with white base.

Brasso-Cattleya Queen Alexandra, Glenthorne variety, from GURNEY WILSON, Esq., Glenthorne, Haywards Heath.—A very fine hybrid, with large, pure white flowers and finely expanded, fringed lip.

BOTANICAL CERTIFICATE.

Saccolabium dasygynon, from Sir TREVOR LAWRENCE, Bart., K.C.V.O.—A pretty little plant of the S. *bellinum* section. Sepals and petals yellow, the bearded white lip having purple markings.

Masdevallia Ortgiesiana, from Sir TREVOR LAWRENCE, Bart.—A profuse flowerer, bearing white flowers striped with purple.

Fruit and Vegetable Committee.

Present: George Bynard, Esq. (chairman); and Messrs. W. Bates, Alex. Dean, H. Markham, Jos. Davis, A. H. Pearson, C. S. A. Nix, H. Somers Rivers, Owen Thomas, Chas. Foster, J. McIndoe, J. Jaques, Geo. Reynolds, Geo. Wyttes, James Vert, and Jos. Cheal.

There was the usual array of seedling and other Apples which had been presented to the Committee for award, but none was found worthy of recognition. The most important group was an exhibit of orchard-house fruits and fruiting trees in pots, shown by Messrs. T. RIVERS & SON, Sawbridgeworth, Herts.

The trees were placed along the centre of the table and some at either end of the display. The best fruit was of Gascoyne's Scarlet Seedling, Belle de Pontoise (a large, handsome variety), Buckingham, and Melon Apples; there were also some Pear trees in pots, and on either side of the table a row of Fig trees. The dishes of Apples and Pears were of excellent quality, being very clear of skin and having intense colouring, as is usual with orchard-house fruits.

The examples of Cox's Orange Pippin had deep red stripes on the mellow skins. Sir Chester Pearmain was almost entirely coloured deep red. There were also fine specimens of Bismarck, Chas. Ross, Washington, King of the Pippins, Lord Derby, Hambling's Seedling, King of Tompkins' County, and Queen. The Pears included Doyenné du Comice (very choice fruits), President Barabé, Beurré de Anjou, Pitmain Duchesse, and Verulam. A couple of boxes of Wyedale Plums gave additional variety (see p. 317, *The Hog Medal*).

A collection of Apples in about 42 varieties was presented by Messrs. HUGH LEW & Co., Bush Hill Park, Enfield, N. The fruits were staged in fancy baskets, and trees of *Citrus sinensis* in fruit and *Cocos Palms* afforded relief to the group. Notable examples were Bismarck, King of Tompkins' County, Allington Pippin, Frogmore Prolific, Alfriston, Cox's Orange Pippin, Tyler's Kernel (a choice sample), Stirling Castle, Gascoyne's Scarlet Seedling, Chas. Ross, Rivers' Codlin, and Paroquet. (Silver Knight Medal.)

MR. W. H. WHITELEY 18, Endsleigh Place, Torquay, showed about 30 dishes of Apples of well-known sorts. The best samples were Royal Jubilee, Blenheim Pippin, Bramley's Seedling, Chas. Ross, Queen, Duchess's Favourite, and Baumann's Red Winter Reinette. (Silver Banksian Medal.)

MR. R. W. GREEN, Wis-bech, showed a large and representative collection of Potatoes, having most of the newer and the best of the older varieties in well-matched, clean-skinned tubers. The exhibit was staged in as attractive a manner as it is possible to adopt with a display of Potatoes. (Silver Banksian Medal.)

Scientific Committee.

OCTOBER 18.—Present: Mr. E. A. Bowles, M.A., F.L.S., in the chair; Dr. A. B. Rendle, Dr. M. C. Cooke, Messrs. Veitch, Odell, Hales, Hurst, de B. Crawshaw, Worsdell, Bennett-Poe, Fraser, Hooper, Fawcett, Worsley, Hudson, Saunders, and Chittenden (secretary).

Snails and Water-Lilies.—MR. G. S. SAUNDERS showed leaves of *Nymphaea* eaten by water snails. Mr. Hudson said that he had found that an insecticide forced into the water so that it would rise just underneath the leaves had proved an effective remedy against the attacks of these pests.

Curious growth of Potato.—MR. VEITCH showed on behalf of Mr. RUMSEY, of Leyton, a curious Potato which had been growing in the light but out of the soil for 18 months. It had, as usual under such conditions, produced a number of short, thick, purplish shoots, reaching in all to a length of about 2 inches to 2½ inches, and from these were developed a large number of closely oppressed greenish roots.

Nomenclature of Orchid hybrids.—The following resolution was received from the Orchid Committee: "That the Scientific Committee be asked to consider and advise upon the proper nomenclature of tri-generic, quadri-generic, and other hybrids, as it appears to the Orchid Committee that not more than two generic names can conveniently be combined in defining the origin of the hybrids." Several letters upon the subject were considered, and suggestions were made as to the best methods of forming names for these hybrids. It was finally proposed by Mr. Veitch, and seconded by Mr. Hurst, that a sub-committee should be formed to consist of five members of the Scientific Committee and five of the Orchid Committee, who should confer together and further consider the subject. This was carried, and Dr. Rendle, Messrs. Bowles, Fawcett, Hurst, and Rolfe were appointed to represent the Scientific Committee.

CONFERENCE ON SPRAYING.

(Continued from page 302.)

PROF. THEOBALD'S PAPER.

PROF. F. V. THEOBALD said there was a great number of washes used for the purpose of destroying insects, either acting directly or indirectly or not acting at all. At present little was known about the subject. A few years' work at Woburn had, however, enabled them to make some advance, whereas previously they had to gain most of their knowledge from America and the Colonies. At present he had not found that the metal emulsions made with ordinary oils were of use in dealing with caterpillars, but experiments had proved that, made according to the Woburn method, they might be just as useful as the more dangerous arsenical sprays. Even then they would have to consider the injurious effect of paraffin in any form on the health of fruit trees as compared with the comparative harmlessness of arsenate of lead. The importance of such a vegetable insecticide as tobacco was one that should be kept well to the fore, for he had never seen the least harm done by it, and the insecticidal value was very great. The one thing growers had to guard against was the throwing on the market of patent washes boomed by people who did not seem to fully appreciate the harm they were doing. When they saw a wash or so-called "spray fluid" being forced upon them that would cure all diseases, insect and fungoid alike, they might rest assured that its real value was a very low one. Growers might spend far too much on the spraying of their plantations—a costly procedure, for the subject was only just at its birth. It was well, therefore, to go cautiously. As far as could be seen at present, winter washing was of use mainly as a means of clearing the trees, and need not be done more than once every three years in the case of a good plantation. No wash had yet been found of any service in destroying insect eggs, nor was it likely to be found in the future. The grower should aim at destroying the young insects by washing in early spring with an arsenical and contact wash, such as arsenate of lead and paraffin, and with this could be added

the fungicide Bordeaux mixture. This should be done again after the blossom had fallen. Gooseberries and Currants might be sprayed in the late winter with paraffin jelly wash or liver of sulphur and paraffin to cope with red spider, scab, and fungus. No single remedy was likely to prove effectual to all, any more than one human dose would cure all man's ills. One point was often neglected. It was that they must see to the general health and nutrition of our trees, grown under unusual circumstances; for healthiness would help a lot to combat disease and would prevent washing being such an absolute necessity as it was to-day. The spraying of fruit trees was essential, but it would only do some good and might exceed in cost the net result gained, unless carried out in a careful manner and unfettered by quackery. The fact should not be overlooked that any of the mineral sprays damaged the plant. Plantations had been ruined by Paris green and Bordeaux mixture. Washes used as insecticides should be looked upon as remedial and not preventive. The more important of these were the following:—

CAUSTIC ALKALI WASH.

- (1) Caustic soda (70 per cent.) ... 1 lb.
Carbonate of potash (80 per cent.) ... 1 lb.
Soft soap ... 1 lb.
Water ... 10 gals.
- (2) Caustic soda (98 per cent.) ... 2½ lbs.
Potassium carbonate (80 per cent.) ... 1 lb.
Lime (fresh burnt) ... 2½ lbs.
Soft soap (8 per cent. potash) ¼ lb.
Water ... 10 gals.
- (3) Caustic soda (98 per cent.) 2 to 2½ lbs.
Water ... 10 to 10 gals.

PREPARATION.—(1) Dissolve the caustic soda and carbonate of potash in water, and then add the dissolved soft soap. (2) Slake the lime in a little water, and then add enough water to make it into a milk of lime (about ½ gallon of water). In this dissolve the soda and potash; dissolve the soft soap in the rest of the water and pour into the lime water. A considerable excess of lime is advised to ensure the soda and potash being converted into the "caustic" state. In (3) the mixing is still further simplified.

USES.—For cleaning old mossy and rough-barked trees in winter and killing mussel scale ova. These must be used only on dormant wood in February or March. The addition of paraffin to this caustic wash had been found to make it much more effectual, and this wash, known as the Woburn wash, is made as follows:—

WOBURN WINTER WASH (NON-FUNGICIDAL).

- (1) Soft soap ... 5 pints.
Paraffin ... 3 pints.
Caustic soda ... 2 lbs.
Water ... 9½ gals.
- (2) Iron sulphate ... ¼ lb.
Lime ... 3 lb.
Caustic soda ... 2 lbs.
Paraffin ... 5 pints.
Water ... 10 gals.

This wash acts as a great cleanser of the trees, removing moss, lichens, algae, &c. It also kills the delicate ova of the mussel scale. Time of application: any time between November and February.

PREPARATION.—Dissolve the soap in warm water, then churn the paraffin into it and afterwards shake in the caustic soda. This soap emulsion does not seem as good in winter as the metal emulsion made with iron sulphate.

WOBURN WINTER WASH (B).

- Copper sulphate ... 1½ lb.
Lime (quick) ... 3 lb.
Paraffin ... 5 pints.
Caustic soda ... 2 lbs.
Water ... 10 gals.

USES.—This wash acts as a cleanser of moss and lichen; it also is fungicidal, and is of value where Apple scab occurs on the wood. The time of application may be any time between November and February.

LIME AND SALT WASH.

This wash has come into use mainly on account of its tending more than anything else to prevent the damage done by Apple sucker.

- (1) Lime ... 1 to 1½ cwt.
Salt ... 30 to 40 lbs.
Water ... 100 gals.
- (2) Lime ... 1 to 1½ cwt.
Salt ... 30 to 40 lbs.
Waterglass ... 5 lbs.
Water ... 100 gals.
- (3) Lime ... 1 to 1½ cwt.
Salt ... 30 lbs.
Washing soda ... 3 lbs.
Water ... 100 gals.

USES.—For the prevention of hatching of the eggs of Apple sucker, Plum aphid, and killing of mussel scale, and also for cleaning trees of moss, lichen, &c. Time of application: the end of February until the beginning of April. Spraying should cease as soon as the buds open.

Lime sulphur, soda wash or Oregon wash for destroying the Pear-leaf blister mite and as a scaldicide.

- Lime ... 3 lbs.
Sulphur ... 3 lbs.
Salt ... 3 lbs.
Caustic soda ... 1 lb.
Soft soap ... 1 lb.
Water ... 10 gals.

This must be used on dormant wood only. In the case of Pear trees, spraying must cease as soon as the bud scales are fully opened. A heavy spray is best. Prof. Theobald gave many other formulae (which are to be published officially) and concluded by saying that they were some of the insecticides and acaricides in use or being experimented with. It would be said that they were very numerous, but one must not expect that the few scientists who worked at this subject could do more for fruit-growers in less than a quarter of a century than medicine had done for man in many hundreds of years. Cleanliness of the trees must be aimed at, but when they came to check any specific parasitical disease they must use the remedy best fitted for the purpose, and not expect that any one of them would cure the lot. Moreover, they must remember it was very easy to cure a man who was not ill, but it was waste of money, and the same might be said of fruit trees. Too frequently, washing went on when there was nothing to destroy. It could only do a certain amount of good, and the more cautious growers got to work with this necessary adjunct to fruit-growing, the more money they would keep in their pockets. For even when they were necessary and did good, it must still be borne in mind that in destroying the disease they themselves too often weakened the patient.

MR. HAMMOND'S PAPER.

Mr. G. HAMMOND treated spraying generally, and offered some remarks from a fruit-grower's point of view. He viewed the practice of spraying as a regrettable necessity, as without it there was at present no remedy for many of the evils from which they suffered. When one's health was up to the mark it threw off all germs of disease. It was the same with fruit trees. It was the sickly and over-cropped trees that were most affected with aphid, the strong vigorous sap of the good grower evidently being distasteful to them. Good condition should therefore be their first aim, and this should be secured by proper manuring, cultivation, and pruning, so as to give the trees the best possible chance of resisting disease. Yet the main factor in the business beyond their control was climate, which would often thwart their best efforts. Among the agents for destroying the various fungi sulphur and its numerous chemical compounds took a high place. Strawberry growers had long been familiar with the use of flowers of sulphur for mildew on their plants, until now it had become a part of the routine in many places to dust-spray all the breadths of Strawberries once or twice, whether the mildew had made its appearance or not, particularly in the case of the Sir Joseph Paxton, this variety being specially subject to its attacks. Within the last year the Board of Agriculture had brought to their notice another form of sulphur, or, rather, a chemical compound, which was a most useful fungicide, viz., potassium sulphide, or liver of sulphur, re-

commended for the American Gooseberry mildew. If it did not kill the pest, it certainly acted as a preventive of infection so long as it could be induced to remain on the bush and was not washed off. Being somewhat of a greasy nature, it was very difficult to make it adhere to the twigs of the Gooseberry bushes. Sulphur turned up again as a constituent of another well-known fungicide as valuable, if not more so, than the last, namely, copper sulphate, the active principle in that universal spray fluid, Bordeaux mixture, whose uses extended from the Potato to the vine, and all fruit trees. It had undoubtedly worked wonders in combating the once dreaded Potato disease. For two years past he had used it as a dust spray with great economy of labour and a total absence of damage. It had been applied at the same rate per acre as when in a liquid state. Bordeaux mixture had also been very successful on the vines in France, and it was present, so far as he knew, the only remedy for black rot in Apples. His own experiments in this direction had not been very successful, but that this or some other remedy must be persevered with was fully apparent to all who saw the immense quantity of scabbed Apples on the market this year. The drawback to this spray fluid was its somewhat slow action and the fact that one could not be sure that it would not scorch the foliage and sometimes cause it to fall. To be thoroughly successful, it should be applied in a mist-like spray at least three times during the period the Apples were growing, and it should be known exactly the strength each variety would stand. In his own case, he gave only one spraying, but fetched down quite 50 per cent. of the leaves, and, though much improved, the Apples were not even now entirely free from spot. He had used a solution of copper sulphate in winter for Botrytis on Gooseberry trees in contact with liver of sulphur in summer, and although not able to quite stamp it out, he had substantially held it in check, where formerly he had to grub out the bushes. He could say little of the American Gooseberry-mildew, but would leave it to the experts to fight out, as to whether pruning, spraying, grubbing, burning, tipping, or any other method be the correct one, but he hoped that what was finally ordered by the Board of Agriculture would be some remedy that had proved to be successful. Then they had to fight the mosses and lichens which covered the limbs and branches of old trees, and which afforded such a splendid hiding-place for insects for the winter, as well as suitable positions for them to lay their eggs. Fruit-growers had long since realised the advantage of ridding their trees of some of this encumbering rubbish, and long ago, before winter spraying was thought of, it had become good practice to strip down the autumn-wash the trunks and all large bushes of trees which had become badly overgrown with moss and lichens. For that reason alone of destroying the harbouring places of insects and so on, winter spraying would be worth while, even though the effect of the various washes on eggs of Apple sucker, aphid and the various caterpillars might remain extremely problematical. As to winter spraying he experimented with one of the winter washes, but failed to find any that corroded any very large percentage of the eggs of the Apple sucker. All of them, however, cleaned well, and to that extent they were successful. They did not try lime and salt wash, but had heard favourable accounts from friends who had tried it, particularly when applied quite late in the spring. What they considered their most favourable result was achieved by the use of hot lime wash made by putting lime straight into the water and applying quite hot, and in as thick a condition as possible. It was so hot as to make the delivery hose uncomfortable to hold, and, of course, burnt face and hands when one was so unfortunate as to get any on them. Applied during the first fortnight in April it adhered to the trees splendidly. Hardly any Apple sucker was left on them. The varieties were Mr. Gladstone, Eckhavia Seedling, Cox's Orange Pippin, and Lord Derby. Although this was so far successful for Apple sucker, it was not so good for killing the winter spores of Apple scab. As to summer spraying, the insects they had to spray for were those which must be killed by direct contact with the spray and those whose food must be poisoned. Among the first were the red spider, Apple sucker, and all the

leaf-eating caterpillars and various beetles. For many years for the former class quassia and soft soap was the universally-recommended wash, and was even now very useful indeed, but it had been gradually superseded by paraffin emulsified by soft soap. A 2 per cent. solution of tobacco made according to Mr. Tucker's formula, was successful not only against Apple sucker, but equally so against aphids and caterpillar whenever it touched them. He had no hesitation in recommending this wash most strongly to growers for spring use. The only drawback was the price of the tobacco, and fruit-growers should unite in strongly urging the Board of Agriculture to enable some scheme to be put forward to relieve such tobacco from the duty which was the bulk of its cost.

For red spiders on Gooseberries which were so tender that paraffin is not advisable, liver of sulphur proved a most excellent remedy, but one spraying was not sufficient, as all the eggs might not have been hatched out. For weevils and caterpillars which were difficult to reach the food should be poisoned. For this something was needed which could be spread in a very thin deposit on all the leaves, and which, while strong enough to poison the insects, would not burn the leaves. He found such a substance in the compound of arsenic diluted with water. London purple used to be largely used, but had been given up as very clumsy and dangerous, and now Paris green or lead arsenate were the most widely-used washes—Paris green 1 lb. to 200 to 250 gallons. No lime was needed when using Paris green, and the risk of burning the foliage was far greater with than without it. He had never sprayed for Codlin moth grub, but others had found lead arsenate an excellent remedy, providing the right time was chosen, just as soon as the blossoms had fallen and for a week or two afterwards. With regard to the black currant mite, he had tried the lime and sulphur remedy, but although successful, it had been found to burn the fruit sometimes rather badly. For nurserymen to use on their young stock it was no doubt an excellent remedy, but rather dangerous for fruit-growers. Personally, he thought the remedy would be found in spraying a greasy substance all over the trees in the spring, so catching the mites. Successful spraying was not by any means the easiest job. If the proprietor or his sons could manage to personally do the spraying work, part of the battle would be over, but where ordinary farm hands had to be trained in the use of the machines, the various quantities of chemicals to mix, it needed constant vigilance to give it any chance of being successful. The nozzle of the machine was most important, but of its form it was impossible to speak with any certainty. He had found those the best in which a spiral twist was given to the liquid before it reached the final orifices, and the pump should be powerful enough for the work. Fancy using a 2-gallon Knapsack sprayer on a tree that required a 40-stave ladder to pick it! As all fluids were diluted, it was absolutely necessary that the spraying machine should contain some device which should effectually agitate and mix the liquid. The jolting on an un-sprung trolley over clods was not sufficient. It had the contrary effect of settling some of the mineral compounds. The use of wire for hoses which was right, but the handiest and handy brass clips with screws being best. These could be easily fixed, and never flew off under the greatest pressure. He had said little of the various quantities for making the spray fluids because there were specialists in that line, and because he had found it best in the long run to buy a good many of the complicated washes and emulsions ready mixed, it generally being only necessary to dilute with water. They should deal with a chemical manufacturer who could be trusted. This made it more possible to leave a gang of sprayers alone for five minutes, secure in the knowledge that they had only a child's work of putting so many pints of mixture in so many gallons of water when they required a fresh lot of spray fluid.

Mr. F. W. MOORE (Dulham) said he was diametrically opposed to the views put forward. One gentleman said they did not spray enough, another said they should not spray in winter. Which was right? There was one thing which had been discounted—that was the intelligence of the cultivator, who was not the simplest he was supposed to be. He would advise the cul-

tivator not to give up his spraying because he was told to do so, but to satisfy himself whether it was necessary or not. He would strongly urge the cultivator not to give up winter spraying. He believed it was essential, and he would advise cultivators to consider carefully before they accepted the statement that spraying with caustic wash was detrimental to the health of the tree. Trees regularly sprayed in winter were better. Some attempt should be made to standardise all the washes. They should know the ingredients, and he maintained the reasonableness of the advice to prepare their own materials where that could be done. As to the American Gooseberry-mildew, there was only one remedy, and that was to burn bushes. Untold injury was done by using bad washes.

Professor F. V. THEOBALD was asked whether there was any remedy for the Apple weevil, and was there any use in grease bands? He replied that he did not think grease bands had the least effect, it being a winged creature. As to the remedy, he was afraid he could not tell one at present. A lime and salt wash had certainly checked it materially.

Mr. W. COLLINGS said if they kept their orchards clean they would not have much trouble with the weevil.

Mr. WALTON said caustic washing did good.

Mr. BAKER said that, on the whole, fungicides were preventive, whereas insecticides were remedial. What they ought to aim at was not so much to find a remedy, but to get a class of plants which had high constitutional strength, or to be able to cultivate them in such a way that they should be less pestiferous. Some plants and trees were horribly infested, others only slightly. There must be some reason for this.

Professor THEOBALD, replying to further questions, said spraying should only be done when necessary. If they were to spray five, six, or ten times a year, where were their profits coming from? He had never come across any preparation that would kill the caterpillar.

Mr. PERCY BENYARD said nicotine would kill it.

The conference then closed, with votes of thanks to the chairman, readers of papers, and others.

DEVON & EXETER HORTICULTURAL

OCTOBER 23 & 24.—The autumn exhibition of this Society was held in the Victoria Hall, Exeter, on these dates, the hall being unobtainable in November. As a whole, the exhibition was fairly successful. The quality was of the highest, and the competition the keenest. In the fruit section Apples were especially good, and in nearly all cases of exceptionally high colour. Pears were only moderate in quality, and Chrysanthemums, because of the earliness of the date, uneven and indifferent in most of the classes. The finest exhibits were in the classes for special prizes, and these raised the tone of the exhibition.

CHRYSANTHEMUMS.—CUT BLOOMS.

A Silver Challenge Cup of the value of £30 was offered by Messrs. Sanders and Biss, horticultural builders, with a special prize of five guineas added by the president as the 1st prize, and three and two guineas respectively for 2nd and 3rd prizes in a class for 12 vases of Japanese blooms of distinct varieties, three blooms in each vase, four vases of incurved varieties, and eight vases of single Chrysanthemums. It resulted in a keen competition between the Rev. T. SHEEPSHANKS, Chudleigh (gr. Mr. Dunkley), and W. BROCK, Esq., Exeter (gr. Mr. Rowland). The 1st prize was made in favour of the Rev. SHEEPSHANKS, Mr. BROCK being awarded the 2nd prize. In Mr. SHEEPSHANKS' group were good specimens of General Hutton, Sir C. Clements, Mrs. A. T. Miller, Mrs. G. Mileham, Mrs. Norman Davis, F. S. Vallis, Florence, Fenford, Paul, P. Radwell, Mrs. J. Haggart, Madame G. Rivoli, and in singles Mary Kitchinson, Lillie Godfrey and Freedom. To this group was awarded the large Silver Medal of the N.C.S. for the finest professional exhibit in the show and the small Silver Medal for the best incurved bloom.

In the class for 24 Japanese blooms, in 18 varieties, the Rev. T. SHEEPSHANKS was again 1st, his collection including Mrs. F. S. Vallis, Mrs. A. T. Miller, Miss E. Fulton, Alcegon Davis, Mrs. W. Duckham, Mrs. A. H. Lee, and President Vigor. 2nd, W. BROCK, Esq.

For the best 12 blooms of Japanese Chrysanthemums distinct, Rev. T. SHEEPSHANKS was again 1st. In the less important classes competition was not very keen.

In the classes confined to amateurs, Mr. C. M. COLLINGWOOD was awarded the large Silver Medal of the National Chrysanthemum Society for the best exhibit by an amateur in the show, and the small Silver Medal for the best Japanese bloom, the variety being Mrs. A. T. Miller. Mr. COLLINGWOOD'S blooms were exceptionally good, among his best examples were Valerie Greenham, Mrs. Willie James, Mrs. A. H. Lee, Mrs. W. Duckham, Mrs. K. Hooper Pearson, and Mrs. G. Mileham.

The competition for table decorations was not strong, only four exhibitors competing. The 1st prize was won by Mrs. Smale for a lightly-arranged table.

In the classes for table and flowering plants, Cyclamens, Bouvardias, Violets, Solanums and Salsvias were exhibited, as also were some well-grown Begonias, Palms, Codiaums and other foliage plants.

FRUIT AND VEGETABLES.

In the Grape classes, SIR DUDLEY DUCKWORTH KING (gr. Mr. Sidney Baker) and Rev. F. W. HAMILTON GELL (gr. Mr. G. Barnes) shared the honours, both showing well-berried bunches of Black Alicante and Muscat of Alexandria, which were remarkable for good bloom and general high finish.

For a collection of fruit a challenge cup was offered by T. LINCOLN, Esq.; it was won by SIR DUDLEY KING, with Royal Jubilee Melon, Primstons Duchess, Duchesse d'Angoulême and Doyenné du Commerce Pears, and Cox's Orange Pippin, and King of Tompkins' County Apples.

For a collection of 24 varieties of Apples, 12 dessert and 12 culinary kinds, the 1st prize was won by Sir W. A. FERGUSON-DAVIE, Bart., (freely) Bart. (gr. Mr. W. Seward), B. H. SALL, Esq., Newcombes (gr. Mr. G. Lock), being a close second. In both collections fine and highly-coloured fruit was shown.

In the class for five dishes of dessert Apples, SIR DUDLEY KING was 1st with fine specimens of American Mother, Ribston Pippin, Blenheim Pippin, Cox's Orange Pippin, and King of Tompkins' County.

J. F. G. BANNATYNE, Esq., Haldon (gr. Mr. Lillicott), was 1st in the similar class for culinary varieties.

For the "any other" dessert class T. KEKEWICH, Esq., of Peamore (gr. Mr. Abram), won the 1st prize with King of Tompkins' County, and Mr. H. H. WIPPELL was placed 1st with Queen Anne in the class for the best five culinary Apples.

Pears.—B. H. HILL, Esq., was first for a collection of nine varieties of Pears, including six dessert and three culinary sorts, Rev. H. CLEEK, (freely) Bart. (gr. Mr. T. W. Seward), and Dr. SALL, Esq., of St. George (gr. Mr. C. A. Williams), being 1st respectively for the best three varieties of dessert and three culinary varieties of Pears.

Vegetables.—The collections exhibited for prizes offered by the Society, and by Messrs. Robert Veitch & Son, Sutton & Sons, Carter & Co., and Jarman & Co., brought out exceedingly close competition, and some grand produce was staged.

In the class for a collection of eight distinct kinds, B. H. HILL, Esq., "Credito" (gr. Mr. Lock) was awarded the 1st prize, and he was closely followed by Mrs. GIDLEY, Hoopern House (gr. Mr. W. R. Baker).

Mrs. GIDLEY won the 1st prize in Messrs. R. Veitch & Sons' class. Dr. GAMWAYS won the premier prize in Messrs. Sutton's and Messrs. Carter's classes, and the same exhibitors were equal in the class in which Messrs. Jarman offered special prizes. In nearly all cases the same types of vegetables were noticed, viz., New Intermediate carrots, Cranston's Excelsior or Ailsa Craig Onion, International Prize Leek, Satisfaction or Factor Potato, Glory or Perfection Tomato, Autumn Giant or Michaelmas White Cauliflower, Improved Parsnips, Exhibition Sprouts, Perfection Beet, Red Garden Globe Turnips.

The trade exhibitors included Messrs. ROBERT VEITCH & SON, Exeter; Messrs. JARMAN & CO., Chard; Messrs. SAUNDERS & BISS, Mr. EDWARDS, and others, while some interesting exhibits, not for competition, were sent by the Bishop of EXETER, Major BRIDGES, and Mr. LYTALL.

NATIONAL CHRYSANTHEMUM.

OCTOBER 26.—A meeting of the Executive Committee took place on this date at Carr's Restaurant, Strand, Mr. T. Bevan presiding. After the adoption of the minutes, the Hendon and District Chrysanthemum Society was admitted in affiliation. The interim financial statement was submitted, showing the balance in hand. It was announced that the dinner would take place on November 26, at which the president, Sir Albert Kolitt, will preside. Judges were elected for the ensuing exhibition, and it was arranged that the Dean Memorial Medal be awarded to the best exhibit in 10 classes 25 to 30, 34, and 38 to 41 inclusive. Five new one-guinea Fellows, eight members at 10s. 6d., and 16 ordinary members were elected.

At a meeting of the Floral Committee, held on the same date, First-Class Certificates were given to the following varieties:—

C. *Hilda Lawrence*.—See description on p. 315.

C. *J. Locke*.—A large, yellow Japanese variety.

C. *Exquisite*.—Large, red Japanese, with long, drooping flowers, with yellow reverse.

C. *Lady Letchworth*.—A large, clear, rather pale yellow variety.

C. *W. J. Davis*.—Chestnut-red Japanese; large flowers with drooping florets.

The above were from Mr. MILEHAM.

C. *Master Dan*!?.—See description on p. 315.

C. *Sir Frank Crisp*.—See description on p. 315.

C. *Lady Crisp*.—A large yellow Japanese variety, from Mr. H. PERKINS, Henley-on-Thames.

C. *H. W. Thorp*.—See description on p. 315.

C. *Rose Pochett*.—A large Japanese variety, from Messrs. WELLS & Co., Merstham.

C. *Mrs. R. H. B. Marsham*.—See description on p. 315.

MARKETS.

COVEY GARDEN, October 28.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday by the kindness of several of our principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the way in which they are offered, the supply in the market, and the demand, and they may fluctuate, not only from day to day, but occasionally several times in one day.—ED.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices. Includes items like Asters, Azalea, Calla, Camellias, Carnations, Chrysanthemums, Dahlias, Eucharis, Gaillardias, Gardenias, Gladiolus, Hyacinths, Lilac, Lilies, Magnolias, Marigolds, Mimulus, Pansies, Petunias, Ranunculus, Roses, Snapdragons, Stocks, Sweet Peas, Tuberoses, Violets, and Zinnias.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and their prices. Includes items like Hardy foliage, Holly, Laurus, Myrtle, and various types of hedges and screens.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various plants in pots and their prices. Includes items like Begonia, Calceolarias, Cyclamen, Fuchsias, Geraniums, Impatiens, and various types of ferns and foliage plants.

Plants in Pots, &c.: Average Wholesale Prices (Cont'd.).

Table listing various plants in pots and their prices. Includes items like Marguerites, Pelargoniums, Solanums, and Verbena.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices. Includes items like Apples, Lemons, Limes, Peaches, Pears, and various types of berries and nuts.

REMARKS.—English Apples are arriving in large quantities, especially from Kent, but trade in this fruit is very quiet except for choice dessert kinds, and medium sized clear-skinned culinary varieties. Apples from Nova Scotia are

GARDENING APPOINTMENTS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be gratefully received, and an acknowledgment made in these columns.]

Mr. W. ROGERS, until recently Gardener to J. M. Gordon Esq., Arden, Holywell, Surrey, as Gardener to Sir Walter Bartelot, Bart., Stopham House, Fulbourn, Sussex.

Mr. A. BENNETT, for the past 34 years Gardener at Newton Sygne Hall, Andover, and formerly for 7 years Gardener to H. Stanton, Esq., at Teynton Court, Hereford, as Gardener to the same gentleman at Shelton Hall, Ashbourne, Derbyshire.

Mr. MCDONALD SKINNER, for the past 3 years Foreman at The Marfords Gardens, Broadborough, Cheshire, as Gardener to J. Herbert Grogan, Esq., Slaney Park, Balinglass, Co. Wick, Ireland.

Mr. G. CARROLL, for the past 9 years Gardener at Uvedale Hall, Needham, Hampshire, as Gardener to Capt. Garstoe-Diffing, Dunburgh House, Bedford.

Mr. G. W. WYATT, for the past 34 years inside Foreman at Leonardslie Gardens, as Gardener to J. Stuart, Esq., Stonehurst, Ardingly, Sussex.

Mr. F. GREEN, for the past 23 years Foreman at Cliffe Hill Gardens, Lighters, as Gardener to Lord GREY, Enville Hall, Stonbridge.

Mr. JOHN BARTON, as Gardener to Mrs. J. S. Clayton, at Standfield, Wavertree, Liverpool. Mr. Barton succeeds his father, lately deceased, who was in the service of Mrs. and the late J. S. Clayton, Esq., 41 years. (Thanks for your contribution of 2s. 6d. to the R.G.O.F. box.)

Mr. ROBERT SOUTER, General Foreman at Roscoe Castle, Montrose, N. B., as Gardener to J. Moncrieff Wright, Esq., Kinnoull, Bridge of Eam, N.B.

Mr. JAS. W. SMITH, for the last 9 years Gardener to the Rt. Rev. Lord Bishop of Newcastle, as Gardener to G. Singer, Esq., Coudon Court, Coventry.

Mr. C. J. CURTIS, for the past 15 years Gardener to T. G. Cornwall, Esq., at Fairway, near Carlisle, as Gardener to G. S. Lyvagar, Esq., Mynehead Court, Wellington, Somersetshire. (Thanks for donation of 2s. G.O.F. box.)

Mr. A. WILKINSON, for the past 4 years Gardener to Mrs. Hamilton, Crown Lane End, Streatam Common, has removed with that lady to Ilstone House, Stokenchurch, Buckinghamshire.

Mr. FRED. C. LING, late Gardener to J. F. Campbell, Esq., Woodseat, Uttoxeter, Staffs., as Gardener to W. Middleton Campbell, Esq., Fen Place, Turner's Hill, Sussex.

selling freely and at satisfactory prices. There still continues to be a good demand for Pears, especially those from California. Best samples of Alford Grapes are dearer, and there is every prospect of their being a good trade in these Grapes for the winter. A few French continue to arrive, principally from Bedfordshire. Supplies of Blackberries are nearly exhausted and good samples are making high prices. There are some good fruits of Cox's Orange Pippin Apples, packed in trays; and they are readily disposed of at prices which English buyers are still firm; French Tomatoes are finished. Scarlet Runner Beans are practically over for the season, and the first consignment of Jersey-grown peas has just reached the market. Good quality pods realising 10d. to 1s. per lb. Asparagus is seen in the market; both Paris Green and Sprue are selling freely. Trade generally is quiet. *E. H. R., Covent Garden, Wednesday, October 29, 1908.*

REMARKS.—Prices are about the same as those of last week. The supply is equal to the demand. Trade is generally fair. *Edward J. Newbom, Covent Garden and St. Pancras, October 29, 1908.*

COVENT GARDEN FLOWER MARKET.

During the past week there has been a slight improvement in trade, although generally prices are lower than is usual at this season of the year. Hardy flowers are still plentiful, and this, in conjunction with the depression in commercial circles, has had a bad effect on the value of flowers cultivated under glass.

POT PLANTS.

Trade has somewhat increased, but prices do not advance. Several persons who sell on commission have stores outside the market, and it seems more than ever necessary that those with stands in the market only should have the advantage of an extra hour to clear their stocks. Chrysanthemums are procurable in all colours. Kathleen Thompson is very good, and that the colour varies, and growers should see that only the plants producing the brightest flowers are used for sale purposes. Kathleen Thompson is very good, and that of a pretty pink shade, with a bronzy-yellow reverse, that should be suitable for market work. Le Pacato's is very good, also Mrs. Wingfield. Erica hymenalis is beautifully flowered, but the plants are very cheap. Ericas in small pots sell well. Plants of Begonia Gloire de Lorraine are abundantly flowered, but there is a limited supply at present. Lilies of best quality have not been quite so plentiful. Marguerites are good; also Zonal Pelargoniums. Ferns vary but little. Neprolepis Toulouides has taken the place of N. Pieronii, but although it is one of the prettiest of ferns it does not sell so readily as do well-grown plants of N. exaltata. Asplenium Nidus continues in demand. There is not such a large call for Adiantums as formerly, and it is remarkable that there is little trade in hardy Ferns.

CUT FLOWERS.

Although some salesmen may demur to the statement, trade has somewhat improved. And there are not so many flowers left over at the close of the market as were seen a few weeks ago. Roses are not abundant, and their prices are, therefore, very supplies seem equal to all demands. Carnations also are of slightly better value. Of Violets good *Parma*s are noticed from France. Chrysanthemums are plentiful, and a good feature in cut flowers. French-grown Lilac is good. Also the French *Paper-white Narcissus*. Camellias are plentiful. Also *Gardians*, *Lapagerias* and *Tuberoses*, and supplies of *Berberis* have fallen in value. There are still large supplies of Dahlias, Asters, and other garden subjects. *A. H., Covent Garden, Wednesday, October 29, 1908.*

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending October 23.

The first keen frost of the present autumn. After eight cold days the weather has to-day become warmer. On two days during the week the temperature in the thermometer screen did not rise above 47°, and on all but one night the exposed thermometer registered a reading below the freezing-point. On the coldest night the same thermometer stood at zero of frost—which is the greatest cold recorded here since the cold period in April. The ground temperatures have gone on considerably lower, and are at slightly cooler at 2 ft. deep, and 1° colder at 1 foot deep, than is reasonable. Rain has fallen on all but one of the last twelve days, and to the total depth of nearly 2 inches. During the same period seven regions of rain-water have fallen, and the best rain-gauge, and four gauges through that on which short grass is growing. The sun shone on an average for 2 hours 38 minutes a day during the week, and the average during the latter part of October. Calms and light airs from the north or north-east have mostly prevailed. The mean amount of moisture in the air at 3 o'clock in the afternoon exceeded a reasonable quantity for that hour by 6 per cent. My Dahlias were killed by the frost on the night of the 24th, which is eleven days earlier than the average date of their destruction in the previous 29 years, and the weather was earlier than last year. *E. M., Bickhamstead, October 28, 1908.*

SCHEDULE RECEIVED.

Bromley Chrysanthemum Society's annual exhibition, to be held at the Drill Hall, Bromley, on Wednesday and Thursday, November 4 and 5, 1908. Hon. sec., Mr. R. S. Fothergill, The Gardens, Bromley Place.

BEGONIA BLOOM: C. H. H. The flower presents an abnormality not uncommon in Begonia flowers. It represents a male bloom that is partially transformed into a female blossom, and the character of the male flower is not altogether eliminated, as is evidenced by the traces of stamens which are present. You are wrong in your supposition that Begonia Gloire de Lorraine does not produce pollen. Instances are frequent in which not only pollen has been produced, but also perfect seeds, which have germinated.

BROOM-RAPE: E. C. S. It is not uncommon for this parasite (Orobanchae) to be found on roots of Heliotrope. Can you send us the specimen?

CHRYSANTHEMUM: D. The foliage shows no trace of rust, or any other fungus disease; but, from the dry specimens, it would be fruitless to speculate on the cause, which may possibly be quite local.

CORRECTION:—Owing to a misprint, the name of Mr. Will Taylor, Hampton, who won the 1st prize in one of the nurserymen's classes at the R.H.S. Fruit Show, appeared in our report last week as Mr. Will Taylor.

CREOSOTE POLES AS SUPPORTS FOR PLANTS: R. H. Creosote is poisonous to vegetation, and creosote fumes from wood blocks in a public roadway have been known to kill plants. It may be better therefore not to creosote the ends of the poles, but to char them.

EXHIBITORS AT FRUIT SHOWS: P. A. M. If the judges requested exhibitors to leave the hall during the act of judging, and one exhibitor in particular refused to go, or succeeded in evading the request, the judges had it in their power to appeal to the officials of the show, who would doubtless have seen that the request was complied with. From every point of view, it is undesirable that exhibitors should be allowed to be present at any show during the time the judges are engaged in making their awards. You ask us in this case whether we think the judges should have awarded the first prize in favour of the exhibitor who evaded their request to leave, but we do not know sufficient of the circumstances to determine this question. It would seem, however, that the judges themselves were satisfied, and there appears to be no reason to dissent from their decision.

GRAPES: A. M. Andie. No fungus was present on the Grapes. The injury is due to some local cause. You had better examine the roots and the border in which they are growing, taking care to see that the drainage is in good condition.

MARCHEAL NIEL ROSE: T. E. B. The leaves are killed by a fungus (*Asteroma roseae*). Burn all diseased leaves, and spray the plant next spring with the raw foliage as unfolding, with a rose-red solution of permanganate of potash.

MEDICAGO MACULATA: A. E. This is a British species, and is known as the Spotted Medick. It has no commercial value. All the pods of *Medicago* species are much curved, some being spirally twisted. The dried pods are brown.

ORCHARD CULTIVATION OF FRUIT TREES: *Plum.* You had better apply to some of the fruit-tree nurserymen or insert an advertisement in some horticultural journal. We believe there are certain market cultivators of fruit who accept young men as students on payment of a premium.

PALM: P. R. S. The fungus present is *Graphiola phoenicis*, a scourge on plants of Phoenix under glass. Scourge the leaves with a solution of soft soap, in which is dissolved sufficient permanganate of potash to form a rose-red solution.

NAMES OF FLOWERS, FRUITS AND PLANTS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to disorganise the preparations for the weekly issue, or encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time; they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. Correspondents not answered in one issue are requested to be so good as to consult the following numbers.

FRUITS: *Culinary.* 1, Ecklinville Seedling; 2, Bramley's Seedling; 3, Noneseuch; 4, Nonpareil; 5, Tower of Glamis; 6, Lord Derby; 7, Marlow; 8, Royal Gloucester; 9, R. Harvey's Defiance; C. S. C. 1, Rymer; 2, Golden Winter Pearmain;—*W. D.*, St. Leonards; 1, Warwickshire Pippin; 2, Cornish Aromatic; 3, Claygate Pearmain;—*A. Moore.* There were no numbers attached to fruits. Please send again, and number each specimen with figures written on stamp paste and affixed to each specimen.—*G. S.* Pear Pitamston Duchess; Apples, 1, Northern Greening; 2, D'Arcy's Spice; 4, Hambleton Deux-ans; 5, Baxter's Pearmain;—*P. M.* 1, Queen Caroline; 2, Yorkshire Greening; 3, Manx's Collin; 4, Bramley's Seedling; 5, Court-pendul-pail; 6, Vicar of Winkfield;—*J. G. Louisa.* Cox's Orange Pippin;—*J. A. S.* 1, Lady Lennox; 2, Maltster; 3, Small's Admirable; 4, Duke of Devonshire; 5, Ashmead's Kernel; 6, Lord Derby; 7, not recognised;—*S. J.* Small's Admirable; 2, Kenette tres Jardine; 3, Prince Alliance; 4, Warner's King;—*Miss Crofton.* Beuré d'Amaluis;—*Apple.* A Worcester Pearmain; B, Peasgood's Noneseuch; C, London Pippin.

PLANTS: *F. W. C.* Salix pentandra.—*A. R.* 1, probably a variety of *Cupressus obtusa*. 2, *Cupressus obtusa tetragona aurea*; 3, *Cupressus obtusa var. lycopodioides*; 4, *Olearia Haastii*; 5, *Deutzia crenata*; 6, *Cupressus Lawsoniana*.—*W. J. M.* Pieroma (Tibouchina) macrantha.—*A. E. C.* 1, *Verbascum Lychitens*; 2, *V. nigrum*.—*H. A.* 1, *Odontoglossum mirandum*; 2, *Oncidium flexuosum*; 3, *Lelia albidum*; 4, *Sigmatostalix radicans*.—*V. F. T.* 1, *Pteris arguta*; 2, *Pteris longifolia*; 3, *Blechnum covocandense*; 4, *Lomaria filiculmis*; 5, *Asplenium dimorphum*; 6, *Adiantum caudatum*.—*E. H.* *Kuella macrantha*.

POT-POURRI: *M. L. Z.* Take the rind of two lemons (cut thinly), one pound of bay salt, one ounce of powdered Orris root, one ounce of Gum Benzoin, one ounce of Cinnamon, one half-ounce of Cloves, one ounce of Nutmegs, one grain of Musk, 12 Bay leaves, a few Sage leaves Rosemary and Lavender cut small, one ounce of Lavender water, one ounce of Eau de Cologne, and one ounce of Bergamot. Mix all together in a pan, and add sweet flowers in their natural state as they come into blossom; stir up frequently—at least once a day. Put into a covered stoneware pot with a wooden spoon to stir it with. At the end of two months the tin will be a fragrant mass. You may fill a number of Japanese rose jars. From time to time throw in fresh Rose petals. There are several other receipts for making Pot-Pourri.

SEED POD FROM UPHOLSTERER: *F. M. N.* The pod you send from the upholsterer's padding is a seed of the Mango (*Mangifera indica*). This fruit is in no way connected with the substance known as "Kymer," which is presumably the floss of silk-cotton from the seed of a species of Bombax.

SIEVE OF PLUMS: *B. D.* A "sieve" is not a standard measure. The "sieve" varies in size; but one of Plums averages 56lb.

HOW TO CONSTRUCT COLD CHAMBERS.

LIKE electricity, cold storage is finding its way into many industries, and has already established itself as a most important adjunct to the business connected with the handling of bulbs. According to experiments that have been made on the Continent, by the Professor of Agriculture of the Côte d'Or, France, who is also a director of one of the large cold storage companies in Paris, its use might be very much further extended. According to Professor Verrier's experiments, it has been found possible to keep certain cut flowers in all their freshness for long periods, up to as much as six weeks, in cold store, and also to retard plants whose buds are on the point of opening. The importance of both of these objects will be apparent to those engaged in the flower trade. The market sometimes suffers from a glut, and on those occasions it would be both convenient and profitable to store the surplus, just as the surplus fruit and other produce is stored in America, until the glut has passed. It would also be both convenient and profitable to florists generally to be enabled to retard the blooming of certain plants for certain occasions Professor Verrier has pointed out in

a paper read before the French Horticultural Society that it often happens that certain flowers are sure of a very good sale if they are ready on a certain day, such as that of a particular fête. It unfortunately sometimes happens that the plants mature a little before their time, and consequently have finished blooming before the fête day arrives, and the sale is lost in consequence. By placing the plants in cold store a sufficient time before they are required they could be produced as the demand for them arises.

WHAT A COLD STORE IS.

A cold store, or a cold chamber, may range in size from the ice cabinets, or ice closets as they are called, that are often seen in hotel coffee-rooms, up to the enormous buildings to be seen, for example, on Thames Side, where very large quantities of produce of all kinds are kept at various temperatures. The principle upon which all of them are constructed is the same, the differences in actual details being such as are due to the different quantities of produce to be handled.

In all cold storage there are two considerations to be kept in view. Heat must be prevented from passing into the closet or chamber from the outside atmosphere as far as possible, and the undesired heat already there—the heat in the produce and the heat which passes into the chamber—must be removed.

The first part of the problem is solved by constructing the cold chambers with linings of special materials known as thermal insulators. Electrical engineers, it is well known, cover their wires and other conductors with certain substances to prevent the electrical currents from leaking out. Similarly, refrigeration engineers line the chambers in which produce is stored with certain substances to prevent the heat from leaking in.

Just as there are certain substances which prevent the passage of electricity through them, called electrical insulators, so there are certain other substances which prevent the passage of heat through them, and are thus called thermal insulators. But not any of the insulating substances are able to completely prevent the passage of electricity or heat through them, but by a proper application of a sufficient thickness of these substances the leakage can be reduced to negligible proportions. The expense of the installation becomes prohibitive if perfect insulation is demanded. In practice, the refrigeration engineer strikes a balance. He insulates as far as his client will allow him, and the apparatus to be described has to make up the difference; that is to say, it has to extract the heat which the defective insulation allows to pass in.

There are a number of thermal insulators, and steam engineers use several of them for covering steam pipes, boilers, engines, &c., in

order to prevent the heat of the steam from passing outwards. The materials used by steam engineers are not usually employed by refrigeration engineers, though any one of the large number of substances could be employed, either for insulating steam pipes or for insulating cold stores, with proper arrangement. Practical experience, however, has shown that a few substances answer best for cold chambers, taking everything into consideration—silicate cotton, flake charcoal and cork. In addition to these, sawdust, ordinary wool, and straw are sometimes employed. Of all thermal insulators, however, still, dry air is by far the best, and it is often employed for the small cabinets used in hotels, &c. It is not em-

FIG. 133.—METHOD OF BUILDING INSULATED WALL FOR COLD STORE, AS ARRANGED BY MESSRS. W.M. DOUGLAS AND SONS.

ployed for larger work, on account of the difficulty of keeping the air still and dry over large areas. It is an important condition of all of the insulators named that they shall be absolutely free from moisture when employed, and for that reason the first three—silicate cotton, charcoal, and cork—are preferred by refrigeration engineers, as it is so much easier to keep them dry than the other substances.

In building a cold chamber also, special precautions must be taken to ensure that wet shall not penetrate to the thermal insulator lining. As is well known, bricks hold a large quantity of moisture even in comparatively dry weather; wood also contains moisture, and if this is allowed to penetrate to the in-

FIG. 134.—METHOD OF BUILDING INSULATED WALL FOR COLD STORE, AS ARRANGED BY MESSRS. H. J. WEST AND CO.

insulator the value of the latter is very largely reduced.

The insulation of any cold chamber or cold cabinet consists, then, in lining it on all sides as well as on the roof and floor with a thermal insulator, protected from moisture. In the case of the small cabinets, they are constructed very much on the lines of the puzzle-boxes that are sold to children, one box inside another, with a space between the two, the inside box being supported by the outside, and the supports tending to break up the air space between the two. The wood employed should be thoroughly dry, and the space is sometimes packed with sawdust or one of the other insulators mentioned, but in the majority of cases the effect due to the air space itself proves sufficient.

For larger chambers, for what would be termed cold stores proper, that is to say, for rooms in which men can walk about, and in which shelves or other arrangements to hold the produce can be fixed, the usual lines of construction are as follow:—The chamber is built in the usual way, of brick, stone, wood, or any other substance, except metal. It may be part

off by switches outside the chamber, and the doors are constructed on exactly the same lines as the walls, with insulating material carried in a space in the door provided for it, the space being lined with insulated paper as in the case of the walls. Where it can be arranged, also, it is wise not to allow the doors to open directly to the outer atmosphere. In large stores the doors often open on to either a corridor or vestibule. When entering any of the chambers, the door of the corridor or vestibule is first opened, and closed behind those entering. Then the door of the individual chamber is opened, and again closed behind them.

HOW THE HEAT IS CARRIED OFF.

It will be understood that the insulation of the cold chamber, whatever its size, is by far the most important part of the problem. It would be quite possible, under certain conditions, to dispense with the apparatus to be described for carrying off or absorbing heat. If, for instance, certain produce, say, certain bulbs, were placed in a cold chamber or cabinet at a

small chambers such as are built for the use of butchers, &c., the heat is absorbed by a quantity of ice or ice and another substance. This forms what may be termed a store of cold. That is to say, every pound of ice in melting will absorb a certain definite quantity of heat, and if a certain number of pounds of ice are placed in a cold cabinet or cold chamber, the ice will absorb the heat that passes through the walls or that enters by the door as long as any of it remains, and after it is melted, the water will continue to absorb heat until the temperature of the water formed from the ice is equal to that of the surrounding atmosphere.

The cooling effect or the absorption of heat by a given quantity of ice may be increased by crushing the ice and mixing it with certain substances, such as common salt, carbonate of soda, and others. Carbonate of soda, the common washing soda, is a suitable substance. When a mass of crushed ice and carbonate of soda is placed in a cold chamber a certain portion of the ice melts, thereby absorbing a certain quantity of heat. The water so formed dissolves a certain portion of the

FIG. 135.—METHOD OF BUILDING INSULATED FLOOR FOR COLD STORE, AS ARRANGED BY MESSRS. W.M. DOUGLAS AND SONS.

of a building, provided the arrangements can be made to insulate the walls the floor and ceiling, in the manner now to be described. On the inside of the walls it is usual to build a lining of match-boarding, the boarding made with tongues and grooves to fit into each other. On the inside of this is placed one or more thicknesses of a special waterproof paper. At a certain distance inside of the wood lining a second wall is built of match-boarding, supported by uprights and by joists from the outside wall. The outer face of this inner wall is also covered with one or more thicknesses of the waterproof paper mentioned above, so that the two surfaces of waterproof paper face each other. It will be seen that a space is provided between the two walls of match-boarding, and into this space, which varies from about 4 inches upwards, one of the insulating substances mentioned above is filled and rammed well down. Figs. 133 and 134 show sections of insulated walls of cold stores, as arranged by two of the leading firms. The arrangements, it will be noted, are slightly different, but the principle is the same. In building the cold chamber it is necessary to see that the wood is dry and that this space provided for the insulating material is also dry. In some cases the process is repeated. That is to say, a second inner wall of match-boarding is built inside of the first one, enclosing a second space between it and the first wall, the two faces of the two walls opposing each other being covered with special waterproof paper and the space between being filled with insulating material.

The ceiling is treated in very much the same way and also the floor, but asphalt is sometimes partly employed to form the floor, in order that sufficient strength may be obtained. Figs. 135 and 136 show sections of insulated floors by the same firms.

The resistance, as engineers express it, opposed to the passage of heat through it by the insulating substance depends directly upon its thickness, providing that it is dry and thoroughly well packed. If it is loosely packed, or if moisture is present, convection air or vapour currents are set up, which reduce the insulating properties. The quantity of heat that can pass through such a wall also depends directly upon the extent of its surface, so that it is not wise to build cold chambers larger than a certain size, unless a corresponding increase in the thickness of the insulation be also provided.

In addition to the insulation of the walls, floor, &c., built up as described, the outsides of structures exposed to the sun and to severe weather are usually protected by insulating substances made in sheets or plates, and specially designed for the purpose. It is important, in particular, to protect the roof in this way from the sun's rays. Cold chambers are always constructed without windows and are lighted where it is necessary by electric lights, turned on and

period of the year or in a climate when the temperature was below freezing, provided that the insulation of the chamber was sufficiently good, the bulbs or other produce should be kept in good condition for a considerable time without the aid of any other apparatus, because the temperature within the chamber should be maintained at a degree not greatly above that at which the produce was stored in the first instance. In practice, however, it is always found necessary to provide some means of absorbing the leakage heat, in some cases that of the produce when first stored, and nearly always that in the air of the chamber. Warm air will enter the cold chamber or cabinet, for instance, whenever it is opened, even though the precaution of providing vestibules be taken. There is also in practice always a certain amount of leakage through the walls, ceiling and floors. In too many cases the owners of cold stores do not spend enough upon the insulation of the cold chambers, and it has to be made up in the apparatus for lowering the temperature. In the case of the small cabinets and of

carbonate of soda, and in so doing calls for a further quantity of heat, which is also absorbed from the inside of the chamber, so that the cooling effect or the time during which the low temperature can be maintained

FIG. 136.—METHOD OF BUILDING INSULATED FLOOR FOR COLD STORE, AS ARRANGED BY MESSRS. H. J. WEST AND CO.

FIG. 137.—COLD STORAGE CABINET MADE BY MESSRS. W.M. DOUGLAS AND SONS. THE BULBS, ETC., TO BE KEPT AT A LOW TEMPERATURE CAN BE PLACED ON THE SHELVES IN THE LOWER PART OF THE APPARATUS; THE ICE IS PLACED IN THE CAGE SHOWN IN THE UPPER PORTION.

is considerably increased by adding carbonate of soda or some other substance to the ice. The ice, or the carbonate of soda, are placed inside the chamber—in a receptacle, so arranged that the liquid formed can flow into another receptacle, but so that no moisture passes into the space where the produce is held. It should also be arranged that the air of the chamber has free access to the receptacle containing the ice or the freezing mixture, as the mixture of ice and another substance is called. What are called convection currents are always set up within a cold chamber. The air which impinges upon the receptacle containing the ice becomes heavier than the surrounding air and falls to the bottom of the chamber, its place being taken by other air, which falls in its turn, and so on, a certain circulation of the air being set up, which tends to distribute the cooling effect all over the chamber. In addition, where it can be arranged, the circulation of the air may be assisted by one of the electrically-driven fans that are now so common. Fig. 137 shows a form of ice cabinet, or small refrigerator, as they are often called. *Sydney F. Walker.*

(To be continued.)

VEGETABLES.

PEA LATE QUEEN.

THIS variety is a good one for producing a large crops of pods through September and October; indeed, in deeply-dug and well-manured soil, I have had Peas from this variety in the northern parts of the country even later than those dates. The plants produce a robust growth, and are quite free from the attacks of midew, a troublesome pest with late Peas. It has broad, fleshy, dark-green pods, covered with a dense bloom, and tightly packed with Peas of delicious marrow flavour. Owing to its hardy constitution, it is one of the best varieties for garden culture. In poor soils on gravel late Peas are not always a success, and, no matter what variety is grown, special culture is needed; in such cases I would advise shallow trenches for the latest supplies. If an ample supply of manure is placed in the trenches, taking care to deeply dig and incorporate the manure with the soil, and an open position is selected, Sutton's Late Queen is one of the latest-bearing Peas.

SUTTON'S "EVERY DAY" CUCUMBER.

THIS variety is certainly an ideal one for fruiting in winter. It is notable for its perfect shape (even at the season named), its short-jointed growth, great freedom in setting, and perfect colour. The seeds are so few that in the winter months the fruits are almost seedless. To get a full winter supply, we had two sets of plants in the same house, some planted out, and a later lot in pots at the back of the house. Even in the worst seasons the last-named gave us late fruits and kept the table supplied till the spring plants came into bearing. The seeds should be sown in September or early in October, and the plants may then be depended upon to fruit in mid-winter. *G. Wythes.*

CYTISUS × KEWENSIS.

THIS pretty hybrid Broom was raised in the Royal Gardens, Kew, and is the result of crossing *C. Arduinii* and *C. albus*. The plant makes an excellent garden subject, and is adapted for planting in positions of a rock-garden where dwarf shrubs can be utilized. The shoots in early summer are crowded for more than a foot of their upper parts with creamy-white scented flowers that have very large standards. Like most of the species of *Cytisus*, the leaves are trifoliate, the petioles and the young shoots being slightly hairy. The plant will thrive in any good garden soil, but prefers a deep loam.

FLORISTS' FLOWERS.

WHAT IS A FLORIST'S FLOWER?

THE publication by Mr. C. Harman Payne of his interesting *Florists' Bibliography* not un-naturally raises the question, "What is a florist, and what a florist's flower?" I had that question submitted to me quite recently in London, and I had to admit that had my late brother, Richard Dean, been alive, no one could have answered it better than he, with perhaps the exception of my friend James Douglas. There seems to be, however, a wide distinction between a florist as the term is used to-day, and a "florist's flower." My questioner has inferred, as probably many others have done, that florist's flowers were terms applied generally to all flowers grown or used by florists. That is, however, far from representing the original meaning of the terms. A florist to-day is anyone who grows, exhibits, or uses flowers, and in public estimation a person selling flowers for trade purposes is as much a florist as anyone else. But the term "florist's flowers" has, I take it, no such general appli-

have varied wonderfully. The Cactus Dahlia has excelled the Show and Fancy Dahlia, and the Chrysanthemum has been and still is a great competitive flower. The list might, of course, be still further extended. *A. D.*

ORCHID NOTES AND GLEANINGS.

DENDROBIUM BICAUDATUM.

THIS is not a handsome species, but it is remarkable in that it seems to connect the Australian species with those of Java, the native habitat of *D. bicaudatum*. In the habit of the plant the appearance of its pseudo-bulbs and hard, fleshy leaves, and in the general aspect of its flowers, it much resembles some of the Australian species. The flowers are produced on erect inflorescences, several on a spike, and each flower is about one inch and a half across. The lanceolate sepals and narrower petals are whitish, changing to greenish yellow, with some faint purple lines. The curiously elongated labellum is white, the side lobes are folded over the column and streaked with purple, the middle

FIG. 138.—CYTISUS × KEWENSIS: FLOWERS CREAMY-WHITE.

[Photograph by Miss Wallace.]

cation. Probably these terms originated with the old florists who took certain flowers in hand for the purpose of developing them, and, perhaps, for purposes of competitive exhibitions. The older florist's flowers were the show section of Auriculas, Tulips, gold-laced Polyanthus, Pansy, Laced Pink, Flaked, Bizarre, and Self Carnation, the Picotee, and Show Dahlia. Very likely there is a more complete list to be found in Glenny's *Properties of Florists' Flowers*, but Glenny was the Coryphæus of the old florists, and laid down the rules or points required in a good flower of any of the species named. Modernists may no doubt smile at these points or rules and treat them with derision, but if so they ignore all the results which have come to the floricultural world through the agency of these old and perhaps fastidious workers, who, in seeking to obtain the realisation of their ideas, at the same time did help to create races of flowers that are to-day filling our gardens with beauty. After the Show Auricula came the Alpine Auricula, a truly beautiful section, also the Fancy or Belgian Pansy, and the Viola. The Rose is now one of the grandest of florist's flowers, and the Pink and Carnation

lobe having several wavy ridges tipped with purple. It flowered with Sir Jeremiah Colman, Bart., Gatton Park (gr. Mr. J. Collier).

BULBOPHYLLUM LEMNISCATOIDES.

THIS remarkable Javan species is flowering for the first time in England in the collection of Sir Jeremiah Colman, Bart. The scape is erect, about 6 inches in height, and bears at the top an abruptly drooping raceme about 2 inches in length with about 20 flowers. These flowers are of remarkable structure, and repay the trouble of examining them with a strong lens in order to bring out the finer details. Each flower is furnished with a short bract, the ovary being green, with short, white hairs. The sepals are similar, deeply concave, dark purple, the exterior having short white hairs and each being furnished with a slender motile filiform appendage, white mottled with rose, which gives the whole inflorescence a tassel-like appearance. The labellum is dark purple, the small petals and columns whitish. It is a very remarkable species, allied to *B. lemniscatum* (Burma). It was collected by Mr. Connell above Soerabaya, Java.

THE ROSARY.

NOTES UPON NEW VARIETIES.

(Continued from page 306.)

EARL OF WARWICK (H.T., Wm. Paul & Son, 1904).—One can never pass this Rose in the garden without noticing it. As an exhibition Rose some say it is only found wanting in shape in the slightest degree; rather unfortunate this, for it is very near having taken a high place, and it is certainly a wonderful garden Rose. I am as great an admirer as anyone of Dean Hole, the best of our modern H.T.s (vide the Nickerson award), but I would rather (despite Dean Hole being a better exhibitor's Rose) couple these two glorious H.T.s as equal, than be forced to place them. How so, if I admit Earl of Warwick to be not as perfect in shape? Well, firstly, it will stand a shower of rain better, thereby being a better garden Rose; and, secondly, it is not subject to mildew, whereas Dean Hole generally suffers late in the autumn. This year it has stood the burden and heat of the day wonderfully. Come drought or come storms of rain it is the best H.T. of its colour,

nothing ill of it. Everyone who grows Roses should include this in their collection; it is the best perpetually blooming garden Rose yet introduced. The colour is coppery-rose, overspread with golden-yellow and the scent is delicious. Leonard Petrie, Gayton, Cheltenham.

(To be continued.)

LATE AUTUMN FLOWERS.

On coming home recently after a fortnight's holiday, I was much gratified to find so many flowers in my garden at this late season of the year. The Dahlias had come into bloom much later than usual; and the beautiful Cactus and decorative varieties were making a wonderfully effective display. The Chrysanthemums also, invaluable in October and even in November for garden ornamentation, were flowering profusely, though for many nights previously there had been several degrees of frost. But what chiefly surprised me on my return was to find so many of my finest Rose trees still making successful efforts to bloom. One of the most charming of miniature Noisettes, *Aimée Vibert*, had sent its graceful pendulous racemes through a lofty Hawthorn hedge at an elevation of not less than 15 feet. I have frequently seen it in

beautiful when in bud. It should be assigned a prominent position in every Rose garden. David R. Williamson. October 27.

THE TREE LUPIN.

The illustration at fig. 139 shows a variety of the tree Lupin (*Lupinus arboreus*) known as "Snow Queen." It has pure white flowers, and is the best variety in gardens. The specimen flowered in Mr. R. C. Notcutt's nursery at Woodbridge, Suffolk, and shows the free-flowering character so common in most of the species of Lupinus.

NOTES FROM A "FRENCH" GARDEN.

We are now "pricking off" Lettuces. Although the weather was very unfavourable for germinating the seeds, it is now suitable for transplanting. In many places germination was retarded owing to the dryness of the soil. We make it a rule not to water the seed beds, but have had to break it this year. Many plants are ready for transplanting at the same time, and if they cannot be put out quickly enough, Cos and Passion Lettuces in frames or cloches may be given a little air in the day-time to harden the young seedlings and prevent them lengthening, but this must be done with great care. Should the plants become too spindly it is better to throw them away; the pricking off can be continued, with good results, till November 8. Where possible, beds should now be prepared for the second transplanting of Cos Lettuces, which will take place at the end of November. Cloches which were used for the Lettuces last August will be available for this purpose, as these plants will be sent to the market in the middle of November.

Cauliflowers pricked off in the frames are now well established. As they require much fresh air we set the lights on bricks.

We are now breaking up the young shoots from the Globe Artichokes (*Cynara Scolymus*). They are potted into big 60-sized pots, in sandy loam, and set in frames for the winter. In March they are planted out at distances of 2 feet 6 inches apart in well-drained, heavily-manured ground. They do well here in the heavy clay and often bear before the old plants, which sometimes suffer during winter.

We are now sending to market the Celery which was grown in the old manure beds. They are well blanched, tender, and very clean. We shall grow a bigger quantity next year, as there will be more decayed manure available. It is not advantageous to grow too much Celery in a new garden, as the plants take most of the goodness out of the old bed, and this soil should be very useful for spring work. F. Aquilias, Mayland, Essex, October 19, 1908.

AMERICAN NOTES.

NEPHROLEPIS.

There appears to be a disposition to depreciate *Nephrolepis superbissima* in Europe and favour *N. Amerpohlii*. The two are so distinct that there should be room for both. *N. Amerpohlii* is a lovely plant for cutting, also for decoration in small pots, but in the case of large specimens, the pinnae, being so very double, make the fronds too heavy for the stems and they heel over. *N. superbissima*, on the contrary, is much stiffer and stands up well under all circumstances, making a fine market plant, though the individual fronds are not so delicate and beautiful as those of *N. Amerpohlii*. It is also a wonderful breeder, the stock benches being soon covered with "runners" after the plants are put out. I hear that Messrs.

FIG. 139.—LUPINUS ARBOREUS "SNOW QUEEN": FLOWERS WHITE.

which is a rich yet delicate salmon-pink, slightly shaded darker in the centre, sometimes being almost vermilion. It is a wonderfully free bloomer, a grand Rose, distinct, and of the greatest merit.

DEAN HOLE (H.T., Alex. Dickson & Sons, 1904).—The year 1904 certainly saw an exceptionally grand lot of new Roses introduced into commerce. This wonderful H.T., the winner of the Nickerson Award for the best of its class introduced in 1900 and subsequent years, has this year excelled itself; but enough has already been written of its merits. I would mention though, for the benefit of any who may not yet have it in their gardens, that besides being already No. 3 on the exhibition list of H.T.s, it has proved itself an absolute success as a "cut-back," and there is no doubt as to its being one of the very best garden Roses. The colour is silvery-carmine, shaded salmon.

BETTY (H.T., Alex. Dickson & Sons, 1905).—This is another Rose that has been so much discussed in the papers there is no need for me to say any more about it. Only believe good and

flower in November, but never growing to such an abnormal height. This is one of the sweetest of all the climbing Roses, and only requires the element of fragrance to bring it nearer to perfection. But there are few varieties, even of the Rose, that have not very obvious limitations, and among these, by reason solely of its lack of odour, is the otherwise incomparable *Frau Karl Druschki*, which even at this period is still flowering in my garden. A. K. Williams has also been showing its luminous colours very late this season, thereby making amends for its failures in July, when it came, characteristically, with hardened buds, incapable of development. Another brilliant crimson variety, and much more reliable, viz., *Captain Hayward*, has been remarkable for the extreme lateness and effectiveness of its intensely fragrant blooms. But the most perpetual of all my roses is *Irish Harmony*, which, when fully expanded, strikingly resembles a single *Dahlia* in appearance; it has never once rested from its floral efforts, since the leafy month of June. This Rose, which highly interesting at all stages, is especially

Pierson have another, even finer, variety, but *Nephrolepis* sports in the States are becoming as numerous as varieties of *Chrysanthemums*.

ROSE MRS. JARDINE.

REFERRING to this variety, a British paper speaks of it as having already made a great reputation in America. This is not altogether true, and the writer probably drew his conclusions from the fact that it has been largely advertised. We have nothing to say against the Rose in question, but it has its reputation all to make as yet, and thus I hope it will do.

THE CHICAGO SHOW.

If the National Flower Show in the present month at Chicago is not a success it will not be the fault of those who have the local management in hand. All are working with characteristic energy, and it is probable that Chicago, the home of big flower shows, will see something bigger and better than ever. While in most respects these do not come up to the best European shows for decorative features, some classes are extremely attractive. The immense vases of different flowers are bold and striking when arranged as they are by our best florists. But in the matter of grouping flowering and foliage plants there is often a lack of variety, while the skill in arrangement is far below the British standard.

MR. NICHOLSON.

THE news of the death of Mr. George Nicholson was received in America with great regret by all who knew him personally and by the far greater number who only knew of him through his services to horticulture, especially in his excellent *Dictionary of Gardening*, which is looked upon here, as in England, as a standard book of reference. H. R. R.

NOTICES OF BOOKS.

* THE FLOWERS AND GARDENS OF JAPAN.

THIS is one of a numerous series of handsomely got up books recently published by Messrs. Black. It is a square demy octavo very tastefully bound in cloth, and contains a series of charmingly executed full-paged reproductions in colour. The letterpress consists of a large, clear-cut type and runs into upwards of 200 pages. In the preface we are told that the book does not pretend to furnish a complete list of all the flowers to be found in the country, but rather to give a description of those which are most remarkable for their beauty and profusion. At any rate, the author has produced a most attractive volume, and the subjects dealt with are as varied as could be wished. The work covers landscape gardening, nursery gardens, Temple gardens, summer flowers, the Plum, Peach, and Cherry blossoms, Wistaria and Pæony, Azaleas, Iris, Lotus, Chrysanthemum, Maple, Bamboo and Pine tree, all of which have their special claim on the lover of flowers in the Land of the Rising Sun, and some of which enter so largely into the hearts of the people as to have their fête days duly allotted to them.

The text is full of most readable matter, and it is a long time since we perused a book on Japan with the same feelings of interest. All the chief features of horticultural beauty and peculiarity are touched upon, and here and there are some of the stories and legends attached to the favourite flowers of the Japanese.

One of the great charms of this volume is unquestionably the coloured plates, which are done in exquisite style and number 50 in all.

The book is in no sense a cultural work, but is an artistic, literary, historic and general treatment of Japanese gardening in its leading phases. To those who have already visited the country it will recall pleasant memories. C. H. P.

* Printed by Ella du Cane and described by Florence du Cane. (Adam and Charles Black, Soho Square, London.)

PANSHANGER, HERTFORDSHIRE.

(See fig. 140 and Supplementary Illustration.)

THIS beautiful Hertfordshire estate, the residence of Lady Cowper, is about three miles from the county town, but the visitor from London should alight at Cole Green, a small station distant not more than about one mile from the mansion. The park gates, however, are not far from the railway, the park itself covering a large area. The fruit and vegetable quarters and ranges of glass-houses are half-a-mile away from the residence. It is said there was an older dwelling-house about which the kitchen gardens were formed, but of this older building we saw no traces, and the new Panshanger stands on higher ground, in a setting of beautiful trees and surrounded by pleasure-gardens and lawns (see Supplementary Illustration). The noble conservatory, however (see fig. 140), is in juxtaposition to the residence, and there is also a smaller glass structure, a corner of which is seen in the right-hand side of the picture. This is used for displaying flowering plants, the conservatory being permanently planted with climbing species and arranged with Palms and other foliage plants,

and Sweet Chestnut, also nearer the house are Cedars, Irish Yews, *Sequoia gigantea*, Hollies, Rhododendrons and other trees and shrubs. An ornamental water basin, with a handsome vase rising from its centre, and planted with Nymphaeas, adds further charm to this portion of the pleasure-grounds, and there are several other ornaments in stonework. The south front is shown in the bottom picture of the Supplementary Illustration, and this spot commands a beautiful view of the park, whilst at the foot of the eminence on which the house is built flows the Mimram, a tributary of the River Lea. This stream flows through the park, and is the home of water-fowl, whilst its banks are beautiful with native flowering plants.

Box and Yew are largely employed as edging in the formation of flower-beds, as can be seen on reference to our pictures, and both these shrubs grow well, so that there is no patchy portion to damage the general effect. Opposite the main front is a sunken garden with five beds forming a design, and other beds are bordered with Box and planted with *Lobelia cardinalis* intermixed with *Iresine Lindenii*, *Cineraria maritima*, *Begonia Little Gem*, and blue *Ageratum*. On the western side is another lawn, and in the

FIG. 140.—VIEW OF THE CONSERVATORY AT PANSHANGER.

some in beds and others in tubs or large pots. On the occasion of our visit in the last week in October, the beautiful autumn tinting of the trees and shrubs was attractive, and there were still plenty of flowering plants in bloom, owing to the exceptionally fine weather of the past few weeks. Many of the flower-beds are planted with permanent subjects, hardy garden plants, Roses and ornamental shrubs being largely employed for their embellishment, while there are some very fine beds formed of Box worked out in scrolls and filled between with coloured stones. These latter beds can be seen in the upper picture of the Supplementary Illustration. Each bed has a different design. They are situated at the east end of the building, and this quarter is known as the scroll or Box garden. A path leads through a broad lawn, and at the eastern extremity of this lawn is a border that was gay with *Chrysanthemums*, perennial Asters, *Rudbeckia Newmanii*, and *Phlox Coquelicot*. The path is bordered with Portuguese Laurels clipped into standard shape, and about the lawn are many noble trees of Oak

centre, in a depression, is an old Oak, the lower branches of which trail upon the ground. The tree has lost some of its larger branches, but it is still a grand specimen, and has a girth of 20 feet at the ground level. Next to this grass-sward the flower-garden proper is entered through a pair of handsome wrought-iron gates worked in vine leaves and bunches of Grapes. There are similar gates at the eastern side, and in the kitchen garden is another pair, of a different, but equally beautiful, design. When the visitor passes through the gateway of this flower-garden to the left is seen a Rosary with a pathway that is covered with arches at intervals, and up these are trained climbing varieties of Roses and Vitis, with ornamental foliage. Two of the largest Rose beds are enclosed with a Yew hedge about 3 feet in height and admittance is gained by four openings: each enclosure forms a square: at each corner is an entrance, and on either side the Yew has been clipped in a globular manner, forming a kind of portal. There are other Rose beds close by which are outlined in Box, whilst along the path specimens of *Cryptomeria japonica*

have been planted in pairs. Just about this spot is a tree of *Liriodendron tulipifera* of very large size, the foliage of which is already beginning to show the autumn tints.

Around the outskirts of this Rose garden is a border of hardy-flowering plants, with a background of shrubs. This border is now in course of replanting in order to confine the subjects to their allotted limits, for the soil is a very rich loam, and the plants grow with luxuriance. There is a summer-house at the end of the path, the roof of which is covered with ornamental tiles in blue and green, and it has a floor of blue tiles in an artistic design. The garden facing the conservatory (see fig. 140) is known as the Dairy garden, because it contains a model dairy. Here, again, the flower-beds are outlined in Box. They are planted with the red-flowered *Phlox Cœquelicor*, *Echinops Ritro*, *Cannas*, *Iresine*, *Panicles*, *Violas*, *Zinnias*, and the double-flowered *Arabis*. In the spring months they are gay with bulbous subjects which are not disturbed in the summer-time.

The conservatory is of noble proportions and is built of stone. Just inside the entrance is a water basin surrounded by a dwarf balustrade in stonework. The building is filled with plants of suitable species, and climbers are trained up the walls and across the roof. All the plants appeared to be doing well. *Pteroma macranthum* was finely in flower, also *Cobæa scandens*, *Cestrum*, and *Cassia corymbosa*. There are fine plants of *Clematis indivisa*, *Mackaya bella*, *Rhynchospermum jasmintoides*, *Camellia*, *Tacsonia*, *Passiflora*, *Prolesia acuminata*, *Cantua dependens*, *Acacia armata*, *Habrothammus*; also, in pots, or planted out, *Valotas*, *Datura*, *Chamaerops Fortunei*, *Casalpinia alpina*, *Zingiber officinalis*, *Aralia Sieboldii*, *Francoa ramosa*, and *Dicksonia antiochica*. On the walls outside are trained *Escallonia*, the *Pomegranate*, a fine plant of *Arauja buxifolia*, and *Roses*.

There is a border between the two conservatories, and this is backed by a tall wall, up which are trained many flowering shrubs, including *Choisya ternata*, *Desmodium penduliflorum*, *Escallonia*, *Ceanothus Gloire de Versailles*, *Wistarias*, *Roses* and many other species.

The entrance to the south front of the mansion has on either side a fine tree of *Arbutus Unedo*, each of which is flowering and fruiting freely. Growing upon the walls are several large plants of *Magnolia grandiflora*, whilst in one corner the wall is resplendent with the deep red autumn tints of *Vitis Cœnigete*. *Garrya elliptica*, *Bamboos*, *Banksian Roses*, and many ornamental shrubs thrive against this warm south wall. The walls of the north or carriage front are furnished with Ivy.

There are about 11 acres devoted to the vegetable and fruit gardens. An enclosed garden embraces about three acres, the fine old walls being planted with fruit trees, which, we were informed, have given heavy crops of good fruits, especially Peaches, which succeed well in the open in this Hertfordshire garden. The soil is a good rich brown loam, and produces excellent crops of all kinds of vegetables. The gardens are in the care of Mr. Staward, formerly of Loosely Park, who received the appointment about nine months ago. Mr. Staward is a well-known exhibitor, especially of *Auriculas*: he comes of a gardening family, and pointed out a fine white *Aurubrium* which was raised 30 years ago by his father. Like his father, he also is a raiser of new plants, and has gained certificates for new culinary Peas; he has also raised new varieties of Potatoes, Violets (a seedling single blue Violet named Lady Jekyll had a stalk 13 inches long), and other flowers. Mr. Staward secured no fewer than 18 first and one second prizes at Vincent Square in 1906 for *Auriculas*. It was therefore not surprising to find the stock embracing, in addition to most of the standard kinds, some 900 seedlings of this flower. The glass-houses include a range of

fruit houses and several plant pits, an old Pine-apple pit—now used as a stove—with green-houses and frames. The houses are all old and belong to a type that has been generally superseded. In one is a remarkable plant of White Ischia Fig, which was ripening a heavy crop of fruits. We measured the bole, and it was 2 feet 1 inch in circumference. It is believed that this old tree was planted when the gardens were formed in 1745. There are also fruit trees in pots of Apples, Pears, and Plums. These were ripening their wood in the open.

One of the larger glass-houses was filled with *Chrysanthemums* and other flowering plants. The whole of one of the side stagings was planted with the border variety Ruby King, a charming and floriferous variety. As a pot plant for decorative purposes, nothing is finer than the yellow Crag Mullar. Several small pots were just planted with Sweet Peas: these will be placed in open borders in November, and it is anticipated that they will flower in May. The houses also contain *Carnations*, *Primulas*, *Coleus*, *Cinerarias*, *Roses* (including a fine plant of *Fortune's Yellow*, which flowers in abundance in a span-roofed greenhouse), and a collection of stove plants and Orchids.

The Week's Work.

PLANTS UNDER GLASS.

By THOMAS LINTY, Gardener to A. STIRLING, Esq.,
Kirk, Fetteshire, N.E.

Chrysanthemums.—Plants that have passed out of flower should be cut over, leaving the stems about 1 foot long upon varieties that do not as a rule produce suckers freely, as in these cases it may be necessary to obtain cuttings from stem-growths. Varieties, however, that produce an abundance of growths from the base should have these thinned out severely in order that light and air may circulate amongst them. Place the pots in a structure where the plants will be exposed to sunlight and where the atmospheric temperature will be about 50° or 55°. A *Chrysanthemum* plant that has been cut down in this manner requires but very little water at the roots, but a slight spraying over the tops of the pots in bright weather helps to promote growth, and keeps the cuttings in a moderately soft condition. Preparations must now be made for propagating plants for blooming next season. See that plenty of small pots are available and that they are made clean inside and outside. The collection which is grown for supplying large blooms should be carefully examined, and any varieties that may be advantageously discarded next season marked, so that they may not be propagated. When once a variety has begun to deteriorate in constitution no effort of the cultivator will suffice to make it produce exhibition flowers. Therefore it is needful to be on the look out for new varieties, and these new varieties have to be grown for one season or perhaps two before the cultivator can be quite sure which is the best bud to select in particular instances. Notes should be taken at the present time of varieties that have been cultivated this season for the first time, as these notes will be necessary next season in determining when to stop the shoots and which buds to select. Early buds always produce the largest blooms, but this is often at the expense of good colour and quality of flower. Many good sorts have been thrown away because the cultivator has not known the proper date to secure the bud. So far as Scotland is concerned, the last week in November is the best time to insert cuttings of varieties that require very early pinching or stopping, as growth here in spring is very slow compared with that of southern plants. For such varieties as H. Stowe, Madame R. Cadbury, J. C. Neville and others cuttings should be put in by the 25th of the present month, and they should be ready for potting into pots 3½ inches in diameter by January 25. Some of the varieties I have mentioned have to be stopped by the first week in February, in order to get crown buds by the first week in August.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. G. L. HOLFORD, C.V.O., C.I.E., Westonbirt, Gloucestershire.

Celogyns.—The species *C. cristata* and its varieties *alba* and *Leoniana* have now completed their season's growth. These plants should be placed for the winter in a cool, intermediate house, well up to the light, where a minimum atmospheric temperature of about 50° is maintained. This treatment will retard the flower-spikes, and will be found to be an advantage when cut flowers are required during winter, as, if a few plants are brought into extra warmth at intervals, a succession of flowers can be kept up for a considerable period. The plentiful supply of water hitherto afforded should now be considerably reduced, but care should be taken to keep the rooting material in a sufficiently moist stage to preserve the pseudo-bulbs in a plump and healthy condition. These plants should never be allowed to become dry at the roots until after the flowering stage is over. Do not permit any plants to flower that were renade this season, as they usually require two seasons to become re-established and fit for this purpose.

Calanthes.—Those of the *C. vesusta* and *C. Veitchii* groups are now ripening their foliage, and concurrent with this natural wet the plants are pushing forth their flower-spikes. Later on, they should be given every encouragement to develop and expand their flowers. Less frequent waterings will now suffice for these plants, but, like the above, they must not be allowed to become dry until after they have finished flowering. Afford sufficient water to the roots to aid the proper development of the flowers, and as soon as they commence to open the atmosphere of the house should be kept rather drier. *Calanthes* at all seasons require a light and airy position, and in their present stage they should be so arranged that their needs in these important respect may be fully satisfied.

Phalænopsis.—The unusually bright, warm weather we have experienced this autumn will have proved very beneficial to the plants of this genus. The cultivator should now be able to dispense entirely with shading, and the division occupied by these plants should, on all suitable occasions, be well ventilated, in order to thoroughly consolidate the newly-made leaves. Henceforward, water to the roots of these plants must be afforded with discretion, as these, as well as the leaves, are exceptionally sensitive. A safe plan, at this period, is to allow the rooting material to dry out, although care must be taken not to let it remain in a dry state for any length of time, otherwise the health of the plants will be impaired, and proper development of the flower-spikes now pushing forth will be hindered.

THE HARDY FRUIT GARDEN.

By F. JOHNS, Gardener to The Downage Lodge, Newborough, Watter Frery, Yorkshire.

Planting of trees.—Seldom have hardy fruit trees made cleaner or better growth than this season. Though at one time they were late in their development, the shoots have ripened most satisfactorily during October. Do not neglect any opportunity of removing the shoots that will not be required for fruiting next year, so that the maximum amount of light and air may have access to every part of the trees. Until quite recently the ground has been too dry for the successful lifting of fruit trees on light soils, and this has delayed planting operations. Autumn is undoubtedly the best season for planting fruit trees, provided the soil has been properly prepared beforehand, but if this has not been done, then, in the case of heavy, moisture-retaining soils, it will be better to defer planting until the spring. In all cases it is important to have a quantity of fresh soil mixed in readiness for use, so that it is possible to apply to each tree at planting time at least one barrow-load of fresh compost. Having prepared the ground, and assuming that the drainage is in proper condition, suitable holes should be dug out for receiving the trees. These holes should be made large enough that the roots may be spread out to their fullest extent. Do not dig the holes long before they are required, and be careful not to plant the roots too deeply. A good guide in this matter is afforded by the mark on the stem of the tree,

showing at what depth it was planted in the nursery, which should never be exceeded afterwards. Cut off any bruised roots, and shorten others that are too long or have extra strength. Place the tree in position, and work a barrow-load of prepared soil in amongst the roots, lightly shaking the trees in an upward direction in order that the soil may percolate into the interstices. Make the soil firm by treading as the work proceeds, being careful not to press the fibrous roots into the soil more than 3 inches deep. The treading may have to be reduced to a minimum on heavy soils that are inclined to hold the wet. Affix a stout stake to each standard tree before planting, and in some cases such a stake will be necessary also for pyramids and bushes. If the subsoil is of a heavy and wet nature, it will be advisable to dig the hole 2 to 2½ feet deep and place a layer of broken bricks or stones at the bottom, covering these with a layer of lime rubble and putting over this some old turves with their grass side downwards. Apply a mulch of light litter to all the trees immediately after planting and give water to the roots if this is necessary. Afterwards light mulches may be applied annually in order to encourage the roots near to the surface. In the case of large fruit trees it is usually necessary to apply a thorough root-watering before attempting to root-prune them or lift them for replanting.

Selection of trees.—In the selection of young trees from the nursery choose healthy specimens two or three years old that have not been subjected to severe pruning. Take every care of trees that arrive from the nurseries, and, if planting operations are delayed, let the trees be unpacked carefully and their roots laid in the earth in a moist situation, as the fibres suffer serious injury if allowed to become dry.

Propagation.—Bush fruits may be propagated so simply, and young bushes produce so much finer fruits than older specimens, that a few cuttings should be inserted each year. These cuttings should be formed of shoots of medium strength, and from 9 to 12 inches long. All the buds except the four nearest to the top should be removed before planting, in order to prevent the formation of suckers. Insert the cuttings in trenches, covering them about two-thirds their length, and placing a little sand amongst the soil, afterwards treading the soil around them firmly with the foot.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VISCY GRIBBS, Aldenham, Wiltshire.

Peas.—Where accommodation is provided for growing early Peas under glass, either in cool houses or pits, seeds should be taken to prepare and sow the first batch of seeds. These may be sown in various ways, for example in rows in well-prepared soil, or in pots, tubs or boxes, where the roots are more confined. I prefer to use 8 or 10-inch pots. These should be moderately drained and half-filled with a compost consisting of three parts light, fibrous loam, and one part either manure from an old mushroom bed or some well-decayed leaf mould, adding a 6-inch pot of bonemeal to every six bushels of compost. Make this moderately firm, and sow the seeds as thickly again as it is intended the plants shall be cultivated. Four or five plants of tall or moderately tall-growing varieties are sufficient for either sized pots. Cover the seeds about 1 inch deep, and apply a thorough watering, afterwards removing the pots in unheated frames. Germination should be allowed to proceed slowly, and during the life of the plants the cooler they can be grown the better. There are now a large number of varieties adapted to this treatment, some being dwarf and others of tall growth. Where circumstances will allow, I should distinctly favour the taller varieties, as they are capable of yielding heavy crops. Such varieties include Gradus, Early Horn, Edwin Beckett, Reading Giant, and Duke of Albany.

Broad Beans.—Although some people experience difficulty in getting these to set well when grown under artificial conditions, especially in pots, there is no occasion for this if proper attention is given to them when in flower. The seeds should be sown now and treated much in the same manner as Peas, excepting that in the case of Beans a warmer place may be assigned to them till after germination has taken place.

Take care to protect the seeds against rats and mice. The old method of sowing Peas and Beans in the open ground during autumn is not to be recommended, except perhaps on very light soils and in the most favourable parts of the country. The new and improved long-podded varieties of Broad Beans are much the best for pot culture.

Stalks.—The crop which has been grown for taking up and forcing under cover may now be lifted. Cut off all the thongs and place them on one side. They will then be ready for cutting into lengths and tying in bundles during wet days to provide material for next year. The crowns intended for forcing may be placed thickly together and covered with ashes until required for this purpose. Little difficulty will be experienced in getting them to grow freely in a temperature of 50° to 55°. The light should be entirely excluded to ensure perfect blanching.

Potatoes.—If these are forced early, the sets intended for such treatment should now be selected and laid out thinly on suitable trays, on which has been placed a little finely-sifted manure from a spent Mushroom bed. Moderate-sized tubers should be chosen, and only of suitable varieties, such as Sharpe's Victor, May Queen and Sharpe's Express. These make little haulm and are quick to mature. The tubers should be placed in a light position in a temperature of about 50°.

FRUITS UNDER GLASS.

By T. COOMBE, Gardener to LORD LANGATOCK, The Hendre, Monmouthshire.

Strawberries.—Strawberry plants in pots should now be placed in their winter quarters. I do not recommend the old practice of stacking the pots on their sides. If cool frames are available, the plants may be safely stored in them, placing them closely together on a firm base of ashes and affording protection during severe weather by glass lights. It is especially advisable to give this accommodation to the plants intended for early forcing. But the greater number of our own plants are plunged closely together in beds of fine ashes, the sides of the beds being supported by planks placed on their edge, and the plants are protected from severe frosts by straw or bracken. Advantage should be taken during the forcing season to dress the plants, doing this work when the soil is moderately dry. Remove the surface soil about half-an-inch deep with a pointed stick, and apply in its place a compost consisting of good loam, mixed with one-fifth its quantity of finely-broken, dry horse-droppings with a dash of soot and a small quantity of artificial manure. Make this compost firm by the use of a rammer.

Early-fruiting Figs.—If Figs are required very early in the season, it will be necessary to have pot-trees specially prepared for the purpose. These should be selected from the trees that were forced early last season, as they may be expected to have well-saturated, short-jointed wood, and the varieties should be such as Violette Sepor, St. John's or O'born's Profic, either of which force easily. If the shoots were carefully thinned and stopped during the growing season, no pruning will be now required. The trees had better be washed with a mild and warm solution of soft soap and water, or, if they are affected with scale, then a solution of the Gishurst Compound may be used, applying this with a suitable stiff brush, to assist in dissolving the scale. The process of forcing must be commenced very gradually; for the first month the trees may be placed on a bed in a house having an atmospheric temperature of about 50°, and afterwards the pots may be plunged in a fermenting bed composed of leaves and stable manure, and having a temperature of 60° or 65°. This will cause the plants to make satisfactory leaf and root growth, and care must be taken to prevent the beds becoming overheated. Root-waterings will not be necessary very frequently, and the amount of atmospheric moisture during winter must not be excessive.

Late Grapes.—Owing to prevalent fogs and heavy rains, extra care has been necessary in the management of the late vines. Such varieties as Lady Downe's, Appley Towers, Black Alicante, and Lady Hunt, are the best late keeping Grapes we have. Take care to keep the atmosphere of the late vinerias at an equal tempera-

ture of about 50°. Ventilate the houses pretty early and freely on fine days, but keep them closed in foggy or wet weather. Do not allow the water pipes to get very hot at any time, as this would cause the fruit to shrivel, and therefore during frosty weather the temperature may be allowed to fall a few degrees below 50°. Examine the bunches every few days, and remove any decayed berries. Make use of the Grapes that will not keep long first. Such varieties include Madresfield Court, Black Hamburgh, Mrs. Pearson, Gros Maroc, and Alwinck seedling. Muscat of Alexandria fruits that were lightly shaded during the time of ripening, the glass having been shaded with lime water, have coloured excellently, and are keeping well. To prevent the berries of this Grape from becoming discoloured or shrivelled by the sun, the bunches should be shaded after the leaves have fallen from the vines, by placing pieces of white paper above the fruit.

THE FLOWER GARDEN.

By W. FYFE, Gardener to Lady WANTAGE, Looking Park, Berkshire.

Climbers upon walls.—It will be necessary to examine wall climbers which have been allowed to overgrow their bounds during late summer and autumn, and prune them to remove the over-weight of growth which, if left, would be likely to cause the plants to get unfastened or broken by the action of wind or snow. In the case of some species it is necessary to retain a considerable portion of young wood, which may be conveniently done if a similar amount of weak and useless sprays is removed to make the necessary room. The stronger-growing plants of this kind of treatment, and the rampant Ivies always have a better appearance if kept well-thinned. In the case of Ivy, the growths should be kept at a little distance from the top of the wall at all seasons. Closely cut and properly thinned, Ivy will be found to cling most satisfactorily to the wall, which is an advantage. Ceanothus Gloire de Versailles should be pruned severely, leaving only two or three eyes on the present year's growth to produce the flowering trusses next season.

Summer bedding plants.—The tender plants which have been hitherto protected in an unheated frame will be safer after this date if removed to some structure where frost can be excluded, such as heated pits or vinerias in which the vines are at present resting and where a little fire heat is used occasionally to expel damp. Old plants will need very little water after they have become established in their pots, but younger plants which may be growing in a heated structure must not be allowed to become dry. Verbenas are rather troublesome at this season if kept in unheated frames, because they are subject to mildew and damping. Nevertheless, if they are kept in drier conditions they are apt to suffer from drips, therefore a moderately dry and cool atmosphere is necessary, and an occasional fumigation alternated with dustings of flowers of sulphur, taking care also to remove all decaying matter from the plants as soon as it is observed. The Calceolaria cuttings, whether in pots or planted in unheated frames, merely require protection from frost, and if ventilation during favourable weather. If allowed to get too dry at their roots, they are apt to shrivel. These remarks apply also to Pentstemon, Violas, Veronica Andersonii, and similar plants.

Heuchera sanguinea.—After a time the older plants of this species naturally appear considerably above the ground level, and it is advisable to either divide the plants at this season for increasing the stock, or apply slight protection from frosts by placing some light, sandy soil around each plant, which will cover the tender portion of the stem. If seeds are sown in unheated frames and the seedlings are transplanted to the open ground in spring, they will flower freely the second season.

Salvia patens.—This species and all similar tubers, including Mirabilis Jalapa (Marvel of Peru) should be lifted and stored in a dry shed or cellar where frost will not be likely to enter. I may mention that on the morning of October 26 there were 10 degrees of frost registered here, and this cold has put an end to our summer bedding.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, and as early in the week as possible and duly sealed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unsolicited communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Local Notes.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, NOVEMBER 9—
Unsted Hort. Fen. and Grav. Soc. Com. meet.
TUESDAY, NOVEMBER 10—
Roy. Hort. Soc. Coms. meet. Nat. Rose Soc. Com. meet. Plymouth Chrys. Sh. (2 days). British Gard. Assoc. Ex. Council meet. Devonian Chrys. Sh. Highgate and Dist. Chrys. Sh. (2 days).
WEDNESDAY, NOVEMBER 11—
Chester Chrys. Sh. (2 days). Cambridgeshire Hort. Soc. Sh. (2 days). Devonian Chrys. Sh. South Shields and Northam Counties Soc. Chrys. Sh. (2 days). Doncaster and Dist. Chrys. Sh. (2 days). Buxton Chrys. Sh. Corn Exchange Chrys. Sh., Mark Lane, London.
THURSDAY, NOVEMBER 12—
Western-super Mare Chrys. Sh. Barnsley Chrys. Sh. (2 days) (provisional). Chrys. Sh. at the White City, Manchester (Botanical Garden), 12 days.
FRIDAY, NOVEMBER 13—
Reading Chrys. Sh. (2 days). Sheffield Chrys. Soc. Ex. (2 days). Nottingham Chrys. Sh. (2 days). Leeds FARMER Soc. Chrys. Sh. (2 days). Huddersfield Chrys. Sh. (2 days).
SATURDAY, NOVEMBER 14—
Burton-on-Trent and Shobnall Chrys. Soc. Ex. at Burton-on-Trent.

AVERAGE MEAN TEMPERATURE for the ENSUING WEEK, deduced from observations during the last 17 Years at Greenwich—49.8°.

ACTUAL TEMPERATURES.—
LONDON.—Monday, November 3 (6 P.M.): Max. 55°. Min. 45°.
Gardens' Chronicle Office, 41, Wellington Street, Covent Garden, London. Thursday, November 3 (10 A.M.): Bar. 30.1; Temp. 57°; Weather—(CLOUDY).
PROVINCES.—Monday, November 4 (6 P.M.): Max. 57°. Ireland S.; Min. 50° Scotland E.

SALES FOR THE ENSUING WEEK.

MONDAY TO FRIDAY—
Dutch Bulbs, at 67 & 68, Cheapside, E.C., by Prothero & Morris, at 10.30.
MONDAY and TUESDAY—
Sale of Nursery Stock at Hare Hill Nursery, Addlestone, by Prothero & Morris, at 12.
WEDNESDAY—
20,000 Fruit Trees, &c., at Messrs. H. Neve & Sons' Nurseries, Ferry Hill, Cliffe, near Rochester, by Prothero & Morris, at 11.30.
2,000 Roses, Herbaceous and Border Plants, Palms, 2 plants, &c., at 67 & 68, Cheapside, E.C., by Prothero & Morris, at 11.
THURSDAY—
Unreserved Clearance Sale of Young Nursery Stock at Portland Grange Nurseries, Matlock, by order of Messrs. Hurd, Sons & Co., by Prothero & Morris, at 11.30.
FRIDAY—
Collection of valuable Orchids, also imported and established Orchids in variety, at 67 & 68, Cheapside, E.C., by Prothero & Morris, at 12.45.

*** The Royal Botanic Gardens, Kew.**

It has frequently been remarked that many of the leading institutions in this country have sprung from quite modest beginnings, and their present greatness is due, not so much to the carrying out of a definite and preconceived plan, as to the more gradual process of a natural course of evolution. Development, in fact, has proceeded

* The Royal Botanic Gardens, Kew: Historic and Descriptive, by W. J. Bean, assistant curator. With an introduction by Sir William Thickett-Dyer, K.C.M.G., &c. With 20 reproductions in colour from paintings by N. A. Oliver, and 40 half-tone plates from photographs by E. J. Wallis. Cassell & Co., 1908.

on lines determined by enviroing circumstances which are continually changing with the lapse of time. The controlling factors are seldom simple in character. The constructive efforts of individuals are not infrequently baffled by the apathy of a more or less indifferent public, and sometimes they are challenged by the active hostility of those in power.

But we are a practical people, and when once an influential section of the community has become convinced of the utility of an enterprise, the means are generally forthcoming to enable it to be carried through successfully.

The history of Kew, as related in the pages of Mr. Bean's admirable book, has in many respects followed the general course of other large movements, and it has assuredly justified the foresight of those who have from time to time helped forward its development. Possibly it is not an altogether unfortunate circumstance, both for Kew and for the country, that its growth was not unimpeded at first. It has had time, so to speak, to look about it, and to seize upon the numerous opportunities for making itself useful that have from time to time occurred since its foundation. We can hardly suppose that the first Royal patronages, to whose goodwill so much is owing, could have had an idea of the vast results which were to be achieved by the modest institution which in its earlier years maintained an unostentatious, if indeed not precarious, existence at Kew.

It happened happily, for the destiny of the great botanical establishment and most fortunately for the empire at large, that the right men were selected to guide its progress. It is due to their splendid efforts, aided by the far-sighted policy of distinguished men, and not least also by the munificent encouragement given by Royal patronages, that this country possesses a botanical institution which is the first of its kind in the world.

Kew Gardens, as we know them to-day, have been formed by the gradual fusion of a number of distinct properties, parks, and gardens, belonging to various houses and palaces. The initial impetus towards the founding of the botanical collection of plants seems to have been started by Sir Henry Capel, who lived in what became known as Kew House. The house passed by marriage to a Mr. Molyneux, who died in 1728, and two years afterwards Frederick, Prince of Wales, obtained a lease of Kew House from the Capel family.

In this manner Kew became associated directly with the Royal House, an association which has been more or less closely maintained up to our own times. It was especially as a consequence of the interest taken in botany and horticulture by Princess Augusta of Saxo-Gotha, that the nucleus of a botanical centre was created at Kew. William Aiton, a Scotchman, who was employed under Philip Miller in the Physic Gardens, belonging to the Apothecaries, at Chelsea, was engaged as superintendent of the Kew gardens. It is of interest to remember that a few years ago Kew discharged her debt which she thus owed to the Physic Garden. For when, owing to various circumstances, this historic place, one of the oldest botanic gardens in Europe, was threatened with dissolution, it was mainly through the efforts of Sir William T. Thickett-Dyer, at that time Director of Kew, that the old garden was not only saved, but rendered available to the large and increasing number of botanists in the colleges of the Metropolis.

It was during the elder Aiton's period of office at Kew that Sir William Chambers built so

many of the temples and other structures, several of which remain features of the gardens at the present day.

Unquestionably the most important event that has happened in the history of Kew was the appointment of Sir William Jackson Hooker as Director in 1841. Hooker was in every respect a great man. Gifted with imagination and endowed with remarkable foresight and energy, he rapidly transformed the 15 acres which at first formed his charge. Soon afterwards the area was increased by additions granted by Queen Victoria, and in 1845 the pleasure-grounds were also handed over to the Director on the retirement of W. T. Aiton, son of William Aiton, who had previously managed them. The great Palm house had already been begun by Decimus Burton, and its noble proportions and beautiful lines still command general admiration. Sixteen years later the Temperate House, designed by the same architect, was begun, though the original scheme of this building was only completed a few years ago.

Space forbids us to dwell, as we would wish, on the later developments which have taken place under Sir Joseph Dalton Hooker, Sir William Thickett-Dyer, and the present Director, but that the progressive work has not been arrested within the past few years is seen in the enlargement of, and improvements in, the Herbarium, as well as in the utilisation of Cumberland Lodge which has been handed over to the gardens.

But it is not only as the place where the finest collection of plants in the world is to be found, nor as a garden of almost unrivalled beauty, that Kew is so justly celebrated. From the point of view of the nation, its value is incalculable, although this aspect of its daily activity is known to comparatively few besides those more directly interested in it. Probably, however, everyone recognises its importance as a centre from which assistance in kind as well as advice to other parts of the empire is continually given, with results that have been in some cases, as Sir W. Thickett-Dyer remarks, in his interesting Introduction to Mr. Bean's book, "fringed with 'wealth beyond the dreams of avarice!'"

But, nearer home, Kew serves another function—that of giving to young gardeners the finest chance a man can have of rising to the front rank of his profession. It is not only at home, but as pioneers in the colonies—they "dot the course of the Cape-to-Airo railway"—that the training received at Kew is found to tell in the case of those who are able to profit by it.

An interesting chapter could be written on the striking personalities that have been connected in one way or another with Kew. William Cobbett, for instance, was a picturesque personage who, though originally a gardener, will be remembered for his political opinions and literary exhibitions of rural life. Perhaps, however, his admonitions on the "rascally Surrey heaths" would fail to command general acceptance at the present day. In surveying the activities of Kew, both past and present, as related in Mr. Bean's book, the reader will be impressed by the Report upon the gardens presented to Parliament in 1841 by the Committee of enquiry appointed by the Government, the lines then laid down for the conduct of a national garden being exactly those upon which Kew has developed. So much is this the case that the recommendations then handed to Parliament and to the new Director, Sir William Hooker, might be written now as a brief description of the functions at present discharged by Kew.

Mr. Bean, who has so well traced the history of the great institution to which he himself belongs, refers also to its influence on the science of botany. Those who are botanists, no less than those whose interests lie more especially in the direction of horticulture and tropical agriculture, will gratefully recognise the inspiration and help that Kew has ever given so freely.

A passing reference must be made to the immense amount of valuable literature which has emanated from Kew. The *Genera Plantarum* by Beatham and Hooker, the *Flora of British India* by Sir Joseph Hooker, and the *Index Kewensis*—only to mention a few of the works published under the auspices of Kew, will stand as permanent monuments to testify to its strenuous activity; whilst the famous *Botanical Magazine*, which was entrusted to the editorship of Sir W. J. Hooker in 1827, has, ever since 1841, been directly associated with Kew.

Many will read with delight the narrative of Kew as told and illustrated in the volume before us. And whether we happen to be specially attracted by the æsthetic, the scientific, or the more practical and economic side of this great national institution, all will readily echo the words with which Sir William Thibault-Dyer closes his Introduction to the book: FLOREANT Kew.

BELGIAN HONOUR FOR MR. HARRY J. VEITCH, V.M.H.—In the *London Gazette* for October 21 it is stated that the KING has been pleased to give and grant to HARRY J. VEITCH, Esq., his Majesty's Royal license and authority to accept and wear the insignia of Chevalier of the Order of Leopold, conferred upon him by his Majesty the KING of the BELGIANS, in recognition of valuable services rendered by him. We are sure all our readers will join in the hearty congratulations we offer to Mr. VEITCH on this auspicious occasion. KING LEOPOLD could not have selected a more representative or highly-respected exponent of British horticulture.

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees will be held on Tuesday, November 19, at the R.H.S. Hall, Vincent Square, Westminster. At three o'clock p.m. a lecture on "British Wild Flowers in the Garden" will be delivered by Mr. JOHN W. ODELL.

BOTANICAL MAGAZINE.—The issue for November contains descriptions and illustrations of the following plants:—

MUSSEUDA ERVTHROPHYLLA, tab. 8222.—This is a showy shrub, described as long ago as 1827, from specimens collected by THONNING on the Gold Coast, but the oldest herbarium specimens at Kew were collected by Mr. GUSTAV MANN in February, 1862, in the Cameroons at an elevation between 3,000 and 4,500 feet. It has since been collected by travellers in various localities from Sierra Leone to Angola and eastward to Uganda. It is a stove shrub belonging to the Nat. Ord. Rubiaceæ; its branches and leaves and flowers are more or less clothed with soft hair. The flowers are about 1½ inch across, borne in dense terminal cymes, and clothed with long spreading crimson hairs on the outside, yellow within, changing to red, crimson in the centre. The ornamental character of the plant arises from the development of calyx leaves of a brilliant red colour. Only one of the calyx lobes on a particular flower develops into a leaf, and in other flowers from the same cyme there is no such development. Mr. W. BOTTING HEMSEY, who describes the species in the *Botanical Magazine*, mentions that the species has been introduced to Kew by Mr. H. N. RIDLEY, Director of the Singapore Botanic Gardens, who forwarded a plant in a Wardian case in 1907. In a note upon the cultivation of the plant

Mr. W. WATSON refers to Mr. W. BULL as having distributed the species in 1883, but it was not successfully cultivated at that time. At Kew, the plants received from Singapore have been grown in a moist tropical stove, where they have formed shapely well-turished shrubs, about 2 feet high, and were in flower for about two months, the red calyx leaves being quite as effective as the bracts of *Euphorbia* (*Poinsettia*) *pulcherrima*, and they appeared to be as persistent.

MECONOPSIS SINICATA, VAR. *1-VIFOLIA*, tab. 8223.—The species *M. sinicata* is not known in gardens, and Lieut.-Col. PRAIN states that it is rare in Alpine Sikkim and Bhutan at 10,000 to 12,000 feet. It is closely allied to *M. aculeata*, figured in the *Botanical Magazine*, tab. 5436, but has narrower, slightly-lobed leaves and longer capsules, widest above the middle. *M. sinicata latifolia* has leaves as wide as those of *M. aculeata*, but as slightly lobed as in the case of *M. sinuata*. Its flowers differ from those of *M. aculeata* in having a narrower, more prickly ovary and a deep pink or bright orange instead of a pale green stigma. Its capsules are, though shorter, obconic as in *M. sinuata*, not widest below the middle as in *M. aculeata*. Lieut.-Col. PRAIN says that this flower may prove distinct, but until it can be compared with living plants of *M. sinicata* the plant is best treated as a variety, *latifolia*, of that species, from which it differs in its wider leaves and shorter fruits. One of the plants at Kew which developed partially double flowers, such as are sometimes seen in *M. integrifolia*, was figured in the *Gardeners' Chronicle*, September 12 last, p. 202.

BERBERIS YUNNANENSIS, tab. 8224.—This Chinese species is described by Mr. J. HUTCHINSON. It was first discovered by DELAVAY in 1885, near Lankong, Yunnan, at an altitude of 10,000 feet. Since then it has been collected in Western China by WILSON. Though very closely allied to *B. macrosepala*, also gathered by WILSON, *B. yunnanensis* is nevertheless distinct, having glabrous young branches instead of shortly pubescent ones. In *B. yunnanensis* the petals are acute and scarcely emarginate and bear small rounded glands, whereas in *B. macrosepala* they are obtuse with a broad, widely emarginate apex, and the glands are larger and more elongated. Mr. W. J. BEAN states that Kew is indebted for this species to Mr. MAURICE L. DE VILMORIN. The fruit is a bright red colour.

COLUMNEA MAGNIFICA, tab. 8225.—This species is figured from specimens presented by Col. BEDDOVE and by Mr. W. E. GUMBLETON. It was figured and described by Mr. T. A. SPRAGUE—who also describes the plant in the *Botanical Magazine*—in the *Gardeners' Chronicle* for February 1, 1908, p. 66.

PYRUS SINENSIS, tab. 8226.—This species was introduced into this country by Captain J. P. WILSON in 1820, and the fruit was illustrated in the *Gardeners' Chronicle*, October 9, 1875, fig. 95. Dr. OTTO STAFF mentions that a fruit produced from a graft in 1823 was described by LINDLEY in *Trans. Hort. Soc. Lond.*, vol. vi. (1826), p. 366, as measuring nearly 3 inches in length and 2½ inches in diameter, forming an almost perfect oval, covered with a pale, dull, yellow skin marked with numerous rough brown spots, and possessing a white, crisp flesh with the flavour of an Apple rather than that of a Pear, though of no particular excellence. *P. sinensis* is known in China as shah (said Pear), and was mentioned as such by ROXBURGH in his *Hortus Bengalensis* in 1814. Mr. W. J. BEAN states that this Pear has been cultivated at Kew since 1875. It flowers freely almost every year early in April, but rarely produces a large crop of fruit. The flowers are white.

HORTICULTURAL CLUB.—The next House dinner of the club will take place on Tuesday, November 10, at 6 p.m., at the Hotel Windsor. Mr. C. D. McKAY will talk about "French Gardening."

BRITISH GARDENERS' ASSOCIATION.—The next meeting of the London Branch will take place at "Fair's," Strand, on November 12, at 7.30 p.m., when Mr. J. HARRISON DICK will give a lantern lecture on "Famous Gardeners." All professional gardeners are welcomed.

THE NATIONAL SWEET PEA SOCIETY will hold its London show in 1909 at the Royal Horticultural Hall, Westminster, on July 23, and the provincial show will be held at Saltair, in conjunction with the Saltair Horticultural and Rose Society, on July 13. The annual meeting of the Society for 1908 will be held at the Hotel Windsor on December 11, at three o'clock. Arrangements have been made for holding trials of Sweet Peas in the gardens of the University College, Reading, in 1909, and it is proposed to make a charge of 2s. 6d. for each variety sent for trial, and to receive varieties only from the raisers or original distributors. The secretary is Mr. CHAS. H. CURTIS, Avelade Road, Brentford.

SOUTH-EASTERN AGRICULTURAL COLLEGE.—A meeting of the Governors of the South-Eastern Agricultural College, Wye, was recently held at Caxton House, Westminster, under the chairmanship of the Right Hon. Lord ASHCROBE. A resolution was passed agreeing with the conclusions of the report of the Committee on Agricultural Education and Research. A special horticultural course has been instituted under the superintendence of a practical fruit grower, and will commence next January. A Fruit Growers' Conference will be held at the college on November 27, when insecticides, spraying, the packing and grading of fruit, &c., will be discussed.

DISTRESS EMPLOYMENT IN THE ROYAL PARKS. Mr. HARGREAVES, First Commissioner of Works, has stated, in reply to a question asked by Mr. PIKE PEASE in the House of Commons, that work will be found in some of the Royal parks for men for whom employment is desired by the Central (Unemployed) Committee. The work consists of digging and sifting gravel, levelling ground, draining, cleaning out ponds and lakes, diverting and widening roads, and preparing ground for nursery purposes. These are works for which no money has been voted by Parliament in the votes, and the wages of the men will be paid entirely by the Central (Unemployed) Committee. The supervision, tools, and materials required will be provided out of the sum taken for this purpose in the vote for the Royal parks which passed the House of Commons last spring.

SALE OF ORCHIDS.—The two days unreserved sale of Mr. J. BRADSHAW'S Orchids at Messrs. PROtheroe & MORRIS' Rooms on October 29 and 30 resulted on the first day in £2,941 and on the second £2,137. The feature in the sale was the maintenance of the value of all good Orchids, and especially of white Cattleyas; and the revival of high prices for fine coloured forms of Cattleya Trianae. *C. Trianae* The Premier realised 61 guineas, 74 guineas, and 52 guineas respectively. *C. T. Clinkaberryman* was purchased for 38 guineas, and others realised equally good prices. Cattleya *labriata* Cooksoniae was sold for 60 guineas; and *C. Downiana* Rosita 60 guineas and 48 guineas. The collection was not rich in good blotched forms of *Ophioglossum crispum*, but those offered for sale well sustained their values.

FLOWERS IN SEASON.—A selection of varieties of Pentstemon has been received from Hawick Nurseries, N.B., where Mr. FORBES has devoted much attention to this useful border and bedding plant. The varieties sent not only represent a great assortment of colours—principally red, white, crimson, and purple, but they have extra large inflorescences of well-shaped blooms. Mr. FORBES' strain ranks among the finest in the country, and the advance seen in some of the more notable varieties is very remarkable. Those gardeners who cultivate the Newbury Gem variety, if they do not already possess the white kind, will, no doubt, desire to include it in their collection. It closely resembles the type in all save colour.

PROPOSED MEMORIAL TO THE LATE MR. NICHOLSON.—We have received the following letter from the secretary of the Royal Horticultural Society:—"October 29, 1908. The Council of the Royal Horticultural Society have been requested to raise a fund for the establishment of a permanent memorial of the late Mr. GEO. NICHOLSON, V.M.H., F.L.S. With this they most cordially agree. There are few, if any, men to whom the present generation of gardeners owes a deeper obligation than to the author of *The Dictionary of Gardening*, a work which 'has done more towards the standardisation of plant names and developing an interest in horticulture than anything published since London, 1829.' Mr. NICHOLSON was for many years a most valued member of the Scientific Committee of our Society. He also took a very active part and been interested in the re-establishment of examinations by the Society, and himself acted as one of the examiners. It is in view of this last point and after carefully estimating the amount likely to be subscribed that the Council propose to establish a 'Nicholson Prize,' to be awarded annually after examination to the students at Wisley. Subscriptions should be sent addressed 'The Nicholson Prize Fund, R.H.S. Office, Vincent Square, London,' and cheques and postal orders made payable to 'The Royal Horticultural Society,' crossed London and County Bank.—W. WILKS, Secretary.
"By order of the Council."

CHRYSANTHEMUM FELTON'S FAVOURITE.—Mr. P. LADDS draws our attention to the description of this variety published on p. 315 last week. The flowers submitted to the Floral Committee were certainly not pure white, and the words "palest lemon, approaching white" fairly described them. A bloom now sent in by Mr. LADDS is nearly white with a lemon centre, and possibly the lemon colour becomes less noticeable with age, but the flowers are hardly likely to be seen at any time as pure white, as, for instance, the old Elaine.

PARIS.—Quite recently the Place du Carrousel in Paris was in the hands of workmen, preparatory to its being turned into a large public garden. It will extend the stretch of greenery which lies between the Champs Elysees and the gardens of the Tuileries. The cost of the enterprise is estimated at 60,000 francs.

* **"BEAUTIFUL FLOWERS."**—We have received a copy of the second part of *Beautiful Flowers and How to Grow Them*, a notice of which appeared in our last issue. This part contains the concluding portion upon Roses, and the rest of the pages are devoted to the subject of bulbs, which is not concluded. Among the coloured illustrations, two of which represent Anemones and Crown Imperials (*Fritillaria imperialis*), are commendable, and another is a pretty representation of a Tea Rose with yellowish blossoms.

* Published by T. C. & E. C. Jack. Price 1s.

PLANTS FLOWERING OUT OF SEASON.—Our remarks last week in regard to a Laburnum flowering at Kingston have brought several letters from correspondents who have noticed similar instances of plants flowering out of season. Mr. R. YEATS, of Gloddath Hall Gardens, Llandudno, describes a Lilac bush in full bloom. It is growing in a north-westerly aspect. A correspondent from Warrington mentions that there are three Laburnum trees in full bloom in that district, and although the flowers appear fully developed, the racemes are short, as we pointed out last week. Another tree noticed in full bloom by this correspondent is the White Hawthorn, which is growing in a situation sheltered from the north by a high building.

MARRIAGE.—Mr. B. FRANCIS CAVANAGH, who was appointed from Kew to the post of Superintendent, Agri-Horticultural Gardens, Madras, in November, 1899, was recently married to Miss ANNIE KATHLEEN WALKER. Mr. CAVANAGH'S present address is the Park, Baroda.

THE DANGER IN SPRAYING FRUITS APPROACHING RIPENESS.—Cultivators who spray their plants with poisonous fungicides or insecticides should beware of the harm that may arise from the poison adhering to ripening fruits. Quite recently a serious case of poisoning was reported from a Continental city, and it was definitely traced to the improper use of sulphate of copper as a spray whilst the fruit was maturing. Apart from the regrettable results that may ensue from such a practice, and the risks thereby incurred, the cultivator, for the sake of his own reputation, should exercise the greatest caution and discretion in the use of poisonous sprays on fruits or vegetables that are used for human consumption.

FORESTRY IN THE NORTH OF SCOTLAND.—A new Lectureship in Forestry has been instituted by the Governors of the Aberdeen and North of Scotland College of Agriculture, and attached to the University of Aberdeen. Dr. MARSHALL LANG, C.V.O., Principal of Aberdeen University, presided at the inauguration, and introduced the lecturer, Mr. WILLIAM DAWSON, M.A., B.Sc. Principal LANG said his presence there that day might be accepted as an expression of the interest which the University of Aberdeen was taking in the cause furthered by the College of Agriculture. That interest was not merely a growth of yesterday. It was first apparent in the year 1750, when the late Sir WILLIAM FORDYCE gave a sum of money for the foundation of a lectureship in chemistry, natural philosophy, and agriculture. In the various lectureships that had already been instituted in connection with the College of Agriculture, he rejoiced to think that there was a direct touch established between the University and the staple industry of the North of Scotland. It was for the advantage of the University that it should have this association with the great national industry. It widened the University's horizon, and it furthered its useful work. It was equally an advantage to agriculture to be connected with that famous and ancient seat of learning, to have access to its accommodation, its resources, and its instruments. They were that day more immediately concerned with a very interesting new departure in the University—the departure signified in the term "forestry." He took it that there was a universal agreement that the timber of this land—the forestry of this land—had been far too much neglected in the past. The causes for that they had not to go far to seek. Perhaps St. Grouse had had something to do with it; perhaps the desire for an immediate return from land also may have been concerned with it, but they could all recognise that the want of knowledge

as to the best way of promoting tree growth, the kinds of trees that best suited the soil, and the cultivation of trees had most of all to do with it. That was true of all Scotland, but more particularly in the north of Scotland. The Aberdeen College of Agriculture was sharing in the revival of interest in that important department, and he had great pleasure in introducing to them Mr. DAWSON, the first lecturer of the University in forestry. Mr. DAWSON was a graduate of Aberdeen, and he did not come among them as a stranger. He came to them with a great reputation, with extensive information, and with capabilities of using and adapting scientific methods. If enthusiasm, the faculty of lucid exposition, and sympathy with students were requisites of a successful teacher, they would find those requisites amply illustrated in the gentleman whom he now asked to deliver his introductory lecture. Mr. DAWSON, who was warmly received by a large audience, gave a long and most instructive lecture.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

CARNATION WINTER CHEER.—I send for your inspection a few blooms of Winter Cheer Carnation from plants growing in beds in the flower garden here. We cultivate this variety extensively for planting out in beds and borders, as it flowers freely during August, September and well into October, after all other border Carnations are over. The cuttings are inserted, each with a heel, in shallow boxes during September and rooted in frames having bottom heat. The variety is also grown in these gardens for flowering in winter. W. WOODMAN, HICKLTON HALL GARDENS, DOMESTIC, OCTOBER 28.

SHRUBS FOR A NORTH WALL (see p. 804).—*Choysia ternata* does well against a north wall; at the present time it is giving its second crop of flowers, which are not the least damaged by the sudden frosts we are now experiencing. *Garrya elliptica* is also valuable for the position named. As the flowers of the male plant are the most ornamental, care should be taken to procure that sex; but where space permits, the female form may with advantage be added for the sake of its black berries. The Camellias are hardy in many districts, and when planted against a north wall the flowering period is delayed, and the blooms often escape damage from spring frosts. Even though they yield no flowers, the Camellia makes a handsome and uncommon wall plant. The single and semi-double forms are the most suitable for outdoor culture. In the southern and western seaside districts the Escallonias thrive surprisingly in a north aspect. *E. macrantha* is the species most commonly grown, but the others are of equal value; for a low wall *Escallonia rosea* is preferable. A. C. BARTLETT, PENCARROW GARDENS, CORNWALL.

PYRUS SORBUS.—Reading the interesting article about this tree, published on p. 236 in the issue for April 13, 1907, it struck me that you might be interested in seeing fruited branches from a tree raised from seed saved from fruit handed to me by Mr. Wm. Robinson 24 years ago. The tree is now 30 feet in height and has a girth of 20 inches at 4 feet from the ground. This is the first year that it has flowered. Not knowing that "the seedlings have been found to be very delicate and should be kept in a cool-house for four or five years during winter," mine were planted out when an inch or two above ground, and not one failed to grow into a healthy tree. A. K., Harrow Weald.

PARASITIC PESTS AND DISEASES.—On p. 299 Mr. Lynch raises a very important question: "Is there any reason for the very common opinion that unhealthy plants are more liable to the attack of insects or fungi than are those which are healthy and vigorous?" Mr. Lynch himself distinguishes healthy and unhealthy plants, and, to avoid misconception, I take it he means by these terms that a plant is performing its functions either normally and is healthy, or abnormally and is unhealthy, without being diseased, by which term I understand that its health is impaired without a parasitic organism being the cause. Everyone has had experience of plants being unhealthy without any apparent cause. The late Professor H. M. Ward says on this point in his little book on *Diseases in Plants*, pp. 93, 94, and 95: "A plant in perfect health and in the fullest exercise of all its functions has its roots in a soil which is suitably warmed and aerated, contains the right quantities of water, which dissolve just the proper proportion of all essential mineral salts, but nothing poisonous, while the soil itself has a texture such that the roots and root hairs can extend and do their utmost in absorbing." A little later he says: "Now suppose the same plant, with its roots in an unsuitable soil, too dry or too poor in mineral supplies, and a starvation period set in." This is one of the causes by which unhealthy plants are produced. Now I take it our next point is to prove whether a healthy plant or an unhealthy plant is more liable to disease. If we bear in mind that disease germs are present everywhere, that spores of parasitic fungi or eggs of destructive insects are deposited upon healthy and unhealthy plants alike, we must own that both are exposed to exactly the same degree of danger from these sources; in other words, they are equally exposed to disease. In human pathology this is exactly the same; we all are exposed to the same risks of disease by infection as plants are. Why should there be any exception in plant pathology? In this argument I would answer Mr. Lynch's question emphatically in the negative, exactly as he himself sees no reason why the one or the other should be more or less liable. Certainly the point as to whether an unhealthy plant suffers more from disease than a healthy one has no bearing on the subject. But there is another side to this argument. Have not all of us learned from experience that, though we human beings, just as plants, are exposed to the same risks of disease, i.e., are equally liable to disease, yet that in cases of epidemics among any kind of living organisms some escape unhurt, while others fall a victim? In human pathology we refer again with regard to disease to the same degree of infection of individuals, but in plant pathology we have hitherto felt disinclined to think them possessed of the same faculties. I think everybody is agreed in medicine that constitution and predisposition are the vital points responsible for increased power of resistance or special liability to disease. This predisposition or liability to take disease, which may be present hereditarily, or develop through unfavourable conditions or surroundings, accounts for the appearance of disease and not in unhealthy plants than in healthy ones. *See T. Cusson.*

Mr. Lynch asks whether unhealthy plants are more liable to the attacks of insects or fungi than are those which are healthy and vigorous. It appears to the cultivator that all plants are equally exposed to contagion, but may not be equally liable to attack, because the healthy plant possesses a degree of resistance to disease that is lacking in plants which have become debilitated, either through lack of nutrition or through being kept in conditions in which they are unable to make use of the nutrition within their reach. Incapability may be a predisposing cause to disease. In human pathology it is well known that certain diseases are more readily contracted when the blood is in a more or less morbid condition. There appears

to be no reason for supposing that parasitic diseases generally thrive better in cases where the host is in a normal condition, but on the contrary whilst it is most unsafe to expose a patient to contagion when the blood is known to be in a condition other than normal, should infection result, the unhealthy subject generally suffers the greater injury. *H.*

I do not feel able to speak definitely as to fungoid attacks, but as regards insect attacks, I think there is no doubt whatever that the common theory is the result of common observation. We almost invariably find in growing large plots of young trees in the nursery that attacks of aphids, &c., start upon stunted unhealthy trees and spread to those around. For this reason we have for some years made a practice of going over the flats in spring and removing and burning all inferior trees. Most gardeners who suffer from the presence of rabbits find that a newly-planted and slightly-wilted plant will be eaten by them when healthy established specimens of the same thing are passed by. Again, it is a fairly well-established fact that parasitic pest of animals are much more numerous on unhealthy individuals. It may be said that this is simply owing to the sickly animal's inability to cleanse itself, but this will not apply in all cases. A healthy dog does worry his tenants unmercifully, but an ox has little facility for harrying his, whether sick or well. The analogies between plants and animals are so close that no excuse is needed for arguing from one to the other. *Chas. E. Pearson, Lowdham Nurseries, Nottingham.*

SPORTING IN A RETINOSPORA.—Seeing the report on p. 293 of the sporting of Retinospora, which was brought before the notice of the Scientific Committee of the R.H.S., I am enclosing pieces of a similar sport with a piece of the parent plant. The tree is growing in these gardens, and I also enclose a small sketch [Not reproduced.—*Ed.*] showing the position of the sport on the tree. *J. Barnard, Mostyn Hall Gardens, Mostyn, N. Wales.*

SOCIETIES.

HEREFORD FRUIT AND CHRYSANTHEMUM SOCIETY.

OCTOBER 28 & 29.—This Society held its annual show on these dates in favourable weather, in the Shire Hall, Hereford. Apples formed the principal feature, and they were of excellent quality. There was, however, a considerable falling off, compared with former years, in the display of Pears. Grapes were creditably staged in the few classes devoted to them, especially good being Muscat of Alexandria, from Stoke Edith Gardens. Chrysanthemums have at no time been a great feature at this Hereford show.

OPEN CLASSES.

In the class for a collection of Apples, both culinary and dessert kinds, arranged, with decorative foliage, in a space of 70 square feet, three exhibits were staged. Mr. R. M. WHITING, of Credenhill, Hereford, deservedly won the 1st prize with clean, highly-coloured fruit. About one-third of the collection were dessert varieties, including King's Acre Pippin, Allington Pippin, Rosemary Russet, James Grieve, Tillington Seedling, Cox's Orange Pippin, Charles Ross, and Herefordshire Pearmain. Of culinary sorts were noted grand dishes of Newton Wonder, Tyler's Kernel, Bismarck, Tibbett's Pearmain, and Bramley's Seedling. 2nd, Mr. E. W. CADDICK, of Caradoc, Ross, with large fruits of leading varieties. 3rd, Messrs. PEWTESS BROS., Tillington Nurseries, Hereford.

A DECORATIVE GROUPE OF FRUIT.

The inclusion of both fresh and preserved fruits was permitted the space being confined to 50 square feet. This was an interesting class, in which three exhibitors staged attractive displays. Messrs. PEWTESS BROS. took the lead with an assortment of fruit, principally Apples

and Pears, arranged in boxes, baskets, and dishes, interspersed with decorative plants; 2nd, THE HEREFORD CO-OPERATIVE FRUIT CO.; 3rd, Mr. CADDICK.

There were four exhibits staged in a class for a collection of Apples, 12 culinary and 12 dessert kinds. The 1st prize was won by Messrs. GERTING & CO., Newton, Glewston Court, Ross. The fruits were large, well-coloured, and clean of skin. 2nd, Mrs. WOOLHUTSE, Burghill Court (gr. Mr. J. Nunn). The class for a collection of 12 dishes of kitchen Apples was competed by five growers. J. LEE, Esq., of Highfield Biddington, Cheshire, being placed 1st with fine dishes of Byford Wonder, Peasgood's Nonesuch, Golden Spire, Alfriston, Annie Elizabeth, &c. Mr. KELLY followed closely.

The class for a collection of eight dishes of dessert Apples made a splendid show. Mr. KELLY being placed 1st amongst eight exhibitors. The Rev. G. H. DEVONPORT, Foxley (gr. Mr. R. Currie), was a good 2nd.

PEARS.—There was no entry in a class for Pears, to be arranged with foliage decorations in a space of 35 square feet. In a class for eight dishes, A. W. FOSTER, Esq., Brockhampton Court, Ross (gr. Mr. Parrott), was placed 1st amongst six exhibitors. 2nd, the Rev. Frederick BRIERLEY (gr. Mr. W. Foster).

There was 25 single-dish classes for distinct varieties of Apples, amongst which were to be found many of the best fruits in the hall, and in the most of the classes there was strong competition.

The best Muscat of Alexandria Grapes were shown by P. H. FOLLY, Esq., Stoke Edith Park, Hereford (gr. Mr. F. Roberts); the best of the variety Gros Colmar by Mr. PARROTT; and the best of Gros Maroc by Mr. SKYES.

Prizes were offered by the Herefordshire County Council for Apples, Mr. KELLY, Mr. F. ROBERTS, Capt. COX, and Mr. WHITING being prominent prize-winners.

The champion dishes were as follow:—Dessert Apples: 1st, Mr. WHITING, with a grand dish of Allington Pippin. Culinary Apples: 1st, Mr. J. LEE, with large and highly-coloured fruits of Mire de Ménage. Pears: 1st, the Rev. DEVONPORT with a fine dish of Doyenné du Comice.

TRADE EXHIBITS.

THE KING'S ACRE NURSERY CO., Hereford, showed upwards of 80 dishes of Apples; also fruit trees in pots and floral devices.

Mr. WILSON, Florist, Hereford, showed floral devices, Chrysanthemum blooms, &c. Messrs. YOUNG & CO., Hatherly, Cheltenham, had Tree Carnations displayed in vases.

THE LEAMINGTON ONION SHOW.

OCTOBER 24.—It was anticipated when the particulars of this Onion Show were first made known that a very keen competition would result, but all expectations were exceeded. No fewer than seventeen hundred bulbs were staged. Although several consignments of these stood out conspicuously from the rest, nevertheless, most of those exhibited were well-grown specimens of the Leamington Giant variety.

The premier award of £100 was made to A. R. SEARLE, Castle Abby Gardens, Northampton, who had an Onion well over 3 lbs. in weight, which was of great depth and splendidly ripened. Many congratulations were offered Mr. SEARLE, and the valuable prize was handed to him on the afternoon of the show.

The second prize was gained by Mr. S. J. BAKER, Wear House Gardens, Exeter, who also staged a remarkably fine Onion, and the third prize by Mr. W. TURNHAM, Culham Court Gardens, Henley-on-Thames. A. G. GENTLE, Little Gaddesden, Berkhamstead, was fourth. There were in all sixty-one prizes for the single bulb.

In addition to these, valuable prizes were offered for collections of vegetables grown in 1908. Messrs. Rogers, Leamington, seeds, and the first prize of £5 and a gold medal was awarded to Mr. WILLIAM FOLKES, Dunstable Street, Ampthill, Bedfordshire, who had some wonderfully fine produce. The promoters of the Show were so well satisfied with the excellence and keenness of the competition that it has been decided to offer valuable prizes again next year.

National Chrysanthemum Society.

NOVEMBER 4-5-6.

CHRYSANTHEMUMS are just now the most prominent flowers in the garden and greenhouse. The important November exhibition of the National Society affords opportunity for comparing the advance made in this beautiful autumn flower, and shows in what direction further progress is likely to be made. In some sections it would seem that perfection had almost been obtained from the exhibition point of view, and certainly in the Japanese type all that is needed has been reached in the matter of size and substance of petals, but there is still room for varieties with improved shades of colouring, especially in the tones of red. The market varieties now hold an important position, for Chrysanthemums are a feature in the flower markets during quite nine months of the year. Those of the border or decorative type also increase in popularity in each succeeding year, and the gardener has now at his disposal a wealth of beautiful varieties that are alike useful for the embellishment of the flower border or for furnishing blooms. The single varieties appear to have always suffered from neglect, and the exquisite flowers are seen less frequently than ever at exhibitions. The trained plants have quite gone out of favour, and this year the class for these plants was omitted from the schedule. The exhibition was opened at the Crystal Palace in favourable weather, the Wednesday at Sydenham being fine, with sunshine at intervals. This year the majority of the exhibits were displayed in the central avenue, and they were in point of numbers about equal to those staged last year, there being more in the larger classes and rather fewer in those of lesser importance. Several novelties were submitted to the Floral Committee, which met at 12 o'clock on the first day, and this body granted Certificates of Merit to 11 new varieties.

GROUPS OF CHRYSANTHEMUMS.

There were two classes provided for groups of Chrysanthemums, one open to all-comers and the other restricted to amateur growers.

In each case the schedule required a display of Chrysanthemums with suitable foliage plants and sprays of other subjects, and not fewer than four sections of the flower were to be represented. The open class was for an exhibit occupying 200 superficial feet. There was only one display in each section, the exhibitor in the open class being Mr. F. BRADLEY, Nurseryman, Addison Road, Caterham. He arranged a circular exhibit, using dambos, eperagnes, short and tall, with a large central stand, and in the foreground large exhibits of numbers of popular varieties in vases. Coloured foliage and sprays of berried plants, with a number of pot plants of Golden Privet, gave suitable relief to the Chrysanthemums. The exhibit was awarded the 1st prize.

The exhibitor in the amateur class was Lady TATE, Park Hill, Streatham Common (gr. Mr. W. Howe) who put up a very creditable exhibit, also in a circular manner. The group was worthily awarded the 1st prize. It contained a wealth of Japanese blooms, arranged principally as a large cone in the centre, and in the outer part were groups of decorative varieties, in which was set a Cocos Palm or a Codium (Croton). The whole was relieved with Ferns, Palms, and Codium.

CUT BLOOMS: OPEN CLASSES.

BLOOMS SHOWN ON BOARDS.

INCURRED VARIETIES.—The class for 36 blooms of distinct varieties was contested by four exhibitors, all the displays being of good quality, although the paucity of bright colours in this type of the Chrysanthemum was apparent in the exhibits. The yellow and white varieties are good, but what is needed are brighter colours, especially shades of red. There are too many of a dull bronze tone. The 1st prize was awarded to J. B. HANLEY, Esq.,

Fetcham Park, Leatherhead (gr. Mr. W. Higgs), who won easily, having by far the largest and best flowers. His varieties were as follow:—Buttercup a fine large bloom, but with rather loose florets; Mrs. Barnard Hanley (silvery-red, the inner surface of the florets are red), Souvenir de Wm. Clibran (white), Lady Isabel (bluish), Embleme Pattevine (yellow), Chrys. Bream (dull bronze-red), Mrs. H. J. Jones (white), May Phillips (yellow, fading to bluish pink), G. F. Evans (a good bloom of yellow colour), H. Hearn, Mrs. J. Hygate (white), Mrs. G. Denyer (white and pink), Miss E. Holding (very pale lilac), W. Higgs, J. Jones, Godfrey's Eclipse, W. Pascoe, Duchess of Fife (of fine globular form, white), Paitia Ralli, Daisy Southam (a choice flower of deepest yellow colour), W. J. Higgs, Mrs. J. Wynn, Frank Trestian, Mrs. F. Judson, Triomphe de Monthrun, Romance, Topaze Orientale (fine form, lemon coloured), Edwin Thorp, Margaret Brown, Le Peyron, Hanwell Glory, Clara Wells, J. Agate, Mrs. A. H. Hall, and Chas. Curtis (the best of the yellow varieties). 2nd, PANTIA RALLI, Esq., Ashted Park, Epsom (gr. Mr. G. J. Hand). The best blooms in this exhibit were Buttercup, W. Pascoe, Amber Beauty, C. H. Curtis, Mrs. F. Judson, Clara Wells, Mrs. Barnard Hanley, and Mrs. J. Wynn. 3rd, A. TATE, Esq., Downsides, Leatherhead (gr. Mr. W. Mease).

TWO INCURRED BLOOMS OF ONE VARIETY.—There was a good competition in this class, eight exhibits being seen, the choicest dozen being shown by Miss WILMOTT, Warley Place Gardens, Great Warley, Essex (gr. Mr. J. Trece), whose blooms were bright and fresh in appearance and of desirable form. The varieties were Mrs. G. Denyer (pink), Buttercup, Mrs. F. Judson (of purest white), W. Biddle, Embleme Pattevine, Triomphe de Monthrun, Godfrey's Eclipse, Mrs. H. J. Jones, Duchess of Fife, Daisy Southam, Lady Isabel, and Clara Wells. 2nd, J. B. HANLEY, Esq., Leatherhead (gr. Mr. W. Higgs), with G. F. Evans (a large yellow flower), Miss E. Holding, Edwin Thorp, Lady Isabel (a shade of red, a desirable colour), Duchess of Fife, &c. 3rd, A. TATE, Esq., Leatherhead (gr. Mr. W. Mease).

SIX INCURRED BLOOMS OF ONE VARIETY.—There were five exhibits in this class, and all were yellow varieties. The 1st prize was awarded to A. T. MILLER, Esq., Emlay House, Leatherhead (gr. Mr. G. Miehams), who had fine blooms of Buttercup. 2nd, A. KEMPE, Esq., 15, Ross Road, Norwood (gr. Mr. A. Osmond), with small but well-formed flowers of F. H. Curtis, 3rd, F. A. BEVING, Esq., New Barnet (gr. Mr. H. Parri), with Buttercup.

JAPANESE CHRYSANTHEMUMS.

The largest class in this section, that for 48 blooms of distinct varieties, was one of the most important in the Show. There were six exhibits, and, collectively, they made a big display. Competition was very keen, and the judges resorted to pointing, with the following result.—EXECUTORS of Lady Louisa Ashburton, Melchet Court, Romsey, Hants (gr. Mr. G. Hall), was awarded the 1st prize with 177 points; 2nd, A. TATE, Esq., Downsides, Leatherhead (gr. Mr. W. Mease), with 160 points; and 3rd, J. B. HANLEY, Esq., Leatherhead (gr. Mr. W. Higgs). The varieties comprising the 1st prize exhibit were those following: F. S. Vallis (a bold bloom), R. Vallis, Mrs. N. Davis, Splendour, W. A. Etherington, Bessie Godfrey (an excellent example of this fine yellow variety), Annie Hamilton (white), Magnificent (of richest colour), White Margosa Venosta, Edith Jameson, Leigh Park Wonder, Valerie Greenham, Mrs. A. T. Miller (a horse flower), Duchess of Sutherland, Mrs. Vallis, Lady Talbot (an excellent bloom, very large in size, with long, narrow, pale yellow florets), Mrs. A. H. Lee, Miss Hickling, William Watson, President Vicer, Sensation, Lady Conyers, Mrs. R. Hooper Pearson, Mrs. J. Dunne, A. Davis (fine in colour, deep yellow), A. H. Broomhead, Mme. C. Nagelmackers, Mrs. F. Coster, M. V. Venosta (a fine bloom of this recurring variety), Mrs. W.

Knox, Mrs. J. Dunne, Thrumpton Pride, Mme. P. Radadelli, J. H. Silsbury, W. Gee, Melchet Beauty, Mrs. G. Miehams, Norman Davis (fine orange-red colour, but rather sunlit), Marquis of Northampton, President Loubet, Eric Crossby, Mrs. D. Fairweather, Mme. R. Oberthur, W. Beadle (of fine colour), Lady Henderson, Maud Jefferies (the best white variety in the exhibit), J. H. Doyle, and Mme. Rivoli (a magnificent specimen of this yellow variety). Mr. TATE showed fine blooms of Lady Talbot, Mrs. E. Crossley, Mrs. J. C. Neil, Reginald Smith, Mme. P. Radadelli, F. S. Vallis, Mrs. L. Thorn, and Mary Inglis.

TWO-TY-FOUR BLOOMS OF JAPANESE VARIETIES, DISTINCT.—A special prize of five guineas was offered in this class by the President of the Society, Sir Albert Rolih, LL.D., D.C.L. Here, again, were seen some fine blooms, the class being contested by seven exhibitors. The 1st prize went in favour of J. D. FABER, Esq., Rush Court, Wallingford (gr. Mr. J. Dymock), for a magnificent collection, the flowers being large, bright, and fresh in appearance. They were all so good that we give the varieties, which were as follow.—Mrs. Norman Davis, F. S. Vallis, Mme. Nagelmackers, Lady Talbot, Valerie Greenham, Mrs. A. T. Miller, Reginald Vallis, Edith Smith, Mary Inglis, Mrs. A. H. Lee, General Hutton, Mrs. Vallis, Duchess of Sutherland, W. A. Etherington, Walter Jinks, J. H. Silsbury, Bessie Godfrey, Henry Stowe, Mrs. G. F. Coster, Mrs. I. E. Donne, Viola, Mme. R. Oberthur, Florence Penford, and Leigh Park Wonder. 2nd, R. B. JACOB, Esq., Ewell House, Ewell (gr. Mr. W. Holden), with F. S. Vallis, Magnificent, Norman Davis, Henry Perkins, Edith Smith, Valerie Greenham, Bessie Godfrey, &c. 3rd, A. JAMES, Esq., Coton House, Rugby (gr. Mr. A. Chandler).

TWO-TY-FOUR BLOOMS OF DISTINCT VARIETIES.—The prizes in this class were offered by four important trade growers, and the conditions were that the blooms were to be of varieties set out by the donors of the prizes and six at least introductions sent out during the last two seasons. The 1st prize was £12 and the 2nd £8. The class brought five entries, all of exceptionally good quality. So close were the first two exhibits that pointing was resorted to, and only two points separated the 1st and 2nd prize groups shown by the EXECUTORS of Lady Louisa Ashburton, Melchet Court, Romsey, Hants (gr. Mr. G. Hall), and JOHN BALFOUT, Esq., Harlow, Essex (gr. Mr. A. Jefferies), respectively.

The winning stand contained the following varieties:—Mrs. X. Davis, Norman Davis, Annie Lunt, W. Beadle, R. C. Pulling, Leigh Park Wonder, Thos. Stevenson, Paul Randley, Edith Jameson, W. Watson, Miss H. Rowley, W. M. Moir, Mary Donnellan, F. Archer, Mrs. J. Neill (a fine bloom of G. Oliver, Joseph Stoney, Harold Wells, British Empire, W. Gee, W. Ring, Miss F. Moore, Mrs. R. Hooper Pearson, and K. Stoop. Mr. BALFOUT had as his best blooms, Splendour, Penford, Leigh Park Wonder, Annie Hamilton, W. Howe, Pocket's Surprise, and Mrs. Chas. Penford.

TWO-TY-FOUR BLOOMS OF JAPANESE BLOOMS, DISTINCT.—This was an exceptionally well-contested class, there being 11 competitors. Generally, the flowers were of a high standard of merit, especially the dozen blooms staged by the EXECUTORS of Lady Louisa Ashburton (gr. Mr. G. Hall), who again secured the 1st prize for these large varieties. He showed F. S. Vallis, Magnificent, Marquis of Northampton, Lady Talbot (a fine flower of pale yellow colour), Edith Smith (a choice white bloom), W. A. Etherington, Annie Hamilton, J. H. Silsbury, Bessie Godfrey, R. Vallis, Mme. P. Radadelli, and Algernon Davis. 2nd, A. JAMES, Esq., Coton House, Rugby (gr. Mr. A. Chandler) who had a magnificent bloom of the yellow F. S. Vallis; also fine flowers of Mrs. Norman Davis, Lady Talbot, Reginald Vallis, &c. 3rd, R. B. JACOB, Esq., Ewell House, Ewell (gr. Mr. W. Holden).

BLOOMS SHOWN IN VASES.

INCURRED BLOOMS.—In a class for 12 vases, each of distinct varieties, three blooms in each vase,

a special prize of five guineas was offered by C. E. Shea, Esq., a former president of the Society. There were three exhibitors, and they furnished the whole space of a very large table. The large, globular blooms showed to advantage set on stiff stems with broad foliage. The 1st prize was won by J. B. HANKEY, Esq. (gr. Mr. W. Higgs), with an even set of large blooms, the varieties being as follows:—Duchess of Fife (white), Lady Isabel (bluish), Fantasia Ralli (bronzey, with reddish inner surface), W. Fessenden (pink), Frank Trestant (buff yellow), Boucage (yellow), Mrs. Bernard Hankey, an unnamed variety paler than Lady Isabel, and a magnificent vase of the yellow Buttercup. 2nd, PANTIA RALLI, Esq. (gr. Mr. G. J. Hunt), with smaller flowers of C. H. Curtis (fine in shape), Emblem of Potteville, Miss E. Holding, and Clara Wells.

Twelve vases of Japanese Chrysanthemum, divinet.—This was the most important of the vase classes, and four persons staged, but the closer competition was between the EXHIBITORS of Lady Louisa Ashburton, Melchet Court, Romsey; Hants (gr. Mr. G. Hall), and G. D. FABER, Esq., C.B., M.P., Rush Court, Wallingford (gr. Mr. J. Dymock). The judges awarded the 1st prize in favour of the first-named exhibitor, and gave Mr. FABER the 2nd prize. Mr. Hall had Lady Talbot, Maud Jefferies, Magnificent, Mrs. Knox, J. H. Silsbury, Mme. Rivoli, Edith Smith, W. E. Etherington, Marquis of Northampton, Reginald Vallis, Mme. P. Raddeili, and F. S. Vallis, all very large in size, and with fine broad foliage. The 2nd prize group contained such choice varieties as Mrs. Norman Davis, Mrs. A. T. Miller, Bessie Godfrey and Reginald Vallis. 3rd, Mr. W. IGGULDEN, Lock's Hill Nursery, Frome, Somerset. In this exhibit was the new yellow variety *Mrs. W. Iggulden* (see Awards).

SINGLE VASE CLASSES.—*White.*—There were six exhibits, and these represented three of each of the varieties Mrs. Norman Davis and Mrs. A. T. Miller. The 1st, 2nd and 4th prizes were awarded to the latter variety, and the 3rd to Mrs. Norman Davis. The Rt. Hon. Lord HOWARD DE WALDEN, Audley End, Saffron Walden (gr. Mr. J. Vert), won the 1st prize; A. T. MILLER, Esq., Leatherhead (gr. Mr. G. Mileham), the 2nd; and Mr. F. BRAZIER, Nurseryman, Caterham, the 3rd prize. *Yellow.*—There were seven exhibits in this class, the varieties being Bessie Godfrey, Mrs. W. Knox and F. S. Vallis. The 1st prize was given to a vase containing splendid flowers of F. S. Vallis, shown by Mr. W. IGGULDEN, Nurseryman, Frome, Somerset. 2nd, to the same variety, shown by JOHN BALFOUR, Esq., Moor Hall, Harlow (gr. Mr. A. Jefferies).

A variety other than white or yellow.—The best of four exhibits was the large, broad Walter Jinks' variety, of rose-pink colour. The exhibitor was JOHN BALFOUR, Esq. (gr. Mr. Jefferies). 2nd, the same variety, shown by Mrs. JEREMIAH LYON, Riddings Court, Caterham Valley (gr. Mr. G. Halsey).

Anemone-flowered varieties.—There were three exhibits in a class for 24 blooms of single varieties. The 1st prize was won by J. BOYD, Esq., North Frith, Tonbridge (gr. Mr. A. C. Horton), who included such varieties as Sabine, de Chalonsais, Mme. Lawson, Mrs. Skimmins, Souvenir de Norgoets, Mrs. H. Eland (a fine pink variety); Owen's Perfection and John Bunyan. 2nd, C. DOUGLAS CLARK, Esq., Eccleshill, Bromley, Kent (gr. Mr. A. Henderson).

Twelve large-flowered Anemone blooms.—These pretty flowers were best shown by J. L. BOYD, Esq., North Frith, Tonbridge (gr. Mr. A. C. Horton). The disc florets are extremely pretty and are surrounded by a zone of ray florets. Delaware, Mrs. Judge, Mrs. Benelli, Mme. C. Lebocqz, (luck, Mlle. N. Brun, and Mme. Godobec were notable varieties. 2nd, C. DOUGLAS CLARK, Esq., Bromley (gr. Mr. A. Henderson).

Twelve large-flowered Japanese Anemone blooms.—The best of three exhibits was from the gardens of J. L. BURGESS, Esq., Hill House, Marseyhampton (gr. Mr. J. A. Humphries). The varieties were Souvenir de Norgoets, Sir Walter Raleigh, Le Chalonsais, W. W. Astor, Sabine, Mrs. H. Eland, &c. 2nd, C. DOUGLAS CLARK, Esq. (gr. Mr. A. Henderson).

Pompon varieties.—The best six vases of these Chrysanthemum were shown by F. BRABY, Esq., Bushey Lodge, Teddington. The flowers were much larger than those in the

other exhibits. The varieties were Elsie Dordan (an exquisite flower of pink shade), Prince of Orange, William Westlake (yellow), Comte de Morney (purple), Mr. Holmes (dull red), and William Sabley (yellow). 2nd, J. L. BURGESS, Esq. (gr. Mr. J. A. Humphries), with similar varieties.

Mr. BRABY won the 1st prize for the best exhibit of six vases of Anemone Poppoms.

Single Chrysanthemum.—These were not numerously shown. Only one class was provided, and this was for twelve vases in not fewer than six varieties. Four growers competed, the premier exhibit being shown by Mrs. JEREMIAH LYON, Riddings Court, Caterham Valley (gr. Mr. G. Halsey), who had bright bunches of Glacie Towers (pink), Miss Cissy (reddish-bronze), Ladysmith, Mrs. H. Perkins (red), F. W. Smith (pink), &c. 2nd, Mr. C. J. STURSON, Nurseryman, Chelmsford, with larger blooms, the Bronze Paganum being very fine.

MARKET CHRYSANTHEMUMS.—A class was provided for six varieties of Chrysanthemum, dis-budded, and suitable for market purposes. Twelve blooms of each variety were to be shown in a vase. There was a poor response, only two groups being forthcoming, the better being shown by F. J. YKROW, Esq., 18, Abbey Road, St. John's Wood (gr. Mr. A. Robertson). The varieties were Chas. Davis, Moneymaker, Lady Hanham, Dazleil (red), Vivand Morel, and Souvenir de Petite Anne. 2nd, J. L. BURGESS, Esq. (gr. Mr. J. A. Humphries), with shorter stalks. The old Souvenir d'Or quite held its own amongst the newer kinds.

There was only one poor exhibit in the class for reflexed blooms.

AFFILIATED SOCIETIES.—Only two exhibits were staged in the class for societies affiliated with the National Chrysanthemum Society, one by THE CHRYSAEMUM AND HORTICULTURAL SOCIETY and the REGATE AND DISTRICT CHRYSANTHEMUM SOCIETY, and the prizes were awarded in the order of the names.

AMATEURS' CLASSES.

The exhibits in this section were not so numerous as in some former years, although there were as many as ever in the decorative classes. The principal of these exhibits were accommodated on one table. There was no entry in the class for 18 Japanese blooms, distinct; but in the smaller class for 12 blooms four exhibitors staged. The premier blooms were shown by Rev. A. C. COOPER-MARSDEN, 60, Wickham Road, Beckenham (gr. Mr. W. Rigby). He showed a good dozen flowers, which included Reginald Vallis, F. S. Vallis, Henry Perkins, Mrs. A. T. Miller, Leigh Park Wonder, Miss Elsie Fulton, W. J. Crossley, and Walter Jinks. 2nd, W. H. STONE, Esq., Sydenham (gr. Mr. T. W. Stevens), with smaller blooms.

Twelve Incurred varieties.—The better of two exhibits shown was from the gardens of Mr. JAMES KING, East View, Hendon, his flowers being somewhat flat, the best example being the beautiful yellow variety named after C. H. Curtis.

The only nine vases of single varieties staged were put up by Mr. C. M. COLLINGWOOD, St. David's Hill, Exeter, the quality being mediocre. There were some creditable exhibits staged in the classes for single vases of large blooms decorated with ornamental foliage of other plants. There were eight handsome exhibits, the majority having blooms of high quality. The 1st prize was made in favour of Mr. C. FOX, Richmond Lodge, Eridge Road, Tunbridge Wells, with the large white Beatrice May variety, decorated with Pampas grass, Asparagus Sprengeri, Berberis, &c. 2nd, A. GROVE, Esq., M.P., (Chalfont St. Giles (gr. Mr. E. Dennis), with large, flat blooms of Mrs. Norman Davis prettily arranged with Oak foliage and grasses.

The best large vase of decorative Chrysanthemum was shown by Mr. C. B. GABRIEL, Easdale, Horsell, Surrey. Other prominent prize-winners in the Amateurs' Classes were Mrs. T. BREWSTER, Canterbury; Mr. JAMES KING, Hendon; Mr. T. W. STEVENS, Sydenham; C. FOX, Tunbridge Wells; C. B. GABRIEL, Horsham; E. HUTTON, Dulwich; W. LINTOTT, Caterham; T. W. HILL, Merstham; and A. C. HORTON, Tonbridge.

DECORATED TABLES, arranged with Chrysanthemums, were especially numerous. Mr.

FELTON, Hanover Square, W., won the 1st prize in the open class, his arrangement being unlike the others. It consisted of a ball of moss at either corner, and one in the centre, the central one carrying a tall stake, on which was another ball of moss. In the moss were arranged Rayonnante and the green Mme. E. Rogers, with Pompon and Single varieties and suitable foliage.

Mr. FELTON also won the Deau Memorial Gold Medal and the Felton Cup, but he presented his own cup to the winner of the 1st prize in Class 25.

FIRST-CLASS CERTIFICATES.

J. W. Molyneux.—A Japanese variety of rich crimson colour. The foliage and growth denotes a variety of robust constitution. Shown by Mr. N. MOLYNEUX, Rooksbury Park Gardens, Wickham, Hants.

Mrs. W. Iggulden (Japanese).—The colour is a deep canary yellow. The blooms are supported on strong stems. The variety gives promise of a good exhibition Chrysanthemum. From Mr. W. IGGULDEN, Lock's Hill Nurseries, Frome.

Sylvia Slade (single).—The colour is lake, with a white zone. The habit is free-flowering, and is suitable for growing either naturally or dis-budded.

White Paganum (single).—A pure white flower, an exact counterpart of the well-known Edith Paganum.

R. F. Felton.—A market variety of a rich golden yellow colour. The plant has a strong constitution and is of free growth, several good blooms being developed on a single plant. These three were shown by Messrs. W. WELLS & Co., Mertham.

Miss Vera Sloop (Incurred).—Of silvery-pink colour, and with stout petals. Shown by Mr. G. CARPENTER, West Hall, Byfleet.

The Hon. Mrs. Lopes (Japanese).—A flower of canary-yellow colour and of good form. Shown by Mr. M. SILSBURY, Shanklin, I.W.

Reginald (single).—A pleasing lemon-yellow variety, suitable for decorative purposes. Shown by Mr. W. J. GODFREY, Falmouth.

Mr. W. Buckingham (single).—The colour is a clear shade of pink, the plant producing handsome sprays of bloom when grown without dis-budding. Shown by Mr. T. BULLMOR, Grove House, Roehampton.

Mr. H. Parker.—A single variety with flowers of a bluish shade. Shown by Mr. H. REDDEN, Manor House Gardens, West Wickham.

Robert Thorp.—A pure white single variety, free in blooming, and with hand-ome foliage. Shown by Mr. H. W. THORP, Worthing.

FRUIT AND VEGETABLE CLASSES.

Some good produce was seen in the fruit and vegetable classes, and exhibits were numerous. Especially good were the collections of vegetables in both Messrs. K. Sydenham & Co. and Messrs. Webb & Sons' classes. The Rt. Hon. Earl SPENCER, K.G., Althorp Park, Northampton (gr. Mr. Silas Cole), won in Messrs. Sydenham's class for a collection of vegetables having very fine produce, including Clayworth Prize Pink Celery, Ailsa Craig Onions, Hollow Crown Parsnips, Autumn Giant Cauliflower, Potatoes, and Brussels Sprouts.

Hon. VICARY GIBBS, Elstree (gr. Mr. Edwin Beckett) won the premier prize in Messrs. Webb's class with excellent vegetables.

Grapes were well shown, also Apples and Pears in their respective classes.

NON-COMPETITIVE EXHIBITS.

GOLD MEDALS.—Mr. NORMAN DAVIS, Framfield, for Chrysanthemums; Mr. H. J. JONES, Lewisham, for Chrysanthemums; Messrs. W. WELLS & Co., Merstham, for Chrysanthemums; Messrs. G. BUNYARD & Co., LTD., Maidstone, for hardy fruits; Messrs. J. PRED & Sons, Norwood, for Chrysanthemums, fruit and miscellaneous exhibits; Mr. PHILIP LADDS, Swanley Junction, for market varieties of Chrysanthemums; Messrs. H. CANNELL & Sons, Swanley, for fruit, Chrysanthemums, Zonal Pelargoniums, &c.

GOLD MEDAL for the best miscellaneous exhibit in the show. Mr. H. J. JONES, Lewisham.

DEAN MEMORIAL MEDAL.—R. F. FELTON & SONS, florists, Hanover Square, W., for floral devices.

SILVER-GILT MEDALS.—MESSRS. W. J. GODFREY & SON, Exmouth, for Chrysanthemums; MESSRS. FELTON & SONS, Hanover square, W., for floral devices.

LARGE SILVER MEDALS.—MESSRS. HOBBS, J. D., Dereham, for Roses, &c.; GOVERNOR OF BRITISH COLUMBIA, for Apples; Mr. C. J. SIMPSON, Cheshamstead, for Single Chrysanthemum; MESSRS. H. SCOTT & SONS, South Norwood, for horticultural sundries, and Mr. G. W. RILEY, Herne Hill, for garden furniture.

SMALL SILVER MEDALS.—Mr. H. W. THORP, Warthing; Mr. F. BRAZIER, Caterham; MESSRS. J. CHEAL & SONS, Crawley; Miss R. DAVIES, Upper Norwood; Mr. J. WILLIAMS, Ealing; MESSRS. W. DEANAN TUCKER & SONS, Cannon Street; and MESSRS. J. LAING & SONS, Forest Hill.

DUTCH BULB GROWERS.

The following Awards have been made at recent meetings of the Floral Committee:—

FIRST-CLASS CERTIFICATES.

Dahlia (Paeony flowered) "Andrew Carnegie," in colour light rose.

Dahlias (Actus) Cecilia, Dorothy, Elsa Ellrich, Eureka, Hamlet, Harold Peerman, Ivernia, Kathleen Bryant, Rev. Arthur Bridge, and Rosa Starr.

Montebria Protheus, Watsonia Ardeniæ.

Anemone japonica "Autumn Queen," a large-flowering, semi-double variety, of clear rose colour.

Anemone japonica "Geant des Blancches," a very large-flowering, semi-double variety; flowers pure white.

AWARDS OF MERIT.

Acidanthera bicolor, a new species from Abyssinia, allied to Gladiolus. The flowers are creamy white, with brownish-red blotches.

Dahlias (Actus) Apricot, Crespy, Charles H. Curtis, Elysian, Flame, Gazelle, Spanish Prince, and C. E. Wilkins.

Gladiolus gandavensis "America."

Gloriosa Leopoldii, a house-plant climbing plant, with elegant, pure yellow flowers.

Lupinus polyphyllus rosæus.

Phlox decussata Gruppenkönigin; large crosses of deep rose-coloured flowers, centre dark violet.

Aster Novæ Angliæ "Ryecroft pink." A very richly-coloured variety, with large flowers, rose magenta, with copper-coloured centre.

Aster puniceus pulcherrimus, with large white flowers, shaded with light blue.

Aster thericus Ultramarin; large ultramarine blue flowers.

Aster cordifolius Spruhlicht, with small, soft blue-coloured flowers, a very free-flowering variety.

Helaborus niger præcox; flowers white, smaller than the common Christmas Rose, flowering in the open air from September until February.

PORTSMOUTH HORTICULTURAL.

OCTOBER 25, 29, 30.—The annual autumn show of this Society was held in the Town Hall, Portsmouth, on the above dates, the exhibition proving a success. Entries were perhaps not quite so numerous as in some former years, but the quality of the exhibits was up to an average standard.

Cut blooms were the leading feature of the show. In the class for 36 Japanese Chrysanthemums in not fewer than 18 varieties the 1st prize included a Silver Challenge Cup value £20, a Gold Medal, and £5. Four growers completed, Lady ASHBURTON, Melchet Court, Romsey (gr. Mr. G. Hill), won the 1st prize easily with large, full fresh blooms of such varieties as F. S. Valls, J. H. Silsbury, Mme. J. Radcliff, Edith Smith, Lady Talbot, Bessie Godfrey, Magnificent, Mrs. A. T. Miller, Marquis of Northampton, and Mme. G. Rivol. PANTIA RAIL, Esq., Ashstead Park, Epsom (gr. Mr. G. H. Hunt), was a good 2nd with smaller blooms.

The next important class was that for 24 Japanese blooms in not fewer than 16 varieties. Four contestants staged; Lady ASHBURTON was

again successful with similar blooms and varied as those staged in the important class. Mrs. GUYLE, Roscroft, Hambledon, Cosham (gr. Mr. L. Davies), won the 2nd prize with slightly inferior specimens.

Incurred varieties were, as is to be expected at this early date, not numerous, although good in quality. Mr. P. RALLI won in the class for 24 blooms with medium-sized, neatly-finished examples of popular varieties. The new Clara Wells variety was well shown in this exhibit.

Pompon-flowered Chrysanthemums were best shown by Mr. H. SNOOK, 5, Fitzroy Street, Fenton.

Mr. C. J. PARK, South Hayling, had the best single-flowered varieties in 12 sprays.

A local class was provided for 12 incurved and 12 Japanese Chrysanthemums. Mr. J. LOVE, Park Road, Cowes, was the most successful, excelling distinctly with Japanese, yet having meritorious incurved blooms also.

Mr. J. NANCE, 98, Hampshire Street, Southsea, staged the best Anemone-flowered varieties. Groups of Chrysanthemums in pots adorned two sides of the Hall. THE PARKS AND OPEN SPACES COMMITTEE (gr. Mr. Papworth) was 1st with medium-sized blooms.

Specimen plants were fairly well represented. Mr. G. AMBERY, Bognor Road Nurseries, Chichester, had the finest plants.

Exhibits of fruit were numerous and good. Black Grapes in two bunches were best shown by Mr. W. H. MYERS, Swanmore Park, Bishop's Waltham (gr. Mr. G. Ellwood). Mr. MYERS also had the best white Grapes in Muscat of Alexandria. He also showed the best set of six dishes of Apples.

Pears were best shown by Mr. G. HOAR, Havant, in six dishes.

THE WEATHER.

THE WEATHER IN WEST HERTS.

A return to unseasonably warm weather.—After a cold period lasting eight days there took place on October 25 a return to unseasonably warm weather. The change in temperature was very marked, the highest reading in the thermometer screen being 48° on October 27, and 62° on the following day. Both the days and nights during the past week have been warm for the time of year. The ground is also now warm and the temperature at 4 feet below 9° warmer, and at 1 foot deep 4° warmer, than is reasonable. No rain worth mentioning has fallen during the week. There is still, however, each day some rainwater coming through the two percolation gauges, but the amounts are gradually becoming smaller. The sun shone on an average for 2 hours 25 minutes a day, which is about the average daily duration for the month of November. Throughout the week the atmosphere has continued very calm. There was about a reasonable quantity of moisture in the air at 8 p.m.

OCTOBER.

A singularly warm and calm October.—This was the warmest October during the 23 years over which my records at Beckhams Wood. The days are a little more unseasonably warm than the nights. There occurred one cold period in the latter half of the month lasting eight days, but with these exceptions all the days were more or less unseasonably warm. On the warmest day the temperature in the thermometer screen rose to 77°, which is the highest reading I have yet recorded here in October. On the coldest day, on the 25th, the thermometer indicated 9° of frost—about an average extreme minimum for the month. Rain fell on 15 days to the total depth of 1.07 in, in one hour of which the maximum fall indicated 9° of frost—about an average extreme minimum for the month. In the first half of the month only a quarter of an inch was deposited, whereas in the latter half there were only three days without rain. The sun shone on an average for 34 hours a day, or for 22 minutes a day longer than is reasonable. Besides being the warmest October it was also the calmest of which I have here any record. In no hour did the wind exceed the force of 10 miles. The direction of the air currents was mostly some easterly point of the compass—the total duration of these light easterly gales being 397 hours, or over 16 days, whereas the average duration for the same direction in October is only 142 hours, or six days. The mean amount of moisture in the air at 3 o'clock in the afternoon exceeded a reasonable quantity for that hour by 2 per cent. —E. M. BARKHURST, November 4, 1908.

GARDENING APPOINTMENTS.

Mr. HENRY J. COOPER, for the past 4 years Gardener and Orchard grower at Slaney Park, Balunglass, Co. Wicklow, as Gardener and Florist at the Galloway Nurseries and at Slaney Park, Balunglass, Wicklow, &c.
Mr. A. MATTHEWS, for the past 5 years Foreman in the gardens of Sir W. G. GILBERT, Grim's Dyke, Harrow Weald, as Gardener to F. ALEXANDER, Esq., Everleigh Hall, Marlborough, Wiltshire.
Mr. G. SMITH, late Gardener to H. B. MONEY-COOPER, Esq., Stodham Park, East Liss, Hants, as Gardener to C. D. ROSE, Esq., M.P., Hardwick House, Whitechurch, Oxon.
Mr. CHARLES SIMONS, for the past 3 years Gardener at Horton Hall, Gloucestershire, as Gardener and Bailiff to Mrs. WYNNE MARRIOTT, Avonbank, Pershore, Worcestershire.

MARKETS.

COVENT GARDEN, November 4.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend on the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate, not from day to day, but occasionally several times in one day.—Ed.]

REMARKS.—English Apples are still plentiful, but the quality generally is very inferior and therefore they are practically unsaleable. Californian Newtown Pippins are now selling more freely and they are arriving in quantities. There has been some very fine samples of British Columbia grown Apples this week, highly coloured clean fruits having a very attractive appearance. The consignments run of about 200 to 300 cases in 25 and 45 lbs. But the fruits did not meet with such a ready sale as was anticipated in consequence of the quantities of home-grown, Californian, and Nova Scotian Apples on the market. Lemons notwithstanding, the samples have not been very good. English and Guernsey Grapes are very plentiful and of poor trade. French Grapes are of fine quality and of good quality notwithstanding the cold weather. Trade generally is fair. E. H. N., Covent Garden, Wednesday, November 4, 1908.

REMARKS.—Trade is quiet, but it is expected to improve in the event of cold weather. Prices are about the same as last week. Edward J. Newbarn, Covent Garden and St. Pancras, November 4, 1908.

COVENT GARDEN FLOWER MARKET.

MARKET REGULATIONS.
The question of the time for closing the flower market is being discussed. Formerly, all concerned were glad to get away in the evening, but now that supplies are excessive, and there are many who have stores open, where buyers can get what they may want at any time during the day, those who only have stands in the flower market feel themselves placed at a disadvantage. Some would like an extension of time. It has been pointed out to me that any suburban florist receiving orders by the morning train in the morning cannot get to Covent Garden in time to buy, except from those who have stores outside the flower market. Another trouble is that the new market for the sale of foreign plants is not opened until later than the ordinary flower market. Standholders in the market pay heavy rents and tolls, and ought to have the privilege of remaining later when necessary to sell perennials. The supply of flowers is now falling, as things are now is that those who have the outside stores can buy at the close of the market and sell at a profit at prices which may have been refused earlier in the morning by growers.

POT PLANTS.
Ericas are of the best quality, and E. hyemalis is now coming from several growers, but the large plants do not make proportionate prices to those sold in the very small pots. Chrysanthemums very much more in quality. Souvenir d'Un Ami from one grower has reached us, and is very good. Le Facile is now very good, and Kathleen Thompson is nearly past; the colour being not so good as in the earlier plants. Begonia Gloire de Lorraine is in flower, but the variety is not so good as the one which is now selling. The plants which are now in the market are of good quality, but the prices which may have been refused earlier in the morning by growers.

CUT FLOWERS.
Chrysanthemums are of the leading feature, and those from the open ground being so good, it has been rather against growers who house their plants early. On Saturday good flowers of Lilium longiflorum were sold out early, plants at the leading were quantities left at closing time. Carnations in all colours are plentiful, but prices are maintained fairly well. Roses of the best quality have advanced in price. The supply of flowers is now falling, as things are now is that those who have the outside stores can buy at the close of the market and sell at a profit at prices which may have been refused earlier in the morning by growers.

ENQUIRIES AND REPLIES.

DRY BORDER.—What plants or bulbs would be best to grow (not over 2 feet high, nor to be fastened to the wall) close to a wall of a house in North Northumberland, in a border about 3 feet 6 inches wide facing due south and under the overhanging eaves of house, and where Gerbera Jamesoni flourishes? Also, what would be good substitutes for herbaceous Peonies growing between two rows of Phlox decussata in an oblong bed on a lawn partially shaded—the Peonies not being a success? A. F. Z.

We assume the border has some degree of shelter, as you say Gerbera Jamesoni flourishes. You might plant Agapanthus umbellatus vars. minor and Moutan; Funkia; variety, notably F. subcordata (syn. grandiflora); Linum arboreum; Iris unguicularis (syn. stylosa); Kniphofia Macowanii, and K. Nelsonii; Tricyrtis hirta; also the following bulbs: the Belladonna Lily (Amaryllis Belladonna); species of Calochortus, Tigridia Pavonia, and Zephyranthes candida. An excellent substitute for the herbaceous Peonies would be the many beautiful varieties of Anemone japonica if they do not flower too late for your purposes. Kniphofia, Sidalcea, Malva, white; Sidalcea Kossy Gem, deep rose; or Chrysanthemum maximum would also thrive in a position where Phlox decussata is successful.

ADDRESS:—W. The address of Mr. H. W. Thorp, who exhibited the incurved Chrysanthemum is Durrington, near Worthing.

AMERICAN BLIGHT ON APPLE TREES: W. C. R. Spray the trees during winter with the caustic alkali wash. This is composed of 10 lbs. of carbonate of potash, 10 lbs. of caustic soda, and 100 gallons of water, to which has been added 3 or 4 lbs. of soft soap for the purpose of making the specific adhere more readily to the trees. You must apply the spray through a delivery nozzle that will distribute it as finely as possible, more as mist than a wash. The trunks should also receive a good application of lime wash. If the presence of the pest is suspected on the roots, apply Kamit as a dressing, and hoe it in.

ANTHRACITE COAL: Encl. There are no appreciable sulphurous fumes from the use of anthracite coal. Your chimney shaft—providing it is not in a low situation nor partly shaded by trees—is sufficiently high to afford proper draught for the burning of this kind of coal, and the latter is set as it should be. Instead of pushing the damper nearly home in the frame fixed in the chimney when banking down the fire last thing at night, as is done when coke is the fuel burned, it should be left quite half open of time. For this is a matter of detail which must be regulated according to the conditions of the weather and other circumstances. We may add that in using anthracite, as large pieces of the coal as can be conveniently placed in the furnace should be used in stoking, instead of breaking them into smaller pieces. If the furnace of a medium or large-sized horizontal tubular boiler to which three or four thousand feet of 4-inch piping is attached to heat a block of forcing—say, Cucumber—houses, in which a minimum night temperature of 70° is observed, be filled with large pieces of anthracite at 10 p.m. and the damper left half open, a good fire will be found eight or nine hours later, with the water in the pipes at boiling-point. If a less tropical degree of heat were required in such block of houses, the fire might be made up early in the evening to last from 15 to 18 hours without needing attention.

APPLE AND PEAR NOMENCLATURE: Some, Devon. Boscher's Pearmain was a misprint for Baxter's Pearmain. Fondante du Paysal is the name of a Pear that was exhibited at the Pear Conference held in the old Chiswick Gardens in October, 1885. It is not mentioned in Hogg's Fruit Manual, but the specialist has grown the Pear for the last 30 years.

Obituary.

ISAAC EASTWOOD.—The death of this well-known and highly-respected Yorkshire gardener, at the age of 77 years, took place at Fox Hill, Westwood, Leeds, on October 25. For fifty-one years he had served the owner, Mrs. Tetley, and her late husband, his services being much appreciated. For over forty years he was a regular and successful exhibitor of stove and greenhouse plants at the leading horticultural exhibitions in the county. Many readers will remember the splendid specimen Perlargonium he staged at the Yorkshire gala from year to year. Amongst his fellow-gardeners he was looked upon as a cheery, well-informed man, who, while being in a keen competitor, was always straightforward in his actions. H. J. C.

JOHN DON.—This gardener died at Nottingham on October 19. Deceased commenced his career as gardener to Sir Thomas Mills, The Wilderness, having been sent there from Dalkeith in the early 'seventies. After 10 years or so had passed, he became representative of Messrs. Cripps & Son, Tunbridge Wells. He held this position until the death of his brother, when he took over the business of horticultural sundries, man and bulb importer, which he carried on for many years. In all these positions he was successful. He made many friends, and was ever ready to give a helping hand to those in need.

SCHEDULES RECEIVED.

Doncaster and District Chrysanthemum show, to be held on Wednesday and Thursday, November 11 and 12, 1908, in the Corn Exchange, Doncaster.
Nottingham and Notts Chrysanthemum Society's exhibition, to be held on Saturday and Sunday, November 13 and 14, in the Melchams' Hall, Nottingham.

It is described as a large, roundish-ovate fruit, with a greenish-yellow skin that is somewhat russety and with a flush of colour. The flesh is firm and sweet, but the variety only ranks as a third-rate Pear. It is in season in November.

ASPARAGUS PLUMOSA: H. J. There is nothing remarkable in the flowering of this plant. The Fern is *Osmunda regalis*, the Royal Fern.

BEGONIA GLOIRE DE LOURNAIS: H. J., *Ilabe-plid*. You had better observe the literal wording of the schedule, or you will incur the risk of disqualification.

CARNATIONS DISEASED: S. E. The trouble has arisen from a microscopic fungus (*Puccinia*), with which is always associated another fungus, *Macrosporium nobile*. Remove the diseased plants at once from the house. Cut away the affected parts carefully and burn them. Ventilate the houses, and generally afford the plants conditions that will harden them so as to be able to withstand the disease.

CHRYSANTHEMUM LEAVES: H. J. We have not found any fungus disease upon the leaves. The injury is probably caused by excessive feeding.

COMMON RIGHTS: F. H. The chain fence which you contemplate would undoubtedly be an obstruction. Indeed, the object of the fence is presumably to prevent people from walking too closely past your house. We think the Conservators would be certain to object to this obstruction, and if you wish to keep on the safe side, you had better approach them beforehand. Possibly they might give you leave on your paying them a nominal rent of 1s. a year, so as to keep their rights alive.

COMPENSATION: P. S. E. We gather from your letter that you are over 21 years of age, that your earning capacity is not diminished, and that no further compensation in the accident case is to be anticipated. Under these circumstances, you cannot claim more than the amount which has been offered.

CYSTARD APPLE: F. H. It is possible to fruit this plant in this country, but scarcely worth the trouble. You will require a house with a safe temperature, and have to wait for several years until the tree reaches a fruiting stage.

CYANIDING VINES IN WINTER: R. J. V. As or about pruning time, when the vines are quite dormant, for the destruction of vine scale, mealy bug, red spider, &c., two cyanidings should be given, at intervals of 24 hours, of 21 ounces of sodium cyanide, 5 fluid ounces of sulphuric acid, and 15 ounces of water. Exposure, 30 minutes, temperature of house, 50 to 55°. These directions, with others, were given by Mr. E. L. Hawes in our issue for April 23, 1904, p. 271.

DISEASED CARNATIONS: A. B. The plants are attacked by the Black Mould (*Heterosporium echinulatum*). Destroy all the affected plants and syringe the rest with diluted Bordeaux mixture.

DISSOLVED BONES: J. H. J. The bones may be dissolved in sulphuric acid. Care must be taken to use a trough that the acid will not act upon, the best for the purpose being one of earthenware; metal and limestone receptacles must not be used. Dilute the crude commercial acid with two or three times its bulk of water. When the bones are dissolved, mix the substance with soil.

EARLY-FLOWERING CHRYSANTHEMUMS: *Blosser*. Six good varieties are the following:—1, *Crimson Marie Massee*, crimson-bronze; 2, *Maggie*, pure yellow; 3, *Madame Marie Massee*, lilac mauve; 4, *Floa*, golden yellow; 5, *Percy's Seedling*, orange yellow; and 6, *White St. Croix*. To obtain bushy plants, you should insert the cuttings in March or April, and remove the growing points when the young plants are 4 inches to 5 inches high.

EVERGREEN CLIMBERS FOR A CONSERVATORY WALL: J. H. A. If the position is somewhat shaded, the following subject should succeed if planted in a well-drained border consisting of peat and sand. *Berberisopsis corallina*, *Cavendishia auminata*, *Cliothus puniceus*, *Lapageria rosea* and the variety *alla*, and *Trachelospermum* (*Rhynchospermum*) *jasmimoides*. Should the position be one exposed to

sunshine you might plant two or three of the following plants:—*Buddiea asiatica*, *Lantana salvifolia* (syn. *delicatissima*), *Mandevilla suaveolens*, *Lonicera sempervirens*, and *Kennedia prostrata* var. *Mariyatua*.

FLORISTS' BIBLIOGRAPHY: H. This book, that was noticed last week, may be obtained from Messrs. Wesley & Son, or from our own publishing department.

GARDENING EMPLOYMENT IN THE UNITED STATES: *America*. You will find an answer to your query in our issue of February 2, 1907. The subject is there dealt with by a gardener who recently returned from a private garden in the United States. He states: "The wages for under and single-handed gardeners are from \$35 to \$50 a month; head gardeners are paid \$80 to \$100 per month, with house and coal. Situations in private places are hard to obtain, and an establishment employing five or six men is considered a large one. If you have no friends, you must have £6 in your pocket on landing. Should you have accepted your engagement before landing, you must remember there is a law in the United States which forbids this, the penalty being deportation to the place of embarkation if you are found out. The right time to arrive is the third week in March."

KEEPING FUCHSIAS, &c., THROUGH THE WINTER: J. G. A. As you appear to have no glass-house at your disposal, but only a room in a London flat, you will probably lose some of the plants during the winter. The Fuchsias can be kept dry and be stored in some place that is frost-proof and where the atmosphere is not excessively dry. They will develop growth again next spring, when they must be given water and extra warmth. The Begonias should be placed in the window and be kept rather dry through the winter. We do not advise you to retain the *Castor Oil* plant, as *Ricinus* is easily raised from seeds sown in the spring-time. It is better to use fresh soil for your bulbous plants, but this is not absolutely necessary.

MOSS IN LAWN: M. G. If the moss is present in great quantity, it is usually indicative of the soil being water-logged and in need of draining. The moss should be raked off with an iron rake and a dressing of decayed manure applied; it will also be beneficial to apply some old peat soil. Next spring give the lawn another good raking and sow seeds of a suitable mixture of lawn grasses.

MOVING PLANTS: *Widhamstow*. Should the weather in December be open and free from severe frosts, your plants may be easily and safely moved in that month. The only advantage likely to result from putting them into boxes at once is the freedom from risk in regard to severe and sustained frost.

NAMES OF PLANTS: F. H. M. Phaeolus Caracalla, the twisted-floored Kidney Bean, or Snail-flower.—L. J. G. *Euonymus latifolius*, *D. M. 1*, *Hypericum hookerianum*, 2, *H. elatum*—C. K. K. *Khus thuyina* (Stags Horn Sumach)—G. P. 1, *Jasminum humile*, known in gardens as *J. revolutum*; 2, *J. primulinum*; 3, *Cotoneaster frigidus*, 4, *C. frigidus* var. *fructu luteo* (we have never before seen a yellow-fruited variety of this tree. Kindly send us name and address); 5, *Phytolacca serotina*, 6, *Drimys Winteri*—J. T. *Connally*, 1, *Juniperus chinensis albo-variegata*, 2 and 3, *Thuja occidentalis*; 4, *Cupressus Lawsoniana*, 5, *Thuja nookatenensis*, 6, *Cupressus pisifera* var. *plumosa*; 7, *C. Lawsoniana* var.; 8, C. L. *lutea*, 9, *Taxus baccata*, 10 and 12, *Cupressus pisifera squarrosa*, 11, *C. pisifera*.—*Correspondent*, 1, *Deutzia crenata*, 2, *Spiraea Van Houttei*, 3, *S. discolor*, 4, *Serrilla hybrida*, 5, *Cercis Siliquastrum*; 6, *Nedelia confertiflora*; S. G. 1, *Begonia sanguinea*, 2, *B. nitida*; 3, *Gesneria elongata*, 4, *Acalypha macrophylla*; 5, *Fuchsia procumbens*; 6, *Choisya ternata*, a fine evergreen shrub. Hardy in sheltered situations.—T. H. 1, *Pteris hastata*, 2, *Adiantum philippicum*, 3, *Woodwardia radicans*; 4, *Oncoclea germanica*; 5, *Nephrodium rigidum*; 6, *Asplenium Trichomanes*—R. Sott. *Aristolochia elegans*.

PLUM TREE: H. F. If the tree is worthless, you should head it down next spring, and graft upon it some variety of merit. The suckers need to be grubbed up, as they have probably an independent root system. You

will save much trouble if you grub out the tree should you decide to exterminate it; the use of acids is unsatisfactory and tedious.

PRIMULA CRONICA LEAVES: B. H. C. There is no fungus disease present in the leaves; the damage is due to some error in culture.

SEMPELVIVENS: *Rav. B. H.* A monograph of the genus was given by Mr. J. G. Baker in our issue for July 25, 1874, p. 103. The number is out of print.

SPINACH FAILING: H. C. H. There is no disease present in your Spinach; the damage has been caused by a grub. We found in every instance its traces, but in no case the grub itself. Apply a heavy top-dressing of soil about the roots of the plants.

TREATMENT OF A FOOTBALL GROUND: *Football*.

(1) The grass should be swept and rolled with a horse roller after every match, if the ground is not frozen. (2) The best method is to lift the turf out of the holes and fill in underneath with soil made very firm. If the turf is damaged badly, it would be better to obtain fresh pees, cutting them as thick as you conveniently can, so that when laid they will be pretty firm. This, of course, must be done previous to sweeping and rolling. The rolling should remove the holes made by the players' studs.

TRELS AND SHRUBS FOR A GARDEN IN YORKSHIRE: H. J. The shrubs mentioned in the following list are perfectly hardy. You may get the specimens from a district having an average temperature similar to the one in which you reside, *Essex*. The two best Barberries are *Berberis Darwinii* and *B. stenophylla*. *B. aquifolium* is beautiful in autumn and winter, when its leaves are heavily suffused with brownish crimson. *Oleaster laestus* is the hardest of a very ornamental group of Composite shrubs. *Cotoneaster microphylla* is useful for clothing walls. It is also a good border shrub, and flourishes in poor soil. *Skimmia japonica* is an accommodating species, with glossy green leaves and panicles of small, sweet-scented flowers. No garden is complete without a selection of hybrid *Rhododendrons*. The double-flowered *Gorse* (*Ulex europaeus flore pleno*) flowers wonderfully well on dry banks exposed to the sun. *Crataegus Pyracantha* is remarkable for its scarlet berries in autumn. It succeeds in the ordinary shrubbery or against a wall.

The gold and silver-leaved varieties of the common Box are of fine growth and very ornamental. *Ribes sanguineum aurea* is very effective. Rich soil, good drainage, and a sunny position are necessary to promote the best growth and leaf colour. *Aucuba japonica* is well known. The Holly in its green, gold, and silver-leaved varieties can be recommended. *Deutzias*: The Ghent and *sinensis* varieties of *Azalea* (*Rhododendron sinense*) are indispensable. *Cotoneaster frigidus* is effective, whether in fruit or flower.

The common Birch (*Betula alba*) is the most attractive of all hardy trees. *Prunella* flower plants is the best ornamental flowering Cherry. The common Laburnum flourishes in all soils and situations. Of Thorns, *Crataegus oxyacanthoides flore pleno coccinea* (double scarlet) should be included. *Cytisus albus* (white), *C. scoparius* (yellow), *C. s. andreaus* (yellow and crimson), and *C. praecox* (sulphur) produce an abundance of Peashaped flowers in spring. *Ribes sanguineum* (flowering Currant), *Spiraea discolor*, *S. O. angustifolia*, *Caragana arborea*, *Genista hispanica*, and *Cydonia japonica* may also be planted.

WELL AND MAIN WATER: J. J. A. The temperature of both will vary greatly, and this will depend, of course, on the external conditions. We do not advise the use of either well or main water for watering plants if soft or rain water can possibly be obtained. If it is absolutely necessary to use hard water, it should be given at the same temperature as the atmosphere in the glass-house where it is applied.

View of the Terrace Garden, Windsor Castle (Supplementary Illustration)	

THE ROYAL GARDENS, FROGMORE.

IN attempting to give some idea of the gardens which His Majesty the King has remodelled at Frogmore, it would be an easy matter to preface this article with several columns of notes upon the unparalleled historical associations of Windsor Castle and Windsor Great Park, and to refer to the many magnificent trees that the park contains. This, however, is not our purpose, and readers who desire information of the Castle itself are referred to the conveniently abbreviated and condensed guide-books, especially that known as *Windsor Illustrated*. But we may state that the great castle, which stands high above the ancient town of Windsor, must necessarily possess peculiar interest for all English-speaking people, for it has been the home of English kings and queens for a period of something like 800 years. As early as the reign of Henry II. it is known to

have been used as a royal palace. Our supplementary illustration affords a view of the castle from the east, with the terrace garden in front. This garden is appropriately laid out in a formal manner, after the Italian style, and it contains a considerable number of figures in bronze and marble, also a handsome fountain. On Sunday afternoons during the summer months the public are admitted to this terrace, where the bands attached to the Household regiments play a selection of music. The beds are furnished during the summer with the ordinary flowering plants in common use for this form of bedding. Everything is on a vast scale, and an exceedingly large number of plants are needed to complete the bedding scheme. The State garden parties given during the week of the Ascot races are held immediately beyond this garden, numerous tents being erected for this purpose. Perhaps the most remarkable feature of Windsor Park is the familiar Long Walk, a magnificent avenue of Elms

seen. Close to Adelaide Cottage is a celebrated Beech tree raised from Luther's Beech (see fig. 143). The following particulars are given on a label fixed near to the tree:—

"This tree was raised from the Beech tree near Altenstein in the Duchy of Saxe-Meiningen called 'Luther's Beech,' under which Dr. Martin Luther was arrested and conducted from thence to the Wartburgh in 1521. The little off-shoot was brought to England from Meiningen by King William IV. (when Duke of Clarence) in 1825 and planted by Queen Adelaide near the house at Bushey Park. Her Majesty bequeathed it in her last will to H.R.H. Prince Albert, with the request that it might be transplanted into the enclosure at Adelaide Cottage, Windsor Home Park, which was successfully done in 1850. The original tree has been destroyed by lightning, July 18th, 1841."

Windsor Great Park consists of 3,000 acres, and the Home Park of 500 acres, whilst the Forest covers 10,000 acres. Another avenue in addition to the Long Walk is known as Queen Anne's Ride, and extends in a south-

[Photographed by special permission.

FIG. 141.—ADELAIDE COTTAGE IN WINDSOR HOME PARK.

extending upwards of three miles from the southern gateway of the castle. The formation of this is stated to have been commenced by Charles II., but it was not completed in his reign. Another feature is that of "the Slopes," which are situated between Windsor Castle and Frogmore. These possess much natural beauty, but they also present opportunities for further improvements, and their interest might be still further increased by the planting of exotic trees and shrubs, accompanied by a corresponding regulation and thinning of the existing growth. Further on towards Frogmore may be seen Adelaide Cottage, the beautiful and prettily-situated building shown at fig. 141. The structure is now used for tea-rooms, and in summer time, when the trees are all in leaf and the garden gay with flowering plants, the cottage and its surroundings make one of the most charming pictures of the kind we have

westerly direction. Cumberland Lodge, which is the chief residential building in the great park is familiar to gardeners by reason of the great vine in cultivation there which fills a house measuring 140 feet by 23 1/2 ft. Th variety is Black Hamburgh, and it has borne a magnificent crop of Grapes of the highest quality during the present season. Like the aged vine at Hampton Court, this one is under the care of Mr. McKellar, head gardener at Frogmore. Cumberland Lodge is now the residence of Prince and Princess Christian of Schleswig-Holstein. An extensive Rhododendron Walk in the Great Park was formed in 1838, and in May and June the great number of plants produce a floral effect of extraordinary degree. Virginia Water is a sheet of water which covers 130 acres and measures two miles in length. It is recorded that its construction was commenced in 1750 by excavating and damming up the Virginian

River, but owing to floods in 1768 the works were injured, and the lake was not finished until 20 years later.

A feature of what is known as the Home Park is Frogmore House (see fig. 142), a handsome residence built for Queen Charlotte, and now occupied by the Prince and Princess of Wales when the Court is at Windsor.

But it is not in any part of either of the parks that King Edward has made the principal alterations since his accession. These have

purpose could be served by its removal. All the houses have been built with one object in view, and one only, that of production. Every new structure is a good house for the growth of plants or the forcing of fruit trees. Windsor, indeed, is now so utilitarian an establishment that it is from this point of view, if any, that there is the slightest opening for criticism. The organisation, the good order, and excellent cultivation are beyond praise, and the wealth of plants and flowers that are

press command of His Majesty the King, to ensure suitable provision being made for housing the young gardeners who are employed in the gardens. Further details will appear below, and it would be satisfactory if in this matter the King's example were followed by many of his subjects.

The erection of potting sheds, packing sheds, fruit rooms, and other structures for storing various garden produce has resulted in making these gardens most liberally provided with garden buildings of every necessary description. As showing the extraordinary extent of the gardens, it may be mentioned that the staff includes 140 men, a fact which in itself is sufficient to indicate the heavy responsibilities resting upon the head gardener and his experienced foremen.

It will be remembered that the Royal Horticultural Society's Council and Committees visited the Frogmore gardens in June last (see note in *Gardeners' Chronicle*, June 13, 1908), and the superior condition of everything in the glass-houses and out-of-doors greatly impressed the visitors, who had specially journeyed to inspect the results of the reorganisation. It may be mentioned here that the whole of the work of rebuilding, including the bothy, new stables, and cottages, also the large vinery at Cumberland Lodge, and the provision of the heating apparatus was carried out by the well-known firm of Mackenzie and Moncur, of Edinburgh.

INDOOR FRUIT DEPARTMENT.

Fruit forcing at Frogmore has of necessity to be done on a very large scale, to meet the demands that are constantly being made for ripe fruits. In addition to the two large ranges of vineries and Peach-houses, which have been in existence for upwards of 50 years, two ranges have been built, of more spacious character and modern design; these cover a distance extending 1,000 feet. The houses have hip-span roofs and all the wood-work is composed of teak; in every respect these structures are excellently equipped for the purposes they are intended to serve. Sufficient space has been provided to allow of the trees being trained at a proper distance from the glass, and as a current of air can circulate between the foliage and the roof there is less danger of injury from burning or scalding. The exact distance in the case of vines is 2 feet 6 inches, in that of Peaches and Figs it is 2 feet. The heating arrangements, to which reference will be made later, are on a very liberal scale, so that it is possible to maintain the proper degrees of heat without unduly heating the pipes. Although these ranges were built only four years ago, the vines already bear large crops of splendid fruit, and Peaches, Nectarines, and Figs have cropped most satisfactorily during the past season. Great care was bestowed on the selection of varieties, and in all cases the attribute of good quality was regarded of the first importance. The varieties of Peaches and Nectarines are strictly limited to the very best. For the earliest supply, such Nectarines as Cardinal, Précoce de Concelles, and Lord Napier are cultivated, and in succession to these there are Pineapple, Rivers' Early Orange, Humboldt, Stanwick Elruge, and others. Of Peaches, Stirling Castle, Royal George, Bellegarde, Dymond, Violette Hative Late Devonian, and Gladstone are those chiefly

(Photographed by special permission.)

FIG. 142.—FROGMORE HOUSE, THE WINDSOR RESIDENCE OF H.R.H. THE PRINCE OF WALES. IN THE FOREGROUND IS A FINE SPECIMEN OF *LIBOCEDRUS DECURRENS*.

been carried out in the gardens themselves, and so thoroughly have they been executed, that Frogmore gardens to-day form an example of English gardening worthy of the position which Windsor Castle occupies as a State residence. It is scarcely too much to say that every plant and fruit house has been removed and fresh ones erected, for the exceptions are very few, and in the case of the fruit range, constructed as it is of copper, no useful

grown and the annual yield of fruits and vegetables enormous. There are, however, no new lofty structures for the cultivation of plants of great height, and therefore there is no winter garden. Mr. MacKellar has therefore no such architectural freaks to deal with as may be seen in some gardens, built ostensibly for the cultivation of plants, but not in the least fitted for such a purpose.

Special attention was directed, at the ex-

grown. With one exception, the trees have been planted during the last five years, but nevertheless they have nearly covered their allotted spaces and are perfect examples of good training.

In most cases each vinery is devoted to one variety of Grape. Muscat of Alexandria alone fills four large houses. Appley Towers and Lady Downe's Seedling and Black Alicante furnish the main supply for late use. The variety Lady Hutt has been planted to supply white Grapes after the fruit of Muscat of Alexandria is consumed. Madresfield Court occupies two houses. Several houses are filled with Black Hamburg for the earliest supplies. Foster's Seedling is represented by a grand old vine about 40 years of age which occupies a house 63 feet long and 16 feet wide.

planted with Figs, the long corridor which connects the east block of Melon, Cucumber, Tomato, and plant houses is devoted entirely to the culture of this fruit, and the trees have already yielded splendid crops.

Melons are grown in great quantities, and during a visit in June we saw some grand crops of the new and superb variety "Eminent," which originated at Frogmore (see fig. 145 from photograph supplied by Messrs. Jas. Veitch & Sons).

Cucumbers and Tomatoes are produced on an equally colossal scale. The new variety Dwarf Red was bearing most abundantly.

The forcing of Strawberries is a matter of great importance at Frogmore, for large supplies of the fruit are needed during as long a season as possible. About 9,000 plants are

that their lasting qualities are very extraordinary. From the large number of vineries we have described it must be obvious that very considerable crops of Grapes are obtained, and two Grape rooms have been built, one of these being capable of storing 1,500 and the other 1,400 bunches.

PLANTS UNDER GLASS.

The plant department, no less than that of fruit, has been entirely remodelled. All that remains of the old structure is the large, span-roofed Palm-house, measuring 150 feet long by 30 feet wide, which is filled with hundreds of well-grown plants. These are used chiefly for purposes of decoration. At the north end of this house is another Palm-house 100 feet by 40 feet and about 30 feet high.

Here are some 30 grand specimens of Kentia, Areca and similar Palms in ornamental tubs standing singly on a mosaic floor of handsome design. Around the walls are planted the choicer varieties of Bamboos for cutting, which are used for purposes of decoration at the Castle and other places. From the Palm-house a small conservatory may be entered, and in this structure there were some splendid groups of flowering plants at the time of our visit, the roof being also ornamented with climbers. A long plant corridor connects the western block of houses, and it commences at this point. The corridor is 400 feet long and 12 feet wide, and a view of the interior is shown at fig. 147. Unlike many structures of this nature, it is divided into sections, with doorways, and one advantage thus gained is that it is possible to keep various temperatures in the compartments, and therefore to cultivate a larger number of species than can be done when the corridor is always maintained open throughout its length. The sides and roof are covered with creepers which include *Rodochiton volubile*, *Chorizema*, *Passiflora atrocaerulea*, *Fuchsias* in variety, *Lasiandra macrantha*, *Cassia corymbosa*, *Abutilons*, *Plumbago capensis*, *Solanum jasminoides*, *Heliotropium*, *Bougainvillea*, and *Lagerströmia indica*. There are 12 houses, each 66 feet long, which open into the corridor. Large batches of flowering plants are grown for supplying Windsor Castle, Buckingham Palace, Balmoral, and the royal yachts when these latter are in use. Of Carnations, upwards of 4,000 plants are raised annually. About 1,000 are grown for flowering in winter. The varieties grown in greater numbers include Mrs. T. W. Lawson and its sports, Enchantress, White Perfection, Mrs. H. Burnett, Britannia, America, Nelson Fisher, Floriana, Harlowarden, and Fair Maid. Of *Souvenir de la Malmaison* Carnations, the varieties include such as Princess of Wales, Sir Charles Freeman, Calypso, Lady Middleton, Churchwarden, Marmion, and the beautiful Duchess of Westminster. All these plants appeared to be in splendid health, and our photographer obtained the view of a group of *Souvenir de la Malmaison* varieties which we shall reproduce in our next issue.

Begonia Gloire de Lorraine, in both pink and white varieties, occupy several houses, some 2,500 plants being cultivated each year. These plants were already 2 feet in diameter in August, and they are now making

[Photographed by special permission.]

FIG. 143.—REMARKABLE BEECH NEAR ADELAIDE COTTAGE, WINDSOR PARK.

It is planted at the back of the house, and the rods extend down the rafters. If evidence were needed in support of the extension system of vine culture, it is afforded by this particular specimen which is illustrated at fig. 144. We do not think it would be possible to discover finer samples of this variety than the fruit produced by this vine, which usually ripens a crop of 150 bunches, averaging 3lb. each. Mr. MacKellar is making some experiments in regard to inarching different varieties of vines, of which we hope something may be heard later. Altogether, there are 18 houses at Frogmore devoted to Grape culture.

Figs form a feature of considerable importance in the supply of forced fruits. Besides several houses which have been recently

grown every year for this purpose, and the variety grown in the largest quantity is Royal Sovereign.

We have not yet referred to the fruit trees cultivated in pots, but we saw a considerable number in full bearing at the time of our visit. A particular note was taken of a batch of Cardinal and Précoce de Cronsels Nectarines in pots 12 inches in diameter. Each tree bore 18 or 20 excellent fruits, and all the specimens appeared in a most satisfactory condition. The old ranges of vineries and Peach-houses which still exist are remarkable for the fact that they are constructed wholly of copper, iron and glass. We do not think there are many plant or fruit houses of this description in British gardens, but it may be supposed

a gorgeous display of bloom. There was a house filled with magnificent *Codiaeums* (*Crotons*), in which the characteristic colours were finely developed. Another house contained *Anthuriums*, *Cordylines* (*Dracenas*), *Pandanus Veitchii*, *Alocasias*, *Marantas*, and other choice ornamental foliage plants suitable for the decoration of the dinner table. *Eucharis grandiflora* is cultivated extensively for supplying flowers for use in a cut state, and a large batch of *Gardenias* is grown for the same purpose. *Cyclamen* and *Primulas* are cultivated in hundreds for winter-flowering. *Pelargoniums*, *Salvia splendens grandiflora*, and *Salvia Pitcheri* are grown with excellent results, and the plants are among those most appreciated. *Campanula*

NEW OR NOTEWORTHY PLANTS.

BURBIDGEA SCHIZOCHEILA.

THERE are now two known species of the genus *Burbridgea* (*Scitamineae*). One, the type of the genus *B. nitida*, Hook. fil., has long been known as a native of North-West Borneo, in the Murut country, between the Lawas and Trusan rivers, where it was obtained by Burbridge, while collecting for Messrs. Veitch. The second, *B. schizocheila*, was first mentioned and partially described by W. Hackett in the *Gardeners' Chronicle*, 1904, page 301, and was fully described and figured the following year in the *Botanical Magazine*, tab. 8009. The plant had been obtained in 1903 from the

ments pinkish orange and the mucro on the upper petal bright red. The whole flower on withering assumes a cherry-pink colour. The plant as figured in the *Botanical Magazine* is of a bright orange yellow. It was suggested by Hooker that this remarkable genus is related to *Hedychium*, but the absence of staminodes excludes it from this affinity. In the peculiar lip and in the form of the stamen, *Burbridgea* appears to me to be most nearly related to *Geocharis*, a genus sufficiently distinct but which Schumann amalgamated with *Alpinia*, natives of the Malay Peninsula, Borneo and Sumatra, allied to which are *Rhynchanthus*, remarkable for its suppressed lip, and *Riedelia*, of Papua. In all of these the staminodes are absent except for two short processes rising from the sides of the broad channelled filament in *Geocharis*.

[Photographed by special permission.]

FIG. 144.—ROYAL GARDENS, FROGMORE: FOSTER'S SEEDLING GRAPE GROWING FROM THE BACK OF THE VINERY.

pyramidalis, *Humea elegans*, *Francoa ramosa*, *Hydrangeas*, *Fuchsias*, and *Cannas* are extensively grown for summer decoration. Thousands of *Lilium Harrisii*, *L. longiflorum*, and *L. speciosum* are cultivated in pots, most of these species being represented by plants in bloom during all the year. *Astilbes* (*Spiraeas*), *Lilacs*, the *Rhododendrons* known as *Ghent Azaleas*; and *Wistarias* are grown in extraordinary numbers. The collection of *Chrysanthemums* include about 3,000 plants; of this number 2,000 are cultivated as bush specimens and 1,000 for supplying large blooms.

(To be continued.)

Buitenzorg Gardens, but its original home was unknown.

This year, however, Mr. J. Hewitt sent a living plant and some dried specimens from the museum at Kuching, in Sarawak, to the Botanical Gardens, Singapore. These specimens had been obtained by Mr. C. J. Brooks at the Bongo Mountain in N. Borneo. The species, is therefore, North Bornean, as might have been expected. The living plant flowered on its arrival in Singapore, but differs slightly from the plant as figured in the *Botanical Magazine*. The flowers borne on the Singapore Botanic Gardens' plant are smaller, and the petals narrower and more pinkish in colour; the corolla tube is of a light cherry red, the s-g-

Geocharis is a genus of about four species separated generically by me in the *Journal of the Straits Branch of the Royal Asiatic Society*, No. 50, p. 143, to include a small number of plants closely allied to *Riedelia*, but with radical inflorescence.

The structure of the flower of *Burbridgea schizocheila* is remarkably like that of *Geocharis aurantiaca*. This group of genera might be classed as *Riedeliae*; it is the largest in the group, and would thus include *Riedelia*, *Burbridgea*, *Geocharis* and *Rhynchanthus*; genera ranging from Sumatra, through the south of the Malay Peninsula and Borneo to Papua, with an outlying species or two in Borneo. *Henry N. Ridley, Botanical Gardens, Singapore.*

* PRONUNCIATION OF PLANT NAMES.

PRONUNCIATION.—In the first word in each line the accent (´) is short; (˘) is long.

In the second word vowels are to be pronounced as—

arise, á, áge, árt, áll, áll end, égg, éat, érr, éwe in, í, íre, sír on, ótter, ówe, ór, óð, ówl, óil us, úter, úse, úra "ch," as in chin; "th," as in thin "s," as in soft; "f," as in far "g," as in go.

All other letters are unmistakable.

The Week's Work.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchard Grower to Lt.-Col. G. L. HOLFORD, C.V.O., C.I.E., Westbury, Gloucestershire.

Cattleyas and *Laelio-Cattleyas*.—The autumn and early-winter-flowering sections of these plants are undoubtedly the most showy and desirable Orchids for blooming in these seasons, when in most large establishments there is a demand for choice cut flowers. For all kinds of decorative purposes there is nothing to surpass these gorgeous coloured flowers, and especially when seen by artificial light. At one time the section was restricted to a few imported species, including *C. aurea*, *C. Bowringiana*, *C. labiata*, *L. Perini* and *L. prinstans*, but the hybridist has furnished other beautiful kinds having a variety of form and colouring, many of them blooming late and thus prolonging the season of flowering. Space does not permit of the enumeration of the whole of these hybrids, but the following is a selection:—*Cattleya* Mantini, *C. Ariel*, *C. Mrs. W. H. Whiteley*, *C. Fortia*, *C. Fabia*, *C. Hardyana*, *C. Iris*, *C. Clarkia*, *C. Ashtoniana*, *C. Mrs. Pitt*, *C. Wendlandiana*, *Laelio-Cattleya Irene*, *L.-C. Ophir*, *L.-C. Clive*, *L.-C. Cornelia*, *L.-C. Berthe Fournier*, *L.-C. Lumosa*, *L.-C. Cappi*, and *L.-C. Charlesworth*.

The flowers of all these plants, especially when they are cultivated in gardens which are tolerably free from fogs, last in a good condition longer than those which develop during bitter seasons. It is a temptation to allow the flowers to remain for a longer period than is good for the plants; the effect is seen in the pseudo-buds, which gradually become wrinkled owing to the flowers taking the greater part of the nourishment. Plants that are weakened in this manner require a considerable time to regain their former healthy condition; indeed, if they have suffered considerably from this cause they rarely make satisfactory growth the following season, and if they do flower they only produce very inferior flower-spikes. This is also very often the starting of the plants on a downward course, and they get weaker and weaker and are only to be saved by very great care. But, on the other hand, it must not be assumed that cutting out the flower-spikes at the wrong time does not have a considerable influence upon the plant's welfare. It is natural for the plants to produce flowers, and the majority of those under consideration do so much more freely than many other kinds of Orchids. Even weakly plants of these *Cattleya* and *Laelio-Cattleya* will send up their flower-spikes, but they are usually produced considerably later than those of the normal flowering. These weakly plants are benefited by the removal of their flowers as soon as they appear through the sheaths, for this will often assist a plant in regaining its lost vigour. Yet to perform a similar operation in the case of Orchids in full vigour will only result in mischief, and would probably cause the plant to burst away into growth at a time and under conditions most unfavourable for its permanent welfare. Thus it is seen that the removal of incipient flower-spikes may be necessary, whereas under other conditions the cutting out of the influence may be injurious.

FRUITS UNDER GLASS.

By T. COOMER, Gardener to Lord LEASINGTON, The Hendre, Bournemouth.

Rotting old vines.—It is the case sometimes that old vines, having become weakened, and therefore less productive than formerly, are uprooted and burned, when it would be an easy matter to restore them to vigorous growth and a fertile condition. In some instances deterioration is brought about by the pruning continued year after year on the short spur principle. Such vines, provided their roots are in a satisfactory condition, may be greatly improved if cut down beneath the butt-nut, smoothing the wound and dressing it thoroughly with sytptic. There need be no doubt as to the vine breaking into growth again from the old stem; as a matter of fact, several growths will be likely to appear, and the cultivator should select the most suitable one for forming the new rod, cul-

tivating it as would be a young vine. We have treated vines 30 years old in this manner, and the results have been in every way satisfactory. This treatment is desirable also if it is intended to march old vines with a new variety, and in these gardens we have just inarched Prince of Wales upon Alwrick Seedling. Directions have already been given in previous Calendars for the renovation of unsatisfactory borders containing the roots of early vines, and attention may now be directed to the borders of late vines. If there has been any shanking in the borders, this is direct evidence that such attention is needed. In cases where the roots extend into out-of-door and inside borders, one of these should be treated first, leaving the other until next season, bearing in mind that the inside border must on no account be interfered with until all the Grapes have been cut. If most of the roots are deep in the border, take out a trench at its extreme end, and gradually and carefully portion of the roots away up to a point near the stem of the vines, causing as little damage as possible to the roots. Then coil the roots back and protect them with damp mats. Make the drainage perfect, and cover the material with a thin layer of turf, placing the grass side downwards. Make up the border to a little more than half its depth, and then proceed to add the upper portion. During this latter operation arrange the roots of the vine in layers through the soil. As the work proceeds, cut away any damaged portion of the roots, and shorten any that are extra long and bare of fibres, carefully preserving those which are most fibrous. The borders should be composed of moderately dry soil, and it should be made tolerably firm. When all is completed, a surface mulch should be added and a thorough application of water given. The leaves of the vines should be syringed every day until they fall, but at this season no shading will be required. In cases where the drainage is already in perfect condition and the roots of the vines are fairly near to the surface, it will be sufficient if the top soil be removed until the uppermost roots are exposed, when a top-dressing should be applied consisting of fresh soil, with bonemeal, or some other suitable fertiliser, wood ashes, and crushed mortar rubble, mixed thoroughly together.

THE KITCHEN GARDEN.

By E. BUCKLE, Gardener to the Hon. VISCOUNT GREYS, Aldenham House, Elyres, Hertfordshire.

Cucumbers.—Maintain an atmospheric temperature of not less than 65° unless the weather is unusually cold, taking care to promote plenty of atmospheric moisture. The glasswork of the house should be kept thoroughly cleaned that as much light as possible may reach the plants. Apply a moderate surface dressing over the roots, such dressing consisting of three parts well-decayed leaf-mould and one part light, fibrous loam, adding a little finely-broken charcoal. This mixture should be warmed to the same temperature as the house before it is applied to the roots. It is important that the roots are not allowed to suffer from drought even for a short time. Regulate the growths and stop them as they require it, and on no account over-tax the plants by attempting to obtain an excessive number of fruits. If red spider appears upon the leaves it will be necessary to sponge them carefully with warm water, containing plenty of soft soap in solution. Young plants in pots that will fruit late should be exposed to the light and encouraged to become well established in 6-inch pots before it is necessary to plant them cut into the permanent bed. Seeds may still be sown singly in small pots, providing very light compost and plunging the pots in a hot-bed. Varieties that grow to a moderate length only are much to be preferred.

Tomatoes.—The plants specially prepared for fruit in winter are now ripening their first fruits. The plants succeed best if trained on wires in a light span-roofed house where the atmospheric temperature is maintained at 55° to 60° and a dry, buoyant atmosphere is maintained by admitting air whenever the weather is favourable. The plants must not be over-watered or in all probability the spot fungus will attack the leaves. The blooms require artificial pollination at this season of the year, and it should be done during the morning. Directly any of the fruits show signs of developing colour they

should be cut from the plants and removed to a warm house to ripen. Successional plants should be potted-on, cultivating them in much the same temperature, and doing all that is possible to encourage them to make strong short-jointed growths. Seeds may be sown at the present time for raising plants to fruit during April and May; raise them in gentle heat. Among the most reliable red-fruited varieties are Sunrise and Winter Beauty. Sunbeam is a very desirable yellow-skinned variety; it sets its fruits freely, is pleasing in appearance, and possesses excellent qualities.

Winter salads.—In many establishments fresh salads are required almost every day in the year. Lettuce, Endive and Chicory form perhaps the most important kinds, and Chicory, being very easily cultivated, may occasionally do service for Lettuce and Endive. It may be grown easily on almost any site, and may be forced just as easily if placed in gentle heat where light is perfectly excluded. The roots may be left in the ground for lifting in batches as required, but on the approach of severe weather it is necessary to lift sufficient to last some little time, storing them in sand or ashes in a structure where frost is excluded. There are now several kinds of Lettuce which are capable of being forced. Seeds should be sown in gentle heat and the seedlings pricked out into boxes, putting them three inches apart. Cultivate them in a light position where the atmospheric temperature is kept at about 50°. The Lettuces may be cut much in the same way as Mustard and Cress as required for use. A batch of Endive should always be in process of blanching, tying the plants up in batches for the purpose as they become necessary. Mustard and Cress should be sown every week in May, and Onions for drawing, whilst quite small, may be sown similarly. Tarragon should be lifted as required from the open ground and placed in boxes in a structure where there is moderate warmth.

THE FLOWER GARDEN.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Berkshire.

The Gladiolus.—Although these plants are generally considered to be quite hardy, they are not so warm, light character, to lift them and plant them rather deeply in either ashes or ordinary soil in the reserve garden. If this is done, protection can be easily afforded the corns in severe weather. When transplanting allow the stems and foliage to remain, but remove the old flower-stalks. *Gladiolus brechenleyensis*, *G. gandavensis* and their hybrid varieties may all be treated in this manner, and it is also a good practice to adopt in the case of *Montbretias*.

Lobelia cardinalis.—These plants should be lifted and placed in boxes for storing. Stand them in a cool, dry shed or some other suitable place, and when the soil about the roots has become quite dry, cut off the old stems and arrange the plants tidily in the boxes, packing some light sandy soil between them. They should be watered in a cool, well-ventilated place and should be afforded just sufficient water to keep them moist, but not enough to cause them to start into growth. Seeds of this plant may be sown at the present time, and if the seasons be very proper cut they will flourish, suitable plants for bedding out next season.

Protective plants.—It will now be necessary to protect many half-hardy or tender subjects, and the materials for the purpose should be got together without delay. In the case of plants that have no top growths during the winter, the roots and crowns can be protected by a layer of coal ashes, for although leaf soil and cocoanut fibre are sometimes used for the purpose, the coal ashes are preferable because it is not usually disturbed by birds. Plants that may be protected in this manner include *Acathus grandiflorus*, *Dryas*, *Hollyhock*, *Tritoma*, *Helianthus auratum*, also *Fuchsia*, *Gunnera scabra* is best protected with bracken Fern and then covered with a wire basket. As these protective materials will remain until the spring they should be arranged neatly so as not to become an eyesore.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to the DOWAGER LADY NUNBURGHOLME, WATER PRIORY, YORKSHIRE.

Planting of fresh trees.—The present year has been one of some difficulty in regard to the cropping of Apples and Pears, and special notes should therefore be made of those varieties which have succeeded well, this being the more important in the case of Pears. When making a fresh selection of varieties, the mistake of choosing an excessive number should be guarded against. If the cultivator has removed to an unknown district, he should consult someone in the locality as to which varieties have proved successful there. The distance at which fruit trees should be planted is one partly depending upon the nature of the soil and the district. Pyramid trees or bushes on the Paradise stock and Pears on the Quince stock grow less vigorously than

may be planted 15 feet apart, but if they are trained horizontally, then 20 feet may be allowed. Morelli's Cherries should be given 20 feet between each tree.

Varieties of Apples.—Varieties that succeed well in most districts as pyramids are Lord Grosvenor, Stirling Castle, Warner's King, Lane's Prince Albert, Newton Wonder, and Bramley's Seedling. As standard trees, the following are equally successful: Lord Grosvenor, Eckinville Seedling, Bleenheim Pippin, Duncroft's Seedling, Newton Wonder, and Bramley's Seedling. Dessert Apples suitable for forming pyramids include Irish Peach, Worcester Pearmain, King of the Pippins, Allington Pippin, Cox's Orange Pippin, and Claygate Pearmain. For standards, the first five are equally suitable, and in place of Claygate Pearmain Lord Hindlip may be chosen, being a fine late dessert

at this time of the year, there being more heat in the water pipes and less moisture in the atmosphere than usual, and thrips have a better chance of spreading. In cleaning *Codiarium* (Crotoms) infested with mealy bug, an insecticide may be used in the form of a spray and the plants thoroughly syringed with clear water afterwards. When a sponge is used in cleaning the narrow and especially the curly-leaved varieties, it is difficult to avoid damaging the foliage. During the dull months of winter the glasswork should be washed several times and also the woodwork in the house, so that everything may be as clean and light as possible. Endeavour to get the air of the house changed once each day if possible, but avoid excessively heating the hot-water pipes, this being very harmful to the plants. If the temperatures cannot be maintained without doing

FIG. 145.—ROYAL GARDENS, FROGMORE: HOUSE OF MELONS; THE VARIETY IS EMINENCE. [Photograph by E. J. Wallis.]

the same varieties upon the free stock, and they may be planted at distances of 8 to 9 feet apart. But Apples on the Crab stock and Pears on the Pear stock must be given 12 feet apart at least. Standard Apple trees of strong-growing varieties ought to be planted at distances of 25 to 30 feet apart, but half-standard Plums, or bushes of what are known as the small fruit, may be planted between them. If the soil is especially adapted for fruit culture, Apples on the Paradise and Pears on the Quince stock may be profitably planted between the standards, but they must be root-pruned occasionally, and they may then be expected to increase in value, and can be safely transplanted to other positions when the standard trees have made such growth as to shade them more than is desirable. Fan-trained trees of Peaches, Cherries, Pears, and Plums

Apple. There are many other excellent varieties of Apples, such as Golden Noble, Beauty of Kent, Bismarck, Devonshire Quarrenden, James Grieve, and Ribston Pippin, for dessert. Those who wish to grow for exhibition may safely select such as Peasgood's Nonesuch, Emperor Alexander, Gascoyne's Scarlet Seedling, Charles Ross, Rival, and King of Tompkins County.

PLANTS UNDER GLASS.

By THOMAS LUNT, Gardener to A. STIRLING, Esq., Keir, Perthshire, N.B.

Stove or hothouse plants.—Examine these plants thoroughly for insect pests, and any that are found to be attacked let them be cleaned at once. It is necessary to fumigate the stove occasionally

this, it will be better to put in an additional water pipe.

Lalium speciosum.—Plants which are now passing out of flower should be kept rather on the dry side, and when all the foliage has fallen the stems may be cut down to the level of the pot before placing the pots containing the bulbs in a perfectly cool and dry place, where they remain until early in the spring, when it will be necessary to shake them from the old soil before repotting. The ordinary soil or loam in some gardens is not suitable for this Lily, and in such cases, provided there is plenty of leaf-mould at hand, this may be used instead with some fine, soft sand mixed with it. When this is done, it will be necessary to apply frequent waterings of liquid manure during the growing season of the plants.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of Plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, and not only in the week or two before they are signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unneeded communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, NOVEMBER 16—Nat. Chrys. Soc. Com. meet. TUESDAY, NOVEMBER 17—Windsor Chrys. Sh. (2 days). WEDNESDAY, NOVEMBER 18—Darlington Chrys. Sh. THURSDAY, NOVEMBER 19—Edinburgh Chrys. Sh. (3 days). Linnean Soc. meet. SATURDAY, NOVEMBER 21—German Gard. Soc. meet.

AVERAGE MEAN TEMPERATURE for the ENSUING WEEK, deduced from observations during the last Fifty Years at Greenwich—42.3°.

ACTUAL TEMPERATURES.—LONDON.—(Wednesday, November 11 (6 P.M.)) Max. 56°, Min. 39°.

GARDENERS' CHRONICLE OFFICE, 41, WELLINGTON STREET, COVENT GARDEN, LONDON.—(Thursday, November 12 (10 A.M.)) Bar. 29.9; Temp. 55°; Wind, E. rather fine, bright.

PROVINCES.—(Wednesday, November 11 (6 P.M.)) Max. 57° Cornwall; Min 30° Lincoln.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY.—Dutch Bolls, at 67 & 68, Cheapside, L.C., by Protheroe & Morris, at 10.30.

TUESDAY.—Sale of Jersey Stock at The Nursery, Gloucester Road, Kingston Hill, by order of Mr. J. Puttock, by Protheroe & Morris, at 12.

WEDNESDAY.—Azaleas, Rhododendrons, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 5.

THURSDAY.—Bulbs, Herbaceous Plants, &c., at 11.30; 1.621 cases Japanese Liliaceae, at 1, 2, 500 Roses, Palms, Azaleas, &c., at 67 & 68, Cheapside, E.C., by Protheroe & Morris.

FRIDAY.—Choice Imported and Established Orchids, at 67 & 68, Cheapside, E.C., by Protheroe & Morris, at 12.45.

* The Germination of Orchid Seeds. M. Noël Bernard's earlier investigations into the germination of the seeds of Orchids have already been noticed in these pages (July 8 and August 5, 1905).

Horticulturists specialising in this group of plants know how uncertain is the germination of the seeds of various Orchids, notably of species of *Odontoglossum*, *Phalenopsis*, and *Vanda*. M. Bernard's recent observations and experiments, which he summarises in a lecture given during the International Horticultural Exhibition at Ghent, in April last, on the occasion of the centenary of the Société Royale d'Agriculture et de Botanique de Gand, throw light on one cause of this uncertainty. Whilst not providing a ready remedy, his results cannot be ignored by practical men, since they suggest methods whereby the chances of germination may be increased. The brochure gives an account of M. Bernard's results, and promises a fuller exposition in the near future. We will, therefore, for the present, content ourselves with stating concisely the main points of these discoveries, reserving a more complete account till the detailed work is published.

La Culture des Orchidées dans ou rapports avec la symbiose, par Noël Bernard. Edward Saëer, Gand, pp. 20, avec 6 planches.

Briefly, M. Bernard has shown that germination only takes place when the threads (mycelium) of a certain fungus, which normally inhabits the cells of young roots of the adult Orchid, are present in the soil or other material in which the seeds are sown; and that, unless these fungus threads gain an entrance into the tissue of the minute embryo of the seed, germination fails.

He has sown Orchid seeds on sterilised substances; observed that, in these circumstances, germination does not occur; then, by the addition of a pure culture of the fungus to the seed-bed, has succeeded in causing the seeds, not only of *Cattleya* and *Cypripedium*, which grow fairly readily; but also the seeds of the more refractory *Odontoglossum*, *Vanda*, and *Phalenopsis* to germinate freely. Yet more remarkable, though disappointing from the point of view of immediate application in a practical manner, he has shown that such pure cultures grown on various media used for the culture of fungi in the laboratory lose, after a time, the power of stimulating the embryo to develop.

He concludes that just as disease-producing microbes, cultivated outside the body, may lose their virulence and become attenuated, as was shown long ago by Pasteur's famous experiments, so also the fungus grown apart from its host the Orchid root loses its special faculty of inducing germination in the embryos which it penetrates.

We cordially recommend M. Bernard's little book to the notice of those interested in its special subject, or in the progress of botanical research in relation to horticultural practice.

Ordeal Plants.

The poisonous properties of *Primula obconica*, *Rhus Toxicodendron* and other plants have recently been discussed in our own columns as well as in those of the general Press, producing in the minds of some people the fear lest the familiar *Ampelopsis Veitchii*, which it in no way resembles, should turn out to be the dangerous *Rhus*. Another aspect of poisonous plants which has also attracted some attention of late is that of Ordeal Poisons, the best known of which is probably the Calabar Bean, or as it is perhaps better known, the Ordeal Bean of Old Calabar (*Physostigma venenosum*). The bark of the Sassy tree or Redwater tree of Sierra Leone (*Erythrophleum guineense*) is also a well-known poison. With regard to the first, it is interesting to recall some points of its history and introduction into medicine in this country. The plant is a woody papilionaceous climber growing 50 feet high, a native of West Tropical Africa, near the mouth of the Niger and Old Calabar, where, indeed, it is said to be somewhat rare, having been destroyed by order of the Government, though many were preserved in order to supply seeds for use as an ordeal. Their properties first attracted notice in England in 1840. Further researches were made in 1855 and again in 1858, but it was not till about 1863 that it was discovered that an alcoholic extract of the seed possessed the power of contracting the pupil of the eye, so that the substance in question became generally used in ophthalmic cases, as well as in tetanus or lockjaw, epilepsy and other nervous affections, the alkaloid being known as physostigmine or

eserine. Up to about 1863 the Beans, which are about 1 inch in length and of a reddish-brown colour and kidney-shaped, were only occasionally seen in the English market, and their properties being then but little known they failed to find buyers. A quantity was offered for sale in Liverpool without success, and some of them found their way to a rubbish heap, where they were discovered and eaten by some children, with serious or fatal results. In trial by ordeal, the result of their use is very similar to that described by Sir Harry Johnston when writing of the bark of *Erythrophleum guineense*. He says "the bark is stripped off by the medicine man, who smashes it up and triturates it with water into a paste. If he desires to kill his victim outright, he mixes a *Strychnos* or other poison with it. If the man does not care, or has been bribed to save the life of the accused, the mixture is probably a simple decoction, more or less strong of the *Erythrophleum* bark." As many as 100 species of *Strychnos* are said to be used in ordeal trials. To prepare the potion, the root is finely grated and infused in cold water, which the man or woman accused of some misdeed is afterwards required to drink. It even happens that people only suspected take it of their own accord, in order to prove their innocence. In the opinion of the negroes, the guilty man invariably dies of this poison, whilst the innocent is only rendered indisposed. The first effect of the drug is to intoxicate. The people who drink it take care to place themselves beside a tree or stake, which they grasp firmly when their head begins to reel, for a fall at this moment would be regarded as proof of their guilt.

It will be remembered that, while both these ordeal plants belong to the same Natural Order, Leguminosae, *Physostigma* is a climber of the usually wholesome sub-order Papilionaceae, while *Erythrophleum* is a tree of 40 to 50 feet high belonging to the sub-order Caesalpiniaceae, in which are found plants of very varied properties.

LINNEAN SOCIETY.—A meeting will be held on Thursday, November 19, at 8 p.m., when the following papers will be read:—1, "On a new Species *Symphyla* from the Himalayas," by Prof. A. D. JAMES, B.A., D.Sc.; 2, "The Freshwater Crustacea of Tasmania," with remarks on their Geographical Distribution, by Mr. GEOFFREY SMITH, M.A., F.L.S.; Exhibitions: 1, Mr. HAROLD WAGER, F.R.S., F.L.S., "The Optical Behaviour of Epidermal Cells of Plants," with lantern demonstrations; 2, Mr. C. T. DRURY, F.L.S., "The Singular Growth of a *Scolopendrium* in an Airtight Case"; 3, the Rev. J. GERARD, S.J., F.L.S., photographs of a Yew tree showing twin-like growth; 4, "Wistaria, as Affected by the Duction of Twining"; 5, Miss A. L. SMITH, F.L.S., "Myxococcus pyriformis, a British Species of Myxobacteriaceae"; 6, the Rev. T. R. STEBBING, M.A., F.R.S., F.L.S., "*Cavernularia obesa*, from Borneo," collected by CHARLES HOSE, D.Sc.

BRITISH GARDENERS' ASSOCIATION.—A public meeting of professional gardeners will be held at the new hall of the Co-operative Society, Clay Hill, Haslemere, Surrey, on Saturday, November 14, at 7.30 p.m. An address upon the "Aims and Objects of the British Gardeners' Association" will be given by Mr. J. WEATHERS, secretary of the B.G.A., supported by Mr. E. F. HAWES.

SIR DANIEL MORRIE, K.C.M.G., V.M.H., &c.—The President and Council of the Royal Horticultural Society have unanimously appointed Sir DANIEL MORRIE to be an Honorary Life Fellow of the Society, in recognition of his valuable services to horticulture in various parts of the Empire.

PLANTS IN FLOWER AT GLASNEVIN.—Mr. F. W. MOORE writes as follows from the Royal Botanic Gardens, Glasnevin, Dublin:—"The season has been so abnormal that I thought it might interest you to see some flowers gathered here on November 5, from the open air, where they were absolutely unprotected. There are shrubs, herbaceous and Alpine plants, and flowers are appearing on some of the shrubs that the leaves are falling off. The Elms are quite green still, but the leaves are falling from most of the other trees owing to the heavy fogs and dews at night. It is curious to see the water lilies in the sunny forenoons nicely open. In fact, were it not for the colour of the leaves it is more like April here than November. In the list of plants, I have not included ordinary autumn flowers, such as Asters, *Pyrethrum uliginosum*, and similar species which frequently flower in November. They are as follow: *Amicia Zyonensis*, *Astrantia*, *Abelia*, *Berberis*, *Colutca*, *Clematis*, *Campanulas*, *Cestrum Parqui*, *Coronilla Emerus*, *Clerodendron laetidium*, *Escallonia*, *Fuchsias*, *Dianthus*, *Hypericum*, *Iris stylosa*, *Dielytra speciosa*, *Medicago arborea*, *Nymphaea Marliacea*, *Enothera taraxacifolia*, *Lavatera arborea*, *Linaria anticaria*, *Moraea iridoides*, *Phlox reptans*, *Parochetus communis*, *Phlomis fruticosa*, *Primroses*, *Strawberry*, *Spiraea*, *Solanum jasminoides*, *Roscs*, *Veronica angustifolia*, *Verbena venosa*, *Tradescantia*, *Rhododendron parviflora*.

A GARDENER'S BEQUESTS TO THE CHARITIES.—Under the will of the late Mr. BENJAMIN GREAVES, formerly gardener at Broome Hall, Surrey, the Gardeners' Royal Benevolent Institution and Royal Gardeners' Orphan Fund have received £50 each.

NYMPHÆA LOTUS AS FOOD.—A writer in the *Tropical Agriculturist* states that the rhizome of seeds of this plant form a common article of diet for the poorer classes in Madras. The people use rafts or hollowed trunks of the Palmyra Palm in order to gather the plant, the rhizome of which is eaten as curry. The seeds, when prepared free from the fruit, are of a dirty white colour, and are boiled like Rice, or ground to flour, which is then made into cakes. The seed is said to be very palatable, but to be inferior in nutritive value to Rice. Sometimes, especially in times of scarcity, a fair price (Rs.40 per 500lb.) may be obtained for the seed as an article of food.

AN HONOURABLE RECORD.—On November 8, 1908, Mr. JOHN BLACK, whose portrait appears on this page, completed his 50th year as head gardener at Smeaton-Hepburn, where he has been with the late Sir THOMAS BUCHAN-HEPBURN and the present owner, Sir ARCHIBALD BUCHAN-HEPBURN. In April last Mr. BLACK celebrated his golden wedding. He has a numerous family, and three sons have served their apprenticeship as gardeners under their father. The eldest is now gardener to the Duke of LEINSTER, at Carton, and the other two control large private establishments in the United States. Mr. BLACK is still the first up in the morning, and the hardest worker on the place, the difficulty being to get him to realise that at the age of 78 years he should relax his efforts. Mr. BLACK has kept the records of the meteorological station in

the Smeaton-Hepburn garden during the 50 years, night and morning, with scarcely a break. A correspondent writes as follows:—"Mr. BLACK was recommended as gardener to Sir THOMAS BUCHAN-HEPBURN by JAMES McNAB, of the Royal Botanic Gardens, Edinburgh. Sir THOMAS was a great tree planter, and most of the large Conifers which are now such conspicuous features in the grounds were planted by Sir THOMAS and Mr. BLACK. Many uncommon shrubs were also planted, and interesting species seldom seen outside botanic gardens were added to the indoor plant department. Orchids were favourites, and the wall-enclosed garden which in 1808 was in a neglected condition, was brought to a model of neatness. The latest phases—or shall I say crazes—of gardening were initiated. These included low single espalier fruit trees, and a series of flower-beds that were laid out in the bedding-out style of that period, which have ever since continued to be a feature of the garden. At the same time, everything possible was done to preserve its characteristics, and to-day it is one of the most interesting among Scottish gardens of the late 17th or early 18th centuries. In recent years the present proprietor

MR. JOHN BLACK, FOR 50 YEARS HEAD-GARDENER AT SMEATON-HEPBURN.

has considerably extended the kept portion of the ground, embellished the portions around the artificial lake, formed an extensive Alpine garden, and made other improvements. Mr. BLACK has officiated as judge at the principal flower shows for half a century. A few years ago the members of one of these societies presented him with a timepiece on the occasion of his officiating at their show for the 40th time."

FARMERS AND SCIENCE.

In his presidential address to the members of the Birmingham Microscopists' and Naturalists' Union, Mr. Walter E. Collinge, M.Sc., F.L.S., F.E.S., Director of the Cooper Research Laboratory, dealt with the value of Economic Biology to the agriculturist and horticulturist. At the present day this subject is recognised and carefully studied by all thoughtful and far-seeing people who are interested in plant and animal life, but it is only comparatively of recent years that the subject of economic biology has received the attention that so important a study demands and merits. Indeed, we in this country are far behind many others, and not until we more fully realise that our field and garden crops suffer to the extent of from 25 to 75 per cent. of their value by the attacks of injurious animals and fungi, that our live stock

are seriously impaired, that stored grain, timber, and other products of great commercial importance are seriously injured will the subject receive the thorough attention it deserves.

It will thus be seen that the subject is one of great scope and importance, as well as of great interest, and in the present days of farming, gardening, and commercial competition the part played by animal and vegetable parasites is now recognised to be one of prime importance. No student of agriculture, and no one who gardens for profit can afford to neglect this subject, for the successful agriculturist and horticulturist must not only be able to grow crops, but he must be able to obtain the largest possible yield by protecting his crops from the damage and destruction caused by disease. In order to successfully combat the pests, it is necessary that we should know something about them, their habits, methods of attack, where they live, their migrations, when they appear, and why they become destructive. Without this knowledge it is almost useless to expect any good results from the steps we take to destroy or hold them in check. With a full knowledge it is often possible to devise simple means for checking them or stamping them out almost entirely, or even possible to prevent their coming. In practically every civilised country, except our own, the subject is being entered into with energy and enthusiasm, with what results all who are interested in agriculture and horticulture know only too well. It is only by long and patient study that we can arrive at proper conclusions respecting the value of those forms of life which are termed useful, and the seriousness of the harm done by those termed injurious. The loss that injurious insects inflict upon our crops and forests is enormous. Many years ago Dr. Riley estimated the average damage to crops in the United States at nearly £60,000,000 per annum. In this country it is no unusual thing to find injury to the extent of 25 to 50 per cent. of the crop, whilst in other cases it is much beyond that. Curtis records that in 1780 the Turnip crop in Devonshire suffered to the extent of £100,000 owing to the injury caused by insects, and about the same time the Turnip sawfly destroyed thousands of acres of Turnips in Norfolk, and again in 1835. In 1881 the Turnip flea beetle did damage to the extent of half a million sterling in this country, and in 1882 the Hop aphid caused a loss of over a million and a half sterling. During the past year, owing to the winter moth laying her eggs long after winter spraying had been completed, and even the greatest being removed from the trees, fruit growers have lost tens of thousands of pounds. These cases might be multiplied to almost any extent, although most of us are aware of the seriousness of the situation. With the advance that has been made in our knowledge of the life history of the different species and the improvement in our methods of attack, there is every reason to expect that the farmer and fruit grower will suffer less if he takes advantage of the known preventive and remedial measures. The injuries effected through the agency of insects and other parasites upon live stock are of an extensive nature. The aggregate loss occasioned by the ox warble flies (*Hypoderma lineata* and *H. bovis*) in England has been variously estimated at from £2,000,000 to £7,000,000 per annum. The sheep maggot is another insect which causes considerable loss, but I am not able to give any exact figures. The gadflies (*Tabanidae*) and bot flies (*Oestridae*) are further examples of insects causing considerable losses to stock-breeders and feeders, whilst there are a large number of what may be termed minor pests, such as fleas, the flesh fly, stable fly, sheep "kild," &c., while sheep scab, husk, liver-fluke, gid and other diseases due to internal parasites exact a heavy toll. Soil biology and the scientific breeding of plants were next dealt with, and the vast possibilities awaiting the investigator and the agriculturist were referred to. In conclusion, Mr. Collinge pointed out that farmers, stock breeders, fruit growers, and gardeners throughout the land were beginning to realise that the man who could associate science with practice was worth paying attention to, for his advice meant healthier stock, better crops, and bigger prices. The address was illustrated by a large series of lantern slides typical of some of the parasites and the diseases they set up in live stock and crops.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

RENAMING FRUIT AT SHOWS.—Exhibitors are at times thankful to judges and experts for correcting errors in naming fruit at shows. Many a time the correct name of a fruit has been obtained by an exhibitor in this manner, but even judges are liable to fall into an error. A striking instance of this came under my notice at the recent fruit show in the Vincent Square Hall. A competitor staged a dish of Beauty of Hants Apple, whatever this variety may be. I look upon it as an inferior, and perhaps a seedling from Bleinheim Pippin. One of the judges erased the name written by the exhibitor and substituted Mabbott's Pearmain, which the Apple does in a slight measure resemble, but upon a closer inspection they are quite dissimilar, and in no way more pronounced than at the time of ripening. The *Fruit Manual* says Mabbott's Pearmain is a valuable dessert Apple in use up till Christmas. Beauty of Hants is an season in October, and is quite useless in November, much less Christmas. The flesh of Beauty of Hants is white and not highly flavoured, whereas in Mabbott's Pearmain it is yellowish and richly flavoured. Having planted the tree from which the fruit was gathered as Beauty of Hants, thirty years ago, obtaining it from R. Smith and Co., Worcester, I have reason to know a mistake was made in altering the name. *E. M.*

MISNAMING OF FRUITS.—Looking round the stalls in Nottingham market-place recently, I was attracted by a good sample of Pears bearing the label "Williams." Ingratulating myself by a small purchase, I hinted as delicately as possible that a mistake had been made, and that the Pear was the well-known market variety, "Bonsooch," which ripens long after the favourite "Williams" are over. My surmise proved correct, but I was not quite prepared to hear the explanation that "if I didn't label them 'Williams' I couldn't sell a Pear." I had an almost similar experience in Leicester on the 24th ult., which shows that the practice is general, at least in the Midlands. My impression is that if any one cared to take the matter up the practice could be proved illegal, but perhaps I may be corrected on this point. *L. Fosbrooke.*

CLEMATIS INDIVISA FOR FORCING.—This species, introduced to this country in 1847 from New Zealand, makes an excellent subject for early forcing in a warmth of 50-55°, and is capable of being brought into bloom in the month of February. It is admirably adapted as a market pot plant for Easter decorations. The whitish-yellow blooms have a diameter of 2½ inches, arranged in large corymbs, and these being in open order afford a pleasing appearance. The foliage is shining dark green, and similar in form to that of Smilax. In the open air the flowers appear in April. *F. M.*

BENTHAMIA FRAGIFERA.—Even in the southern part of Hampshire, within 10 miles of the Isle of Wight, this shrub does not succeed. Fifteen years ago I raised several plants from seed, grew them on in pots until well established, and planted them out in the open spring. They were planted carefully in the most favourable spots in the garden, and they have grown fairly well, but have never shown signs of fruiting. It may be that the soil is of too cold a nature to enable the plants to grow sufficiently vigorous. *S. Hants.*

CLIMBING PLANTS IN ARGVLE.—On October 23, during a visit to Craignish Castle, the pretty autumn residence of Colonel and Mrs. Gascoigne, I was surprised at the beauty and vigour of climbing plants. Craignish Castle is situated on the West Highlands of Argyll and close to the sea. The castle overlooks a lovely flower garden, at the top of which there is a retaining wall. On this wall many so-called tender plants are thoroughly happy. Crinodendron Hooker had flowers for the second time, Escallonia montevidensis was covered with clusters of white flowers, and Berberidopsis corallina was charming with its coral-red flowers. I had never seen Solanum jasminoides in such condi-

tion, the whole plant being covered with a sheet of blossom. Twining here and there was Rhodochiton volubile, and I was astonished when told that this plant had survived the winter of 1907. Fuchsia fulgens also survives the winter, while the old F. Riccartonii is to be seen in huge bushes. On another wall Lapageria rosea displayed its bell-shaped blooms; this Mrs. Gascoigne and her gardener considered their triumph; the white variety, however, shows no signs of flowering. Exogonium Purga in a sheltered corner was a mass of lovely bloom. Echeverias live out on rocky fissures, and near to them I noticed Fuchsia procumbens in fruit. *D. S. McNeill, Fochaltach, Argyll, N.B.*

JAPANESE MAPLES, HARDINESS OF.—The recent correspondence in the *Gardener's Chronicle* bearing on the hardiness of the Japanese Maples has interested me much, as I have had a good deal of experience of these beautiful shrubs. It is claimed for them that they are as hardy as the Laurel, and, as far as resisting the winter's cold is concerned, I do not dispute it; but unless especially sheltered, the more delicate kinds suffer badly from spring frosts and cutting winds just as the new foliage is developing. What is more, they often remain a good deal crippled for the rest of the season. The more vigorous kinds, such as *Acer palmatum* itself, and its varieties atropurpureum and sanguineum, will thrive where many others fail; indeed, I look upon sanguineum as the best of them all for the open ground, as it is of free growth and the foliage, richly coloured throughout the summer, has that character greatly intensified in the autumn before the leaves drop. The remark of your correspondent A. S., p. 314, proves nothing, as the Japanese Maples referred to may be the green-leaved form of *Acer palmatum* or its variety sanguineum, whereas Mr. Clark in his notes includes quite a long list of varieties. *J. J.*

ESCALLONIA AND CHOISYA TERNATA FOR NORTH WALL.—Mr. A. C. Bartlett's note on p. 330 is interesting, but he writes from Cornwall. Needless to say, both plants would prove superior additions to the few plants adapted for north aspect walls, if they would thrive around London and in the Midlands. Can any reader affirm he has been successful with them planted in such positions in the latter localities? I have seen Escallonia planted as a hedge, and although it seemed cruel to clip it when past flowering, it did uncommonly well. *William Early.*

SOCIETIES.

ROYAL HORTICULTURAL.

NOVEMBER 10.—The meeting on Tuesday last was held in bright, though cold weather, and there was a good attendance of visitors. The most important exhibit was a group of Ferns, which occupied a very large space, and was accorded a Gold Medal. The ORCHID COMMITTEE granted one First-Class Certificate, three Awards of Merit, and four Botanical Certificates.

THE FLORAL COMMITTEE granted one First-Class Certificate and seven Awards of Merit. At the afternoon meeting of Fellows, 22 new candidates were elected, and a lecture was given by Mr. John W. Gell on "British Wild Flowers in the Garden."

Floral Committee

President. W. Marshall, Esq. (chairman), and Messrs. H. B. May, George Paul, E. H. Jenkins, W. P. Thomson, Chas. T. Druery, John Green, E. H. Bowles, T. W. Turner, G. Ruthe, C. J. Salter, W. Cuthbertson, J. F. McLeod, J. Jennings, C. R. Fielder, Chas. Dixon, F. Page Roberts, Chas. E. Pearson, Chas. E. Shea, J. Hudson, and R. Hooper Pearson.

MESSRS. J. HILL & SONS, Edmondton, occupied the entire width of the hall, plus an extension, with a very finely-grouped collection of exotic Ferns embracing about 150 species and varieties. The whole of the plants were large and well-cultivated specimens, among the most noteworthy of which was a large plant of *Angiopteris evecta*, rarely seen at shows on account

of its size; also magnificent examples of some of the newer varieties of *Nephrolepis exaltata*, including *N. e. Ameripholii*, *N. e. superba*, and others of that class; *Phlebodium glauca* Mayi, a grand plumose form of that species, *Pteris serrulata* Summeris, *P. s. Childsii*, *Asplenium Mayi* and *Davallia filijensis robusta*. (Gold Medal.)

MESSRS. H. B. MAY & SONS, The Nurseries, Edmondton, staged a most interesting group of *Nephrolepis*, representing 50 species and varieties of this genus, which in recent years has furnished fine varietal forms as to eclipse any other exotic genus entirely for garden purposes. The contrast between the simply pinnate, specific forms and the finely-divided plumose variations and densely crisped and crested ones is extremely striking. Messrs. MAY also showed *Begonias* of the *Gloire de Lorraine* type; *Veroncas* of the Andersonii section, *Bouvardias* and *Carnations*, with the variegated *Ficus repens*, small Ferns and Palms intermixed. (Silver-Gilt Flora Medal.)

Single *Chrysanthemums* in variety were extensively displayed by Mr. C. J. SIMPSON, St. John's Nursery, Cheshamford. (Bronze Banksian Medal.)

MESSRS. W. WELLS & CO., Merstham, Surrey, displayed *Chrysanthemums* in variety, having large Japanese blooms, also decorative, single and other types of the flower in good condition. (Silver Flora Medal.)

A group of *Chrysanthemums* was shown by Mr. W. P. HORTON, Cravenhurst, Seaford, Sussex, who also displayed a small rock-garden exhibit and ornamental-leaved plants of exotic species.

MESSRS. JOHN FEED & SON, West Norwood, London, showed a large exhibit of *Chrysanthemums* upon the floor under the wall. At the back of the Palms overhung large Japanese blooms, whilst the foreground was composed of decorative and single varieties set in *Adiantum* Ferns, the continuity being broken with bamboo epergnes filled with decorative and single *Chrysanthemums*. The same firm exhibited, as a separate group, a collection of Alpine plants, and small specimens of succulents. (Silver Banksian Medal.)

Chrysanthemums were displayed by G. FERGUSON, Esq., Weybridge (gr. Mr. F. W. Smith). Many were single varieties of Mr. Smith's raising. A pretty combination was made with Belle of Weybridge (chestnut-crimson) and Wm. West, lake yellow. In the foreground were large blooms of Japanese varieties, the group being enlivened with hardy foliage in its autumn tints.

REV. H. BUCKTON, Sutton Hall Gardens, Elwell, Derby (gr. Mr. A. Shambrook), exhibited a large number of plants of *Cyclamen*. The plants were excellently flowered and well cultivated in every respect. (Silver-Gilt Banksian Medal.)

MR. W. H. PAGE, Tangle Nurseries, Hampton, showed pink-flowered *Astilbe* (*Spiræa*), a few *Carnations* and a dwarf perpetual flowering Rose, labelled Flower of Fairfield.

MESSRS. HUGH LOW & CO., Bush Hill Park, Enfield, showed winter-flowering *Carnations*, also "Salmon King" *Cyclamen*. (Bronze Flora Medal.)

MESSRS. WM. CUTBUSH & SON, Highgate, London, N., showed *Liliums*, *Azaleas*, *Astilbe* (*Spiræa*), *Lily of the Valley*, and other plants that had been grown from retained roots; also berried plants in a setting of Palms and Ferns, and a magnificent array of *Carnations*. (Silver Banksian Medal.)

MESSRS. H. CANNEL & SONS, Swanley, Kent, displayed a selection of *Zonal Pelargoniums*, as at the last meeting. (Silver Banksian Medal.)

MR. L. R. RUSSELL, Richmond Nurseries, Surrey, showed berried plants, also Ivies with variegated foliage, *Eurya latifolia* alba, *Elaeagnus*, *Garrya elliptica*, ornamental *Conifers*, &c.

MESSRS. CLIBRANS, Altrincham, showed a batch of their pretty hybrids of winter-flowering *Begonias*, having four new varieties, one of which was granted an award (see below).

MESSRS. JAMES VEITCH & SONS, LTD., King's Road, Chelsea, filled a large table with varieties of winter-blooming *Begonias*, including the *semperflorens* and the Mrs. Heal types. *Stevia serrata*, a composite plant having a resemblance to *Eupatorium riparium* was exhibited in this group. The flowers are fragrant. (Silver Banksian Medal.)

A large table was filled with pyramidal-trained plants of Begonia cloire de Lorraine and others of the type. They were freely-flowered, and showed to greater advantage in a setting of Codiaums (Crotons), Aralias, Ferns, Palms, Abutilons, Celosias, &c. The exhibitor was E. H. BROWN, Esq., Highwood, Rochester (gr. Mr. R. Bradford). (Silver-Gilt Banksian Medal.)

A semi-circular group of flowering plants, principally Begonias and Primulas, relieved with Palms, Codiaums (Crotons), Dracaenas, Ferns, &c., was shown by P. FUNKELL, Esq., Streatham Hill, S.W. (Bronze Banksian Medal.) Mr. E. POTTER, Camden Nurseries, Cranbrook, Kent, showed a double-flowered variety of Paul Crampel Palægonium.

The Misses HOPKINS, Mere Gardens, Shepperton-on-Thames, displayed a small rock-garden exhibit arranged with suitable plants.

Miss GRACE LAYTON, Pirbright, Bourne-mouth, showed paintings of native plants easily recognisable, although having no pretension to botanical details. (Silver Flora Medal.)

AWARDS.

FIRST-CLASS CERTIFICATES.

Nephrolepis rufescens amabile.—This is believed to have originated from N. r. Mayi, a densely-congested variety, but it differs greatly in bearing large, over-lapping polydactylous tassels at all tips, in other respects it agrees with the presumed parent in having narrow, imbricate fronds, but has a laxer habit. This form was certificated as *N. amabile*, a specific name, an error which should be corrected and the specific name inserted. In this family the specific differences were originally very marked, but are liable to be entirely obscured by the variations that have occurred, so that the parentage must often be merely presumed by the raiser from his spore-sowing record, rather than from any obvious specific differences. Exhibited by Messrs. HILL & SOXS, Edmonton.

AWARDS OF MERIT.

Begonia Clibran's Pink.—This is an excellent addition to the section of winter-flowering Begonias raised from crossing the tuberous with the fibrous-rooted sections. The flowers are double, and in colour a rich shade of carmine-pink. The plants are very floriferous, and the habit is good. (Shown by Messrs. W. CLIBRAN & SON.)

Chrysanthemum Hetty Wells.—A decorative variety of smooth Japanese type; colour reddish-chestnut and buff. (From Messrs. W. WELLS & CO.)

Chrysanthemum Hon. Mrs. Lofet.—This is an extra large yellow Japanese flower. It is probably one of the very best, being of excellent colour, and the largest exhibition size. (From Mr. MARTIN SILSBERY.)

Chrysanthemum Purity.—A large, white, Japanese bloom of exhibition size, and having a pale-lemon tint about the centre. (Shown by Mr. MARTIN SILSBERY, Shanklin.)

Chrysanthemum R. F. Felton.—W. WELLS & CO. (See description on p. 333 of last issue.)

Chrysanthemum Sylvic Slade.—Shown by Messrs. W. WELLS & CO. (See p. 333 of last issue.)

Nephrolepis rufescens Mayi var. ornata.—This is a secondary sport from N. Mayi, a robust, erect, congested variety. It is distinguished markedly from the parent form by being tri-pinnate, sub-congested, and somewhat imbricate. It retains the bold, erect habit of growth of N. Mayi, and is a fine decorative form. (Shown by Messrs. H. B. MAY & SON.)

Orchid Committee.

Present: Norman C. Cookson, Esq. (in the chair), and Messrs. Jas. O'Brien (hon. sec.), de B. Crawshaw, W. Boxall, F. M. Ogilvie, F. J. Hanbury, C. J. Lucas, G. F. Moore, R. G. Thwaites, A. A. McBean, W. Cobb, J. Charlesworth, J. Cypher, H. G. Alexander, A. Dye, W. H. White, W. P. Bound, H. Ballantine, Gurney Wilson, J. Wilson Potter, R. Brooman-White, H. A. Tracy, and J. Gurney Fowler.

Messrs. CHARLESWORTH & CO., Hayward's Heath, were awarded a Silver Flora Medal for a very select group of new and rare Orchids, all well worthy of the show stand, and in which appeared the pure white *Vanda cœrulea* Charles-

worthii, which gained a First-Class Certificate at the last meeting, the new *Lælio-Cattleya* *Phœbus* (L.-C. Cappei × C. Iris), a glowing flower, with golden-yellow sepals and petals and deep, blood-red lip, with gold lines; *Cattleya* *Vulcani marianum*, deep rose-purple, with white margin to the lip, and others.

Lt.-Col. G. L. HOLFORD, C.I.E., C.V.O., Westonbirt (gr. Mr. H. G. Alexander), showed three good novelties, viz. *Lælio-Cattleya* *Golden Beauty* (L.-C. Ernesti × L.-C. Henry Greenwood), a charming yellow flower, with ruby tip to the lip, the spike bearing 10 flowers; *Brasso-Cattleya* Mrs. J. Leemann Westonbirt variety, a delicate primrose-coloured flower, tinged with lilac; and *Cypripedium* *Dante magnificum*.

FRANCIS WELLESLEY, Esq., Westfield (gr. Mr. Hopkins), sent *Cattleya labiata* *Her Majesty the Queen*, a large, pure white flower, with a very faint tinge of pink on the front of the lip, the disc being pale yellow; and *Cattleya* *Gaskelliana Delight*, a finely-formed white flower, with

Messrs. HUGH LOW & CO., Enfield, were awarded a Silver Banksian Medal for a group which contained several white forms of *Cattleya labiata*, including the varieties *Queen Maud*, *Reedleyensis*, and *La Vierge*.

W. P. HORTON, Esq., Cravenhurst, Seaford, staged a small selection of *Cypripediums*, of which the large and finely-formed *C. Cobbæi* was the best.

Messrs. SANDER & SONS, St. Albans, showed their new bigeneric hybrid *Chondropetalum* *Fletcheri*, a very remarkable and pretty flower, with emerald green sepals and petals and white lip.

H. S. GOODSON, Esq., Fairlawn, Putney (gr. Mr. G. E. Day), showed a fine specimen of *Cattleya labiata* *Amesiana*, with four pure white flowers, with pale pink labellums, on a spike; and *Lælio-Cattleya* *Clive Keswick* variety, distinct in colour.

SIR TREVOR LAWRENCE, Bart., K.C.V.O., Burford (gr. Mr. W. H. White), sent three very dis-

(Photographed by special permission.)
FIG. 147.—ROYAL GARDENS, FROGMORE: VIEW IN THE PLANT CORRIDOR.
(See page 339.)

a small, deep rose blotch on the lip, and a pale yellow tinge in the tube.

Messrs. JAS. CYPHER & SONS, Cheltenham, staged a most effective group, for which a Silver Flora Medal was given, in the centre of which were a number of fine plants of *Dendrobium* *Phalenopsis*, including two nearly white forms, together with the rose-purple *D. Slaterianum*. *Cypripediums* were well represented by *C. insignis* *Sanderæ* (about 20 flowers), *C. l. Harefield Hall*, and other varieties of *C. insignis*, &c.

Mr. H. A. TRACY, Orchid Nurseries, Armand Park Road, Twickenham, secured a Silver Flora Medal for a well-arranged group, in which his fine type of *Cypripedium* *Spiræianum*, raised from home-saved seeds, were well represented. Varieties of *Odontoglossum amabile* and other showy hybrid *Odontoglossums*; a pretty, white *Cattleya*, with purple lip, raised between *C. Parthena* and *C. labiata alba*; and other species were included.

similar varieties of *Lælio-Cattleya* *Adolph-Harrisoni* (L.-C. Adolphus × C. Harrisoni), the one being nearly all yellow, the other cream-white, spotted with purple, and with a purple margin to the lip, and the third bearing some resemblance to *C. calumata*.

G. P. WALKER, Esq., Heatherwood, Putney (gr. Mr. McGregor), showed *Lælio-Cattleya* *Heatherwood* (L.-C. Schilleriana × *C. granulosa aurea*), a neat flower, with cream-white sepals and petals, and bright purple lip.

J. FORSTER ALOOCK, Esq., Northchurch, Berkhamsted, sent *Cypripedium* *nobile*, a very large and well-formed flower, and two other good home-saved hybrids, one of which resembled *C. triumphans*.

H. H. ARMITAGE, Esq., Sheffield (gr. Mr. Baker), sent a flower of a delicately-tinted hybrid between *Cattleya Dowiana aurea* and *C. Victoria Regina*.

AWARDS.

FIRST-CLASS CERTIFICATE.

Sopiro-cattleya Doris (S. *grandiflora* × C. *Doveiana aurea*), from J. GURNEY FOWLER, Esq., Cleveleys, South Woodford (gr. Mr. J. Davis). A brilliant hybrid, with beautifully-formed flowers of a bright scarlet colour, the veining being slightly the darker, especially on the lip, which has an orange base.

AWARD OF MERIT.

Cypridium Dentic magnum (*Euryades* × *Charletworthii*), from Lt.-Col. G. L. HOLDFORD. A beautiful flower, with a white dorsal sepal, blotched with vinous purple, the rest of the flower being yellow, tinged with red-brown.

Cattleya Clarkie intensa (*labata* × *bicolor*), from LEOPOLD DE ROTHSCHILD, Esq. (gr. Mr. Hudson). A fine flower of the shape of C. *tris*, and bright rose in colour, with a golden sheen on the petals.

Cattleya Fabra Cooksoni (C. *aurea* × C. *labata* *Cooksoni*).—A very handsome white flower, with intensely bright rosy-crimson lip.

BOTANICAL CERTIFICATES.

Polystachya Laurentii.—A trailing plant, with fleshy, green leaves, and branched spikes of white flowers.

Bulbophyllum Illacinum.—Flowers in dense racemes, white, tinged with purple.

Bulbophyllum cupressinum.—The flowers are copper-yellow coloured.

Maxillaria phoenicenthera.—A pretty, profuse-flowering species of the M. punctata class. The flowers are white, sparsely spotted with purple. These four were exhibited by Sir TREVOR LAWRENCE, Bart., K.C.V.O.

Fruit and Vegetable Committee.

Present: A. H. Pearson, Esq. (in the chair), and Messrs. Jas. Cheal, W. Bates, J. Willard, Alex. Dean, H. Parr, J. Davis, W. Barnes, Edwin Beckett, P. D. Tuckett, Geo. Wythes, W. H. Divers, W. Poupert, C. G. A. Nix, A. R. Allan, and Charles Foster.

This Committee had very little brought to its notice: there were the usual seedling and unnamed Apples for consideration and naming, the only exhibit of importance being a collection of Apples and Pears, together with three bunches of Grapes, exhibited from the gardens of the Duke of RUTLAND, Belvoir Castle, Grantham (gr. Mr. W. H. Divers). The Apples were good samples, and embraced a very large number of varieties, the finer being Mère de Ménage, Castle Major, Lane's Prince Albert, Warner's King, Wealthy, Bramley's Seedling, Sandringham, Reineite de Caux, Cockle Pippin, Belle de Boskoop, Broad-Eyed Pippin, and Cox's Orange Pippin. The Pears included Emile d'Hayot, Gilgill, Marchal de la Cour, Welbeck Bergamot, Beurré Dieul, Beurré Clairgeau, Marie Louise, Beurré du Buisson, Easter Beurré, and Doyenné d'Alençon. The Grapes were Muscat of Alexandria, Black Alicante, and Gros Colmar. (Silver-Gilt Knightian Medal.)

A collection of Apples and Pears was also exhibited by Messrs. HUGH LOW & Co., Bush Hill Park, Enfield.

Scientific Committee.

OCTOBER 27.—Present: Mr. E. A. Bowles, M.A., F.L.S. (in the chair), Messrs. W. Hales, E. W. Holmes, G. Massee, G. Gordon, H. T. Gussow, J. T. Bennett-Poe, W. Cuthbertson, J. Douglas, W. C. Worsell, L. Crawshaw, G. S. Saunders, J. Fraser, and F. J. Chittenden (secretary).

Fasciations in Boms.—Mr. WORSSELL remarked that though the cause of this well-known phenomenon was so far unknown, in many cases it appeared possibly due to an excess of nourishment directed to a given spot, but it was also partly constitutional. He showed numerous specimens of Bean seedlings (Phaseolus multiflorus) in which he had, by removing the central shoot as soon as it made its appearance outside the seed, induced fasciation in the shoots which arose in the axils of the cotyledons. A majority of the plants treated had behaved in this way, but not all. In P. vulgaris, in which the cotyledons are raised above the surface, he had failed to induce fasciation, as the long hypocotyl apparently took all the surplus nourishment from the cotyledons. Fasciated roots appear to be rarely met with in nature, but he had been able to

induce the formation of such in one case of Phaseolus vulgaris. After removing the radicle, an adventitious root had sprung from the hypocotyl, and this had become fasciated.

Mr. CHITTENDEN, on b-half of a correspondent, showed a fasciated stem of Calystegia pubescens.

Adventitious shoots on leaves of Curdamin pratensis.—Mr. HOLMES showed leaves of Caidamina pratensis fl.-pl. bearing well-developed shoots arising from the tips and surface. The same phenomenon is frequent in the single form as well as in the double.

Viviparous grass.—Mr. HOLMES also showed a specimen of Airacacitosa with numerous small branches springing from the nodes. Such growths are very common in some grass species, and are often found in the inflorescence, particularly after a period of wet weather. They normally occur in that region in some species, as in Festuca ovina, in moist mountainous regions.

Parasitic Rye canker.—Mr. GUSLOW showed further specimens of this disease due to the attack of the fungus Comothrium Fueckeli.

Aerial tubers in Achimenes grandiflora.—Mr. HALES showed specimens of this plant bearing numbers of greenish tubers in the leaf axils. These tubers easily fell away, and were produced by plants which had been grown on after they had finished flowering.

Crocus corns diseased.—Mr. MASSEE showed corns of Crocus which had been killed by the bacterium, Pseudomonas hyacinthi, which is the cause of the well-known disease of Hyacinths. He wished to draw attention to this disease, for which there is no cure, and to warn cultivators against planting diseased corns. When cut, the corns show the same yellow gummy exudation typical of the disease in Hyacinths.

New certificate.—Mr. BOWLES announced that the Council had had under their consideration a new certificate which, it was suggested, should be designated Certificate of Appreciation, to be awarded for worthy exhibits at the shows of objects demonstrating the results of experimental cultures in gardens, with the object of encouraging individual effort in this direction. The Council suggested that this committee should undertake to consider such exhibits, a suggestion which the committee cordially agreed to carry out.

Curious Narcissus bulb.—From the Rev. J. JACOB came a curious bulb of Narcissus in which the axis of a lateral offset had elongated and produced at its apex a small bulb quite normal in structure, about 2 inches above the other bulb.

Poppies with bracts, &c.—From a correspondent at Lincoln, who previously sent Shirley Poppies with numerous bracts just below the flowers, came further specimens. In the accompanying communication he stated that these plants were undoubtedly hybrid, though unfortunately it was not known what the pollen parent had been, though the seed parent was the Shirley Poppy. Little seed was produced this year. From the same correspondent came specimens of Polyanthus having an enlarged calyx and no flower, and others with a rather less enlarged calyx and a small flower.

Apples showing "glassiness".—Two specimens of the Apple Lane's Prince Albert were sent, one from Harpenden, the other from Ross, both showing the peculiar greenish semi-transparency known as "glassiness." The appearance is due to the translocation of the cell walls into intercellular spaces, and it was suggested that this was due, perhaps, either to the very hot weather experienced during the beginning of October, or to the abundant rain following a period of drought. In the former case it was reported that every year from one tree some Apples showing the same appearance were gathered, and that the affected spots rotted after a time, and in the case from Ross 24 Apples showed the trouble, the remainder of those upon the tree being quite normal.

SOUTHAMPTON ROYAL HORTICULTURAL.

OCTOBER 28, 29, 30.—The annual autumn show was held in the Skating Rink, Southampton, on these dates, and was equal in merit to the best of the autumn exhibitions hitherto held by this society. Chrysanthemums, considering the early date, were remarkably good, while fruit and vegetables left little to be desired.

Groups of Chrysanthemums.—Exhibits of these are always well arranged at Southampton. The plants, furthermore, were clothed with good leaves and carried really fine blooms. J. C. E. D'ESTERRE, Esq., Elmfield, Southampton (gr. Mr. C. Hosey), won the premier prize with a desirable exhibit.

Cut blooms were numerous and good. In the class for 12 Japanese Chrysanthemums of distinct varieties, three blooms of each kind arranged in vases, Prince HATZFELDT, Draycot Park, Chippenham (gr. Mr. F. Bible), was the most successful exhibitor, having large, fresh blooms of Bessie Godfrey, Lady Edgait, J. Henderson Mrs. F. Vallis, Algernon Davis, Lady Henderson Mrs. F. Pearce, President Viger and J. H. Silsbury. Mr. W. IGGUDEN, The Nurseries, Frome, won the second prize with smaller specimens. Prizes were offered for three blooms each of two varieties of white Japanese Chrysanthemums. Major CHESTER, Embley Park, Romsey (gr. Mr. B. Hollis), won the leading place with typical examples, Mrs. A. T. Miller and Edith Smith. 2nd, Mr. IGGUDEN. Prince HATZFELDT was placed first for three blooms each of any two varieties of Japanese Chrysanthemums other than white, with Algernon Davis and Bessie Godfrey in excellent condition. Incurred varieties were not extensively shown, although those seen were of good quality. Prince HATZFELDT had the finest set of 18 specimens, the blooms being large and fresh, although none too well presented. In a smaller class Prince HATZFELDT won the similar position easily, although Mr. F. W. FLIGHT, Cortstiles, Twyford, Winchester (gr. Mr. W. Neville), staged nearer, it smaller specimens.

Single-flowered varieties made, as they always do, an attractive display. In the class for six varieties five growers competed. Major CHESTER won the first prize with the varieties Will Jordan, Mary Richardson, Florence Robinson and Annie Holden.

Decorative varieties in four distinct sorts were best shown by Mr. B. PEPPER, Vernon Hill, Bishop's Waltham. The varieties Source d'Or, Soleil d'Octobre and White Quintus are apparently still the favourites in this section. Prince HATZFELDT again displayed his supremacy, winning in the class for 24 specimens in not fewer than 16 varieties, with really fine flowers. Mr. F. CHAMBER, 75, Shirley Road, Southampton, was the most successful amateur exhibitor.

In the class for table decorations seven persons competed. Mr. R. H. JEFFERY, Nursling, was awarded the 1st prize for an effective combination of pink Carnations, Roses, &c.

Fruit was a distinct and interesting feature of the show. Grapes were very prominent. For three bunches, distinct, J. WILLIS FLEMING, Esq., Culworth Manor (gr. Mr. H. C. Dredge), was placed first with finely-finished examples of Mrs. Pince, Gros Maroc, and Muscat of Alexandria. A. P. RALL, Esq., Twyford Lodge, Winchester (gr. Mr. J. Hughes), had the best two bunches of Black Alicante. Mr. J. WILLIS FLEMING, with two superb bunches of Muscat of Alexandria, was awarded the leading prize in the class for this Grape.

Apples were a great feature of the show. As many as 16 growers entered in the class for four dishes of dessert varieties. W. H. MYERS, Esq., Swanmore House, Bishop's Waltham (gr. Mr. Ellwood), won easily with beautifully-coloured examples of Cox's Orange Pippin, Blenheim Pippin and Ribston Pippin. Mr. DORRIS, showed the best kitchen Apples in four dishes, having very fine examples.

Vegetables were good in quality and numerously shown. Messrs. TOOGOOD & SONS, Seedsmen, Southampton, and Messrs. SUTTON & SONS, Reading, provided the prizes in two classes, which provoked a keen competition, but Mr. W. H. MYERS, Swanmore Park, won easily with typical examples of Onions, Celery, Potatoes, Cauliflowers, Tomatos, and Leeks.

Trade exhibits added much to the interest of the show. A Gold Medal was awarded to Messrs. OAKLEY & WATING, Florists, Southampton, for a display of floral work. Messrs. E. HILLER & SON, Winchester, had an interesting exhibit of Apple Messrs. CLIBBON, Altrincham, showed Chrysanthemums in variety. Mr. W. J. GORREAU, Exmouth, had Chrysanthemums and Zonal Pelargoniums, Messrs. W. WELLS & Co., Merthur, showed new Chrysanthemums.

BRIGHTON AND SUSSEX HORTICULTURAL.

NOVEMBER 2.—The seventeenth annual exhibition of Chrysanthemums was opened on the 2nd inst. in the Corn Exchange and Dome adjoining the Royal Pavilion. Although there was a considerable falling off in the competitive classes for Chrysanthemums, yet the other features, consisting of Begonias, table plants, fruit and vegetables, and non-competitive displays were exceptionally good. There was a total of 322 entries. The weather was fine and bright, and the show was attended by a large number of visitors.

CUT BLOOMS.

In the premier class, being one for 36 Japanese blooms in not fewer than 24 varieties, not more than two of one sort, Mr. C. J. DICKER (gr. to the EXECUTORS of the late Hon. Louisa Canning, Frant Court, Sussex), secured the 1st prize. In addition to the cash prize, the president's Silver Challenge Bowl and the Society's Silver Medal were also awarded to this exhibit, the principal varieties staged being Mrs. W.

Capt. J. R. SMILEY, Horsted Place, Uckfield), obtained the 2nd prize.

For twelve large flowering Japanese blooms there was only one entry, the 1st prize being awarded to Mr. E. JONES (gr. to HARRY YOUNG, Esq., Withdean Grange).

For 25 Japanese blooms, in not fewer than 18 varieties in five vases, for which was offered the Society's Silver Medal and a substantial cash prize, Messrs. J. STREDWICK & SONS, Silverhill Park, St. Leonard's, secured the premier position with some well-finished blooms, including two seedlings. Mr. C. J. DICKER, was 2nd. The last-named exhibitor also staged a splendid collection of Apples, consisting of over 60 varieties, and the exhibit is greatly to be commended as coming from a private garden.

PLANTS.

Mr. E. JONES being the only exhibitor in Classes I. and II. for groups of Chrysanthemums, was awarded 1st prize in each class for excellent displays. For a similar group, open to private gardeners and amateurs only, Mr. G. H. BENNETT obtained the 1st prize.

Crawley. The premier award in this section was the Gold Medal worthily earned by Messrs. W. BALCHIN & SONS, of Hassocks, for a magnificent display of Orchids, foliage plants, Lilies of the Valley, Chrysanthemums, &c., arranged in a most graceful manner.

FRENCH NATIONAL CHRYSANTHEMUM.

NOVEMBER 3, 4, 5.—The thirteenth annual congress and exhibition of the French National Chrysanthemum Society took place at Tours on these dates. The congress was held in the Hotel de Ville, and was attended by about 80 persons. M. George Bruant, of Poitiers, presided. The principal business accomplished on the first day was the passing of the *brochure de propaganda*, the decision as to the place of the congress next year, viz., Marseilles, and the voting of the congress medal, M. Charvet being the fortunate recipient.

The show was held in a huge tent supported by a wooden framework erected in the Place

FIG. 148.—ROYAL GARDENS, FROGMORE: SPECIMEN PALMS IN TEAK-WOOD TUBS ON A MOSAIC FLOOR.
(See page 337.)

[Photographed by special permission.]

Knox, Leigh Park Wonder, Mrs. Norman Davis, F. S. Vallis, Joseph Stoney, Viola, Edith Smith, Mrs. R. Hooper Pearson, O. H. Broomhead, Bessie Godfrey, Reginald Vallis, Miss O. Miller, J. Roberts and Walter Jinks. Next in order of merit came Mr. G. HUNT (gr. to PANTIA RALLI, Esq., Ashhead Park, Epsom) with a fairly even set of blooms, and was followed by Mr. J. HARRIS (gr. to Col. C. P. HENTY, Avington, Arundel).

Mr. G. HUNT was again to the fore with twelve incurveds, distinct, having a bright, even set of blooms, the finest of which were Mrs. B. Hankey, Emblème Poitevine, Buttercup, Duchess of Fife, and W. Biddle. Mr. M. Tourle (gr. to

DECORATIVE CLASSES.

Table decorations are always a strong feature at this show. MISS MABEL HOWELL, Tower Lodge, Queen's Park, secured the 1st prize from 11 competitors.

For an open class consisting of a mantelpiece decoration, Messrs. GEORGE MILES & SON, Dyke Road, West It.

NON-COMPETITIVE EXHIBITS.

Fruit, flowers and foliage plants were well shown by Messrs. W. MILES & Co. (Silver-Gilt Medal); Mr. HICKSON also obtained a similar award for fruit, likewise Messrs. SUTTON & SONS, Reading, and Messrs. J. CHEAT & SONS,

de la Gaie. It measured more than 200 feet by 125 feet, and was artistically laid out in beds and winding paths. Besides Chrysanthemums, there was a large display of other flowers, including Dahlias, Heaths, Cyclamen, and Begonias.

In the Chrysanthemum classes there were many entries, mostly from local growers. Seedlings were gladly shown by M. ERNEST CALVAZ, including some massive blooms in the Japanese section. The Marquis DE PINS, M. CHANTREUX, M. HERAUD, and M. DUBOIS also sent new varieties.

M. PINON had an interesting display of trained plants of Chrysanthemums in pyramid,

fan, and other shapes. Some of the best examples were Tokio, Mrs. Coombes, Chas. Weeks, Prefet Lepine, and Triomphe de Montbrun. M. BURET-KEVERDÉ had close by two big groups, in which were noticed Paris 1900, Satin Rose, Tokio, Henry Second, E. J. Brooks, and M. de H. Tucker.

Messrs. VILMORIN, ANDRIEU ET CIE., Paris, set up finely-developed pot plants in two groups, for which a Walk of Art was awarded. We noted Vivand Morel, Algeria, Hy. Weeks, W. Wells, Mme. Rene Oberthur, Exelda, W. Duckham, Victoria and Albert, Meynell, R. Hooper Pearson, Merstham Yellow, &c. Other exhibitors were Messrs. RENGNY, PELLISSIER, BACHET, ROBERT, PAGE, LAPLANE, PARROT (pyramids), LECLERC, CARION, LIQUVILLE, DUPONT, FIERDEFRIED, ALLERY-AUBERT, DALLIERE, MONTIGNY (novelties of 1908), TRAVOILLON, BARILLET, &c.

Vegetables were well shown, the collections being remarkable for the great variety exhibited. There were collections from Messrs. VILMORIN, ANDRIEU ET CIE., the SYNDICAT HORTICOLE DE TOURS, M. BOUCHARD, M. ROBERT, DUPONT FIERDEFRIED, BOCARD, and others.

M. PINGUET-GUINDON was awarded the Grand Prix d'Honneur for a display of Conifers, trained fruit trees, and fruit, chiefly Apples and Pears. This prize was offered by the President of the French Republic. M. BUCHERON and M. VASSORT also showed fruit. Grapes were shown by M. PAJOTIN and by M. DEHUGNET. Trained fruit trees were staged in the promenade leading to the show by M. PLOQUIN and M. JOHANNEAU.

A banquet was given to the jury on the evening of the first day. Among those present were M. Pinguet-Guindon, President of the Tours Horticultural Society, the Mayor of Tours, the Prefet, the representative of the Minister of Agriculture, Mr. Harman Payne, who was appointed president of the jury; Mr. George Clarke, vice-president of the jury; MM. Calvat, Rivoire, Chantrier, Liger, Charvet, Choulet, and Barbier (of Orleans). There was also an interesting excursion to visit some of the sights of the neighbourhood, and other festivities.

CARDIFF AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 4, 5.—The 22nd annual show held in connection with this society took place on the foregoing dates in the Park Hall, Cardiff. The number of entries was somewhat below the average, although the quality of the flowers was good. The exhibition is not confined to Chrysanthemums, but there were displays of Orchids, Carnations, Begonias, hardy fruits and floral designs.

CHRYSANTHEMUMS.—Mr. GEO. DRAKE, Cardiff, secured the first prize, including a challenge cup, for eight vases of specimen blooms, each vase containing three blooms of one variety. He showed well-developed blooms of Reg. Vallis, Mme. G. Rivol, P. S. Vallis, Mrs. F. W. Vallis, Bessie Godfrey, F. H. Silsbury, and Mme. P. Radell. The MARQUIS DE BUTE (Mr. H. Farmer) was placed 2nd. The 1st prize for 24 blooms of incurved Chrysanthemum in not fewer than 12 varieties was also won by Mr. DRAKE. The MARQUIS DE BUTE was again awarded the 2nd prize, but this nobleman was 1st for 12 blooms of Japanese varieties.

In the amateurs' division Mr. F. E. AIKINS, of Llandaff, exhibited 12 remarkably fine Japanese blooms in six varieties, and for which he secured a 1st prize and a challenge cup. The varieties staged were F. S. Vallis (awarded a prize as being the best bloom in the show), Norman Davis, Bessie Godfrey, Mand Jeffries, Algernon Davis, and Mrs. A. T. Miller. In the same section Mr. A. F. HILL, Cardiff, won the premier place in the class for 24 Japanese blooms, and that for 12 varieties.

Mr. DRAKE showed the best stand of six white Japanese blooms.

The MARQUIS DE BUTE was awarded a Silver Cup for an exhibit of six Japanese and six incurved blooms of distinct varieties. Among the best of the former were Ben Wells and President Viger, while Mrs. F. Judson and Mrs. Wynn were the best of the incurved flowers.

F. PRIMAVESI, Esq. (gr. Mr. Webber), won the 1st prize and a challenge cup for six vases of cut blooms, three blooms of a distinct variety

in each vase, the best being Lady Talbot, Mrs. W. Knox, and F. Vallis.

In the class for a group of single and large-flowering Chrysanthemums occupying a space of 60 square feet, and arranged with foliage plants, Messrs. G. WILLIAMS & SONS, Cardiff, were placed 1st. The same firm was awarded a Certificate of Merit for a new variety of Chrysanthemum named Helena Williams, a yellow sport from Mme. R. Oberthur.

Dr. WALLACE, of Cardiff, who for many years past has made a speciality of single varieties, carried off the leading prizes in the classes for this type of the flower.

ORCHIDS were remarkably well shown. Messrs. JAS. CYPRER & SONS, Cheltenham, showed a fine collection, for which they were awarded a Gold Medal.

J. J. NEALE, Esq., Cardiff, also exhibited a group of Orchids and a collection of insectivorous plants, for which he was awarded a Gold Medal.

Messrs. W. TRESSEDER, P. THOMAS, and W. HEDGE showed bouquets, wreaths, and other floral designs.

FRUIT.—Hardy fruit occupied a prominent place in this exhibition. The 1st prize for a collection of dessert fruits of five distinct kinds was won by Mr. J. H. MULLINS, Preshylyla. A Silver Cup and a 1st prize were awarded to Sir JOHN GUNN for a collection of eight dishes of Apples (four dessert and four culinary varieties), and for four dishes of Pears, two cooking and two dessert varieties. The Grapes staged were generally not of high quality.

Messrs. BASHAM & SONS, Bassaleg, were awarded a Gold Medal for an exceptionally fine non-competitive display of hardy fruit.

CHELTENHAM ROOT, FRUIT AND CHRYSANTHEMUM.

NOVEMBER 4, 5.—The annual show of this society was held in the Winter Garden, Cheltenham, on these dates. The entries were about an average in number, a slight falling off in Chrysanthemums being made up by the increased exhibits in the other flower classes. Mr. H. O. LORD, Charlton Kings, secured the Silver Bowl presented by Mr. Horlick, of Cowley Manor, for an ornamental group, the trophy now becoming his absolute property. Mr. LORD won it in the two previous years successively. The Cup offered by the Mayor and Corporation for six varieties of Japanese Chrysanthemums was won by Mr. G. MAYHO, and Colonel F. PALEY, of Mickleton, carried off the special prize for the best specimen bloom in the show. Mr. LORD won the chief prizes for a miscellaneous group of plants, and for a collection of 36 varieties of Chrysanthemums. Other winners in the Chrysanthemum classes were Mr. GEORGE PATES, Mr. H. ANDREWS, Toddington Grange; Mr. G. W. RESTALL, Mr. H. J. TILLEY, Mr. G. E. COX, and Miss ROBINSON.

Fruit was extensively exhibited. The principal winners in the Apple classes were Mr. W. S. C. COX, ROSS; Mr. C. W. POWELL, Mr. J. BUTT, Mr. G. GILDER, Mr. C. W. TAYLOR, Mrs. ROBINSON, and Major SELWYN PAYNE. The last-mentioned gentleman won the cup offered for the best dish of dessert Apples.

Mr. POWELL, Mr. HUTCH, Mr. NOOREMAN, Mr. C. M. FIELDER, and Major SELWYN PAYNE won the chief prizes for Pears, and those for Grapes went to Mr. HUGH ANDREWS.

LIVERPOOL HORTICULTURAL ASSOCIATION.

NOVEMBER 4, 5, 6.—This society returned to its old quarters, St. George's Hall, for the 29th annual show. The exhibits were slightly fewer in quantity and inferior in quality, although some sections, including the classes for Grapes, Apples, Cyclamen, Begonia, and Salvia were well represented.

Chrysanthemums in pots were, as is usual at this show, a great attraction, especially the trained plants.

Mr. W. WILSON showed the best four large-flowered trained Chrysanthemums, having splendid plants of Mrs. Beckett, Mrs. Dixon, &c. A. A. PATON, Esq. (gr. Mr. J. Pilkington),

won the 1st prize for one specimen of a trained plant.

Mr. T. HITCHMAN and Mr. W. WILSON also secured 1st prizes for trained plants, with single and pompon varieties respectively.

JOHN FINDLAY, Esq. (gr. Mr. E. Wharton), won the 1st prize for six untrained plants.

MISCELLANEOUS PLANTS.—In the class for four stove and greenhouse Ferns, W. TOD, Esq. (gr. Mr. G. Eaton), secured the leading award.

The best exhibit of four plants of Gloire de Lorraine Begonia was shown by N. NOBLETT, Esq. (gr. Mr. R. T. Busby).

Sir W. B. FOXWOOD, Bart. (gr. Mr. P. Jakeman), had the best Orchids, and Dr. J. A. COOK (gr. Mr. G. Osborne) the best Palms and Cycads.

CUT BLOOMS.—In the class for 48 blooms of Chrysanthemums, to include 24 Japanese and 24 incurved varieties, only two competitors staged, and it proved an easy win for last year's champion, Sir W. H. TATE, Bart. (gr. Mr. G. Haigh), with the result that the Cup now becomes this exhibitor's absolute property; 2nd, Sir GILBERT GREENHALL, Bart. (gr. Mr. C. Goves).

Mr. J. YOUNG won the 1st prize for 18 incurved Chrysanthemums, distinct, with blooms of moderate quality; and the best exhibit of 12 incurved blooms, distinct, was shown by THOS. CLARKE, Esq. (gr. Mr. J. Clarke).

R. HOBSON, Esq. (gr. Mr. W. Wainwright), won the premier honour for 18 Japanese blooms, with a fine collection, especially good being Mrs. Barkley, Dorothy Goldsmith, Magnificent, and F. S. Vallis.

The smaller classes were well filled. Mr. P. JAKEMAN was to the fore in the class for six vases of Japanese blooms, distinct, three blooms in each vase, having especially fine flowers of the variety Elsie Fulton. F. BACON, Esq. (gr. Mr. J. Rothwell), won in the class for six vases of single Chrysanthemums, Bronze Pagram being shown exceptionally well.

FRUIT.—An important class was for six dishes of distinct varieties. The Earl of Derby (gr. Mr. F. Hazelton) led with Black Alicante and Muscat of Alexandria Grapes, Melon Royalty, and Apples Cox's Orange Pippin and Mother, and Pear Pittomach Duchess; 2nd, Mrs. BRIGHT (gr. Mr. J. Skitt).

Mr. J. SKITT showed the best two bunches of Black Alicante Grapes; whilst Mr. W. EVANS won in the class for any other black Grape with Gros Colmar.

Other prizewinners in the fruit classes were W. CRUMPHAM, Esq. (gr. Mr. Wilson), Mr. W. MACKERRALL, Mr. E. F. HAZELTON, Mr. J. LEE, and Mr. A. A. EVANS.

Non-competitive exhibits were important, and included Orchids, shown by Messrs. MOORE & CO., Leeds; Begonias, exhibited by Messrs. CLIBRANS, Altrincham; Apples, displayed by Messrs. DICKSONS; Liliums, Lily of the Valley, and Begonias, shown by Messrs. THOS. DAVIES & Co.; Carnations from Mr. W. ROWLANDS; and Orchids from the LIVERPOOL ORCHID CO.

NEWPORT CHRYSANTHEMUM.

NOVEMBER 5.—The annual show was held in the Gymnasium, Newport, Monmouthshire, on this date. The show generally was a success, though several of the Chrysanthemum classes were not filled.

GROUPS OF CHRYSANTHEMUMS.—In the class for a group of Chrysanthemum and ornamental foliage plants, H. OAKLEY, Esq., Chepstow (gr. Mr. W. E. H. Pearce), was the only exhibitor. The group was awarded the 1st prize, including the Mayor's Cup. The exhibit was composed principally of well-grown Chrysanthemums, and it was edged with dwarf plants of single-flowered varieties, intermixed with ornamental-leaved plants.

There were three creditable groups of Chrysanthemums, each arranged in a space of 40 square feet, W. F. DAWSON, Esq. (gr. Mr. R. Long), being placed 1st; 2nd, Mr. T. W. FRANCIS. The 1st prize included the "W. F. Dawson" Challenge Bowl.

Mr. PEARCE had no competitor in the class for a group of miscellaneous decorative plants occupying 30 square feet. He was awarded the 1st prize for a bright, well-arranged exhibit.

The "Lewis Haslam" Bowl, offered for a group of Chrysanthemums occupying 20 square feet, was won by Mr. A. MORGAN.

PLANTS.—G. F. COLBORNE, Esq. (gr. Mr. Harris) was the only exhibitor in the class for three dwarf-trained Chrysanthemum plants, and deservedly secured the 1st prize.

Mrs. WILLIAMS, Bryn Glas, Newport (gr. Mr. Duff), showed the best three plants of bush form, having Vivand Morel, Hon. Mrs. Ackland, and Nellie Pockett. Mr. HARRIS won the 2nd prize. Mr. DUFF was also 1st for three bush plants of single varieties.

CUT BLOOMS.—Mr. DUFF had no opponent in the class for 24 Japanese blooms, but he staged a splendid set of large, highly-coloured blooms, and was worthily awarded the 1st prize.

Mr. DUFF was the only exhibitor in the class for 12 Japanese blooms, distinct, and here again he staged good blooms of leading varieties. He also staged the best 12 blooms of Japanese varieties; 2nd, W. A. TODD, Esq., Förtshhead (gr. Mr. Sutton).

AMATEUR CLASSES.—Mr. W. H. HOLLINGDALE won the "Jas. Clements" Challenge Cup for 12 vases of Japanese Chrysanthemums, but with fewer than six varieties, and having twice previously won the trophy, it now becomes his absolute property. 2nd, Mr. W. CONYERS KERRY. There were two other exhibitors in this class.

BLOOMS SHOWN IN VASES.—In the class for eight vases of Japanese blooms, distinct, Mr. G. W. DRAKE, Cardiff, won the 1st prize with large, well-coloured, solid blooms of J. H. Silsbury, President Viger, F. S. Vallis, Mme. Paolo Radaelli, &c. Mr. DUFF was a close 2nd.

Six exhibitors entered in the class for six vases of single varieties. Mr. R. V. WOOD won the chief honours, with beautiful vases of Eureka, Grandee, Metta, Edith Pagram, Bronze E. Pagram, and Marchioness of Cholmondeley; 2nd, Mrs. T. W. FRANCIS.

Mr. W. H. HOLLINGDALE was 1st for three vases of Japanese blooms, distinct, with good blooms of Mrs. Percy Cleave, W. R. Church, and Duchess of Sutherland; 2nd, Mr. J. MATTHEWS.

FRUIT.—The best two bunches of Grapes were shown by Mr. LONG, the variety being Muscat d'Alexandria; 2nd, Mr. J. PERKINS, with finely-coloured bunches of Black Alicante.

Mr. DUFF staged the best six dishes of Apples, T. Wilson, Esq. (gr. Mr. Hobbs), and E. PHILLIPS, Esq. (gr. Mr. Watts), were other prizetakers in the fruit classes.

BURY ST. EDMUNDS CHRYSANTHEMUM.

NOVEMBER 5, 6.—This show was held at the Corn Exchange, Bury St. Edmunds, on these days, during fine weather, and was well attended. The exhibits, taken generally, were quite up to the standard of other years.

In the class for 36 cut blooms, in as many varieties, there was only one exhibitor, C. MEZER, Esq., Shortgrove, Newport, Essex (gr. Mr. E. Guile), who showed some excellent flowers, including the best Japanese bloom in the show—a handsome example of Mrs. A. T. Miller. The same gentleman also had no competitor in the class for 12 cut blooms of incurved varieties, in the class for 24 Japanese blooms, in as many varieties, there was stronger competition, the prizes being awarded in the following order—1st, Lord HOWARD DE WALDEN, Audley End, Suffolk (gr. Mr. J. Vert); 2nd, Trustees of Late Sir JAS. MILLER, Newmarket (gr. Mr. J. Heath); 3rd, Mr. G. W. AGNEW, M.P., Rougham Hall, Bury St. Edmunds (gr. Mr. W. Noble). In the class for 12 Japanese blooms, in 12 varieties, the 1st prize was won by Lord HOWARD DE WALDEN; 2nd, Mr. C. MEZER. The Trustees of the late Sir JAS. MILLER showed the best exhibit of six Japanese blooms, in one variety; whilst Mr. C. MEZER won in the class for six cut blooms of an incurved variety. There were four entries for a group of Chrysanthemums, 7 feet in diameter. Mr. AGNEW was placed 1st. Mr. AGNEW also won in the classes for decorative and single varieties, and he had the best vase of 12 blooms.

The same gentleman also took the premier honours for a collection of fruit, and for two bunches of white Grapes. The 1st prize for two bunches of black Grapes went to Hon. W. LOWTHER, Campsea Ash, Wickham Market (gr. Mr. A. Andrews).

Mr. A. B. H. GOLDSCHMIDT, Cavenham Hall, Mildenhall (gr. Mr. Hatch), gained the 1st prize for a collection of 12 kinds of vegetables.

ECCLES AND PENDLETON CHRYSANTHEMUM.

NOVEMBER 6, 7.—This society is to be congratulated on a distinct improvement seen in its exhibition. This was especially noticeable in the plant classes, which this year proved a record as regards quality. Cut blooms were shown in considerable quantity, and were of good quality in their several sections.

PLANTS.—Lady ANNETTE DE TRAFFORD (gr. Mr. J. Ashley) won the 1st prize in a class for a group of plants arranged for effect. This exhibitor showed blooms of moderate quality, and their arrangement was rather flat. The Misses HEYWOOD (gr. Mr. J. Beswick) were placed 2nd for an exhibit that embraced many varieties of single Chrysanthemums.

In a class for six plants of three incurved and three Japanese Chrysanthemums of distinct varieties, JAMES BROWN, Esq. (gr. Mr. J. W. Smith), was distinctly 1st with very fine plants, notably Chettoni, Vivand Morel, and J. BRYCE; 2nd, Mr. J. Ashley.

Mr. SMITH also showed the best three plants of single Chrysanthemums, the varieties Emily Clibran and Emily Hills being laden with flowers; and in the class for three plants not disbudded the same exhibitor again won the 1st prize, having extra fine examples of Source d'Or and Ladysmuth.

In the class for six dinner table plants Sir W. H. TAYE, Bart., Woolton (gr. Mr. G. Haigh), added to his Liverpool success by winning outright the Silver Challenge Cup presented by the late Mr. H. Gosage; Esq.; the same exhibitor won the 1st prize in the classes for 12 incurved and 12 Japanese blooms in not fewer than eight varieties; also for six Japanese, six incurved, six Anemone, six reflexed, 12 incurved, 12 Japanese, six incurved, and six Japanese Chrysanthemums. Other prominent winners in these classes were T. HENSHAW, Esq. (gr. Mr. J. George), Miss LIGHTBROWN (gr. Mr. J. Roberts), S. F. ARMSTRONG, Esq. (gr. Mr. C. Weaver), and Mr. J. BESWICK.

W. SCOTT FORBES, Esq. (gr. Mr. W. Holmes), was to the fore in the class for 18 large-flowered Chrysanthemums in six varieties shown in vases; also for 18 sprays in six vases and for six incurved and six Japanese Chrysanthemums of distinct varieties.

Exhibits by amateurs were well staged. Mr. J. H. COUNSEL secured the silver Challenge Cup in the class for 18 blooms. Mr. W. W. WOLLANS won the first honours in four classes with creditable blooms, and Mr. J. B. WROE in two classes. In a class for amateurs not employing a gardener Mr. F. B. WROE won a Silver Challenge Cup and one other 1st prize.

BIRMINGHAM CHRYSANTHEMUM, FRUIT, AND FLORICULTURAL.

NOVEMBER 10, 11, 12.—On the first day of the forty-eighth annual exhibition of this society, held in the Bingley Hall, the weather was cold, but fine.

In point of quality and quantity, Chrysanthemums were below those exhibited a year ago. There was a great falling off in the number of entries in the competitive classes, but honorary exhibitors were more numerous.

Apples were shown in splendid condition, and although vegetables were not so numerous as at some previous exhibitions of this society, the quality not only in the collections, but in the single-dish classes, was superb. It was disappointing to find one competitor only in the principal class for a group of Chrysanthemums, although last year three exhibits were staged. Another discouraging feature was noted in the six classes provided for specimen Chrysanthemum plants. For several years past the number of prizes offered has been in excess of the number of entries. In the classes referred to £15 10s. were offered in 18 prizes, for which 15 exhibits only were staged. There was also a decrease in the number of cut blooms introduced, about three years ago.

An imposing exhibit of shapely, well-coloured Apples was sent by the Agent-General for British Columbia.

GROUPS OF CHRYSANTHEMUM PLANTS.

For the first time, these classes were judged by points. The space allotted in the principal

group was 20 feet by 12 feet. Ferns and foliage plants were admissible. The 1st prize, which included the "William Butler Memorial" Silver Cup, was awarded to the only competitor, J. A. KENRICK, Esq., Berron Court, Edgbaston (gr. Mr. A. Cryer), who has been a regular exhibitor in this class for a number of years and his first success was well deserved. The flowers, mostly of the large Japanese varieties, were displayed in a tall central pyramid and three small mounds or cones, relieved with Palms, Bamboos and Codiums (Crotons).

In a similar but smaller class there were three exhibitors, the same number as competed twelve months ago. The 1st prize was well won by T. W. PIGGOTT, Esq., Park Hill, Moseley (gr. Mr. R. Bullock), whose group contained some very creditable blooms. 2nd, F. MAXLEY, Esq., Holly Lawn, Beech Lane, Birmingham (gr. Mr. A. J. Davis).

Another class was provided for a group of decorative Chrysanthemums, in which quality of bloom, variety and general effect were the essential points. Thinning was allowed, but not disbudding to single flowers. The 1st prize was won by Mr. C. H. HERBERT, Hazlewood Road, Acocks Green, for a group in which single-flowered varieties mingled with the small delicately-coloured Japanese varieties with pleasing effect. 2nd, Messrs. JAMES SIMPSON & SONS, Harborne.

SPECIMEN PLANTS.

These were shown in a very much better condition than was the case a year ago, but there was no increase in the number of competitors.

J. A. KENRICK, Esq., Berron Court, Edgbaston (gr. Mr. A. Cryer), took the lead in classes provided for (1) six Japanese varieties, dissimilar; (2) three Japanese varieties, dissimilar; and (3) one large flowering variety (Japanese excluded). E. MARTINEAU, Esq., West Hill, Edgbaston (gr. Mr. O. Brasier), was 2nd in each instance.

In a class provided for six large flowering varieties (Japanese excluded) and in another for three single-flowered varieties, the order above was reversed, E. MARTINEAU, Esq. (gr. Mr. O. Brasier), being 1st, and J. A. KENRICK, Esq. (gr. Mr. A. Cryer), 2nd.

The best single plant of any Japanese variety was shown by Col. E. PALEY, Mickleton Manor (gr. Mr. C. Rowland), the plant being a splendid example of "The Princess" variety.

CUT BLOOMS.

The principal class was one for a group of cut blooms arranged on a floor space of 30 feet by 8 feet. Cut foliage and foliage plants were permitted. No restriction was placed upon exhibitors as to the number or kind of vases employed. The 1st prize of £15 and a Silver Challenge Shield were withheld, as the judges did not consider either of the two exhibits sufficiently meritorious for this award. The 2nd prize of £10 was awarded to Mr. H. WOOLMAN, Sandhill Nursery, Shirley. The arrangement of the group was weak and lacked finish, as the legs of the floral receptacles were exposed to view, and a green canvas screen at the back detracted from the general effectiveness. Mr. G. HANCOX, who was placed 3rd, had a well-arranged group, but his flowers were of very poor quality.

BLOOMS SHOWN IN VASES.

The leading class was for 18 Japanese blooms in six varieties. 1st, Sir ALBERT MUNTZ, M.P., Rugby (gr. Mr. H. Blakeway), whose best flowers were Mrs. A. T. Miller, Bessie Godfrey, Mrs. J. Duan, and Mme. P. Radaelli. 2nd, Mr. W. IGGULDEN, Frome, with beautiful flowers of Mrs. W. Knox and Bessie Godfrey.

The last-named exhibitor was placed 1st in a class for 12 Japanese varieties, three blooms of each. He showed large flowers of Mme. P. Radaelli, J. H. Silsbury, F. S. Vallis, and Mme. G. Rivet. 2nd, Sir ALBERT MUNTZ, M.P. (gr. Mr. H. Blakeway).

In a new class for 12 Japanese varieties, one bloom of each arranged on a table space of 6 feet by 3 feet, the Rt. Hon. JOSEPH CHAMBERLAIN, M.P., Highbury, Birmingham (gr. Mr. John Deacon), won the 1st position with well-finished flowers; 2nd, F. E. MUNTZ, Esq., Umberslade, Birmingham (gr. Mr. H. S. Foster).

Mr. W. IGGULDEN, Frome, had the best vase of any pink-coloured variety in Mme. P. Radaelli, the best crimson-coloured variety in

Magnificent, and the yellow variety in F. S. Vallis.

The best vase of any white variety was exhibited by the Rt. Hon. JOSEPH CHAMBERLAIN, M.P. (gr. Mr. John Deacon), the variety being Mrs. A. T. Miller.

The best four varieties of single Chrysanthemums, eight sprays in a vase, were from the gardens of A. H. HICKMAN, Esq., Cookey, and they were much admired; 2nd, A. HUGHES, Esq., Knowle (gr. Mr. T. Parry).

The last-named exhibitor won the 1st award in a class for six varieties of decorative Chrysanthemums.

Several classes were reserved for local growers, in which the Rt. Hon. JOSEPH CHAMBERLAIN, M.P. (gr. Mr. J. Deacon); T. W. PIGGOTT, Esq., Moseley (gr. Mr. R. Bullock); and R. PEYTON, Esq., Edgbaston (gr. Mr. A. W. Younge), were the most successful.

In the decorative classes were seen 20 decorated tables, each 8 feet by 4 feet. The judges considered that arranged by E. A. PALMER, Esq., Handsworth (gr. Mr. G. Winter), the best; 2nd, Mrs. E. WINCHESTER, Northfield.

MISCELLANEOUS PLANTS AND CUT FLOWERS.

The Rt. Hon. JOSEPH CHAMBERLAIN, M.P. (gr. Mr. J. Deacon) won the 1st prizes in classes for (1) six Cyclamen and (2) 12 Cyclamen. (1) A. KENRICK, Esq. (gr. Mr. A. Coyer), who was awarded 2nd prizes in the above classes, took the lead in others provided for (1) six single-flowered Primulas and (2) one tree Fern. Mr. S. BOURNIE, Kewledge, Farnham, showed the best Carnation blooms, occupying a table space of 10 feet by 4 feet; 2nd, Messrs. JAMES RANDALL & SONS, Shirley, Birmingham.

FRUIT.

Competition in the Grape and Pear classes was not so keen as on some previous occasions, but in the large class for a collection of British-grown hardy fruits there were three entries.

The 1st prize for a collection of British-grown fruit occupying a table space of 40 square feet was won by the Earl of HARRINGTON, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre), who had Muscat of Alexandria, Madresfield Court, Black Alicante, and Gros Colmar grapes well coloured; Cox's Orange Pippin, Gascoyne's Scarlet, Peasegood's Noneseuch, Emperor Alexander, and Ribston Pippin Apples; Doynend du Comice and Pitmasdon Duchess Pears; and a dish of the uncommon Sam Joyce Fig. 2nd, Lord BILDULPH, Ledbury (gr. Mr. H. Cotton).

Another important class was one for a collection of British-grown hardy fruits arranged on a table measuring 12 feet by 8 feet. Last year's prizewinner, Mr. C. W. POWELL, of Warcham, Hereford, succeeded in retaining the Silver Challenge Cup offered in addition to £5 as the 1st prize. Large, well-coloured Apples were shown in great variety; Pears, Medlars and Nuts were included in this very attractive exhibit. 2nd, Messrs. PEWTRISS BROS., Hereford.

GRAPES.—In the class for six bunches, in not fewer than three varieties, the Earl of HARRINGTON, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre), led with even bunches, four of Muscat of Alexandria, one of Black Alicante, and one of Gros Malice; 2nd, Lord BILDULPH, Ledbury (gr. Mr. H. Cotton).

The best three bunches of black Grapes were Gros Colmar, shown by Lord BAGOT, Rugeley (gr. Mr. E. Benneman); the Earl of HARRINGTON (gr. Mr. J. H. Goodacre) had the best three bunches of Muscat of Alexandria Grapes.

Mrs. F. NEED, Great Malvern (gr. Mr. F. Jones), led for two bunches of white Grapes (Muscats excluded).

G. BLENLEN, Esq., J.P., King's Heath (gr. Mr. A. Ganderton), and C. WINN, Esq., Selly Hill (gr. Mr. T. Sheppard), were successful in the local Grape classes.

APPLES.—Mr. C. W. POWELL, Hereford, won 1st prizes in the classes for (1) six dishes of culinary Apples, and (2) six dishes of dessert Apples. Lord BILDULPH (gr. Mr. H. Cotton) was placed 2nd in each class.

VEGETABLES.

In the class for Messrs. Sutton & Sons' prizes for nine distinct kinds, there were four competitors. The produce was very meritorious, especially that from the Hon. VICKY GIBBS,

Eistree (gr. Mr. E. Beckett), who had Onion Ailsa Craig, Cauliflower Autumn Giant, Leek Prize-taker, Asc. 2nd, C. W. ALSTON, Esq., Elmdon Hall, Birmingham (gr. Mr. C. Haynes); Mr. Robert Sydenham's prizes were offered for nine distinct kinds. Mr. W. FOLKES, Amphill, Bedfordshire, was successful in this class with splendid produce. 2nd, J. KERR, Esq., Loudwater (gr. Mr. T. Avery).

The prizes offered in Mr. Sydenham's local classes were won by Mr. E. DEARIN, Hay Mills, Birmingham, and J. A. KENRICK, Esq., Edgbaston (gr. Mr. A. Coyer).

Messrs. Webb & Sons offered prizes for eight distinct kinds. There were eight exhibitors, the 1st prize being taken by the Rt. Hon. EARL SPENCER, Northampton (gr. Mr. S. Cole); 2nd, Rt. Hon. J. F. HALSEY, Hemel Hempstead (gr. Mr. H. Folkes).

CERTIFICATES OF MERIT were awarded to each of the under-mentioned Chrysanthemums.—Elena Williams (Japanese), exhibited by Messrs. WILLIAMS & SONS, Cardiff; Reginald Godfrey (single), exhibited by Mr. W. J. GODFREY, Exmouth; J. W. Molyneux (Japanese), exhibited by Mr. W. J. GODFREY; Lady Chino (single), exhibited by Mr. W. J. GODFREY; and Mrs. W. Eggleton (Japanese), exhibited by Mr. W. J. GULDEN, Frome.

NON-COMPETITIVE EXHIBITS.

Gold Medals to the AGENT-GENERAL FOR BRITISH COLUMBIA, for Apples; Mr. W. J. GODFREY, Exmouth, for Chrysanthemums and Zonal Pelargoniums; Messrs. GUNN & SONS, Olton, for floral designs; Messrs. GUNN & SONS, for rock plants; KING'S ACRE NURSERIES, Hereford, for vegetables; Messrs. JOHN WATERER & SONS, Bagshot, for hardy shrubs; Messrs. WEBB & SONS, Stourbridge, for vegetables; Messrs. YATES & SON, Birmingham, for vegetables; and Messrs. RICHARD SMITH & CO., Worcester, for hardy shrubs.

Small Gold Medals to Mr. R. W. GREEN, Wisbech, for Potatoes; and Messrs. HEWITT & CO., Solihull, for hardy shrubs.

Silver-Gilt Medals to Messrs. BAKERS, Wolverhampton, for hardy shrubs; Messrs. LAXTON BROS., Bedford, for fruit; and Messrs. THOMPSON & CO., Birmingham, for Chrysanthemums.

Silver Medals to Messrs. BICK BROS., Olton, for Alpine plants; Mr. E. BERDEN, King's Heath, for Apples; Messrs. PEWTRISS BROS., Hereford, for fruit; Messrs. JAS. RANDALL & SONS, Shirley, for Peas and Chrysanthemums; Messrs. W. H. SIMPSON & SONS, Birmingham, for vegetables; and Mrs. THOMPSON, Handsworth, for Cacti.

Bronze Medals to Mr. F. A. GODFREY, Stourbridge, for hardy shrubs; Mr. W. J. ROBERTSON, Great Malvern, for hardy shrubs; Mr. VINCENT STONE, Taunton, for Zonal Pelargoniums; Messrs. JAS. SIMPSON & SONS, Harborne, for hardy shrubs; and Messrs. YOUNG & CO., Cheltenham, for Carnations.

Exhibits were also shown by Mr. N. N. ELLISON, West Fromwich, who had one of Pears; and H. A. WILSON, Esq., Edgbaston (gr. Mr. A. D. Christie), who exhibited Cactaceous plants.

SOUTHEND-ON-SEA CHRYSANTHEMUM.

NOVEMBER 3. 4.—This society held its annual exhibition of Chrysanthemums, fruits and vegetables in the Winter Garden of the Palace Hotel on the above-mentioned dates, and it was a complete success in every way. In the open classes for cut blooms J. TAMBOR, Esq., The Lawn, Rochford (gr. Mr. J. Burles), was the most successful exhibitor, taking five 1st prizes, in addition to winning the Silver Challenge Cup offered for a circular group of Chrysanthemums in pots, while Mr. H. E. CAMPKIN, Boscombe Road, Southend-on-Sea, was by far the most successful exhibitor in the amateur (open) classes, securing eight 1st prizes and a silver medal. Other successful exhibitors in the open cut bloom classes were Messrs. J. B. STEER, R. MAY, Stroud, Rochford; J. WHIFFIN, Queen's Hotel, Westcliff-on-Sea; F. W. BELCHER; G. W. HETON-ARMSTRONG; and Mrs. MILLER, Leigh House, Leigh-on-Sea (gr. Mr. Epps).

In the principal class for cut blooms, 24 Japanese varieties, Mr. J. BURLES' excellent exhibit, which was a good first, winning the sil-

ver medal and a money prize, consisted of, among others, grand blooms of Reginald Vallis, Walter Jinks (a fine rose-pink flower), F. S. Vallis, Jessie Godfrey, F. Penford, Mrs. A. T. Miller, Leigh Park Wonder (orange-yellow, shaded bronze), Duchess of Sutherland, and Mrs. A. H. Lee. Mr. EPPS was a good second in this class.

In the class for a group of miscellaneous plants arranged for effect Mr. A. DAVIS, Elm Road Nursery, Leigh-on-Sea, was the 1st prizewinner, but he was followed closely by the Rev. R. S. KING, Leigh-on-Sea, and Mr. A. EPPS.

In the fruit classes Apples and Pears were well shown by Messrs. H. B. HERBERT, G. MURRELL, A. GREEK, W. A. VOSS, Keyleigh, and the Rev. T. O. KEAY, Pritwell.

Vegetables were shown extensively, but the best collection was staged by Mr. MEEKINGS, of Great Waleing.

BROMLEY AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 4, 5.—The 27th annual exhibition of this Society was held in the Drill Hall, Bromley, Kent, on the above dates. There was an increase in the number of exhibitors and of entries in most of the classes, and the quality of the exhibits throughout the show was good. H. F. TIARKS, Esq., of Foxbury, Chislehurst (gr. Mr. John Lye), won for the first time the Challenge Cup offered for 48 blooms of distinct varieties. J. SMITH, Esq., Warren Wood, Hayes (gr. Mr. Govier), secured the Mayor's Cup in the large vase class. Mr. Govier is one of the younger members of the Society.

The Certificate of the National Chrysanthemum Society was awarded to W. G. DEVON-ASTLE, Esq., Hamilton Lodge, Bickley (gr. Mr. E. Legg), for the premier Japanese bloom in the show—an enormous specimen of the F. S. Vallis variety, perfect in form and in colour.

The fruit classes were this year a feature of the show. A prominent winner in these classes was the late MARTIN SMITH, Esq., Warren House, Hayes (gr. Mr. Blick), who also, as was expected, secured the 1st prize in the newly-formed class for perpetual-flowering Carnations.

COVENTRY AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 5.—The fourteenth annual exhibition of this society was held on the above date in the spacious Coventry Drill Hall. The Mayor (Alderman W. Lee) presided at the opening ceremony. Regret was expressed that the entries did not include this year any from George SINGER, Esq., of Condon Hall, who has been a prominent and successful exhibitor at previous shows. The quality of the exhibits on this occasion was well up to that of previous years.

The exhibits of groups of plants were of much merit, and were especially well staged, the best being shown by W. FINCH, Esq., Coventry, and H. STURMEY, Esq., Quarry Close (gr. Mr. H. Hollicke), who took the 1st and 2nd prizes respectively. J. RAVEN, Esq., won the 1st prize in the class for four distinct varieties of single Chrysanthemums. C. V. PUGH, Esq., Radford (gr. Mr. J. Palmer), secured the 2nd prize in this class. J. PALMER, Esq., Berkswell (gr. Mr. W. Parker), showed the best Primulas. In the class for a group of miscellaneous plants—excluding Chrysanthemums—the prizes were awarded in the following order: 1st, W. FINCH, Esq.; 2nd, HUGH ROUTHAM, Esq.; and 3rd, C. V. PUGH, Esq.; whilst for a group of Gloire de Lorraine Begonias, F. TWIST, Esq. (gr. Mr. W. Hicks), took the premier award.

In the classes devoted to large Japanese blooms Colonel BEECH, Brandon Hall (gr. Mr. E. J. Brooks), scored three successes, his nearest competitors being Mrs. MELLOWEY, of Copsewood Grange, and Mr. W. FINCH.

TRADE NOTICE.

MR. G. H. COLE has taken over the business of Florist and Seedman at Elm Close, Radford, Leicestershire, which has been carried on for the past 13 years by Mr. DEAN, Mr. COLE is the son of the late Mr. COLE, of Wiltington Nurseries, Manchester.

GARDENING APPOINTMENTS.

Mr. G. PROBERT, for the past 5 years Gardener to Mrs. Middleton...

Mr. W. BOND, for the past 24 years Foreman at Chilton Lodge Gardens...

Mr. H. F. BAZON, for the past 4 years Gardener to the Rev. Richard Burdett...

The undermentioned appointments have been made by the Parks Department...

Mr. WILLIAM KENT, late Gardener to A. C. Drummond, Esq., Cadland...

Mr. J. COOK, for the past 3 years Gardener to W. L. LEVITT, Esq., at Otleton Hall...

Mr. G. W. TURNER, for nearly 6 years Gardener to F. Lubbock, Esq., Emmetts...

Mr. H. BRAY, for the past 7 years at Draycot Gardens, Chippingham...

COVENT GARDEN FLOWER MARKET.
 Since writing my last notes most flowers in the gardens have been blackened by frost, which has ranged from 14 to 17 degrees. To-day we have milder weather again, but the damage has been done. The frost, however, will not make a great difference in prices for a few days, as growers cut heavily in anticipation of frost and saved a large supply. The frost has also caused the leaves to drop from almost all hardy deciduous foliage shrubs. This will be an advantage to those growers who have supplies of Codium (Crotus) leaves, Aparagus, Smilax and other foliage grown under glass.

POT PLANTS.
 On Tuesday several plants showed damage from frost, especially bolanums. I noted some consignments feeling the effects of the cold, whilst others close by, which had been grown under more exposed conditions, did not appear to be injured. Many plants will not for some time be coming into flower, and cold unless they are put into warmth. I noted a Fern which had been taken into a warm room had all its fronds discoloured, while the same variety remaining in a cooler position of the building showed no sign of having suffered.

Of Chrysanthemums the later varieties are now arriving heavy and the pink variety are both good. Callingtonfordi remains a favourite crimson; Souvenir de Petit Ami a good white, and Mrs Wingfield is one of the best pink varieties. Heads are remarkably good; Erica gracilis and the white variety are exceptionally well flowered; plants of these in small pots are very pretty, and sell at good prices. Cyclamen are well-flowered. Begonia Gloire de Lorraine is now seen on several stands. Bouvardias are of moderate quality only. The pink Astilbe (Spiraea) appears to be rather a failure, for the colour is not sufficiently deep, and as a market plant it is hardly so desirable as the best white varieties.

CUT FLOWERS.
 Since the frost there have been larger supplies of Chrysanthemums, but in a few days there may be a falling off in their numbers as with all other flowers, and prices will be very uncertain. Liliums were plentiful during the past week, but the cold will have given them a check, and supplies may be short at the end of this week. Carnations continue to arrive in large quantities and they are of good quality. Roses are not quite so abundant, but supplies from France will make up the shortage. The foreign flower market is opened, but at present there is not a great trade except with those persons who buy in bulk to resell in the ordinary flower market. *A. H. Covent Garden, Wednesday, November 11, 1908.*

Obituary.

MARTIN RIDLEY SMITH.—The news of the death of Mr. Martin R. Smith on the 8th inst., at Warren House, Hayes, Kent, will be received with general regret. Mr. Smith was not only a most liberal patron of horticulture, but practised the art himself with rare skill and success. He made Carnations his special study, and his collection of these plants was amongst the most famous in Europe. He was president of the National Carnation and Picotee Society, and at every exhibition contributed plants and flowers from the Warren House collection. The plants invariably exhibited the most excellent culture, and very rarely indeed were the cut flowers excelled in the competitive classes. But Mr. Smith was not merely a cultivator, he was the greatest raiser of new seedling Carnations in this country, especially varieties of the border and Souvenir de la Malmaison types. In our own pages frequent references have been made to the varieties raised by Mr. Smith, and there are very few gardens in which some of these may not be found. Mr. Smith was among the first sixty horticulturists who were selected by the Royal Horticultural Society in 1897 for receiving the Victoria Medal of Honour.

MRS. H. J. CLAYTON.—I regret to record the death of Mrs. Clayton, wife of Mr. H. J. Clayton, late gardener at Grimston Park from 1872 to 1907. Mrs. Clayton died on the 7th inst. at the age of 72 years. Many an old pupil of Mr. Clayton's, like the writer, will recall the time when she so gently would tie up a wound or visit the sick bed. Mr. Clayton will have the greatest sympathy in his bereavement. *J. Small.*

ANSWERS TO CORRESPONDENTS.

BEGONIA GLOIRE DE LORRAINE: E. P. C. Probably the young plants have been kept on the stage which is more suitable for the mature plants, being at too great a distance from the glass of the roof. If that is the case, and you can arrange a shelf for them nearer to the glass, they will probably regain their vigour by the end of the year, and early in the new year they should be repotted into pots of a larger size. Be careful not to overwater the plants. Remove at once all damaged foliage.

CAULIFLOWER ROOT ROT. W. B. The trouble appears to be the early stages of Root-rot caused by the fungus *Thielavia basicola*. No fungicide has at present been found of any service, but the disease is said to be due to the alkalinity of the soil. It is recommended that no lime be used, but that sulphate of potash or double manure salts be applied—and phosphoric acid in the form of acid phosphate—or dissolved bone, to correct the alkalinity of the soil.

GLADIOLUS Flower. The correct pronunciation of Gladiolus, as given on p. 309, is Glad-i-olus, with the accent on the first syllable. This is indicated by the position of

THE LATE MARTIN R. SMITH.

the accent. The *o* does not mean that the accent is on this vowel, but that it is to be pronounced as nearly as possible like the *o* in the word *over*, and not in any of the other and various ways in which this vowel is pronounced in English. Throughout the glossary the accent marks the emphatic syllable, whilst the signs over the vowels merely indicate how they shall be pronounced, according to the key given at the top of the first column.

JUDGING. *University of Minnesota.* What you require is *Rules for Judging*, issued by the Royal Horticultural Society. Copies may be obtained from our publishing department, price 1s. 6d., postage extra.

PROPAGATION OF VINES: *Jno. Ross.* This matter will be the subject of a note in the next issue in "Fruits Under Glass" column.

SPRINGING LEAVES DISEASED: *C. E. M.* This injury has been very prevalent during the last few years in this country. It has been investigated by Prof. Beijerinck who discovered a bacterium as the responsible cause. It is named by him *Pseudo-monas Syringae*. We advise you to cut away all diseased tips and leaves and burn them. Lilacs growing in dry situations are very rarely subject to this malady. Spraying is of no use.

NAMES OF FLOWERS, FRUITS AND PLANTS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed in any organic tie-up for the weekly issue, or to encroach upon the time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time: they should be very careful to pack and label them properly, to give every information as to the country the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in one issue are requested to be so good as to consult the following numbers.*

FRUITS: W. C. Son & Co. The Apple much resembles Hall Door.—R. A. H. 1, Byford Wonder; 2, Melon Apple.—A. E. Critchley, 1, Coloned Vaughan; 2, Gilliflower (not Cornish).—J. Hillier, 1, Dumelow's Seeding; 2, Golden Russet; 3, King of Tomkins County; 4, Old Hawthornden; 5, Ribston Pearmain; 6, Byford Wonder; 7, Lane's Prince Albert; 8, New Hawthornden; 9, Court-pendù-pat; 10, not recognised; 11, Fearn's Pippin; 12, resembles a highly-coloured fruit of 2, Bramley's Seeding.—J. W. 1, Marie Louise; 2, Bergamotte d'Automne; 3, Gascoyne's Scarlet Seeding; 4, Golden Spire; 5, Ribston Pippin; 6, Cox's Orange Pippin.—E. Ross Bank, (Not recognised.) There is little doubt but this is a local variety.—Battson, 1, Dutch Codlin; 2, Dumelow's Seeding; 3, Hanwell Souring; 4, Small's Admirable; 5, Court-pendù-pat; 6, Old Nonpareil.—E. G. C. The fruits received were too much shrivelled to be named with any degree of accuracy.—H. T. 1, Striped Reineette; 2, Allington Pippin; 3, Durondeau; 4, Beurree de Jonghe; 5, Fearn's Pippin.—A. B. C., September Beauty.—F. A. Edmore, Fear Catillac. Some of the numbers were detached, the small red Apple is Duchess's Favourite, and the brown russet marked fruit Allen's Everlasting; 2, Wiltshire Defiance; 3, Lady Henniker; 4, Lane's Prince Albert; 5, Broad-Eyed Pippin.

PLANTS: C. & Sons. *Cupressus sempervirens.*—Vitis, 1, Aster levis "Robert Parker"; 2, A. cordifolius var.; 3, A. novi Belgii (seedling variety); 4, A. cordifolius; 5, A. novae angliae palchellus; 6, Helenium autumnale.—A. E. C. The plant is a seedling of *Verbasum nigricum*, but as it is not typical it may have been hybridised.—J. U. Gerbera Jamesoni (Barbottan Daisy). Hardy in sheltered situations, but does best in a cold greenhouse. Apple next week.—Hortus, 1, Selaginella umbrosa; 2, Oncidium candidum; 3, Pteris longifolia; 4, Adiantum hispidulum; 5, Brassia brachiatata.—W. G. The Orchid is *Maxillaria picta*; the shrub *Gauntheria Shallon*.—T. B. 1, *Ceanothus rigidus*; 2, *Cistus incanus*; 3, probably *Indigofera* (send when in flower); 4, *Myrtus communis* var. *microphyllus*; 5, send better specimen with flowers or fruit; 6, *Echeveria*, one of the garden forms of *E. retusa*.

WIREWORMS: W. S. If you are quite sure the trouble is from wireworms, you might treat the ground used for vegetables with gas lime at the rate of 1 ton per acre, but it must be turned over afterwards, and left for several weeks before any crop is planted upon it. You had better not apply the gas lime amongst the fruit trees or upon the grass.

ammonia is somewhat serious. The expansion coils are therefore often placed in what is called an expansion tank, a tank which is filled with a solution of what is called brine. Brine may be made from common salt, but more frequently a solution of calcium chloride is used. It has the property of not freezing at a lower temperature than water. Where brine is used, a grid of pipes, similar to those employed for the gas, is fixed in the chamber, and the brine is kept circulating through the expansion tank and through the grid of pipes by means of a pump. There is a third method in which the cooling effect in the expansion coils may be made use of to produce the low temperatures required in the cold chambers, and this is the one most commonly employed in modern cold stores. A portion of the air of the cold chamber is being continually withdrawn and passed over a cooling appliance, and returned to the store to mix with the air there, just as was explained in connection with compressed air. The air may be cooled by passing over a grid of brine pipes, cooled by the brine circulating in them and through the expansion tank, or it may be cooled by passing directly over the expansion coils themselves, or again it may be cooled and dried at the same time by passing over metal plates or discs or drums that are wetted with brine that has been reduced to a low temperature by passage through the expansion tanks. Cooling and drying the air is the more modern arrangement advantageous to avoid moisture, because it is as well to cool the chamber where the produce is being stored. *Sydney F. Walker.*

(To be continued.)

FORESTRY.

FAILURES IN PLANTING.

UNDER the above heading, in the issue for July 13, p. 378, a writer records some alarming failures in forest planting. I planted this spring about 3,500 trees, mainly of Spruce, English and Japanese Larch, Scotch Fir, and a few Oaks and Austrian Pines; the plants of Austrian Pine were 4 feet in height. Last week we pulled up the dead ones, numbering 160, but not one of the Austrian Pines had died. Perhaps the plants that succumbed had fewer roots than others. Why so many should perish I cannot explain. However, the result is different to your correspondent's experience, who stated that out of some thousands only five per cent. lived.

Perhaps I took more pains in the planting than foresters do. In February, as soon as it was decided to plant, I commenced to dig the holes 12 inches square and the depth of the spade, and the bottom of the hole was loosened with a fork. Most of the ground has a rapid fall, the soil at the upper portion was clayey sand, but the lower part was sticky clay; so much so that I had a few loads of sandy soil carted to cover the roots.

In the process of planting the best of the soil was chopped and put round the roots. We commenced planting on March 17 on the higher ground, but had to wait some days for the water to drain away from the holes in the lower part of the ground, the plants in the meantime being covered with tarpaulin. I could not give any idea of the expense beyond the price of the trees, which were all English grown, for the men were frequently pelted with rain and had to take shelter under tarred sheets. I think some of the failures that occur are due to the plants, after being lifted, lying with their roots uncovered in the nurseries for perhaps a day or two.

Our planting was done to hide an unsightly object in the centre of the enclosure, and the plants were arranged in irregular groups to be further regulated as they grew. H. P. R., *Cærdon Hall Gardens, Preston, November 8.*

NOTES FROM A "FRENCH" GARDEN.

THE Ox-Heart Cabbage should now be planted in previously dug ground which has been liberally manured. They should be planted as deeply as possible in rows of 18 inches apart, and the drills being 3 inches deep.

The Cos Lettuces under the cloches are doing well, and will be transplanted shortly into a fresh bed, putting 14 plants under each cloche, but before removing the plants they will be thoroughly examined and cleansed of decayed seed leaves. Passion Lettuces, if grown under cloches, may now be given a little ventilation, but if grown under lights ventilation must be afforded more freely, as in this case they are more likely to damp off. Should the weather become very cold, the mats must be spread at night, but this must be done with discretion, as

guides. Hot manure is then formed into a ridge (dry manure being already on the ground), and the proportion of each will be according to the plants it is intended to grow. The two manures should be mixed well together. If long strawy stuff is used with short manure, the mixing must be done carefully, as the bed sinks deeper where strawy manure is prevalent and the heat therefore is uneven.

When making a first bed, allow for the treading on the outside path. Plenty of strawy manure should be used for this, and the treading down should be done as the work proceeds. The bed must be kept level and beaten with the back of the fork. It is usual to finish the bed by using strawy manure as advised for the outside path. When completed, it must be trodden down as firmly as possible, and, if necessary, levelled. In measuring the width of a bed, we

FIG. 151.—WINTER-FLOWERING BEGONIA "CLIBRAN'S PINK," WHICH GAINED AN AWARD OF MERIT FROM THE R.H.S. FLORAL COMMITTEE ON THE 10TH INST., WHEN EXHIBITED BY MESSRS. W. CLIBRAN AND SON.

(See ante p. 347.)

dampness is as injurious to the Lettuces as frost.

On the ground where we intend to make the hot-beds next January, the decayed manure which will form the soil is set in ridges 3 feet high and 3 feet wide, with spaces of 10 feet between the ridges. In the beginning of December dry manure will be brought to this open ground and, if the weather is very cold or wet, it can then be spread on the ground and ridges of soil. At the same period the frames will be set on the ground and lights placed in heaps of 15 at each end of the beds, one heap for two beds. This is done in order to save time when starting the hot-beds.

To form a manure bed, the place should first be marked by placing a peg at each corner and sticks at intervals of two or three yards as

allow 10 inches for the path, and 3 or 4 inches over and above the width of the frame. The reason for this is that when bringing the frames and filling them with soil, that side is entirely wasted owing to the treading. The frames are next brought on the bed, set straight and level, and filled with a layer of manure about 2 or 3 inches deep, afterwards putting in the soil to within 2 inches from the top of the frames. The soil must be levelled with a rake, and the frames covered with lights. This work should be arranged so that the bed is completely finished before the evening, as the weather may not permit of its being continued on the following day, for it must not be attempted in frosty weather; neither should frozen manure nor frozen soil be used. *P. Aquatics, Maryland, Essex, November 6, 1908.*

CHRYSANTHEMUMS IN THE L.C.C. PARKS.

The exhibitions held every year in several of the parks controlled by the London County Council continue to attract a large number of visitors. Londoners appreciate the rich displays of colour, provided at a time when the outdoor attractions in public parks are diminishing. The shows are advertised on all the trams of the Council which lead in the direction of any of them. Finsbury, Victoria, Battersea, Waterlow, and Southwark parks hold the most important exhibitions.

FINSBURY PARK.

The collection in this park is so arranged as to avoid a straight line. A large group occu-

and the show of blooms will continue for two or three weeks longer. The Japanese and single-flowered varieties are those chiefly grown; they are well cultivated, and foliage and blooms of good character were noted, although the flowers are scarcely of exhibition size. We give a list of the more prominent varieties, viz., *Wilhe Bullmore*, a flower of a lake colour, florets straight, white suffused with lake on the reverse side; the incurved Japanese *J. H. Silsbury*; *J. H. Daniel*, a yellow and crimson incurved Japanese; *Mrs. A. T. Miller*, the florets snow-white, partially reflexing and incurving at the tips of the florets; *Henry Perkins*, having a similar form of bloom and of the purest white; *Capt. Percy Scott*, with orange, reddish-brown

tipped with bright lilac; *Mrs. T. W. Pockett*, and others. The recent damp weather has as yet not materially affected the blooms. The tasteful arrangement reflects great credit upon *Mr. J. Rogers*, the superintendent, and his staff. *AL.*

SOUTHWARK PARK.

In spite of evident adverse conditions, the standard here is exceedingly high as regards the quality and quantity of bloom. The size and depth of some of the flowers is surprising considering the neighbourhood in which they are grown. Several novelties were noted, the yellow *George Mile*.

FIG. 152.—ROYAL GARDENS, FROGMORE: SHOWING A HOUSE CONTAINING SOUVENIR DE LA MAISON CARNATIONS.

(See ante p. 389)

[Photographed by special permission.]

pies a space in the centre of the house, and the pathways lead in a sinuous fashion from end to end. Decorative varieties are trained up the sides and the roof. Among the noticeable blooms were the varieties *Norman Davis*, *Lady Byron*, *Mrs. A. T. Miller*, *J. H. Silsbury*, *Henry Perkins*, *Buttercup*, *W. R. Church*, *R. Hooper Pearson*, *Phœbus*, *Nellie Pockett*, *Lord Hopetoun*, and *Mme. P. Radaelli*.

BATTERSEA PARK.

An interesting display of plants in bloom may now be seen in the frame ground at this park,

florets, yellow on the reverse side; the fine white *Florence Molyneux*; *Lady Byron*, a good white Japanese flower; *Miss Alice Byron*, a white incurved Japanese; *Buttercup*; *Mrs. John Shrumpton* having straight, orange-coloured florets of great breadth; *Mrs. Coombes*, a Japanese, with blue-coloured straight florets; *Mrs. Knox*; *Mary Ann Pockett*; *W. Seward*; *Lady Lennard*; *W. R. Church*; *Pantia Ralli*; *Rev. W. Wilks*, having a purplish rose tint and incurved florets; *President Nonin*; *Reine des Roses*, a semi-double flower, the florets reflexing, somewhat showy and attractive; *Fair Rosamond*, a single-flowered variety, white florets

ham, *F. W. Lever* (very good), *Mrs. R. A. Evc*, *Mrs. Norman Davis*, *W. Beadle*, *Violet Carpenter*, *Margaret Codrington*, *A. J. Norris*, *G. F. Evans*, and the single-flowered *Florrie King*. Some very fine blooms of *Jumbo*, *W. Biddle*, *Mrs. F. Judson*, *Miss Nellie Southam*, *Buttercup*, and *W. Duckham* were included among the incurved varieties. Others were *Henry Stowe*, *Miss A. T. Miller*, *Miss Mary Godfrey*, *Mrs. W. Knox*, *Mrs. Walter Jinks*, *Reginald Vallis* and *J. H. Doyle*. The large number of people visiting the show sufficiently proves that the efforts of *Mr. D. Carson*, the superintendent, are much appreciated. *IL.*

THE ROSARY.

NOTES ON THE NEWER VARIETIES.

(Continued from page 324.)

MONS. JOSEPH HILL (H.T., Pernet Ducher, 1904).—A beautiful Rose of somewhat irregular growth. It does not succeed as a standard, but as a dwarf Rose it is fairly vigorous. The plant has dark, glossy foliage, and is with me mildew-proof. The flowers are large and have a full centre; colour, pinkish-flesh, shaded yellow, the outside of the petals being coppery-yellow. They are of perfect form and are beautifully pointed, the buds being very long and oval-shaped. It is a free bloomer, and sweetly scented, and the flowers last a remarkably long time in water.

COUNTESS ANNESLEY (H.T., Alex. Dickson & Sons, 1905).—I do not recommend this Rose, as with me it is a thoroughly bad doer. I am told

mon centre with the outer petals rose, passing to flesh-veined peach. The plants have an erect growth, are vigorous, and branch freely. They seem to be perpetual bloomers and have never suffered from mildew with me during the four years I have had them.

COUNTESS OF GOSFORD (H.T., S. M'Gredy & Son, 1906).—The much coveted N.R.S. gold medal was well earned by this most lovely Rose. It is a distinct flower, yet after the style of Killarney. Its colour is, shall I say, salmon-pink-rose? with the base of the petals suffused with saffron-yellow, the whole being wonderfully bright. It is one of the thin kinds, but the buds are beautifully pointed with a high centre, and the flowers have nice, open guard petals of good depth and substance, not, perhaps, full enough for exhibition, but it is a very striking garden Rose. The plant is a good grower, of free branching habit, and a constant bloomer.

with a fawn centre suffused with yellow, and the exterior of the petals is of the deepest rose-ryed with a suspicion of coppery-yellow shading. It is most striking, and is distinct from any other Rose, though it has been likened to Mme. Abel Chatenay. I think in course of time Elizabeth Barnes will be one of the most popular cut flowers sold in the Covent Garden flower market, and it will equal Mme. Abel Chatenay in popularity in the garden. The blooms are full, slightly pointed in the centre, of beautiful form, and they have a delightful fragrance.

SOUVENIR DU ROSE VILIN (H.T., Vilin, 1905).—This Rose, like Etoile de France, will not succeed in this country. The raiser described it, I believe, as "opening well." It has never opened at all with me in three years' trial; I shall therefore consign it to the rubbish heap.

MARICHU ZAZAS (H.T., Souperl et Notting, 1905).—This Rose has done remarkably well

FIG. 153.—ROYAL GARDENS, FROGMORE: SHOWING THE INTERIOR OF THE CATTLEVA HOUSE AS IT APPEARED IN JUNE LAST. (See page 864.)

[Photographed by special permission.]

it needs generous treatment, and have tried this, but it has been a bigger failure this year than last.

COUNTESSE ALEXANDRA KINSKY (Tea, Souperl et Notting, 1905).—This Rose has done very well again this year, and certainly is to be recommended. It has erect stems and is exceptionally free. It also has a pleasing perfume. The flowers are white, with an apricot-yellow centre. They are beautifully formed, and are very pretty in the bud. Besides being a good garden Rose, I hear it is excellent for forcing.

COUNTESS OF DERRY (H.T., Alex. Dickson & Sons, 1905).—Countess of Derby is an honest all round Rose, being a good exhibition sort, a superb garden Rose, and useful for forcing purposes. There are perhaps more beautiful Roses. Its form is too stiff, some might say, being similar to Catherine Mermet. Every flower always opens perfectly, and the blooms are produced on erect flower-stalks. They last well, both on the plant and when cut, and they are very fragrant. The colour is distinct, a sal-

COUNTESSE DE SANE (Tea, Souperl et Notting, 1905).—This is a pure white variety with a pale yellow centre, a fairly large and very full flower. It is also a free bloomer, but I neither admire nor recommend it as a garden Rose, though some speak well of it for exhibition purposes. The slightest rain spoils the flowers. I do not think it has come to stay.

COUNTESSE FESTETICS HAMILTON (Tea, Nabonand, 1899).—I would like to particularly recommend this very strikingly beautiful Tea Rose of brilliant carmine colour with a coppery centre, as it does not appear to me to be known as well as it ought to be, although it is not new. It is marvellously free, and is a gem as a decorative garden sort.

ELIZABETH BARNES (H.T., Alex. Dickson & Sons, 1907).—Very few rosarians living can remember having had such a show of blooms during the month of October as we have had this year. As I write of this Rose, on the 19th of October, it is still holding its own with the best of them. The colour is satiny-salmon-rose,

this year and been greatly admired. It has large and decidedly full flowers, nicely imbricated, on very long, erect stems. The colour is similar to crushed strawberry, with rose tinge. It is sweetly scented and also is very pretty in the bud stage.

SOUVENIR DE MARIA DE ZAZAS (H.T., Souperl et Notting, 1906) is a large, fairly full, vivid carmine flower of nice shape. It is a good grower, a free flowering sort, and the flowers are fragrant.

SOUVENIR DE MARIA ZAZAYA (H.T., Souperl et Notting, 1904).—I do not recommend this Rose, owing to its very stiff and ugly shape.

HUGO ROLLER (Tea, Wm. Paul & Son, 1907).—This is a distinct and attractive flower, with a very pleasing tea scent, and has proved itself a free and continuous bloomer this season. It is a creamy-yellow with the outside petals crimson; it is also a nicely shaped flower. If it has a fault in its combination of colours, I should say that the contrast is too severe: but all my lady friends admire it.

COLONEL R. S. WILLIAMSON (H. T., Alex. Dickson & Sons, 7077)—Satin-white, deepening to blush in the centre, with round, smooth and most substantial petals, quite large flowers and perfectly formed; this is, in fact, an all round good Rose. It should do well as an exhibition rose, and is also an ideal garden Rose, as it is always blooming and there is never a bad flower. Every bloom is on a stiff and long stalk. A magnificent addition to this class.

MRS HAROLD BROCKLEBAN (H. T., Alex. Dickson & Sons, 7007)—This is one of the most perfectly shaped blooms ever introduced. They are large and full and are borne on erect foot stalks. The colour is creamy-white with a buff centre, the base of the petals a soft shade of golden yellow, and sometimes the outer petals are tinted salmon-rose. The buds are very prettily flushed with salmon-pink. It is a constant bloomer, and the scent is exquisite. *Leonard Peirce, Gayton, Cheltenham.*

HOUSE OF COMMONS AND PLANT DISEASES.

In the House of Commons on the 12th inst., the following questions relating to the spread of certain plant diseases were addressed to the honourable Member for South Somerset, as representing the President of the Board of Agriculture:—

Mr. Laurence Hardy asked whether the Board are aware that the black scab of the Potato has broken out in Germany; and whether they intend to take steps to prevent the importation of diseased Potatoes into Great Britain by issuing an order in similar terms to the Irish Order of October 17 which prohibits the importation of diseased Potatoes into Ireland?

Sir Edward Strachey: The Board understand that the disease in question has appeared in certain small holdings in Germany that are cropped year after year with Potatoes, but that fields under rotation are free. The Board do not propose to adopt, at any rate at present, the suggestion of the honourable member.

Mr. Laurence Hardy: Whether the Board will proceed against the outbreaks of black scab in Potatoes in England and Scotland by adopting the same measures as are being carried out in Ireland, namely, the immediate destruction of the diseased tubers and the isolation of the infected area; and, if not, why this disease should be treated differently in this country?

Sir Edward Strachey: The number of outbreaks of the disease in Great Britain is far greater than is believed to be the case in Ireland. In all cases growers have been urged to destroy diseased tubers and to take other means for preventing the spread of the disease, but it would be impracticable to "isolate" all the diseased premises. Isolation to be effective would have to be enforced for more than five years.

Mr. Laurence Hardy: Whether, in view of the fact that the Gooseberry-mildew Orders have been in force for more than a year, the Board will now present returns showing the areas infected in each county, the number of outbreaks, and the success or failure of the measures adopted by order of the Board to deal with the disease; and whether the Board will in future secure that the fungicides used in connection with their orders should be approved as efficient by the Board, as is done in connection with sheep dips under the Sheep Scab Orders?

Sir Edward Strachey: A report on the administration and effect of the American Gooseberry-mildew Orders will be issued in due course. There seems no good reason for the adoption of the suggestion contained in the latter part of the question, as the fungicide usually used is that specified in the Board's Orders, and in the rare cases in which other fungicides have been used the Board have been consulted as to their efficiency.

Mr. Laurence Hardy: Whether the Board were advised, as long ago as October 1st, that an outbreak of Gooseberry-mildew had occurred in the county of Surrey; whether any order has been issued by the Board to deal with the disease in the county of Surrey; and whether, in view of the fact that during October and November most of the necessary sales of plants take place, he will say what precautions have

been taken at this time to prevent the spread of so infestious a disease?

Sir Edward Strachey: The reply to the first part of the question is in the affirmative. An inspector visited the affected premises and explained the procedure and precautions to be adopted in dealing with the disease. The Board have no evidence to show that the disease is spreading in Surrey, and have not therefore considered it expedient to issue a special order for that county at present.

The Week's Work.

THE FLOWER GARDEN.

By W. FIVE, Gardener to Lady WANSFAGE, Lockinge Park, Berkshire.

Bedding Pelargoniums.—Remove all decayed leaves and stir the surface soil occasionally in the case of rooted cuttings in boxes, or that were dibbled into frames. Choose a fine day for watering the plants, it being necessary that the water should drain away quickly so that wet conditions will not last long. It may be necessary to remove caterpillars from these cuttings by hand picking. Allow plenty of ventilation, and keep a little hot at the water pipes. Old plants that were lifted from the beds and are now in warm frames will require to be cleaned and the dead stems cut off.

Other tender bedding plants.—Cuttings of Coleus, Iresine, and similar plants should be kept in an intermediate temperature which will not excite growth.

Berries and fruit in the flower garden.—As this season of the year when the flowers are over and most of the trees and shrubs bare of their leaves, nothing is more pleasing than the bright tints of the berries and fruits of such trees as Cotoneasters, Berberis, Eucyonemus europæus, Arbutus (Freddy), Aucubas, Hollies (both green and variegated-leaved), Crataegus pyracantha and the variety Lalandi which forms a splendid plant for clothing walls; it bears its fruits on the wood of the previous year. Then also the Pernettyas furnish large clusters of berries in pink, rose, crimson, white and purple colours according to the variety. This plant thrives best in a moist peaty soil mixed with plenty of sand and leaf mould. The Skimmias, of which S. Fortunei and S. japonica are the best for garden purposes, thrive in a well-drained loam soil with which is incorporated plenty of peat. Of the Cotoneasters C. Simonsii, C. microphylla and C. m. var. glacialis (syn. C. congesta), are to be recommended. The Sea Buckthorn-Hippophae rhamnoides furnishes a display of orange-coloured berries in large clusters, set off by beautiful glaucous foliage. It must be remembered in planting that Hippophae is dioecious, therefore, in addition to the female plants, a specimen or more of the male must be included, in order that the berries may be set, and the same also applies in the case of the Aucuba.

Lawns.—The mowing of lawns should now be discontinued but in order to keep the sward in a good condition the turf should be swept each week. This will disperse the worm casts, and after the sweeping the roller may be used, but only sparingly.

Frost.—There were 17° of frost registered in these gardens on November 10.

FRUITS UNDER GLASS.

By T. COOMBE, Gardener to LORD LEANINGTON, The Hoe, Southamptonshire.

Early Peach trees.—Directions have already been given for preparing trees in the early house, and if these directions were carried out the house may now be closed in preparation for forcing. If the berries are in the least dry, give them a thorough watering with tepid water, or greatly diluted manure water. The date at which the fruits will ripen will depend upon the varieties, and in most circumstances it is convenient, for the sake of succession, to have some early and some second early varieties in the same house. If the trees were forced early last season, they will respond more readily to the forcing now about to be commenced. No fire heat should be made use of during the first fortnight, but the house should be kept closed unless the atmospheric temperature rises to 50°, in which case the ventilators may be opened a

little. At the commencement of actual forcing and the employment of artificial heat, a night temperature may be maintained of from 40° to 45°, allowing it to increase during the day from 50° to 55°, and by sun heat from 60° to 65°. Damp the available surfaces in the house with tepid water according as the weather is bright or dull, and spray the trees with water in the morning and afternoon on fine, sunny days. If any of the roots are in an outside border, such border should be thickly covered with tree leaves, and glass lights may be placed over the leaves to afford further protection.

Propagation of vines from eyes.—Well-ripened, strong laterals should be selected for propagating purposes at the time the vines are pruned. They must be kept cool with the ends inserted in moist soil until the end of January or early in February. At that time the eyes should be prepared for insertion by cutting the wood through at half-an-inch on either side of the bud and taking off a thin slice of the wood from the opposite side of the bud. Some 3-inch pots should be properly drained and filled moderately firmly with fine soil composed of two parts sand and one part leaf-mould one part with silver sand added. Make a suitable hole in the soil and place a little sand in it. Upon this sand the eye should be firmly embedded so that the point of the bud is just up to the surface of the sand-sprinkled soil. Plunge the pots in a bed having a heat of 80° and in a pit where the night temperature is kept at 60° or 65°, and the temperature during the day 70° to 75°. When a few leaves have developed and the roots have made corresponding progress, shift the plants into 5-inch pots and replunge them in the bed for a few weeks. They will need to be repotted several times afterwards into moderately rough compost which should be warmed before use. Stop the laterals and sublaterals at one leaf, and after the plants are potted into their final pots and have filled these with roots, give them a light top-dressing with a suitable fertiliser. Maintain a uniformly warm and moist atmosphere with proper attention to ventilation; syringe the plants in the morning and again when the house is closed early in the afternoon. When the canes commence to ripen more liberal ventilation will be necessary.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICEROY GINNS, Aldenham House, Elstree, Herts, Herts.

Vacant plots.—Land of a light nature may be trenched forthwith. The particular treatment of vacant plots will depend upon the nature of the soil; it is intended to grow upon them. At the same time, I am a strong believer in deep trenching in all cases, and if this is done some manure or decayed vegetable matter may certainly be placed in the bottom of the trench. Endeavour to get the whole of the soil as speedily as possible into a suitable medium for vegetable crops, which is only possible by frequently bringing some of the subsoil to the surface. Ground which has been occupied with kitchen-garden crops for a number of years should be given liquid and soot freely, proceeding in the order of working, and a good surface dressing when the work is completed. Leave the surface as rough and lumpy as possible, thus exposing the soil to the weather. Wet or retentive soils should not be trenched before spring, but the surface may be given a liberal dressing of such materials as wood ashes, old mortar rubble, lime, and soot. The surface ground may then be lightly forked over. All rubbish collected in or about the garden should be burned or carried on vacant pieces of ground and the residue after burning will grow beneath the soil.

The compost yard.—Every garden should have a piece of ground reserved for the storage of manures and soil likely to be required in cultivation. Any out-of-the-way corner may be selected for the purpose that is well drained, and there should be some provision made for keeping dry small quantities of the various ingredients for raising seedlings, also sheds for storing and turning manure intended for forming Mushroom-beds, and providing shelter for the carrying out of various operations which may be done by the workmen during inclement weather. The provision for a good time for making provision for another season, and in doing this each heap of material should be neatly and properly stacked.

THE HARDY FRUIT GARDEN.

By F. JOEGAN, Gardener to The Downer Lady Nunburnholme, Waterbury, Yorkshire.

Pears.—It is not easy to select varieties to suit all soils, but for pyramids I could recommend Fondante d'Automne, Belle de Hardy, Doyenné du Comice, Louise Bonne de Jersey, Pitnaston Duchesse, and Josephine de Malines. The following varieties succeed as standards: Beurré d'Amanlis, Williams' Bon Chrétien, Doctor Jules Guyot, Emile d'Heyst, Comte de Lamé, and Hesse. For stewing purposes, Bellissime d'Liver and Catillac are two of the best garden varieties. The Black Worcester Pear is one of the best that can be planted for forming a standard tree. Good Pears that might with advantage be added to larger collec-

especially in the case of borders under north walls, where Cherries, Plums, and Pears are grown to afford late crops. Drains should be placed in the borders 3½ to 4 feet deep, and in most cases the old-fashioned V-shape rubble drains are most satisfactory. A fresh compost should be used where the staple soil is unsuitable, in which case a compost that is peculiarly fitted for each kind of tree can be applied to a depth of 2 feet. No digging should afterwards be allowed in the spaces I have indicated, but any roots that may be found beyond the width described may be cut off each year. If this is not done, the trees will be likely to make excessively strong and unfruitful growths.

Treatment of permanent borders.—When the pruning is completed the surface soil of the

The best trees for planting are those not more than two years old. They should be planted in permanent positions, and the roots ought to be kept in check by root pruning during the early stages in the life of the tree, as later it is dangerous to hit them. Good varieties include Moorpark, Hems Kirk, Kaisha, and Large Early.

THE ORCHID HOUSES.

By H. G. ALXANDER, Orchid Grower to Lt.-Col. G. L. HOFFORD, C.V.O., C.I.E., Westonbirt, Gloucestershire.

Sophranitis hybrids.—These charming hybrids are the result of crossing the brilliant little species *S. grandiflora* with the showy kinds of *Cattleya* and *Laelia*. *Sophr-Cattleya eximia*, *S.C. Nydia*, *S.C. Calypso*, *S.C. Cleopatra*, *S.C. Doris*, *S.C. Chamberlainiana*, *Sophr-Laelia Veitchii*, *S.-L. Gratixæ*, *S.-L. Heatonensis*, and *Sophr-Lælio-Cattleya medea*, *S.-L.C. Dana*, all produce their flowers during the autumn season. On the contrary, *S.C. Queen Empress*, *S.C. Saxa*, *S.C. George Hardy*, *Sophr-Laelia lata* and *S.-L. Phroso* flower in the spring and summer. These hybrids thrive best in an intermediate temperature and in pans that may be suspended from the roof rafters during the present season of the year. In the brightest months they are better if kept at a greater distance from the glass, and they require rather more shade than that afforded *Cattleyas*, otherwise their treatment is similar. They produce their flowers before the new growths are fully developed, therefore both at this period and afterwards until their small pseudo-bulbs are fully matured there must be no decrease in the water supply to the roots. Less will suffice during the resting period, but even then if the roots are allowed to get parched the plants will suffer.

Epidendrum vitellinum and its variety *majus*.—This species produces its flowers during the autumn, and is easy of cultivation when grown under cool intermediate conditions. They require a light position in a well-ventilated house at all seasons, and copious supplies of water during the growing and flowering periods, but in the resting period sufficient only to keep the pseudo-bulbs in a plump condition.

Ada aurantiaca.—This Orchid needs very careful treatment in the matter of root waterings during winter, otherwise the foliage is apt to become disfigured by black spots. If the rooting material is of a porous nature, as advised in a former Calendar, and these are always allowed to get dry before more water is supplied them, little difficulty will be experienced, even during winter. As has been previously pointed out in these columns, a slightly warmer temperature than that of the cool house, such, for instance, as is afforded by the cool intermediate house, is better for this species, and particularly so at this season.

PLANTS UNDER GLASS.

By THOMAS LUNT, Gardener to A. STIRLING, Esq., Keir, Fifehire N.B.

Plants in frames.—Tender plants, such as *Cinerarias*, *Cyclamen*, *Schizanthus*, and others growing in unheated frames must now be removed into structures where means are provided for keeping the atmospheric temperature above freezing point. After the plants have been placed in a heated house they will require frequent attention in regard to watering.

Forcing of flowering plants.—A batch of these plants should now be placed in heat, and they may include *Rhododendron Nobileanum* and *R. Jacksoni*, *R. sinense* (*Azalea mollis*), *Deutzia gracilis*, *Staphylea colchica*, and *Spiræas*. If *Lily of the Valley* crowns are cultivated for forcing, some of these should now be lifted in clumps measuring 18 inches by 12 for placing in boxes. If the crowns are forced in this manner a satisfactory amount of foliage will be produced as well as flowers. A succession of batches of Roman Hyacinths may be placed in heat each week. Also a batch of Early Tulip *Duc van Tholl*. Such early varieties of *Rhododendron indicum* (*Azalea indica*) as *Deutsche Perle* should also be placed in heat, and will require to be syringed twice each day with tepid water. Examine the roots carefully and see that they are not allowed to suffer from drought.

FIG. 154.—ROYAL GARDENS, FROGMORE: ROSE MADAME PLANTIER.

(See page 364.)

tions are Doyenné d'Été, Beurré Superfin, Marguerite Marillat, Conference, Beurre Diel, and Water Neis.

Peaches.—Reliable and hardy Peaches are Waterloo, Hale's Early, Goshawk, Violette Hative, Bellegarde, and Dymond. Nectarines include Lord Napier, Hardwicke, and Dryden.

Fruit trees against walls.—The border reserved for fruit trees should not be less than from 4 to 6 feet in width, and for Pears on the Pear stock a width of 7 feet is not excessive. Good drainage is of the utmost importance, and it is usually necessary to apply artificial drainage

borders should be lightly pricked up with a fork, and this operation is necessary again in July and August, when much watering has to be carried out.

Planting.—In planting Peach and Nectarine trees a little bonemeal may be used with advantage, but all other manures should be excluded. Apricot trees require a deep and well-drained loamy soil, and should only be planted against walls facing to the south or west. Good drainage is more than usually necessary in the case of Apricots, as they require a great amount of water during their season's growth.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for publication, as well as specimens or plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not receive any contributions or illustrations, or to retain unsolicited communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for loss or injury to his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, NOVEMBER 24—Roy. Hort. Soc. Coms. meet.

THURSDAY, NOVEMBER 26—Roy. Hort. Soc. Ex. of Colonial Products and Preserved Fruits (2 days).

FRIDAY, NOVEMBER 27—Aberdeen Chrys. Sh. (2 days). Dundee Chrys. Sh. (2 days).

AVERAGE MEAN TEMPERATURE FOR THE ENSUING WEEK, deduced from observations during the last Fifty Years, at Greenwich—41° F.

AIR TEMPERATURES:—LONDON.—Wednesday, November 18 (6 P.M.) Max. 51°; Min. 38°.

GARDENERS' Chronicle Office, 41, Wellington Street, Covent Garden London.—Thursday, November 19 (10 A.M.): Bar. 29.8; Temp. 47°; Weather: B.ull.

PROVINCES.—Wednesday, November 18 (6 P.M.) Max. 54° Ireland S.W.; Min. 47° Durham.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY AND FRIDAY—

Dutch Bulbs: at 67 & 68, Cheapside, E.C., by Frotheroe & Morris, at 10.30.

WEDNESDAY—Azaleas, Rhododendrons, &c., at 67 & 68, Cheapside, E.C., by Frotheroe & Morris, at 5. 2,000 Roses, Fruit Trees, Herbaceous Plants, Palms, Ferns, Azaleas, &c., at 67 & 68, Cheapside, E.C., by Frotheroe & Morris, at 1.

JERIDAY—Choice collection of rare and valuable Orchids, at 67 & 68, Cheapside, E.C., by Frotheroe & Morris, at 12.45.

The Fruit and Floral Committees.

It is possible that very few Fellows of the Royal Horticultural Society, or even members of these Committees, are aware that the Fruit Committee is now in its jubilee year, and that the Floral Committee will be so next year. The records in the *Transactions* of the Royal Horticultural Society, and in the horticultural Press do not appear to indicate the causes which led to the formation of these Committees, although, as the Society grew, it became inevitable that some such bodies must be formed at some time. The Society, however, had been in existence more than half a century, and possibly there was agitation in favour of their formation for some considerable time before the Council of that day was induced to take the needful steps to establish them. So far as the Fruit and Vegetable Committee is concerned, it is likely that its origin grew out of the old British Pomological Society, which was still in existence in 1858. In any case, although that Society did survive the formation of the Fruit Committee for some time, it eventually expired after doing much useful work, and it is doubtful whether any member of it remains alive to-day. The late Dr. Robert Hogg and Mr. Thos. Rivers were among its chief members, and records show that they frequently presided at the various meetings. Dr. Hogg continued to associate

himself with the Pomological Society for some time after he became a member of the Fruit Committee, but he continued to be a member of the Fruit Committee until the date of his death. The first chairman of the Fruit and Floral Committees were clergy-men. The first Fruit chairman was the Rev. L. Vernon Harcourt, a greatly honoured name, and that of the Floral Committee was the Rev. Joshua Dix, Rector of All Hallows, Bread Street, London, a devoted florist and a most enthusiastic gardener, well known to the Rev. W. Wilks, M.A., the present secretary. The earliest announcement of the formation of the Fruit Committee was made in the columns of the *Gardeners' Chronicle* on March 6, 1858, when it was stated in an Editorial Leader that the Society had taken measures to organise before another year a permanent Committee of Fruit.

In that article certain recommendations were made as to the leading principles that should guide such Committees in the making of awards, and if the extract containing these recommendations, which we now reproduce in another column, be read carefully, we think it will be seen that, taking the Royal Horticultural Society's Committees generally, they have acted in accordance with the suggestions then enunciated. It is a matter for regret that the proceedings of the Society fifty years ago were not so fully reported as they are to-day. Had this been done, more complete details of the formation of these Committees would be available. The Council of 1858 were obviously unwilling that the newly-formed Committee should adopt a revolutionary course, for its formation was accompanied with a string of no fewer than 38 regulations, most of which, however, with age and experience, have fallen into desuetude. The Committee comprised, with the secretary, Mr. Robert Thompson, of Chiswick, and Mr. C. Edmonds, of Devonshire House Gardens, vice-chairman, 32 members, of whom none survive. Amongst these illustrious horticulturists were Jas. Veitch, John Lee, John Fraser, G. Fleming of Trentham, Thos. Ingram of Frogmore, Thomas Moore of the Chelsea Physic Garden, Thos. Oxborn, W. Tillery, then of Heckfeld, Thos. Rivers, R. Smith of Worcester, and Lewis Solomon of Covent Garden.

Beyond mention of the fact that the Floral Committee, controlled by but 16 regulations, seems to have held its first meeting on July 7th, 1859, with the Rev. Joshua Dix as chairman, no information is furnished as to its original members. The present chairman, Mr. William Marshall, was appointed a member in 1868, and became chairman in 1871. He has thus filled this latter position for nearly half of its history. Many, indeed, of those who have been distinguished leaders of horticulture have, in the past as in the present, been members of these bodies and have thus rendered great and acceptable service both to the Society and to horticulture generally.

The Committees originally consisted of twenty members, but the number was subsequently increased to thirty, and later to forty members.

The next oldest body—the Scientific Committee—was established in 1868, the Narcissus Committee in 1885, and the youngest body—the Orchid Committee—which, in spite of its

youth, finds so much work for its energy was formed in 1889.

It is very natural that some expression should have reached us in favour of celebrating in some fitting way the joint jubilee of the two elder Committees, and if this took place at the close of the present year or early in 1909 it would serve to link these jubilees into one. The matter is one for the Council of the Society to consider. The 50 years' existence of these bodies is a bright feature in the history of horticulture, and specially in the life and operations of the Royal Horticultural Society. Some form of public celebration, may, therefore, be desirable.

ESTABLISHMENT OF THE FRUIT COMMITTEE OF R.H.S.—

The following is extracted from leading article which appeared in these pages on March 6, 1858, which announced the decision of the Society to form permanent committees. "The constitution of the committee, the 1. of its action, the principles that are to guide have still to be settled: and we are persuaded that in a matter of such great importance, which such varied interests are mixed up, so public discussion would be useful. We shall therefore, be happy to open our columns to short communications on the subject. For ourselves, we cannot but think that the following points should be in all cases first decided:—(1) Has the variety any merit? (2) What is the nature of its merit? (3) Is it so different from other varieties as to deserve cultivation? (4) If so, in what does the difference consist? To this would have to be added, when a variety is approved, its history; that is to say, its parentage, the place where raised, the year when raised, its manner of growth, its period of flowering, the time of maturity, the whole to conclude with a carefully drawn description of the perfect fruit. Such materials would rapidly accumulate and form the foundation of a new catalogue of fruits, which is greatly wanted. Everybody would gladly open a communication with such a committee, or, if any failed to do so, they would be bad guardians of their own interests. The only risk of erroneous judgment would consist in taking the climate of London as that by which new fruits should be judged. Were that indeed to happen the decisions of the committee would lose their value. But we can hardly contemplate such a result, provided sufficient care is observed in striking the committee. For assuming the members to possess the intelligence necessary to their task, they would never take so narrow a view of their duties as to imagine that London is of more importance than York, Edinburgh, or Aberdeen. We, therefore, entirely believe that the committee would receive support in every quarter and that their decisions would be looked at as conclusive upon the varieties which might be brought before them."

ROYAL HORTICULTURAL SOCIETY.—The next meeting of the Committees will be held on November 24, at 3 o'clock p.m.; a lecture on "Italian Gardens" will be given by Mr. J. CHEAL.

THE PARKS AND THE UNEMPLOYED.—According to the *Times*, the Town Clerk of Paddington has received a letter from the First Commissioner of his Majesty's Works, stating that he fears the suggestion of the Borough of St. Pancras (which the Paddington Council supported) that an open-air swimming bath should be constructed in Regent's Park is one which it is hardly possible to adopt, inasmuch as it would be impossible to make such a bath in any part of the park without interfering

seriously with the open space for games. The Commissioner adds that he is making provision for finding employment for workmen supplied by the Central (Unemployed) Body for London, in surface draining and cleaning out the lake, and that if circumstances admit, he is prepared to extend this work still further. In the House of Commons on the 16th inst., Mr. B. STUART asked the First Commissioner of Works whether, owing to the amount of unemployment in London, he could arrange to have the cleansing of the Serpentine taken in hand with as little delay as possible. Mr. HARCOURT replied that he regretted that this was a suggestion which he was unable to adopt, but he was arranging to clean part of the lake in the Regent's Park.

FLOWERS IN SEASON.—Mr. AMOS PERRY, Enfield, sends a very fine hybrid Iris, raised from I. Korolkowii and I. iberica by the late Sir MICHAEL FOSTER. It seems to be a worthy addition to florists' Irises. The mingling of the two distinct sections of Iris results in the production of a showy flower, in which the rose-purple and velvety black of the parents are interestingly combined.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held in the Lecture Hall of the Institution, on Monday, November 23, at 8 p.m., when a paper will be read by Mr. HERBERT T. SCOBLE, entitled "The Administrative Aspects of Sewage Disposal."

LABURNUM OUT OF SEASON.—A correspondent, H. S. Z., writes as follows: "It is not only in England that Laburnum is flowering a second time. At Antwerp, on November 1, I observed a small tree in full bloom, though the racemes were short, as mentioned by other of your correspondents. A thick, cold fog hung about Antwerp that day. The Laburnum was growing in the Zoological Gardens, which are among the finest in Europe, particularly from an ornithological standpoint, and they contain a few interesting trees and shrubs."

PRIZES FOR SPRAYING MACHINES.—The Royal Agricultural Society's Show at Gloucester is announced to take place on June 22 to June 26, 1909. During the week preceding the show, trials of fruit-tree spraying machines will be held in the neighbourhood of the Show Ground at Gloucester. One competition will be for machines worked by hand-power, and another for machines worked by steam, petrol or mechanical power. The exact date and place will be notified after the number of competitors has been ascertained. Full particulars can be obtained from the Secretary, 16, Bedford Square, London, W.C., to whom entries for the prizes offered must be sent on or before Saturday, March 20, 1909.

DIMORPHOTHECA BARBERIÆ ROSEA.—Mr. GUMBLETON has shown us a flower of a very distinct form of *Dimorphotheca*. It differs chiefly from *D. Barberiæ*, of which a figure appeared in the *Botanical Magazine*, tab. 5337, in having clear, rose-coloured flowers, with bronze tinting on the underside of the petals, a very distinct and pretty combination, and it grows a little less strongly, the flowers being somewhat smaller in size. Though regarded at present as merely a variety of *D. Barberiæ*, for gardening purposes it is not only distinct, but a very much better plant, owing to its attractive colouring. Mr. GUMBLETON takes unusual interest in the genera *Arctotis* and *Dimorphotheca*, and cultivates all the species known as pot plants in a greenhouse. Mr. GUMBLETON received the new variety from Barberton, Transvaal Colony, it having been sent to him by Mr. THORNCROFT.

ELECTRIC LIGHT AND VEGETATION.—Many observations have been made since electric street lamps became common on the effects they produce on the branches of trees that may happen to be close to them. Sometimes these branches push their leaves earlier, and retain them later in the year. There may even be colour differences to be seen, thus Herr GRAEBENER, writing to *Gartenwelt*, has noticed that the leaves on a plant of *Rochia trihophylla*, at distances of 9 to 13 feet from a lamp, not only showed increased vigour, but their leaves remained green while those of plants further removed from the light assumed a red colour. Doubtless many of these effects are to be attributed to the increased warmth, and the matter is worth investigating from this point of view. There may, however, be other and more obscure reactions to the electric light, which is so rich in the violet and ultra-violet rays of the spectrum. These rays are known to produce remarkable chemical effects, with some of which every photographer is familiar. There is, of course,

JOURNAL OF THE R.H.S. GARDENS CLUB.—The first number of this publication has been received. As the opening paragraph states, the issue "is a very modest one, partly for want of funds and partly because there has not been time to obtain contributions from members." From the addresses given it is seen that the members are very widely distributed, and are represented in British (Columbia, India, West Africa, Cape Colony, France, Norway, California, Canada, and the United States). The object of the Club is to keep past and present students and employés of the R.H.S. in touch with each other, and thus promote a sympathetic, friendly, and mutually helpful association. All past and present students and employés of the R.H.S. are eligible for membership. The Editor appeals for articles, letters, and notes for publication in the next number of the *Journal*, which will be published at Michaelmas, 1909. All communications should be addressed to the Hon. Sec., Mr. R. J. WALLIS, R.H.S. Gardens, Wisley, Ripley, Surrey.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—Mr. A. J. BROWN informs us that the annual concert held in the Constitutional Hall, Chertsey, on behalf of the funds of this institution will take place on Wednesday, December 2, under the patronage of Sir EDWARD and Lady STERN. These concerts have been held for many years past at Chertsey, and they have resulted in the collection of considerable sums of money for this charity. We hope that local gardeners and others will endeavour to make the forthcoming event successful. Tickets are 3s., 2s., and 1s. each, and these, or any information may be obtained from Mr. A. J. BROWN, Jesamine Cottage, Eastworth Road, Chertsey.

A BIG RICHARDIA.—In the *Gartenwelt* for October 17 last part of a plant of *Richardia africana* is figured bearing four fully-opened spathes and one unopened, growing in the nursery of R. LEHMANN, Weissensee, near Berlin. The plant threw 15 spathes one after the other, and was standing in a 10-inch pot. The total height of the plant and pot was 42 inches; diameter of the biggest spathe, 9½ inches; circumference, 30 inches. HERR LEHMANN has grown his *Richardias* from seeds for many years, saving the seeds from plants which produce the largest spathes. The plant figured is three years old. In general practice it is found that the size of the spathes and their number are due to good cultivation rather than excellence in variety.

ICONES PLANTARUM.—The recent number of *Hooker's Icones Plantarum* forms a fascicle of descriptions of new species of *Impatiens* by Sir J. D. HOOKER, who has shown a special interest in this difficult and critical genus. The fascicle, in which 25 new species and varieties are described and figured, supplements Sir JOSEPH's epitome of the British Indian species of *Impatiens* in the records of the Botanical Survey of India (1904-1906). The majority of the plants described are from Indo-China, from material in the Paris Herbarium, with a few from China, from the Le Mans Herbarium and elsewhere. We refer with much pleasure to this useful piece of work, and the evidence it affords of the continued botanical activity of the veteran botanist.

Publications Received.—*Intracellular Enzymes*, by H. M. VERNON, M.D. (John Murray.) Price 7s. 6d. net.—*British Mosses*, by the Rt. Hon. Sir EDWARD FRY, G.C.B. (London: Witherby & Co.) Price 1s. 6d. net.—*Studies in Gardening*, a series of articles reprinted from the *Times*. (London: John Parkinson Bland, the *Times* Office, 2, Printing House Square, E.C.) Price 1s. net.—*In My Lady's Garden*, by Mrs. RICHMOND, F.R.H.S. (London: T. Fisher Unwin.) Price 12s. 6d. net.

MR. ARCHIBALD MACKELLAR.

His Majesty's Head Gardener at Frogmore.

the further question, which is, however, hardly pertinent to these examples, of the direct action of the current on the constituents of the air.

PESTS OF FRUIT TREES.—So much interest is being taken in the subject of spraying at the present time, that the little book by Messrs. SPENCER PICKERING and F. V. THEOBALD* should be certain of a welcome. We have seldom seen a better type of practical guide, for it contains exactly the information which the grower wants, tells him what to avoid, and indicates the reason for some of the precautions which are found by practice, or suggested by theory, to be expedient. Although the treatment of the subject only occupies a little more than 100 pages, an enormous amount of information is given, and the book, written by such well-known experts, may be cordially recommended to everyone who desires to know what can be done to prevent or remedy the attacks of the numerous enemies of fruit trees.

* *Fruit Trees and their Enemies*, with a spraying calendar, by Spencer Pickering, M.A., F.R.S., and Fred. V. Theobald, M.A., Simpkin, Hamilton, Kent & Co., Ltd., 1908. Price 1s. 6d. net.

THE ROYAL GARDENS, FROGMORE.

(Continued from page 340.)

ORCHIDS.

Orchids are grown in quantity, and 12 houses are entirely devoted to their culture; a house of *Dendrobium formosum giganteum* presented a grand sight. Cattleya Mossiae were beautifully in bloom in June, whilst *C. Mendelii*, *Laelia purpurata*, *Odontoglossum crispum*, and most of the showier *Dendrobiums* are also cultivated to perfection. The houses containing *Odontoglossum crispum* had a fine show of bloom, and most of the other houses contained plenty of flowers. All the plants are well cultivated, but the house of *Calanthes* of the *C. Veitchii* class probably surpasses any in cultivation, and Mr. MacKellar may justly be proud of his success with these brilliant and useful Orchids, especially as the specimens have increased in vigour for some years under his care. Those who know *Calanthe Regnerii* in its imported state would scarcely consider it possible that the comparatively small pseudo-bulbs of the freshly-imported specimens could be made to produce pseudo-bulbs of such gigantic proportions as those grown at Frogmore. The plants in the warm *Calanthe* house were uniform throughout, the silvery skin of the old bulbs and the clear green foliage of the new growths which are produced from one to four on a plant, and in June were about equal to the bulbs in height, were quite spotless. It is the practice of some growers to keep the deciduous *Calanthes* quite dry until they are well advanced in growth, but at Frogmore they seem to be kept much more moist at the root in the early stage of growth than in most gardens, and it is probably this circumstance which has largely contributed to their extraordinary development.

THE ROSES OUT-OF-DOORS.

Nearly all varieties suffered this year in greater or lesser degree from the cold weather in April, but, thanks to the more congenial conditions which prevailed during the greater part of May, most of the varieties recovered themselves so fast that, in June, when our

photographs were taken, the plants presented most satisfactory masses of flower. Lady Battersea, one of the earliest to bloom, was excellent. Liberty, another early variety, has

white variety in existence, also Madame Abel Chatenay and Antoine Rivoire were showing well. George Nabonnand is essentially an autumn-flowering variety and should be

FIG. 157.—ROYAL GARDENS, FROGMORE; MR. MACKELLAR'S HOUSE.

done splendidly. The newer Richmond was in full flower, and it is certainly an acquisition to the decorative class of Roses. Madame Ravary has a habit of the very best type and is a continuous bloomer. Its colour is a lovely shade of orange yellow, and it forms a beautiful flower before becoming fully expanded. Gustav Grunerwald and Ulrich Brunner were seen at their best. Mrs. J. Laing, one of the most useful varieties for decorative work, and Frau Karl Druschki, the best pure

planted expressly for that purpose. It usually flowers well into the month of November, but when these notes were taken the plants were full of growth and young flower-buds. Caroline Testout is one of the most useful Roses for making a display in the garden, and, notwithstanding its lack of perfume, it is popular because it is one of the hardest in constitution and is a very continuous bloomer. Of climbing varieties *Hiawatha* was beautiful; it is certainly one of the best of the newer climbers. Blush Rambler is also an excellent deer and a beautiful Rose. Aimée Vibert, Madame Plantier, Mrs. F. W. Flight, Claire Jacquier, Climbing Caroline Testout, Reine Olga de Wurtemberg and Dorothy Perkins were all flowering freely, and the plants were wonderfully free from mildew. The Terrace walk between the glass range and kitchen garden is 30 feet wide, and is bordered on each side by grass, in which are cut beds for Roses. The oblong ones are in pairs and are filled with hybrid Teas, and between them are circular beds, with iron frames, 10 feet in height and 6 feet in diameter, covered by climbing Roses. These beds are also arranged in pairs—two white, two pink, and two crimson alternately. This is a charming drive when the plants are in flower, and is over 600 yards in length. Our illustration at fig. 154 shows the very old variety Madame Plantier. It is one of several similar specimens which grow in small circular beds cut out of the grass on the side of one of the broad paths.

THE BOTHY.

The new bothy, in which the young gardeners reside, is a model of what such a structure should be. It is situated off the broad path that passes between the herbaceous

FIG. 156.—ROYAL GARDENS, FROGMORE; SHOWING GARDEN BUILDINGS ON LEFT, AND THE ROCKERY AROUND THE ENDS OF THE GLASS-HOUSES ON THE RIGHT.

borders, in very pleasant surroundings (see fig. 158). It was one of the very first improvements which the King ordered to be carried out in the gardens after his accession. His Majesty gave special orders that a place should be built which should tend to educate the men in matters connected with their profession and elevate their tastes and habits. This order has been faithfully carried out. There is accommodation for 24 men; each man has a separate bedroom, which is furnished with a chest of drawers and wardrobe, so that there shall be no excuse for untidiness. The bedrooms are approached by a wide, stone staircase from the front hall, and each bedroom is connected by a corridor which extends all round the building. At the top of the staircase is the lavatory, which is arranged on the best sanitary lines, and contains two bathrooms. There is also a bathroom on the ground floor. The rooms downstairs are spacious, well ventilated, and are suitably furnished. The dining-room is situated in the middle of the building, and contains two large tables capable of seating about 30 people. The walls are hung with old prints of Windsor Castle and its associations. The sitting-room, which is also used as a library (see fig. 158), is a well-furnished and comfortable apartment. The bookcases contain many instructive books for the use of the young men. There is a bagatelle table in the middle of the room, and other games and means of recreation are introduced to encourage the men to stay indoors after working hours. The kitchen is conveniently situated near the dining-room. It has all the necessary appliances and utensils, and everything is kept scrupulously clean.

The rooms on the ground floor on the right of the picture are sick-rooms for isolating cases of infectious illness. On the opposite side are the caretaker's rooms. The floors in the dining-room, corridors, and passages are laid with Tarazza mosaic. The whole of the building is lighted by gas and heated by hot-water pipes and it is practically fireproof.

HERBACEOUS PLANTS.

The borders of herbaceous plants situated near to the bothy are 300 yards in length, with a broad path between them. Each border is 20 feet in width, and at the back of one of the borders is a row of cordon Pear trees, consisting of 1,800 specimens. The herbaceous plants were not at their best when our photographs were taken by Mr. W. J. Vasey, but they form a magnificent effect in the latter end of August.

THE HEATING APPARATUS.

The arrangements for heating the plant and fruit houses at Frogmore are as perfect as it is possible to make them. Before the alterations were made, about thirty boilers were employed, whilst at the present time there are but seven. This is not only a great saving of labour, but also of expense. The houses are divided into eastern and western sections. There is a boiler-house for each section, each containing three large steel "Cornish" boilers, measuring 22 feet in length. From the boiler houses the main pipes run through tunnels 6 feet high by 4 feet wide. From the tunnels the pipes branch off to the different houses. The main pipes are 6 inches heavy cast-iron flanged pipes. The boilers and main pipes are covered with non-conducting composition to conserve the heat. There are

separate sets of main or leading pipes for fruit and plant-houses, but all the leaders are connected with each boiler, so that each and any boiler may be worked separately for fruit or plant-houses as desired. Altogether there are 13 miles of hot-water pipes. Rain water is used for supplying the boilers, and it is collected from the roofs of the houses in two large underground tanks, each capable of holding 100,000 gallons. The water is pumped into overhead cisterns in the boiler-houses by power obtained from gas engines. From these cisterns a supply is

also are well furnished with trained trees. Two rows of pyramidal Apple and Pear trees have been recently planted, and they extend across the vegetable quarters. These trees will not only afford a very large addition to the fruit stores, but they will also have the effect of relieving the flatness of the open spaces under cultivation of such crops as Onions and Cabbages, which are grown by the acre. Many hundreds of fruit trees have been added during the past six years, and a wall facing to the south, measuring nearly 400 yards long and 12 feet high, although

FIG. 153.—ROYAL GARDENS, FROGMORE: EXTERIOR OF THE YOUNG GARDENERS' BOTHY, AND INTERIOR OF THE LIBRARY.

laid on to the cistern in the fruit and plant-houses for use in watering and syringing.

THE KITCHEN GARDEN.

The magnitude of the fruit and vegetable garden is unequalled in a private establishment and consists of about 60 acres of kitchen garden and orchards. Despite its unusual size, it appeared to be impossible, at the time of our visit, to discover a weed in it. The neatness and order prevailing in the other departments were just as manifest in the quarters devoted to vegetable culture. In addition to the usual vegetable crops, there are plenty of fruit trees in the form of espaliers and bush-trained specimens, whilst the walls

only planted four years ago with Peach trees, is now nearly covered, and the trees bore very heavy crops of fruits during the past season. The out-of-door Peach and Nectarine trees are protected from frosts when in flower by the use of canvas blinds on rollers. These are portable and are removed from the walls when the fruits have set. Frogmore, lying as it does in a low situation in the Thames Valley, is liable to late spring frosts, and such protection is an absolute necessity. The total length of wall space for the training of fruit trees is nearly $\frac{1}{2}$ miles, and some very excellent examples of trained trees may be seen. So immense are the gardens and

so great are the supplies of produce sent to various heads of departments in the Royal Palaces, that confusion would certainly arise were it not avoided by skilful organisation and assiduous attention to the details of administration.

Mr. MacKELLAR.

As we have already stated, the Frogmore gardens are under the care of Mr. Archibald MacKellar, who was appointed head gardener there in succession to Mr. Owen Thomas after the accession of King Edward VII. in 1901. Mr. MacKellar, whose portrait is reproduced on p. 363, was born in Ayrshire, his father being also a gardener. He served his apprenticeship in the garden then under his father's care, and afterwards removed to Hopetoun, the Earl of Hopetoun's seat in Linlithgow, in 1870. On completing two years at Hopetoun he removed to Tynninghame and became foreman out-of-doors. In 1874 he was engaged at Chatsworth in the fruit department, and two years later went to Lord Penrhyn's garden at Penrhyn Castle as general foreman under Mr. Walter Speed, who still holds the position of head gardener. Mr. MacKellar stayed at Penrhyn seven years, and then removed to Floors Castle, the seat of the Duke of Roxburgh near Kelso, to take up his first position as head gardener. It was after spending 11 years at Floors Castle that he was selected to become head gardener to the King (then Prince of Wales) at Sandringham, Norfolk. After the accession of King Edward, Mr. MacKellar was appointed to the Royal Gardens, Frogmore, his place at Sandringham being filled by the appointment of Mr. Thomas H. Cooke, who at that time was head gardener to Earl Wemyss at Gosford, East Lothian.

A view of the gardener's house is given at fig. 157. It is a very attractive building, erected in 1844, and is situated in a central position in the garden.

THE LATE MARTIN RIDLEY SMITH.

All lovers of the Carnation will regret the death of the President of the National Carnation and Picotee Society, as recorded in the last issue of this journal. His fame as a cultivator and raiser of new Carnations is world-wide. He took up their cultivation about 20 years ago, and spared no pains to obtain the best varieties. He made a journey to Germany to see the best in flower there, and invited me to go with him. We carefully inspected every plant in the collection of Mr. Ernest Benary at Erfurt, and Mr. Smith purchased all the best self-coloured and fancy sorts. These formed the collection from which he obtained the fine seedlings he raised at Hayes. I have been a careful student of the work done at Hayes during the last 20 years, for I was entranced by Mr. Martin Smith to introduce all his new varieties to the public in those early years. The first varieties to be introduced were self-coloured ones only (1869). Abigail, Niphetos, Aline Newman, Lady Gwendoline, and Mrs. Louise Jameson. Previous to this, Mr. Smith had been working in quite a new direction. I well remember his state of pleasurable excitement on one of my early visits as he showed me a house nearly full of new varieties of *Souvenir de la Malmaison* he had raised from seed. I sent a report to the *Gardener's Chronicle*, which was probably the first published notice of them. In 1894 I introduced 10 new varieties of self-coloured and fancy Carnations from the Hayes seed beds; most of them had obtained First-Class Certificates or Awards of Merit. They were a considerable advance upon any varieties hitherto

seen in cultivation. The best of them were Cardinal Wolsey (fancy), Hayes Scarlet (self), Mephisto (self), Miss Audrey Campbell (a fine yellow self), Miss Ellen Terry (a very large white self), King Arthur (a fine crimson-starlet), Waterwitch (blush), and The Pasha (the best variety of Apricot colour up to that time). The same season (1894) the new type of *Souvenir de la Malmaison* was introduced for the first time. There were five varieties, viz., Mrs. Everard Hambro, Princess May, Sir Charles Freemantle, Sir Evelyn Wood, and The Churchwarden. In 1896 five more new "Malmaisons" were introduced, viz., Lady Grimston, Lord Rosebery, Nell Gwynne (the only pure white yet raised), Prime Minister, and Trumpster. Every year since then new varieties have been introduced, all of them in some manner different from those already in cultivation. I find, on referring to the Carnation catalogue for this year there are 170 varieties described, including those of the "Malmaison" type, all raised from seed at Hayes. As an instance of Mr. Smith's keen interest, I may say that I noticed him at one of the exhibitions carefully examining the exhibits, after which he remarked to me that quite four-fifths of the varieties exhibited were raised by himself. All his work in connection with the raising of seedlings was done in the most methodical manner, and his personal interest at the time of the flowering of the seedlings was intense. I happened to journey to Hayes on one occasion by the same train as he did. I found his servant waiting at the station with his garden coat and cap; he quickly changed at the station, and went off at once to his Carnation bed. He would have 15,000 to 20,000 seedlings, and from these 200 to 300 would be selected to grow again, and they were tested out-of-doors for border culture as well as for flowering under glass in flower-pots.

When he first commenced Carnation culture, he determined not to grow any of them under glass, but he found after experience that the best flowers were obtained under glass; not that equally large and fine flowers could not be obtained from well-cultivated plants in the borders, weather permitting, but that our uncertain climate has to be reckoned with. Insect pests are also difficult to deal with out-of-doors. In Great Britain and Ireland it is always worth while to cultivate some of the best border Carnations under glass. Even in Germany I noticed that the best self-coloured and fancy varieties in Mr. Ernest Benary's nursery were covered with glass overhead, but they were exposed at the sides.

At Hayes, numerous beds of Carnations were planted in the flower garden, and visitors in the season will remember the excellent effect produced by some of the beds being planted with one variety only. The latest work of Mr. Smith was a very successful attempt to improve the yellow-ground Picotee. As is well known, there is no difference botanically between a Carnation and Picotee. The difference is in colour only. From the point of view of the florist, a Picotee has the marginal colour only, but 20 years ago there were very few varieties that were not marked more or less with flakes on the petals. I had produced a few very perfect flowers some 20 or 25 years ago. One named Agnes Chambers was the first, and this was succeeded by Mrs. Robert Sydenham, Mrs. Douglas, Mrs. Dranfield, and one or two others. Mr. Smith's first success was Child Harold, and his latest is John Ruskin, which, as exhibited last season, I take to be the best yellow-ground Picotee yet raised—the master's last and best gift. He will be long remembered for the work he has accomplished. It rests with those of us who yet remain to carry it on still further, for there is no known limit to what may be done in floriculture.

SELECT LIST OF CARNATIONS RAISED BY THE LATE MR. SMITH.

SELF CARNATIONS.—AGNES STREET (ERFURT), AND HATHAWAY (YELLOW), ANN DOLEYN (SALMON), BENBOW (BLOSSOM), CECILIA

(YELLOW), COPPEHEAD (DARK APRICOT), DAFFODIL (YELLOW), EUNA (SCARLET), GOSSET (DARK APRICOT), HELMSTADT (WHITE), LADY HERMIONE (SALMON-PINK), LADY LINLITHGOW (BRIGHT ROSE), MEPHISTO (CRIMSON), MISS AUDREY CAMPBELL (YELLOW), MISS MAUD SULLIVAN (DELICATE PINK), MISS WILSON (FRONT), MUCH-DE-MILLER (PURE WHITE), QUEEN OF SCOTS (CLEAR PINK), SEYMOUR CORLEAN (AMBER), TROJAN (WHITE), TITAN (MAROON), ZELIA (PURE WHITE), ZEPHYR (BLUSH), KING ARTHUR (CRIMSON-STARLET).

FANCIES.—ARIELAN, BANSHIE, BRODICK CARNIVAL, CHARITACEE, CHARLES MARTEL, DIDO, DODSON, ERIK KING, FAICA, GREY FRIAR, GUMBEVER, HADJAGI, HORSIA, KING SOLOMON, LORD BASTON, LORD BRYCE, MANDRILL, MILKMOO, MRS. CHARLES GARRAN, MOLLY MAGUIRE, MOLETER, PAGAN, PASQUIN, RONY BUCHANAN, SIR LANCELLOT, ROBERT HODD, SAM WELLS, STRONGLOW, THE NIGAM, TWINGH, YOLANDE.

YELLOW-GROUND PICOTEES.—ABBOT, ALCIOMUS, ALDEBOLAN, ANNOT LYLE, ARGOSE, COUNTESS OF STRATHMOUE, DANIEL DEFOE, DIANA, ELIE DEANS, EMPRESS EUGENIE, GERTRUDE, GADSDY, GREENE, GROW, HEATHER BELL, HENRY FALKLAND, HESPERIA, HYGIEA, LADY AUBREY, LADY BRISTOL, LADY ST. OSWALD, LANZAN, LORD NAPIER, LOUISA, LUCY GLITTERS, MABEL, MRS. WALTER HERIOT, MOLLIE, ORMONDE, ORCHETO, PROFESSOR, SARDONIAN, TENNYSON, VOLANTE, WASP.

SOUVENIR DE LA MALMAISON VARIETIES.—ALBION (DEEP-SALMON), BALDWIN (ROSE-PINK), CALYPSO (PALE PINK OR BLUSH), CHERRY (ROSE), CLACKATHRAN (ROSE), JOHANNE (BRIGHT ROSE), KING OSCAR (CRIMSON), LADY GRINSTON (PINKISH GROUND MOTTLED ROSE), LADY JANE SEYMOUR (PINKISH BLUSH), LADY RUSKIN, LADY SYDNEY (CRIMSON-GOLD), LORRAINE (CRIMSON), MARGARET (BRIGHT ROSE), MERE (SALMON), MONK (SALMON), MRS. DE SATGE (LIGHT SCARLET), MRS. TORRENS (SALMON-PINK), MRS. TRELAWNY (DARK-COLOURED CRIMSON), NAUTILUS (DELICATE PINK), NEW GOWN (WHITE), PRIME MINISTER (SCARLET), SAINT (SALMON), THE CHURCHWARDEN (CRIMSON), THORA (BLUSH), J. Douglas.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

FIBRE FROM PINE LEAVES.—Referring to the paragraph on p. 280 on cloth made from the leaves of *Pinus ponderosa*, I may, perhaps, be allowed to supplement it by saying that the application of the leaves of Pines to textile purposes has been known for a considerable time; for instance, somewhere about the year 1860 a fabric called Pine wool was brought to notice as a special product of some factories that had been recently established near Breslau, in Silesia. The process of manufacture consisted of reducing the Pine needles to a coarse kind of fibre of a brownish-yellow colour. In this state it was used for stuffing cushions, mattresses, etc., and as a kind of wadding. With further developments it was made into yarn and then woven, chiefly in conjunction with animal wool, and sold as Pine wool flannel, with a strong recommendation of its superiority over ordinary flannel, as it was said to be not only very durable, but to keep the body warm without undue heating. The principal species used in the preparation of this wool was said to be *Pinus Laticia*. Articles of underclothing were, a few years ago, and may still be, obtainable in London. About 1887 or 1888 another kind of Pine wool became generally known as a North American product, which was prepared from the long leaves of the Turpentine Pine (*Pinus australis*). This fibre, however, was used chiefly in the manufacture of carpets and matting, much of it being left in its natural brown colour, but some being dyed, chiefly red, so that in the weaving a pattern could be produced. I can testify to the durability of this Pine fibre, having had one of these mats in constant use in my house for a considerable time. Considering the large area over which *Pinus australis* grows in Carolina, Georgia, and Florida, the trees offer an almost endless supply of material. Samples of both this and the products of *Pinus Laticia* are exhibited in the Kew collection. John R. Jackson, Claremont, Lynnston, Devon.

NOTES FROM THE NORTH-WEST.—Mr. Earley's enquiry in the last issue of the *Gardener's Chronicle* drew my attention to a plant of *Escallonia macrantha* which was planted here against a north wall fully 50 years ago, when the shrub was a novelty. The wall and the plant are 18 feet high, and there is a fine display of flower on it at the present time. As for *Chioysia ternata*, which we treated to a greenhouse when it first appeared, it will grow in any aspect on the west coast, provided it is not exposed to bitter winds that scar the fine foliage. Its aromatic properties protect it from rabbits after it is well established, and we use it here as pheasant cover in the woods. The brightest thing in the woods just now is *Parrotia persica*. Unluckily, my stock seems to have been derived

from cuttings, for the plants never assume an upright growth. It has not flowered in this district, so far as I know. *Schizostylis coccinea* and *Senecio pulcher* are in fine bloom at present. *Pitiosporum Tobira*, on a wall, has a few trusses of fragrant bloom, but we cannot emulate its luxuriance on the Mediterranean seaboard, where it scents the whole air at this season. *Antholyza paniculata* is worth growing for its foliage alone. The flowers are long past, but its great sword-like blades are now a fine glowing sheaf of russet and orange shades. *Funkia ovata* and *F. subcordata* are disappointing in their bloom, but well worth planting beside woodland walks for their clear golden-yellow tints in autumn. Rabbits will gnaw them when first planted, but leave them alone when established. The same applies to *Fulcanaria mollis*, of which the great spotted leaves are as ornamental in the woodland at this season as are its blue and rose-coloured flowers in early spring. *Herbert Maxwell, Monroith, Scotland, November 15.*

UNSEASONABLE FLOWERS (see also p. 363).—In a garden situated on the west shore of the Garloch, Dumbartonshire, Scotland, it is to be seen a Laburnum tree in full bloom with also the seed vessels of last spring attached to the tree. During October Broom growing by the roadside here was also in bloom. *Alexander E. Bruce, The Bungalow, Rosneath, Dumbartonshire.*

RENAMING FRUITS AT SHOWS.—The case of renaming an Apple at the recent R.I.S. Fruit Show mentioned by *E. J.* on page 346, was in the class for "any other variety of dessert" Apple. As so many persons hold Beauty of Hants to be but Blenheim Pippin under another name, the fruits were disqualified. The three judges were quite assured that the fruits were not those of Beauty of Hants, but were most probably those of Mabbott's Pearmain, and they so named them. Having originally named Beauty of Hants Apple when first seen growing at Glenbyre, Southampton, nearly 40 years ago, I am certain that the fruits in question bore no resemblance in their appearance to the fruits of the original tree. No doubt many varieties were sent out under that name. It very often happens at ordinary R.I.S. meetings that the nomenclature both of exhibitors and nurserymen has to be corrected. *A. D.*

SOCIETIES.

SCOTTISH HORTICULTURAL.

NOVEMBER 3.—The monthly meeting of this association was held on this date. Mr. Whytock, the president, occupied the chair, and there was a large attendance of the members. Mr. David Nicoll, Rossie, Forgandenny, read a paper on "Chrysanthemums: the Growing and Showing of Large Blooms for Beginners." Mr. Nicoll confined his remarks entirely to the details of his own methods of cultivation. Twenty-one new members were elected. The paper for the next monthly meeting, to be held on December 11, will be by Mr. R. P. Frotherston, the subject being "To Prune or Not to Prune?"

ASCOT HORTICULTURAL AND CHRYSANTHEMUM.

NOVEMBER 3, 4.—The members of this society held their twenty-third exhibition on the above dates, and the show was in every way a success. The president, Sir Edwin Dunning-Lawrence, Bart., won most of the first prizes in the classes for groups of Chrysanthemums and for vegetables. The weather was fine, and the attendance was numerous.

In the open class for 24 Japanese blooms, distinct, the 1st prize was won by the Hon. Justice SWINLEN EADY, Outlands Lodge, Weybridge (gr. Mr. J. Lock), with good blooms of popular varieties. 2nd, CHRISTIE RESIDEN, Esq., Windlesham (gr. Mr. W. Wilson).

In the class for 18 incurved blooms, Mrs. CHRISTY won the 1st prize easily; 2nd, C. ATKINSON, Praxson, Esq.

Mrs. CHRISTY was awarded the 1st prize for 26 blooms of incurved and Japanese blooms in equal numbers, being the only exhibitor.

In the class for 12 Japanese blooms open only to exhibitors employing a single gardener, C. H. ATYDEN, Esq., Englefield Green (gr. Mr. H. G. Worsfold), was placed 1st.

E. IVENSON, Esq., The Charters, Sunninghill (gr. Mr. F. Capp), showed the best group of Chrysanthemums not disbudded; 2nd, Miss TRICKER (gr. W. Neat).

In the classes for vegetables Sir E. DUNNING-LAWRENCE was the most successful exhibitor.

TORQUAY DISTRICT GARDENERS.

OCTOBER 5.—This association held a most successful Chrysanthemum show in the Bath Saloons, Torquay, on this date. The fine weather resulted in a very large attendance of the public, and as the association has been fortunate in securing fine days for its shows for the past few years, its financial position at the present time is exceptionally strong. Competition was very keen, and the entries exceeded those of previous years, while seven competitors exhibited for the first time. Sir JOHN EDWARDS-MOSS showed (not for competition) a group of Orchids, including many rare species and varieties, among which was a fine white hybrid *Cattleya*.

In the competitive classes the Rev. T. SHEFFSHANKS won the 1st prizes in the classes for 26 Japanese and 12 Japanese blooms. COL. CARY was placed 1st in the class for 24 blooms. The best six incurved Chrysanthemums were shown by Mr. H. A. W. FLETCHER, and Mrs. J. LYON gained the 1st prize for 12 large blooms staged in vases. Mrs. C. W. TAYLOR showed the best six white Japanese, Mrs. J. LYON the best six yellow Japanese, and Col. CARY the best six blooms of any other colour in Japanese blooms. The best four vases of single Chrysanthemums were exhibited by Mrs. J. LYON. The Silver Cup presented by Lady Martha Logan for a group of Chrysanthemum plants was secured by Mrs. RICHARDSON, and the Silver Cup for a group of single Chrysanthemums, presented by Lady Macgregor, by Mrs. J. LYON.

Many classes, which were well filled, were devoted to fruit and vegetables, the chief winner in these being Mr. P. P. ALEXANDER.

The DEVON ROSERY, Torquay, staged a fine collection of plants, which comprised Orchids, Crotons, Begonias, Heaths, Palms, Chrysanthemums, Cyclamen, and a splendid display of fruit came from the fruit farm of this company. Messrs. ROBERT VEITCH & SONS, Exeter, showed a collection of rock and border plants, a pleasing selection of winter-flowering Carnations, berry-bearing shrubs, and single Chrysanthemums. Mr. W. B. SMALE, Torquay, contributed stove and greenhouse plants; and Mr. J. HEATH, Kingskerswell, exhibited Violets in many beautiful varieties.

PUTNEY AND WANDSWORTH CHRYSANTHEMUM.

NOVEMBER 5, 6.—Whatever degree of falling enthusiasm there may be noticed in some districts in regard to exhibiting Chrysanthemums, nothing of the kind in the least affects the exhibitions of this suburban society. The 31st annual show was held in the Town Hall, Wandsworth, on the above dates, and the display was rather better than usual. Not only were the exhibits of Chrysanthemums numerous and of good quality, but the contributions of Begonias, decorative plants and fruit and vegetables added much interest to the event. Begonia Gloire de Lorraine was especially good. There were many more exhibits of these plants than there were prizes offered, otherwise each collection was worthy of acknowledgment. It is remarkable what fine specimens can be grown in pots as small as 5 inches in diameter, and the colour of the protuberance flowers is so bright as to cause the Chrysanthemums to suffer in comparison.

In the class for displays of Chrysanthemums and foliage plants arranged on spaces not exceeding 40 superficial feet, G. P. B. FORKES, Esq., Blenheim, Raynes Park (gr. Mr. C. Pullen), won the 1st prize, and the 1st prizewinner of last year, J. W. CHAMBERLAIN, Esq. (gr. Mr. J. G. Smith), was placed 3rd in this class, but was awarded the 1st prize for a group of miscellaneous plants. Madame STICARE, The Convent, Reochampton (gr. Mr. A. Smith), won the 1st prizes in the classes for (1)

24 cut blooms of Chrysanthemums, (2) 12 cut blooms, (3) six yellow Japanese blooms, and four of the classes for fruit. J. A. YOUNG, Esq., Stone House, West Hill (gr. Mr. G. H. Street), had the best Chrysanthemum plants, and won 1st prizes for Potatoes and a collection of vegetables. Other winners of 1st prizes included JAS. HOOKER, Esq., Putney (gr. Mr. J. Dark), the Dowager Countess of KILMORE (gr. Mr. D. Anderson), and others.

Messrs. JAS. VEITCH & SONS, Ltd., Royal Exotic Nurseries, Chelsea, contributed a large group of choice foliage and flowering plants; Mr. J. RUSSELL, Richmond Nurseries, Surrey, a group of shrubs; and Mr. R. NEAL, Trinity Road, Wandsworth, a group of plants.

WINDSOR CHRYSANTHEMUM.

NOVEMBER 6.—This annual show was held in the Albert Institute, Windsor, and was a success in every way, cut blooms especially being remarkably fine. The flowers that won the King's Cup were probably the finest shown anywhere this season in size, quality of petal, and colour. Fruit and vegetables, also miscellaneous subjects, added to the interest of the exhibition.

CUT BLOOMS.—The King's Silver Challenge Cup was the leading prize in the schedule. It was offered for the best six vases each containing five blooms of a Japanese variety. The Cup must be won three times before it becomes the absolute property of an exhibitor. Last year Prince Hatzfeldt secured the trophy, but this year he was placed 3rd. E. MOCATTA, Esq., Adlestone (gr. Mr. Stephenson), won the trophy on this occasion quite easily, making his second victory. The varieties were Leigh Park Rival (magnificently coloured), Duchess of Sutherland, F. S. Vallis (of enormous size), Reginald Vallis, Lady Talbot, and Walter Jinks 2nd. G. F. FABER, Esq., C.B., M.P., Rush Court, Wallingford.

In the class for 18 Japanese blooms on long stems arranged in a space of 5 feet by 3 feet, with foliage plants of cut foliage, there were five entrants. E. MOCATTA, Esq., again secured the leading position with handsome blooms of popular varieties pleasingly associated with *Spiraea Thunbergii*, golden-leaved Privet, and Asparagus plumosa. Mr. FABER followed closely.

In the class for 12 Japanese and 12 incurved blooms, distinct, a silver Challenge Cup formed part of the 1st prize, for which four growers competed. G. B. FORTESCUE, Esq., Dropmore, Maidenhead (gr. Mr. C. Page), won the 1st prize easily with handsome examples of F. S. Vallis, W. Etherington, Edith Smith, Spender, R. Vallis, Lady Talbot, W. Jinks, and others.

There was a class for 12 Japanese blooms arranged in a vase with any natural foliage, and this made a pleasing display that demonstrated the value of large Chrysanthemums for decorative purposes. Mr. FORTESCUE was 1st with handsome flowers and richly-tinted sprays of *Guedler Rose* foliage. 2nd, Mrs. GOODLAKE (gr. Mr. H. Hearn).

GROUPS OF CHRYSANTHEMUMS in pots were not numerous, although those seen were of much interest. Mrs. E. B. FOSLER, Clewer Manor (gr. Mr. W. Cole), won in the large-flowered section with well-grown plants neatly arranged, and bearing handsome blooms.

Two groups of single-flowered varieties not disbudded made an interesting display, and showed well the value of this section of the flower for decorative purposes. F. RICARDO, Esq., Old Windsor (gr. Mr. E. West), won the 1st prize.

DERBY GARDENERS.

NOVEMBER 6, 7.—This association held an exhibition at the St. James' Hall on these dates. In spite of the difficulties the promoters had to encounter through the hurriedly-arranged show, the parent society having met with disaster, the exhibition was successful. Decorative exhibits were abundant; cut blooms were, however, not numerous, the flowers of local growers having suffered from damping. The groups of Chrysanthemums made an effective display. Sir EDWIN ANNS (gr. Mr. Daimie) secured the 1st honours, being closely followed by Councillor FEENE.

Table decoration presented a charming sight.

the 1st prize being taken by Mrs. FLINT. Table plants exhibited by Mr. J. EVANS, Haddesden Hall, were very choice; likewise bouquets staged by Mr. J. WOOD.

The Earl of HARRINGTON, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre), showed a collection of fruit, the display being a great attraction. Mr. SHAMBERG put up a splendid group of Carnations, edged with Cyclamen; also a group of Begonias. Mr. JOE KING furnished many decorative flowering and foliage plants.

The leading class for cut blooms was one for 12 Japanese Chrysanthemums, the premier position being won by Mr. J. EVANS; 2nd, Mr. F. MEAKIN. Mr. EVANS also led in the class for 12 mixed varieties. The arrangements were admirably carried out by Mr. W. Garton, the hon. secretary.

GLOUCESTERSHIRE FRUIT AND CHRYSANTHEMUM.

NOVEMBER 9.—The 45th annual exhibition of the Gloucestershire Root, Fruit and Grain Society was held on the above date in the Corn Exchange, Gloucester. As showing the rapid strides made by this society in the West of England, it may be stated that in 1891 there were only 50 classes in the schedule and 300 entries. On this occasion there were 116 classes and nearly 700 entries.

In the classes for Chrysanthemums the chief prizes were won by Mr. JAS. HORLICK, Cowley Manor (gr. Mr. J. Maddocks), Sir HUBERT PARRY, Highnam (gr. Mr. H. Berry), and Mr. W. NEATH BAKER (gr. Mr. J. Alpin).

The fruit classes were particularly well filled, and some magnificent specimens, both of culinary and dessert fruit, were shown. In the Apple and Pear classes the principal prize-winners were Messrs. D. PHELPS, Tibberton; Col. HENRY, Ledbury; M. K. M. POWER, Ross; A. HARRIS, Quedley; W. G. CANNING, Hartpury; JAMES HUTCH & SON, Shurdington; W. S. R. COX, Koch; Sir WILLIAM STANLEY, Bart., Stanley Park; J. R. BENNETT, Claxhill; Sir WILLIAM WEDDERBURN, Bart., Meredith; and Sir HUBERT PARRY.

The champion pear, a silver cup presented by Mr. Henry Terrell, K.C., awarded to the competitor gaining the highest number of points, was won by Mr. H. DENT, Brocklehurst, Sudeley Castle.

WEST OF ENGLAND CHRYSANTHEMUM.

NOVEMBER 10.—This society held an extremely successful exhibition in the Guildhall, Plymouth, on this date. The cut blooms attained a high standard of merit. In the premier class for 48 Japanese blooms the competition between Mr. W. LORRY and Terrell, K.C., awarded to the competitor gaining the highest number of points, was won by Mr. H. DENT, Brocklehurst, Sudeley Castle.

NOVEMBER 10.—This society held an extremely successful exhibition in the Guildhall, Plymouth, on this date. The cut blooms attained a high standard of merit. In the premier class for 48 Japanese blooms the competition between Mr. W. LORRY and Terrell, K.C., awarded to the competitor gaining the highest number of points, was won by Mr. H. DENT, Brocklehurst, Sudeley Castle.

The principal prize-winners in the competitive classes were Mr. W. GOLDFEN, Exons, of Lady ASHBURTON, the Rev. T. SHEEHAN, the Rev. S. BARKING-GOULD, Messrs WEBBER & SON, Mrs. BAINBRIDGE, Mr. J. HANNAFORD, Mr. C. BOWEN, Mr. C. FINCH, and Dr. BREKE.

The chief prizes for fruit and vegetables were won by Mr. B. H. HILL, but the Earl of MORTON, General Sir R. BOURKE, the Earl of DEVON were also winners in the fruit classes.

Messrs. ROBERT VULCH & SON, Exeter, showed a collection of winter-flowering Carnations, also many berry-bearing shrubs and other plants. The DEVON ROSERY, Torquay, staged a fine display of Apples. Messrs. HEATH & SON, Cheltenham, exhibited a representative collection of scented-leaved Pelargoniums, also Orchids and Carnations.

CORN EXCHANGE CHRYSANTHEMUM.

NOVEMBER 11.—The annual exhibition held on behalf of the funds of the Corn Exchange Benevolent Society took place on this date in a room adjoining the Corn Exchange, Mark Lane, London. There was a fair number of exhibitors, but the competition was not so keen as could be desired.

In the class for 12 Japanese blooms, distinct, the 1st prize was worthily awarded to E. MOCATTA, Esq., Woburn Place, Addison-st. (gr. Mr. Thos. Stephenson) for a very fine set of blooms, consisting of Lady Talbot, Mrs. W. KNOX, Leigh Park Wonder, Reginald Vallis, and other important varieties. The group was awarded a Silver Challenge Cup. 2nd, W. R. CLARKE, Esq., Debden Hall, Loughton (gr. Mr. F. King). There were six competitors in this class.

The keenest competition was in the class for six large Japanese blooms arranged in a vase. There were nine exhibitors, and the 1st prize was secured by C. B. GABRIEL, Esq., who had good blooms of F. S. Vallis; 2nd, WICKHAM JONES, Esq., South Norwood.

For a collection of single Chrysanthemums, arranged in a vase, E. MOCATTA, Esq., won the 1st prize.

ALFRED BOVILL, Esq., Dunmow, was awarded the 1st prize for a basket of fruit. The best black Grapes were shown by F. W. SMITH, Esq., Duneevan, Outlands Park (gr. Mr. H. Hasell).

READING CHRYSANTHEMUM.

NOVEMBER 11.—The usual autumn show was held in the Town Hall, two large rooms being occupied by the exhibits. In each case in the competing groups the plants and flowers were packed much too closely and stiffly. Only two large groups were in competition for the Challenge Cup, the first place being taken by the President, S. B. JOEL, Esq., of Maiden Erlegh (gr. Mr. Johnson), who had much the better flowers; 2nd, C. E. KEYSER, Esq., Aldermast-on Court (gr. Mr. A. Galt). There were three smaller groups, each arranged too solid and most maristic.

Messrs. SUTTON & SONS set up a large group of single-flowered Chrysanthemums raised from seed sown last spring, the plants being shown in carrying numbers of light, elegant blooms. There were several groups of Zonal Pelargoniums in small pots arranged on a table; the best of these came from Lady COOKE, Reading (gr. Mr. J. Wynni). In competition for prizes offered by Messrs. Sutton & Sons for seedling-raised Chrysanthemum plants, the first of these was taken by Mr. PERKINS, of Greenlands Gardens, Henley-on-Thames.

Cut blooms.—Very fine and well-finished blooms were the 24 mixed Chrysanthemums shown by Mrs. GIBBIE, Windlesham (gr. Mr. W. Wilson). A. TAYLOR, Esq., Leatherhead (gr. Mr. W. Mease), won the 2nd prize with larger flowers that lacked refinement. For 12 mixed blooms C. T. CRAWN, Esq., Billingsbear Park (gr. Mr. Ashman), was placed 1st. Mr. MEASE won in the class for one variety having fine blooms of Clara Wells. The Silver Medal given by S. B. Joel, Esq., for the best flower in the show was awarded to a specimen of the variety *W. H. CURDS*. Japanese blooms were shown in large numbers, the best in the class for 24 blooms being shown by A. C. HANMERLEY, Esq., Bourne End (gr. Mr. Waller). He had capital flowers of Leigh Park Wonder, J. F. DENNIS, Mme. Carnot, W. A. Etherington, Reg. Vallis, and other popular kinds. 2nd, Mr. MEASE. For six Japanese blooms of one variety G. W. ABRES, Esq., Mortimer (gr. Mr. Sherlock), was 1st, having fine F. S. Vallis. Mr. WILSON set up the best 12 Japanese blooms, while Mr. WALLER was an easy 1st in the class for six vases of large blooms. Twelve bunches of single Chrysanthemums formed a strong feature. Mr. A. C. NICHOLS, of Stratfield-say

Gardens, secured the 1st place with a very bright display. 2nd, Mr. SHERLOCK.

Fruit formed a very large feature at this show, and the competition was generally good. Mr. NICHOLS was 1st in most of the Grape classes. Mr. COOKE won the 1st prize for Lady Downes variety and also 2nd prize in three other classes. Dessert Apples were shown in great numbers, Mr. JOHNSON, Mr. NICHOLS, Mr. ASHMAN, and Mr. F. SCUTTER being prominent exhibitors.

Mr. GARDNER put up the finest eight dishes of Pears, having excellent samples for a rather bad Pear season; and H. F. SUTTON, Esq., Reading (gr. Mr. Wicks), had the best four dishes of these fruits.

Mr. C. FOSTER, University College Gardens, arranged a collection of singularly beautiful Apples, and some cut Chrysanthemums arranged in vases. Floral decorations came from Mr. G. PHIPPS, Mr. S. J. VINDAR, and Messrs. POWELL & SONS, all of Reading.

WOLTON CHRYSANTHEMUM.

NOVEMBER 11.—The tenth annual show of this society was held in the Church Hall, which is an admirably-lighted building.

The entries were slightly lower than usual, but in some classes the quality was of the best. This was especially noticeable in the class for large cut blooms, in which five exhibits were staged.

W. TON, Esq. (gr. Mr. G. Eaton), won the 1st prize in the class for 24 Japanese Chrysanthemums in not fewer than 18 varieties with excellent blooms, including Mrs. C. Penfold, for which he received the N.C.S. Certificate as being the best Japanese bloom in the show. The other prizewinners in this class were Lieut.-Col. J. B. GASKELL (gr. Mr. J. Stoney) and THOS. CLARKE, Esq. (gr. Mr. J. Clarke). The best 18 blooms of Japanese varieties, distinct, were shown by Sir W. H. TATE, Bart. (gr. Mr. G. Haigh), while in the class for 12 varieties P. W. BAKER, Esq. (gr. Mr. T. Keightley), was placed 1st.

Mr. J. STONEY won the leading position for 18 incised varieties, but Mr. J. CLARKE, who was 2nd, had the premier bloom in his example of Buttercup.

For nine vases of single varieties, nine flowers in each vase, Mr. H. HOWARD was awarded the 1st prize for fresh, well-grown blooms, but their beauty was somewhat marred in their being staged too high. Mr. G. EATON won the 2nd prize in this class with a charming lot.

Mr. W. Wilson (gr. to W. CUNNINGHAM, Esq.) led in the class for three vases of single varieties.

Chrysanthemums in pots are always shown well at this exhibition. For three Japanese plants of Chrysanthemum Mr. W. WILSON secured the premier award; also for one incised, one reflexed, and one pompon variety. The best plant of a variety of single Chrysanthemum was won by A. EAKLE, Esq. (gr. Mr. T. Hitchman); while the best plant of an Anemone flowered variety was shown by Mr. T. KEIGHTLEY.

In the classes for miscellaneous plants the principal prize-winners were Mr. T. HITCHMAN, Mr. G. HAIGH, Mr. G. HAIGH, J. W. HUGHES, Esq. (gr. Mr. J. McColl), Mr. G. EATON, and Mr. STONEY.

In the fruit classes the best black and the best white Grapes were shown by Col. R. IRELAND-BLACKBURN (gr. Mr. A. Evans). This exhibitor also secured the leading award for three dishes of dessert and three dishes of culinary Apples, also for one fish of stewing Pears.

Mr. T. KEIGHTLEY showed the best collection of vegetables.

CHESTER PAXTON.

NOVEMBER 11, 12.—The 20th annual exhibition of this society was held in the Town Hall, Chester, on these dates. The number of individual exhibitors and also the number of entries exceeded those of previous years, and the attendance of the public was satisfactory. The 1st prize for a group of single Chrysanthemums was won by F. B. SUMMERS, Esq., Bache Hall (gr. Mr. E. Stubbs), last year's 1st prizewinner. Dr. LAWRENCE, of the County Asylum, Leasland 2nd. The president of the society is J. GIBBINS, Esq. (gr. Mr. T. Gibb); he awarded the 1st prize for a group of mixed Chrysanthemums; 2nd, Mr. JOHN M. SPOFFORD,

Tattenhall (gr. Mr. Green). Only one entry was received in the class for a group of Japanese and inc. varieties, the exhibitor being Mr. E. STUBBS, Bache Hall. The group was awarded the 1st prize. Some excellent cut blooms of Japanese and inc. varieties were shown, but the number of single varieties exceeded these considerably. The Champion Prize and Medal for the best 24 dishes of Apples was awarded to Mrs. PITCAIRN CAMPBELL, 'Christie' Hall (gr. Mr. John Weaver); 2nd, Mr. J. SAUNDERSON. In the cottagers' class some excellent Apples were shown. Trade exhibits of Chrysanthemums were put up by Messrs. DICKSONS, LTD., Chester; Messrs. CLIBRANS, Oldham; Messrs. McHATTE & CO., Chester; Mr. F. W. DUTTON, Chester, and Mr. JOHN KIRK.

BRITISH GARDENERS' ASSOCIATION.
(LONDON BRANCH.)

NOVEMBER 12.—The third monthly meeting of the winter session was held at Carr's Restaurant on this date, Mr. E. F. Hawes presiding. It was resolved at the general meeting that all members of this branch should contribute 1s. annually to the Journal Fund. At the close of the ordinary business a paper entitled 'Famous Old-time Gardeners,' illustrated by line-drawings, was given by Mr. J. Harrison Dick.

ANCIENT SOCIETY OF YORK FLORISTS.

NOVEMBER 11, 12.—The twenty-ninth annual Chrysanthemum show held in conjunction with this society took place on these dates. Taking the exhibits as a whole, they compared very favourably with those of previous years. The building at York in which this show is held is very suitable for the purpose. The floral exhibits are arranged on the ground floor, and the fruit and vegetables in the galleries.

In the class for a group of Chrysanthemums, interspersed with other foliage plants, there were four competitors, two of the exhibits being very good. The 1st prize was awarded to the exhibitor, Messrs. HARRINGTON (gr. Mr. Hanchant), the exhibit being a very fine one. The 2nd prize also went to an exhibitor from Harrogate, Mr. S. SPENCER (gr. Mr. Pettinger), whose plants forming the background were not so good as his Chrysanthemums.

For a group of Chrysanthemums arranged for effect the 1st prize was awarded to Mr. J. W. HIELDS, Acomb, York, for a capital exhibit of well-grown plants. The same exhibitor won the 1st prize in a class confined to amateurs for a group of plants. The next class was for a pillar group of Chrysanthemums, a somewhat novel but artificial arrangement, and one that it is only possible to stage in a high building. Messrs. THEAKSTONE & SONS, florists, York, were awarded the 1st prize with a very effective exhibit; 2nd, Mr. G. COTTAM, Cottingham, Hull. There was good competition in the classes for incured Japanese, and single Chrysanthemums as pot-grown plants, though the exhibits were not up to the standard of some few years ago. Mrs. GURCH (gr. Mr. H. G. Harte, York), showed well-grown plants in these classes.

The exhibits of cut flowers were very good, especially in the classes for Japanese varieties. For 36 blooms the Marquis of NORTHAMPTON (gr. Mr. Searle) won the 1st prize with a fine array of flowers of leading varieties; 2nd, Mr. W. IGGULDEN, Froise, Somerset. For 18 blooms in not fewer than 12 varieties the Earl of FEVERSHAM (gr. Mr. Williams) was placed 1st. He also secured the same position in the classes for 12 and 18 blooms in one variety. Capt. LAYCOCK, Wiseton Park, Bawtry (gr. Mr. Musil), was also successful exhibitor in these classes.

The exhibits of fruit were, on the whole, very good, and Apples in particular. For six bunches of Grapes in three varieties Lord HOTHAM, Dalton Hall, Hull (gr. Mr. Jackson), was a good 1st with Black Alicante, Mrs. Pearson, and splendid bunches of Muscat of Alexandria. The same exhibitor was 1st in the class for six dishes of dessert fruits. For two bunches of Black Grapes the Hon. F. F. Wood (gr. Mr. Daves) was awarded the 1st prize for Gross Colmar. Lord HOTHAM won in the class for white Grapes.

There was keen competition in the classes for

Apples and Pears, Capt. LAYCOCK, the Marquis of NORTHAMPTON, Lord DEKMORE, Hesthington, York (gr. Mr. Goddall), and Mr. J. BROWN and (gr. Mr. Hathaway) being the most prominent exhibitors.

The vegetables were of good quality, but they were not staged so tastefully as might be desired.

STIRLING CHRYSANTHEMUM.

NOVEMBER 12, 13.—The 19th annual show of the above society took place in the Albert Halls, Stirling, on these dates. Compared with those of former years, the exhibition showed a great advance in the numbers and general excellence of the exhibits. The entries were 80 in excess of those of last year. The lesser hall was requisitioned to accommodate the displays of decorated dinner tables, amateurs' plants, and vegetables.

Mr. STEWART, Dunkeld, secured the premier award of the show, the Hon. President's Cup, in competition with six other exhibitors. Last year's cup-holder, Mr. MORTON, Cullen House, Banff, followed closely, and Mr. D. CARMICHAEL was placed 3rd. Mr. JENKINS, Aberdeen, was the most successful amateur competitor.

A large number of exhibits of plants was seen, and competition in this section was unusually keen. Mr. JENNER, a Stirling amateur, secured the Corporation Cup with four well-grown specimens; 2nd, Mr. WOOD, and Mr. GRAY 3rd. Mr. GRAY led in most of the other classes for plants.

Fruit was well staged, especially fine being Apples. Mr. MORTON showed the best dessert Apples, and Mr. BLACKLOCK, Blairdrummond, was placed 1st for culinary varieties. Mr. RITCHIE won the first prize for Pears, and this exhibitor won three 1st prizes in the Grape classes. Mr. RITCHIE is retiring from his position at Polmaise, having had the care of these famous fruit gardens for more than 30 years.

VEGETABLES.—Mr. JOHN OGLIVIE, Larbert, secured the premier place for a collection of vegetables. In the amateur classes Messrs. JENNER and CARRIGAN, Gargunnoch, were the principal leaders.

HONORARY EXHIBITS were staged by Messrs. DRYMOND & SONS, Stirling, who showed a number of named varieties of Apples. Mr. JOHN CRAIG, Stirling, flowering and foliage plants, also floral devices. Mr. ROGER, Stirling, showed decorative foliage plants. Mrs. TASKER, Stirling, exhibited 40 varieties of Chrysanthemums, grown outside. Mr. JENNER staged large plants of Chrysanthemum Ladysmith.

MANCHESTER ROYAL BOTANICAL AND HORTICULTURAL.

NOVEMBER 12, 13, 14.—It is not pleasing to record a decline in the quality of the old-established Chrysanthemum show held by this society, but the falling off was very pronounced. There was an entire absence of "trade" exhibitors.

There were 20 classes provided for in the schedule, but the entries did not average three in each class.

The principal prizewinners were JAS. BROWN, Esq., Heaton Mersey; the Executors of Lady ASHBURTON, Ronisey, Hants; W. IGGULDEN, Froise; Mr. G. W. DRAKE, Cardiff; Lt.-Col. GASKELL, Liverpool; Sir W. W. TATE, Liverpool; PANTIA RALLI, Esq., Epsom; F. ELLIS HESWALL, Esq., Cheshire; and Sir GILBERT GREENALL, Warrington.

NATIONAL CHRYSANTHEMUM.

NOVEMBER 16.—A meeting of the Executive Committee took place on this date at Carr's Restaurant, Strand, Mr. Thomas Bevan presiding.

An interim financial statement was presented showing a balance in hand to date. The following gentlemen were elected as judges for the December show: Japanese and inc. buds, Messrs. Wells and Prickett; other cut blooms, Messrs. Howe and J. H. Witty; decorative classes and groups, Messrs. Fellows and H. J. Jones. It was arranged that the dinner of the Floral Committee should take place at Carr's Restaurant, on December 7. Friends are invited to this festival. Twelve new Members and one Fellow were elected.

MARKETS.

COVENT GARDEN, November 18.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week ending on the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and they may fluctuate not only from day to day, but occasionally several times in one day.—E.D.]

CULTURE OF FRUIT TREES IN POTS.

AN Orchard house in which all kinds of dessert fruits both in and out of season can be produced is a necessary adjunct to gardens having any pretence to completeness. This provision is by no means an expensive one, and it comes within the reach of the owners of the small and medium-sized gardens, seeing that houses suitable for the culture of fruit-trees in pots vary in prices according to the requirements of individual proprietors of gardening establishments, and may be obtained from £10 upwards. Those in possession of an unheated Orchard house may obtain supplies of ripe Apples, Apricots, Peaches, Pears, Plums, Nectarines, Cherries and Figs, not to mention Gooseberries and Currants, a few weeks earlier than the same kinds of fruits would ripen out-of-doors, and still earlier in structures in which a flow and return 4-inch hot-water pipe is provided. But it is more especially to the owners of gardens situated in the Midland and Northern counties, where the climatic conditions are un-

favourable to the production and ripening of the above-mentioned fruits out-of-doors, that the possession of such a house is most essential.

A span-roofed house extending from north to south is, all things considered, the most suitable kind of structure for the culture of pot-fruit trees, seeing that the trees equally share the benefit of the sunshine throughout the day from the end of March onwards. The length, width, and height of span-roofed houses may vary, according to the requirements, from structures measuring 12 feet by 8 feet, to others 200 feet long, 30 feet wide, and 15 feet high from floor line to bottom of the ridge. However, a suitable-sized house may be found in a structure 20 feet wide inside the walls, 12 feet high from floor-line to apex, and 4 feet high to the eaves, including 2 feet 9-inch brick wall and front ventilating sashes 2 feet deep and about 3 feet wide, so as to correspond with the width of the two bays immediately above them in the roof. Span-roofed houses should, as a matter of course, be provided with two sets of front and roof ventilators on either side. A house of the length indicated will accommodate five rows of young pot-trees standing on the ground space between the side pathways, one row of the taller trees placed under the ridge, two of the smaller ones on either side at a little over 2 feet apart, and one row on the space between the front ventilators and the pathway, the trees in each succeeding row being set anglewise to those in the preceding row, so as to allow the individual trees room to develop, subsequently affording more standing room in proportion to the extension of the growth of the trees. Bush and pyramidally-trained trees are capable of yielding heavy crops of fine fruit at the age of three to five years from the bud and onwards, with their roots in pots ranging from 9 to 12 inches in diameter. Owing to an annual extension of branch growth many of the trees will require to be shifted into pots 15 and 18 inches in diameter. A few cordon Pears, Apples, Plums, Apricots and Cherries may be profitably grown among the bush and pyramid trees, as the single upright stems take up very little room, and, moreover, when studded with bright-coloured ripe fruits, they are very effective.

Fruiting trees of all the kinds mentioned above growing in 9-inch and 11-inch pots and well furnished with fruit buds may generally be obtained from any nurseryman having a reputation for the growth of fruit-trees in pots, at the following prices:—Apples, 3s. 6d., 5s. and 7s. 6d. each; Apricots, 7s. 6d. to 15s. each; Pears, 3s. 6d. to 7s. 6d. each; Plums, 3s. 6d. to 10s. 6d. each; Peach and Nectarines, 7s. 6d., 10s. 6d., 15s., to 21s. each; Figs, 5s. 6d. to 10s. 6d. each.

Varieties of the several kinds of fruit that are known to fruit well in pots should be selected for pot-culture, although for the matter of that, most if not all, cultivated varieties of the respective kinds, even shy-bearing varieties, will be found to fruit freely enough when subjected to pot-culture, as with such restricted root-space the trees necessarily make short-jointed growth and become well furnished with fruit buds. Mention may be made of a few selected varieties of the respective kinds for the guidance of beginners and amateur fruit-growers who may contemplate the culture of fruit-trees in pots. *Apples*: Allington Pippin, Bismarck, Baumann's Red Reinette, Beauty of Bath, Astrachan Red, Cox's Pomona, Cox's Orange Pippin, Empera Alexander, James Grieve, King of the Pippins, Cellini, Lady Sudeley, Peasgood's Nonesuch, Wealthy, Worcester Pearmain and Lane's Prince Albert. *Apricots*: Moorpark, Hemskerk and Shipley. *Cherries*: Bigarreau Napoleon, Black Eagle, Black Tartarian, Early Rivers, Governor Wood, May Duke and Werder's Early Black. *Figs*: Brown Tur-

key, Pingo de Mel, Violette Sepor, Negro Largo and White Marseilles. *Grapes*: Black Hamburgh, Buckland Sweetwater, Madresfield Court, and Foster's Seedling. *Peaches*: Alexander, Amisen June, Hale's Early, Crimson Galande, Dymond, Goshawk, Royal George, Violette Hâtive, Princess of Wales, and Sea Eagle. *Nectarines*: Cardinal, Early Rivers, Erluge, Lord Napier, Pineapple, Humboldt and Victoria. *Plums*: Bergamotte Espere, Beurré Bachelier, Beurré d'Amant, Peurré Ballet Pere, Williams's Bon Chretien, Doyenné Bouches, Le Lectier, Marie Benoist, l'Imaison Doussich, and Doyenné du Comice. *Plums*: Bryanston Gage, Cox's Golden Drop, Denaston's Superb, Green Gage (old), Jefferson, Red Magnum Bonum (white), Late Transparent Gage, Swan, Oullie's Golden Gage, Reine Claude de Bayay, and Washington.

Maiden trees of Apples, Cherries, Pears and Plums may be purchased from a fruit-tree nurseryman at from 1s. to 1s. 6d. each, and Apricots, Peaches and Nectarines from 1s. 6d. to 2s. 6d. each. The trees should be obtained from the nursery as soon as they have shed their leaves in the autumn. The roots should be shortened prior to being potted into pots 7 or 8 inches in diameter. Clean pots should be used for this purpose, and in these should be placed a piece of potsher (hollowside downwards) over the hole in the bottom of each pot, following with smaller pieces and finishing with potsherds passed through a ¼-inch meshed sieve to fill in the chinks, covering these with a layer of thin turf, grass-side downwards, to secure perfect drainage. Pot the trees into these pots in a compost consisting of, say, four bushels of good turfy loam, well broken up, one of old lime, or plaster rubble, one peck each of some good plant food and charcoal, and an 8-inch pottal of new soil, mixing the whole well before using. In the process of potting the compost should be rammed well round the roots, so as to make the soil firm up to within an inch of the top of the rims of the pots. This done, the pots should be stood closely together on a bed of cinders and ashes out-of-doors where water is not likely to accumulate, and the plants should be well watered to settle the soil about the roots. On the approach of winter the pots should be protected from the effects of frost by a covering of tree leaves and stable litter, the latter being added to prevent the leaves being disturbed by the force of the winds. Any young growths which the trees may have made during the current year should be shortened in December. The trees should be allowed to remain in their winter position during the ensuing year, taking out every other potted tree when growth has commenced in the spring, and standing them in a like position, about 9 inches apart, in order to afford proper space for the trees to develop a sturdy, healthy growth. The foundation of healthy fruitful trees should be made by judicious disbudding and pinching of the growths, careful watering and syringing overhead. After the soil is permeated with young roots, surface dressings of Peruvian guano or some other approved chemical manure should be given immediately before applying clear water at the roots, and this should alternate with waterings of diluted liquid manure three or four times each week. About the middle of September the trees should be turned out of the pots, the balls of soil and roots pricked round slightly with a pointed stick and then repotted into pots 9 inches in diameter. The pots should have 2 inches of potsherds placed in the bottom of each for drainage in the manner indicated above, also using the same kind of mixture as recommended for a rooting medium. In potting, ram the compost well round the balls, using flat rammers to work the soil into the space between

the edge of the pots and the roots, and blunt ones to make the soil firm on the top up to within an inch of the top of the rim. The pots should then be placed on a bed of cinders and ashes, as previously recommended, and watered, syringing the trees overhead two or three times each day, in order to freshen up the foliage and preserve the leaves on the trees until the roots have taken hold of the soil, and with this object in view the trees should be shaded with a strip of tiffany during sunshine for a week or ten days, by which time the roots will have pushed into the compost. On the approach of winter the pots should be protected from the effects of frost as advised above. If the disbudding and pinching of the shoots retained to form the tree and produce fruit the following year has been judiciously attended to during the previous April and the four following months, very little winter pruning will be necessary, further than the shortening of a

THE GENUS EUPHORBIA.

COMMONLY known as Spurge-worts, the members of this large and extensive genus are widely distributed over the world, occurring in large numbers in tropical and sub-tropical Africa, also in Europe, India, equatorial America, and the Canary Islands. The species vary greatly in habit. They are represented in this country by about a dozen annual or perennial herbs, several of which are common garden weeds. Most of the species, however, are of succulent habit, and vary in size from fleshy herbs a few inches high to large trees 30 feet and upwards in height. They all possess a powerful acrid and poisonous milky juice, which contains active medicinal properties.

In a genus having such a wide distribution, it is perhaps not surprising that there exist great differences in the structure of the stem and

of bright scarlet bracts. Another species, *E. splendens*, having very thorny stems, was formerly largely grown as a decorative warm-greenhouse or stove plant, but is now comparatively seldom seen. Of hardy species the best is *E. epithymoides*, a beautiful herbaceous perennial plant, with yellow flowers and numerous light-yellow bracts, surmounting the tops of the numerous herbaceous shoots. A pretty annual species well worth a place in the herbaceous border is *E. variegata*, in which the upper leaves, together with the floral bracts, are white, and remain in good condition from one to two months during late autumn. The collection in the Succulent House at Kew is probably the richest in point of numbers in cultivation. Numerous grand specimens are there planted out in a stony border in the centre of the house. One specimen of *E. Tirucalli* has formed a large tree, and, having long since

FIG. 159.—GROUP OF EUPHORBIAS SHOWING DIVERSITY IN HABIT.

- 1, *E. mamillaris*; 2, *E. corulea*; 3, *E. cervicornis*; 4, *E. Candelabrum*; 5, *E. pereskiaefolia*; 6, *E. grandicornis*; 7, *E. Caput-Medusae*; 8, *E. ornithopus*; 9, *E. Nivalis*; 10, *E. parviamma*; 11, *E. bubalina*; 12, *E. procumbens*; 13, *E. collettoides*; 14, *E. Berthelotii*; 15, *E. uncinata*.

[Photograph by C. F. Raffill.]

growth here and there in order to get the trees into symmetrical shape before removing them to the glass structure wherein they are to fruit.

In the following winter the growths of Apples, Apricots, Pears, Plums and Cherries will require to be spurred in more or less, and the third year it will be necessary to shift them into 11-inch pots, the work being a repetition of that previously described. The pots when placed in the house in which the trees are to fruit should be stood in each case on two bricks, the latter being placed clear of the hole in the bottom of the pot, so as to afford a free passage for the water applied at the roots, and at the same time preventing the soil becoming waterlogged at any time. H. W. Ward.

(To be continued.)

leaves. In outward appearances some of the species resemble members of the Cactus family, also species of *Ceropegia*, *Stapelia*, *Pelargonium*, *Cotyledon*, and *Crassula*. The structure of their flowers has remained fairly constant, and the milky juice furnishes a ready means by which Euphorbias may be distinguished from most other plants of similar habit.

Although the genus as a whole possesses but little decorative value, there are several species which are cultivated for the sake of the beautiful bracts which surround the otherwise inconspicuous flowers. The best known of these is *E. pulcherrima*, commonly known in gardens under the name of *Poinsettia pulcherrima*, with its large, bright red or vermilion bracts, and the almost equally well-known *E. fulgens* (syn. *E. jacquiniiflora* of gardens), with its wreaths

reached to the roof, has frequently been pruned back. A gutta-like substance is obtained from this plant in Angola and Loanda, which is used in some industries as a substitute for gutta-percha. A large clump of *E. Candelabrum* is to be seen near the centre of the house, forming erect stems reaching to the roof, without a branch. A young plant is depicted in the accompanying illustration (No. 4). This species forms an erect tree, 30 feet or more in height, in its native habitat. The bulk of the collection, however, are grouped together on a stage at the north end of the house. Here are to be seen the whole of the specimens illustrated, together with a large number of others. They furnish an object-lesson in "divergence from an ancestral type" such as can hardly be equalled in any other garden in the world. C. F. Raffill.

* PRONUNCIATION OF PLANT NAMES.

PRONUNCIATION.—In the first word in each line the accent () is short; () is long.

In the second word vowels are to be pronounced as—
arise, ät, äge, ärt, äir, äll
end, ägg, äat, äer, äwe
in, it, ite, sir
on, ötter, öwe, ör, dö, öwl, öll
us, ütter, öse, örn
"ch," as in chin; "th," as in thin
"s," as in soft; "f," as in far
"g" as in go.

All other letters are unmistakable.

* The first instalment appeared in the issue for September 26.

ORCHID NOTES AND GLEANINGS.

VANDA CÆRULEA CHARLESWORTHII.

THE beautiful blue-flowered *Vanda cœrulea* is one of the most charming Orchids, but, at the same time, attempts have been made to obtain an albino. In the variety illustrated at fig. 160, all the colouring in the flower is eliminated. *Vanda cœrulea* Charlesworthii is noteworthy because it is the first wholly white-flowered variety of this species. In all other respects the flowers are similar to those of the type. The entire absence of colouring is remarkable, especially as the lip of this *Vanda* is usually of a very pronounced shade of blue. When exhibited at the meeting of the Royal Horticultural Society on October 27 last by Messrs. Charlesworth & Co., Hayward's Heath, the Orchid Committee awarded the variety a First-Class Certificate.

TRICHOCENTRUM ALBO-PURPUREUM.

This rare and pretty little Orchid has been in flower for some weeks in the Orchid Nurseries of Mr. H. A. Tracy, Amyand Park Road, Twickenham. The plant, which is in a suspended Orchid pan, has oblong-lanceolate leaves about 3 inches in length, the short peduncles bearing one to two flowers, each an inch and a half across. The tawny sepals and petals are tipped with green, the large lip, which is two-lobed at the apex, is white with a large purple blotch on each side of the crest. Mr. Tracy recently imported another *Trichocentrum* from Peru, but only one or two plants survived. The frail little scarlet *Nasonia punctata* also died, but odd plants of *Eriopsis scepterum* and a few other interesting things, including *Sobralia Catleya*, survived.

HOW TO CONSTRUCT COLD CHAMBERS.

(Continued from page 357.)

FOR the storage of bulbs, plants, cut flowers, &c., any one of the arrangements previously described may be utilised, and complete control of both temperature and humidity may be obtained by any of those methods in which the modern refrigerating plant is employed. With cabinets and cold chambers containing ice or freezing mixtures, it is not so easy to maintain a control of the temperature and humidity as with the other apparatus. With compressed air a constant temperature can be maintained with comparative certainty, but it is not so easy to control the humidity. The constant temperature is secured by varying the speed of the compressor. With apparatus in which a refrigerator is used, the temperature is governed by allowing more or less of the liquid refrigerant to pass into the expansion coils. Between the condenser and expansion coils there is a valve fixed, which is very carefully constructed and it gives the engineer complete control over the rate of producing cold from that apparatus. Allowing more liquid to pass into the expansion coils lowers the temperature and increases the rate of producing cold, and *vice versa*. The lower the temperature in the cold chamber the more work the compressor has to perform.

The compressor may be driven by any convenient source of power: an electric motor, a gas or oil engine, or a steam engine.

With ammonia there is another system in which the compressor is replaced by the use of steam. It is known as the absorption system, and depends for its working upon the variation in the quantity of ammonia that water will dissolve at different temperatures. Two vessels are provided, in one of which the water carrying ammonia is heated, the ammonia being driven off, and passing to the condenser, just as from the compressor referred to above. It passes from the condenser to the expansion coils, as in the compression system, and from the expansion coils to another vessel containing water, called

the absorber, in which it is dissolved. In principle the main working is very similar to that described above, the alternate absorption and expulsion of the ammonia taking the place of its compression.

SHOWING WHAT IS GOING ON IN COLD CHAMBERS.

FOR keeping a check upon what is going on in a cold chamber there are several mechanisms at the command of the refrigeration engineer. He knows by the pressure to which the refrigerant gas is lowered in the act of expansion what its temperature is. With each substance employed in refrigeration there is a temperature corre-

below the air in a cold chamber or in the cooling and drying apparatus.

The actual temperatures of the air in each chamber may also be ascertained by means of thermometers fixed in the chambers. They are electrically connected with indicators which can be read in any part of the building, or, if desired, in the proprietor's or manager's house, some distance away. The temperatures may also be recorded upon a chart, similar to the barometer charts that are to be seen in almost every town. The humidity may be tested in the usual way, by wet and dry bulb thermometers fixed in each cold chamber, an attendant going into the chamber

FIG. 160.—A PURE WHITE VARIETY OF *VANDA CÆRULEA*, SHOWN BY MESSRS. CHARLESWORTH AND CO. (FIRST-CLASS CERTIFICATE).

sponding to every pressure, and the gauges which are fixed on refrigerating apparatus have two scales, showing both temperature and pressure, so that the person in charge can tell at a glance the temperature of the refrigerant. It is usually kept at about 10° Fahr. below that of the substance it is cooling. Thus, when the expansion coils are fixed in the cold chamber, the temperature to which the gas is lowered will be 10° below that of the air it is cooling. Similarly, it will be 10° below that of the brine in the expansion tank, and the brine will be kept 10°

for the purpose of examining them; or it can be shown by two electrical thermometers fixed in each chamber, one having the usual wet rag over it, and the indications may be given at any spot that may be desired, just as the thermometric indications are. There are also instruments on the market which give accurate indications of the actual humidity corresponding to any temperature and any difference between the wet and dry bulb, and such apparatus may be fixed in any convenient position.

For the cabinets and smaller cold chambers,

the maximum and minimum thermometers must be employed.

Small cold storage plants are now constructed for the use of butchers, poultrymen, &c., and these would be suitable for stores, such as might be erected for nurserymen in a moderate way of business. They occupy little space, and can be driven either by electricity, gas, steam, oil, or any other convenient source of power.

The writer hopes it will be clear from the foregoing account that, not only is there a wide scope for the use of cold storage in horticulture, but that it is within the reach of every grower and every dealer, large or small. *Sydney F. Walker.*

DEFORESTATION IN NEW ZEALAND.

(Concluded from page 356.)

DARWIN, in the *Voyage of the Beagle*, mentions that he landed on the coast north of Auckland and noted at that time how the Maoris burnt out large areas of forest, which became replaced by Fern-clad wastes. It is no doubt due to their activity that such a large area of soil contains the Kauri gum. That this forest would re-establish itself in some localities, if given a chance, is shown by the clump of young Kauri and *Phyllocladus trichomanoides* to be seen springing up in the gulches on the Nihotupu foot hills. In one enclosure I saw quite a plantation of self-sown young Totara and Maitai coming up very well, but they were rigorously protected against fire by the enlightened owner. Wretched clumps of hundreds of Nikau Palms *Rhopalostylis sapida* are here to be seen, left exposed by the burning of the protecting trees. Like some species of tree Ferns, these Palms can resist fire. This is no doubt due to the storage of water in their tissues, but when once they are exposed to light and wind, the lamina of the leaves does not expand, and the rachis remain vertical as in bud, never assuming the horizontal position. Thus they persist, forming piteous caricatures of the unspoilt trees as seen in the depth of their native habitat, with their graceful spreading habit, rivalling Polynesian forms in size and beauty.

The same story of regrettable devastation is repeated in the Thames Valley, a huge alluvial plain south of Auckland, now cleared from end to end, but formerly clothed with beautiful trees. It was at this spot, on a magnificent tree—a Rimu, I believe—that Captain Cook wrote his name, and that tree was religiously preserved by the Maoris. However, what the savage respected the settler disdained, and the tree was burnt with its compeers.

From Thames, Mangroves (*Avicennia officinalis*) run in for some distance, as the river forms a huge estuarial swamp. Flax (*Phormium tenax*) and Cabbage trees (*Cordyline australis*), associated with Manuka, succeed; then clumps of fire run Kahikatea reveal the natural inhabitants of the soil.

Why clearing has taken place is not apparent, there is no attempt to plant the *Phormium* systematically; and Kahikatea, though a valuable wood, which is perfectly tasteless, and therefore much used at home for making butter boxes and exported to Australia for the same purpose, is apparently only fit to be burnt or cut out. It seems to occur to nobody that the supply of this tree is limited; for the river beds, its natural habitat, have all been cleared, and it only grows singly in the mixed forest.

As the land rises towards the foot hills, the usual Manuka waste occurs, varied by good meadow land where the forest soil was saved by immediate sowing and systematic clearing. Where the land is neglected, Bramble, Gorse and Broom speedily take possession. These hills, which culminate in Te Aroha Mountain, over 3,000 feet, are fortunately reserved; they are rocky and steep, and are still clothed with forest from about a thousand feet upwards. The Nikau Palms can be observed in their full beauty, with the splendid *Cordyline*

insignis as undergrowth, while the beautiful Saxifragaceous *Ixera brixoides*, covered with corymbs of white blossoms, an inch or more in size, is one of the dominant trees. The exquisite crimson Rata (*Metrosideros diffusa*) forms flaming epiphytic splashes against the evergreen background.

Cutting for firewood, resulting in an impenetrable upgrowth of Fern, is steadily encroaching on the mountain slopes.

There are many gold mines in these hills, working and otherwise, with tracks running up to and connecting them with each other. This makes it easier to penetrate the hills than is usually the case in this trackless country. Here immigration again merely results in wholesale burning out, as the bare slopes of what must have been the exquisite Warongamai Valley testify. After Morrinsville on the way to Rotorua, the monotonous Manuka plains which extend down to Lake Taupo begin. A gratifying break occurs round Mamukau, where the

Nothing short of an actual deposit of salt by the evaporation of constantly-streaming water seems to kill it.

The great Weirakei geyser was the only exception which came under my observation. There a mass of *L. ericoides*, which clothed the bank just behind the recurrent column of boiling water, was clipped to an almost Moss-like thickness (see fig. 161).

Round the Blue and Green lakes on the way to Lake Tarawera there is some grateful shade, but clearings by the roadside show a wild growth of Hawthorn and Bramble, which luxuriate everywhere. The latter is supposed to be proscribed by legislation.

There is some attempt made at planting by the Government at Rotorua, but only of Larch and other foreign trees. At Waitapu there is another area in which planting is being tried by prison labour. I believe it was only on the earnest representations of Mr. Cheeseman, whose splendid handbook of the New Zealand

FIG. 161.—A HOT SPRING IN THE WEIRAKEI VALLEY, NORTH ISLAND, N.Z. THE TREES BEHIND THE GEYSER ARE *LEPTOSPERMUM ERICOIDES*.

railway crosses a low range still clothed with some splendid forest, including the lovely Kawaka (*Libocedrus Doniana*), but it is being rapidly stripped of the sound trees by the colony of saw mills established there.

The world-renowned Rotorua is a Manuka waste. That the country was previously a forest dip is shown by the remnants persisting on the top of a hill beyond Ohinemutu, untidy patches of bush on the far side of Rotorua Lake and Kahikatea on the swampland near side, and on some of the promontories and gorges. Here, of course, volcanic activity has much to answer for. Curiously enough, the hot springs, which merely betray themselves in various localities by the steam continuously arising from them, do not affect the growth around. Both *Leptospermum scoparium* and the really charmingly graceful *L. ericoides* fringe the boiling water or muddy area, as the case may be.

Flora has earned him a world-wide reputation in systematic circles, and the lasting gratitude of every botanist visiting the country, that planting of *Podocarpus Totara*, the glory of New Zealand forest, the chosen tree of the Maori for his war canoe, and a splendid wood for all industrial purposes, was attempted on anything like an adequate scale.

A weary day's coaching in blazing sun, loose sand, and driving dust, takes one to Lake Taupo, through nothing but Manuka and bracken, varied sometimes by *Dracophyllum subulatum*, the formation being composed of loose scoria from successive eruptions. By the lake, Broom is encroaching rapidly on the Manuka, and formed a blaze of colour in November. After crossing the lake to Tokaanu the coach drive passes over high, wind-swept Tussock plains (*Poa caespitosa*) and sand ridges. Here again in the gulleys the handsome tree *Nothofagus Menziesii* is to be

seen, and road cuttings show the blackened trunks of trees sticking out of the sand. Ancient forest crowns the hills on each side, but scorched inroads are showing in it. The ridge culminates in the volcano Tongariro, 7,000 feet high, the single cones of the active Ngauruhoe and Ruapehu, with spreading outflows, standing alone.

The forest of the North Island, especially of the northern portion, and on the north-western side is strikingly Polynesian in appearance, as is shown by its varied character, typical undergrowth, and epiphytic luxuriance. Appearances are borne out by pronounced generic affinity, many species even being in common. A greater number of plants, however, are endemic, not occurring elsewhere, and many of the most interesting are purely local in incidence, being restricted to small areas. With the destruction of their environment they also disappear and are lost to science. That this strange outlier of the great Indo-Malayan vegetation region, whose varied types have been a focus of interest to the botanical world, is to be shorn not only of its natural grace, but also of its phytogeographical interest, is an offence to, not a necessity of, civilisation.

One or two generations cannot dissipate a storehouse of natural treasures, fostered by climatic and geographical conditions, without causing irreparable loss, and this fact will soon be proved to the national cost in the altered topographical and climatic conditions which the wholesale razing of forest land invariably entails. *L. S. Gibbs.*

The Week's Work.

THE FLOWER GARDEN.

By W. FIFE, Gardener to Lady WANTAGE, Lockinge Park, Berkshire.

Plants for cultivation under trees.—Sites under the dense shade of trees where grass will not grow satisfactorily may be made to appear attractive if a few loads of leaf-mould or loam are applied to them, and possibly a few pieces of rock, and suitable species afterwards planted. Such pieces include the common kinds of Fern and Heath, also Foxgloves, Primroses, Aconites, and Snowdrops, as most of these plants flower early and mature their growth before the trees develop their full complement of leaves. Certain shrubs also will succeed under the drip and shade of trees. Such are *Daphne Mezereum*, *Euonymus*, *Acubia*, *Buxus*, *Taxus*, *Ephedra*, *Hex*, *Spiraea*, *Prunus*, *Ruscus*, *Vinca*, *Ligustrum*, *Hypericum* (St. John's Wort), and *Hedera* (Ivy).

Flowering shrubs.—Some of the most valuable flowering shrubs for various purposes include *Deutzia crenata gracilis*, *Forsythia suspensa*, *Kerria japonica*, and its double-flowered variety; several species of *Viburnum*, *Hypericum*, *Philadelphus*, *Staphylea*, *Syringa*, *Cydonia*, *Pyrus*, and *Cytisus*.

Protection of tender trees and shrubs.—The best kind of protective material for certain Counters, *Viburnums*, and other tender shrubs is one that affords only partial shade. Branches of Spruce, Fir, or English Yew having a good supply of twiggy shoots answer admirably. A dense covering, such as mats of straw, is not desirable. Upright poles may be driven into the ground at distances of 2 or 3 feet and the Spruce or Yew branches woven round them in the fashion of a basket. Plants growing against walls or upon crevices may be given a covering of the same description, but the branches should not be fixed in such a manner as to exclude light. Dry Bracken fronds may also be utilised for protective purposes, especially in the case of Roses and other plants in beds.

Plants in tubs.—These plants are now under cover, and in beds *Agapanthus*, *Alovia citrodora*, *Myrtus*, and others, which merely require the protection of an unheated house, and the more tender plants, such as *Fuchsia*, *Pelargonium*, and *Hydrangea*. They should not be allowed to dry off, or partially dry off, too rapidly.

Briars for budding Roses.—The present is a good time to collect Briars as stocks on which to bud Roses. Briars with clean stems about 2 inch in diameter and from 3 to 4 feet in height should be selected. Trim the roots of

each plant and put them into rows arranged at distances of 4 feet, putting the stocks 6 inches apart in the row. Tread the soil in about the roots during the planting process, and when this has been done apply a surface dressing of short manure as a protection from frost.

Rose cuttings.—If not already done, cuttings may now be taken off with a "heel" attached. Plant them in rows about 9 inches asunder, and put the cuttings 2 inches apart in the row. They should be made about 9 inches in length and inserted 5 or 6 inches deep. A border with a north or east aspect, containing light and sandy soil, is a suitable site for them.

Herbaceous plants.—In the case of recently formed borders the lifting of plants for the purpose of division will scarcely be necessary, except in a few cases where the weaker species are in danger of being robbed by more vigorous growing plants. Most of the plants may now be cut down almost to the ground level, and when this has been done surface soil may be picked over with a fork, after which mounds of ashes may be placed around tender species as a protection against frost. The whole of the border may be given a good mulching, composed of charred garden refuse and leaf-mould. We are at present replanting *Delphiniums* which have been divided, for division is necessary in cases where varieties of particular colours have to be perpetuated. At the same time *Delphiniums* may be very easily raised from seeds, and when this is done there will have to be the rigorous selection practised before the plants can be employed generally for effect. *Delphiniums* require a rich, mellow loam with some well-rotted manure incorporated with it, and a moderately moist situation. As different varieties vary from 2 to 8 feet in height, suitable plants may be selected for various situations. When planted in beds a distance of from 2 to 3 feet should be allowed between each plant, the greater distances when they are planted in borders.

FRUITS UNDER GLASS.

By T. COOMBE, Gardener to LORD LLANCAOTOCK, The Henric, Monmouthshire.

Late-keeping Grapes.—The time for cutting these Grapes from the vines must be determined by circumstances. If they are allowed to hang upon the rods longer than is necessary they become a drain upon the vines, and the season pruning is inconveniently deferred. Muscats of all kinds, and other Grapes, except the very latest keepers, should be cut, bottled, and stored in the Grape-room early in December. The Grapes will then keep just as well as if they were left upon the vines. Lady Downe's and Gros Colman do not develop their full flavour until the end of December, and they are expected to keep in good condition until April or May. These and also the varieties Appley Towers and Gros Guillaume should not be cut until about the last day in December. Previous to cutting the Grapes, the Grape-room should be well cleansed, the bottles filled with clean water containing a piece of charcoal, and the bottles fixed in their racks. When cutting the Grapes, do not shorten the laterals, but cut them immediately above the bud which will be left for next year. The laterals then being of considerable length, the wood will easily reach to the water contained in the bottle, and the fruit will be held at such a distance that it will not come into contact with the bottle or with the shelf or rack containing the bottle. It is scarcely necessary to add that the greatest care must be taken not to rub the berries. Maintain the atmospheric temperature of the room from 50° to 55°. Ventilate it moderately when the weather is favourable. Keep the bottles filled with clean water, and remove any decayed berries as they appear.

Cherries.—Trees that are planted out or that are growing in pots, but were forced early last season, may now be got in readiness for forcing, as the fruit will be ready to close the house early in December if early fruits are required. Much fire heat is extremely detrimental to Cherries at any stage of growth. For the first fortnight after the house is closed, no fire heat must be employed, but the house may be moderately ventilated when the temperature has been forced to about 55° by sun heat, closing the ventilators again when the temperature falls to 55°. The use of artificial heat must be commenced

very gradually: slightly warming the pipes so that in cold weather the temperature at night, so far as it depends upon fire heat, will not exceed 40°, and during the day 50°. At this stage considerable discretion must be exercised in the syringing or watering of the trees and damping of the paths. In the case of planted-out trees, the borders may be given a mulch of short litter.

Second early Peaches.—The interior of the houses should be thoroughly cleaned, lime-washed and painted, the trees cleaned and trained, and the borders top-dressed as in the case of the earlier house. Keep the ventilators widely open at present. It is a bad practice to keep tender plants in Peach houses while the Peach trees are at rest, as fire heat may then have to be employed, which excites the buds into growth, and when the ventilators are opened subsequently they suffer a check and, in consequence, are apt to fall. Keep the trees in a uniform state of moisture, remembering that dryness will cause bud rotting.

PLANTS UNDER GLASS.

By THOMAS LEVY, Gardener to A. STIRLING, Esq., Keir, Perthshire, N.B.

Allamanda.—Plants of any species of *Allamanda* should now be gradually dried partially off, never allowing this, however, to be carried to such a length as to cause the roots to suffer. The plants should always be kept in a stove temperature, and as a rule the moisture which is prevalent in a plant stove is sufficient to keep the roots in a proper condition without direct applications of water. The shoots may be pruned back to three or four eyes of this season's growth, unless it is necessary for the plant to cover a greater amount of space.

Clerodendron Balfourii requires to be treated similarly to *Allamandas*, except that in pruning the shoots should be merely thinned out, as those made this year will produce flowers next season.

Bougainvillea glabra.—This plant should now be resting in a cool house. It will submit to very severe pruning if the wood has been well ripened.

Begonia Gloire de Stouan.—This glorious winter bloomer is now coming into flower, and should therefore be placed in a rather dry atmosphere as the metallic-looking leaves soon show evidence of decay if any of the fallen flowers rest upon them for some time and the atmosphere contains much moisture. The plants need to be fumigated once or twice each month for the destruction of yellow thrips. This *Begonia* is a gross-feeding plant and needs frequent waterings with liquid manure, and an occasional sprinkling of an artificial manure on the surface of the soil during the flowering season.

Euphorbia (Poinsettia) pulcherrima.—The plants are now developing their bracts, and should be liberally fed with liquid and artificial manures. Keep the plants in a position close to the glass, and turn them round once each week to prevent them getting one-sided. When the crimson bracts are perfectly developed, the plants should be removed into a temperature of 55° and a rather dry atmosphere.

Violets in frames.—In order to prevent excessive damping, the plants should be very carefully examined each week, removing all decayed leaves and flowers, but taking every care not to break the petioles if the healthy leaves, for they are very brittle, and if cracked the leaves will be certain to damp off. Admit air on every favourable occasion, and take means to prevent frost affecting the interior of the frames.

Helleborus niger (Christmas Rose).—Plants of the Christmas Rose should now be lifted and planted in large boxes which have plenty of holes in their base by which the waste water may pass away. Plant the roots in a light, porous soil or in leaf-mould, and place the boxes in a structure where there is a moderate degree of heat. Water the plants each day with clear, tepid water. In this district, at any rate, this method succeeds much better than allowing the plants to remain out-of-doors and simply covering them with hand lights, for the flower-stems become much longer and the blooms themselves are purer white.

Affording water.—Hard-wooded plants need to be watered with extreme care during winter, especially any that were potted this year.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchard Grower to Lt.-Col. G. L. Hulford, C.V.O., C.I.E., Westbury, Gloucestershire.

Cymbidiums.—In this genus *C. Mastersii*, *C. giganteum*, *C. erythrostylis*, and the hybrids *C. Trayanum* and *C. Wynnianum*, make choice additions to the flowering Orchids in winter. These species are either in flower or fast developing their spikes, and the blooms, when opened, last a considerable time in perfection, whether on the plants or in a cut state. When the flowers have fully expanded on the plants, less root moisture will be needed until the growing season comes round again. We allow the rooting materials to dry out before again applying water at this period, and then give a thorough soaking, especially in the case of large specimens. Plants of the late-winter and spring-flowering species are completing their pseudo-bulbs, and many flower-spikes are already visible. Throughout the winter months these spikes will slowly develop and while less moisture at the roots is needed, water should be applied whenever it is found that the compost is approaching a state of dryness. Any root-bound plants that have required a little stimulant during the growing season may still be assisted by occasional waterings of weak liquid farmyard manure until the flower-spikes are fully developed.

Epiphytes.—The species *L. Shinneri* shows considerable variation in colouring, from pure white and other delicate shades to dark, richly-coloured forms. It is a very useful winter-flowering Orchid, and the plants are now pushing forth flower-buds from the base of the last-made pseudo-bulbs. *L. macrophylla*, and the hybrids *L. Ballii* and *L. Mary Gratrix*, are also commencing to produce blooms. Strong, healthy specimens will sometimes carry a large number of flowers without impairing the health of the plants, but in the case of valuable and weakly plants it is always advisable to some extent to reduce the number of flowers immediately the buds appear. During the flowering period the plants should be kept just moist at the roots, but a smaller quantity will afterwards suffice to maintain the foliage and roots in a healthy condition.

Zygopetalum.—*Z. Macbrayi*, *Z. crinitum*, and *Z. intermedium* are winter-blooming species which are well known for the lasting qualities of their flowers. The flower-scapes, which are produced simultaneously with the young shoots which appear shortly after the completion of the season's growth, are now well advanced. In this Orchid, however, more or less active, the roots of the plant should never be allowed to remain in a dry condition for any length of time, but when all the flowers are expanded only a very small amount of moisture should be afforded, otherwise spotting of the blooms may occur. These remarks also apply to the hybrids of the above species which flower during late winter and early in spring.

Odontoglossum crotosum.—This species having completed its season's growth, will need to have the supply of water gradually reduced, for the plants require a long and decided rest during the dormant period. They may remain suspended in the greenhouse, and if a little moisture is afforded them at long intervals it will suffice to keep the pseudo-bulbs plump and the foliage fresh, provided the pseudo-bulbs have been properly matured beforehand.

When the plants have ceased their flowering their season of rest commences and the majority of them will remain more or less dormant until next spring. During this stage of inactivity the amount of moisture applied to the roots must be lessened. But the drying of these plants severely, directly their growth has ceased, is a mistake. The reduction of moisture should be gradual and as long as the roots are sufficiently active to take up water it should be applied. Sometimes the new pseudo-bulbs start rotting shortly after the flower-spikes have been removed. The decay sets in at the apex of the growth and is caused by moisture settling at that spot. Care should be taken to obviate this when cutting the flowers, and it is best done by severing the sheath not more than half way through, but just sufficient to allow the flower stem to be drawn out. The sheath will thus remain almost intact, and if a small quantity of powdered charcoal is placed in the top this will

serve to dry up any moisture that may be present. Subsequently, when the conditions are favourable, the sheath may be removed altogether.

Other members of this class of Orchids belonging to the spring and early-flowering types are in many instances fast completing their season's growth. There must be no lack of moisture at their roots, and every encouragement should be afforded the plants to thoroughly mature their pseudo-bulbs.

THE KITCHEN GARDEN.

By E. ALBERT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

Rhubarb.—If a new plantation of Rhubarb has to be made, the ground should be heavily manured and trenched without loss of time. The Rhubarb is a very deep-rooting plant, and the results are therefore most satisfactory when the soil has been stirred to a considerable depth. The site should be an open one, except that it needs protection on the north and north-east. When the trenching has been done, a good dressing of fresh soot and lime may be applied to the surface and the ground left in this condition until February or March, when the Rhubarb should be planted. If large quantities are forced each year, the roots for this purpose should be cultivated on a south border, as by this means the growth ripens earlier. There are now so many improved varieties available, that it is surprising these are not more often employed. A good strain of Royal Albert may still be recommended for forcing, but, excluding this one, few of the old kinds are worth cultivation. Of the newer sorts, I may mention The Sutton, Hibday's Giant (an extra large growing kind of first-rate quality, worthy of cultivation in any garden), and Day's Champion. The best method of propagating Rhubarb is by dividing the stools as often as it becomes necessary. In order to keep up a continuous supply of forced Rhubarb, fresh batches of roots must be introduced to the forcing house every three or four weeks, and only those varieties that force well should be used for the purpose.

The Herb border.—This should now be syringed and cleaned, and afterwards given a top-dressing, which will not only be beneficial to the roots from a manurial point of view, but also afford them some protection from frost. There is no better material for this purpose than that obtainable from a disused hot-bed. This material should be passed through a coarse sieve for use upon most herbs, but the Fumies, especially the Lemon Thyme, should be dressed with finely sifted road sand, and this should be worked well in amongst the growths. Mint should be covered to the depth of 2 inches with well-decayed leaf-mould which has been passed through a sieve. Make sure that a good stock of dried herbs is in readiness for use in the kitchen; it is not yet too late to collect some kinds, for instance, Sage. The growths should be laid out thinly after being cut, allowing them to become thoroughly dry before tying them into small bunches for suspending in an open shed.

Turnips.—Plants raised from late sowings have made good progress during the last six weeks. Do not hesitate to lift a good number of those which are fit for use and store them in small clamps in cinder ashes or sand. Great care should be taken not to allow these to become heated, or the worst consequences will follow. Any Turnips which are not sufficiently matured should have a little soil drawn over the bulbs, as a protection against frosts, especially the more tender kinds, such as Snowball and Jersey Lily.

Broccoli.—Keep a sharp look-out for any varieties which are about "turning in," and protect the young heads from frost immediately they have formed.

Material for protective purposes.—It will now be necessary to take measures to guard the crops against damage from severe frosts. There is no form of covering that will be found so suitable as bracken. It is very light, is not at all unsightly, and excellent for excluding frost. Celery, Broccoli, and many other kinds of vegetables should be given a light covering with bracken or straw whenever severe weather appears likely. Globe Artichokes may have a mound of finely-sifted cinder ashes placed around the base of each plant, and upon this a covering of long litter, bracken, or straw. Un-

heated frames containing vegetables for winter consumption or seedlings packed out for next spring's supply should be well protected by outside lining, and by covering the glass at nights with mats, and, if necessary, long litter also, to keep out frost. At the same time the crops in these frames need all the ventilation that is practicable and as much light as possible.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to The Dowager Lady NENBURNSHOLME, Water Priory, Yorkshire.

Cherries.—If the growths of dessert Cherry trees are excessively strong, the trees should be partly or wholly litted. In replanting them add plenty of lime rubble and wood ashes to the soil. Take care to see that the soil is not over rich. These Cherries do not like winter pruning, therefore the greater attention should be given to root pruning and summer pinching. Good varieties include Early Rivers, Frogmore Bigarreau, Governor Wood, May Duke, Black Tartarian, and Bigarreau Napoleon, and for north walls Kentish and Morello.

Plums.—Plum trees succeed in most districts, and may be grown as standard or pyramidal trees at distances of 6 to 9 feet apart. The pyramids may be litted or root pruned every three or four years. The choicest kinds only should be selected for cultivation against walls, including Jefferson's, and the Golden Drop. They may be planted against a wall facing to the west, and if a few additional trees are planted against a north-west wall they will be extremely valuable for affording extra late fruits.

Pruning.—As most of the leaves have now fallen from the trees, a start should be made with the pruning and every advantage taken of the mild weather to push the work forward. Apple, Pear, and Plum trees in the open quarters should be taken in hand first, and all prunings and leaves should be afterwards raked up and burned so as to make the borders appear tidy. It is important that the operator should have some knowledge of the different varieties, especially in the case of young trees whose shoots require more severe pruning in order to lay a good foundation for future years. Beginning with old trees that have filled their allotted space, these should have the young wood spurred in from two to four buds, according to the variety. It is generally safe to prune strong-growing varieties to four buds, and weakly or medium growers to two buds. Care must be exercised in pruning varieties which form fruit-buds at the end of the current season's shoots, such as Lady Sudeley and Irish Peach Apples, and Jargonelle and Marie Louise Pears. Allow the shortest of these to remain until next year, when they can be cut back. Old trees are frequently found to be so crowded with branches that sunlight and air are excluded from the interior, and in such cases fruit is only produced at the extremities of the trees. Therefore, as new shoots generally form freely at the base, a few of the oldest of the branches should be removed annually. The same applies to trees that are overcrowded with old spurs; some of these should be removed each year, and wherever the use of the saw is necessary, let the rough edges of the cuts be smoothed over afterwards with the knife. In pruning young bushes and pyramidal trees, if previous instructions with regard to pinching have been followed, very little will remain to be done, beyond the shortening of leading shoots to 10 or 15 inches, according to the size and variety of the trees and the space available, and spurring in the side shoots to about two buds.

Training.—After pruning is completed, training should be given attention. For the purpose of training very young trees, stakes about 3 feet in length should be provided. These should be driven in the ground where required, securing the branches with strong string and training them in any desired direction to maintain a shapely tree, but at the same time allowing sunlight and air to have free access.

Standard trees.—Very little pruning is necessary for these trees, but this should be most carefully done until the tree is five or six years old. The leading shoots should be shortened to about a third or half their length, and any branches which cross each other must be cut back.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, and at early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Appointments for December.

TUESDAY, DECEMBER 1—
Nat. Amatour Gard. Assoc. meet.

WEDNESDAY, DECEMBER 2—
Nat. Chrys. Soc. Early Winter Exhibition (2 days).

SATURDAY, DECEMBER 5—
Soc. Franc. d'Hort. de Londres meet. German Gard. Soc. meet.

MONDAY, DECEMBER 7—
Nat. Chrys. Soc. Exec. Com. meet.

TUESDAY, DECEMBER 8—
Roy. Hort. Soc. Comis. meet. British Gard. Assoc. Council meet.

WEDNESDAY, DECEMBER 9—
Esk. of the Perpetual Flowering Carnation Soc. in R.H.S. Halls Westminster.

THURSDAY, DECEMBER 10—
Nat. Rose Soc. Ann. Meeting and Dinner.

FRIDAY, DECEMBER 11—
Nat. Sweet Pea Soc. Ann. Meeting.

MONDAY, DECEMBER 14—
United Ben. and Prov. Soc. Com. meet.

THURSDAY, DECEMBER 17—Linnean Soc. meet.

SATURDAY, DECEMBER 19—German Gard. Soc. meet.

TUESDAY, DECEMBER 22—
Roy. Hort. Soc. Comis. meet.

FRIDAY, DECEMBER 25—Christmas Day.

SATURDAY, DECEMBER 26—Bank Holiday.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last fifty years at Greenwich—41° F.

ACTUAL TEMPERATURES:—
LONDON.—Wednesday, November 25 (6 P.M.): Max. 52°, Min. 44°.
Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden London.—Thursday, November 26 (10 A.M.): Bar. 30.1; Temp. 52°; Heather—Fine.
PROVINCES.—Wednesday, November 25 (6 P.M.): Max. 52° Ireland S.W.; Min 41° Scotland N.

SALES FOR THE ENSUING WEEK.

MONDAY, TUESDAY, WEDNESDAY, THURSDAY, AND FRIDAY—
At 67 & 68, Cheapside, E.C., Bulbs, by Protheroe & Morris, at 10.30.

MONDAY AND FRIDAY—
1,000 Roses, in variety, at 67 & 68, Cheapside, 1.30

WEDNESDAY—
2,000 Roses, in variety, at 1.30. Palms, 600 Azaleas, Rhododendrons, etc., at 5, at 67 & 68, Cheapside, E.C., by Protheroe & Morris.
Spring-Bowering Bulbs, Tree Ferns, Lily of Valley, &c., at 11.30.
2,400 cases Japanese Lilies, at 1, at 67 & 68, Cheapside.

THURSDAY AND FRIDAY—
Unreserved clearance sale of Nursery Stock, at the Nurseries, Chelmsford, by order of Messrs. Saltmarsh & Son, by Protheroe & Morris, at 11.30.

FRIDAY—
Orchids, at 67 & 68, Cheapside, F.C., by Protheroe & Morris, at 12.45.

The Parliamentary questions and answers on this subject which were published in our last issue related to the occurrence in this country of two fungal diseases, namely, the American Gooseberry-mildew and black scab of Potatoes.

The American Gooseberry-mildew (see *Gardeners' Chronicle*, December, 1905, January 27 and February 3, 1906) is said to have come to us from America. Black scab of Potatoes, which, according to the information supplied by the Board of Agriculture, is becoming common in this country, has reached us from the Continent.

The spreading of the American Gooseberry-mildew has been carefully traced by Mr. Salmon in its progress through these

islands. If anyone will compare the maps which have been published in the *Journal of the Royal Horticultural Society* illustrating the distribution of the disease in Ireland in 1904 and 1906 he cannot but be convinced that the mildew is establishing itself in its new home with slow but sure success. In the north-east counties of Ireland it occurred during 1904 in isolated stations; in 1906 it was already widespread in County Down. Whereas in the earlier year it was reported from nine counties, in the latter year it had invaded eleven. In 1904 *Sphaerotheca mors-uvæ*, the parasitic fungus responsible for this Gooseberry-mildew, was known in Europe only in Ireland, Russia and Denmark; in 1906 it had spread into Sweden, Norway, Germany, Poland, Austria, Finland. As everyone knows, it has now appeared in England.

There can be no doubt that unless its progress—without haste and without rest—can be stayed, an epidemic of the disease will declare itself in this country during the next few years.

Every horticulturist knows the history of the progress from America to England and thence to France of the Vine-mildew and of the Hollyhock-rust.

Now both the diseases under consideration, black scab of Potatoes and American mildew of Gooseberries, have this in common, that the fungi responsible for them, once established in their respective host-plants, have means of resisting the action of all but the most thoroughgoing and drastic remedial measures. A diseased Potato of one year left in the soil is a centre of infection for next year's crop of Potatoes; on the young wood of a fallen branch from an infected Gooseberry plant there may be resting-spores enclosed in a hard coat. These spores, surviving the winter, are liberated, borne to a neighbouring Gooseberry bush, germinate thereon, penetrate its tissues and produce, in the next autumn, a fresh crop of innumerable spores.

Remedy then in these, as in so many other cases, is extremely difficult, but mere difficulty in no way excuses the careless or indolent from the obligation to arrest the spread of infectious disease, when once its true nature has been ascertained.

It is inevitable and reasonable that, as disease ceases to be regarded as an inscrutable mystery and comes to be known as the outcome, at all events in great numbers of cases, of the activity of parasites, sensible men will endeavour to organise remedial measures. Later on they come to accept as their watchword the old saw that "prevention is better than cure." Thus there has grown up the science of preventive medicine, with respect to human and animal diseases; and thus, too, there is growing up a science of preventive medicine with respect to plant diseases.

Now as soon as this position is accepted, it will follow of necessity that men must, in order to secure prevention, submit to some interference on the part of the State with their individual liberty. Submission of this sort, or indeed of any sort, is not exactly a salient trait of our race. Hence there is bound to be a transition period when efforts on the part of authority to enforce regulations will be resented and obstructed, or at any rate

accepted without enthusiasm by those whom such regulations are meant to benefit. Lethargy and obstruction can only be overcome by the assiduous cultivation of public opinion with respect to the state of knowledge which affords a basis for intervention. We have recently had an example of intervention in the issue of the American Gooseberry-mildew orders by the Board of Agriculture. We can hardly escape the conviction that orders of this kind, which may seem a great innovation to horticulturists and are bound to press hardly on individuals, must become more frequent and more preemptory in the future.

The success of such orders in securing the end aimed at, for example, the isolation of diseased plants or areas, must depend, first, on the scientific certainty of the cause of the disease, together with accurate knowledge of the life-history of the parasite; second, on the appeal which such orders make to the good sense of the horticultural community; third, on the dissemination, by the responsible authority, of information serving to educate public opinion. In France it is a practice for the authorities to issue large posters describing the life histories and modes of prevention of such diseases as the leaf blight of Potatoes and mildew of Vine. Illustrated bills are hung up in railway stations and like places. It might break the monotony of railway travelling if a similar experiment were tried in England. Again, if not already done, it might be worth while for the Board of Agriculture to present bound copies of their pamphlets—revised wherever necessary—to free libraries and perhaps also to schools where nature study and gardening form part of the curriculum. Small devices like these may produce but small effects. But the effects, such as they are, will be in the right direction and cumulative. It will be only by resorting to these or similar methods that general recognition of the necessity for preventive measures is likely to be obtained.

Although plant diseases are difficult of prevention, and still more difficult of cure, some advance is being made along the lines of isolation, of spraying, and of breeding. That advance, to be satisfactory, must be led by a Board of Agriculture, certain of the scientific bases of its activity, and possessed of the confidence of the horticultural community. Science, and practice as well, must be represented on the councils which formulate proposals for the progress of horticulture. For, in the last resort, the success of such proposals will depend on the intelligent goodwill of the men whose vital interests are bound up in horticulture.

OUR SUPPLEMENTARY ILLUSTRATION of *Epidendrum falcatum* (syn. *Parkinsonianum*) has been prepared from a specimen which flowered in July last in the Chelsea Physic Garden (Curator, Mr. W. HALES). This fine old Mexican species was discovered by HARTWEG, growing on rocks near Oaxaca, in 1837, and later it was collected for Mr. BARKER, of Birmingham, by Ross, in the Orizaba district. It flowered with Mr. BARKER in 1839. About the same time it was sent by JOHN PARKINSON, Esq., British Consul at Mexico, to the Duke of BEDFORD's collection at Woburn

Abbey, and named *Epidendrum Parkinsonianum* by Sir WILLIAM HOOKER, and figured in the *Botanical Magazine*, t. 3778 (1840). Mr. BARKER also flowered it, and his specimen was named *E. aloifolium* by Mr. BATEMAN (*Orchid Nov. and Gnat.*, t. 25, 1843). It is also the *E. lactiflorum* of A. RICHARD. *Epidendrum falcatum* Lindl. was described by the author in TAYLOR'S *Annals of Natural History*, February, 1840, and it therefore has priority over the other names. The species is very distinct. It grows in an inverted position, which renders it advisable to cultivate it on blocks, rafts, or shallow baskets which can be suspended. The short stems proceed from stout rhizomes, and bear fleshy, linear, lanceolate, acuminate, channelled leaves, from the axils of which the flowers are produced. The sepals and petals are pale yellow-green. The large tubed white labellum has the side lobes rounded, and the much longer linear-lanceolate middle lobe tinged with yellow at the tip. The flowers, which are powerfully fragrant, last in perfection for a considerable time if kept in a rather dry and cool atmosphere. It thrives well when grown with *Lachia anceps*, *L. alba*, *Cattleya citrina*, and others, which, in the earlier days of Orchid culture, had a special house, called the Mexican House, provided for them.

LINNEAN SOCIETY.—A meeting will be held on Thursday, December 3, at 8 p.m., when the following papers will be read:—1, Dr. G. HERBERT FOWLER, F.L.S., "Biscayan Plankton: The Ostracoda"; 2, Mr. BUNZO HAYATA, "Note on *Janiperus taxifolia*," Hook. and Arn.; 3, Mr. R. I. FOCKEN, F.L.S., "Mimicry in Spiders." Exhibition: DR. ROSENHEIM, lantern slides by starch grain colour process.

THE PERPETUAL-FLOWERING CARNATION SOCIETY.—The annual exhibition of this society will be held on Wednesday, December 9, 1908, at the Royal Horticultural Hall, Westminster. This will form the fifth exhibition held under the society's auspices, and the management is endeavouring to attract larger numbers of gentlemen's gardeners and amateurs as exhibitors, for whom a section of the schedule is especially devoted. Hitherto much of the success of these shows has been due to the trade growers, and these, of course, are liberally catered for in the schedule. We notice that growers in the Channel Islands are debarred from competing in some of the classes. This is doubtless owing to their advantage in climate and is not merely a compliment to their superiority as cultivators. A scheme for the registration of new varieties has been formulated, and a new scale of points for judging has been adopted. Further particulars can be obtained from the hon. secretary, Mr. HAYWARD MATHIAS, "Lucerne," Stubbington, Fareham, Hants.

APPOINTMENTS FROM KEW.—The following appointments from Kew are announced in the current number of the *Kew Bulletin*:—Mr. THOMAS CARTWRIGHT, a member of the Kew gardening staff, has been appointed by the Sudan Government, on the recommendation of Kew, superintendent of an experimental rubber plantation at Jebelain, on the White Nile. Mr. ROBERT BARD, also a member of the gardening staff, has been appointed by the Secretary of State for the Colonies, a Curator of Botanic Stations in the Agricultural Department of the Gold Coast. Mr. J. F. DUTHIE, B.A., F.L.S., who was appointed assistant for India on the staff of the Royal Botanic Gardens in 1903, has resigned the post owing to ill-health, and Mr. J. HUTCHINSON, formerly a member of the gardening staff, has been appointed assistant for India in the place of Mr. DUTHIE.

EXPERIMENTS WITH RUBBER SEEDS.—Experiments have been carried out by Mr. H. F. MACMILLAN, curator, and Mr. T. PETCH, Government mycologist, Peradeniya, as to the weight and germinative capacity of Hevea Rubber seed. The seed, states the *Kew Bulletin*, was collected from (A) a group of trees about 20 years old which had never been tapped, and from (B) a group of trees about 30 years old which were tapped regularly in 1905 (29 lbs. of dry rubber being taken from eight trees in three months), occasionally in 1906, but not at all in 1907. One thousand seeds were taken from each group, and each 1,000 were divided into 10 lots of 100 each, which were weighed separately. One lot from each group was planted on September 14th, and the remaining lots were planted in pairs, after weighing at intervals of a week, until all were planted. It was found that the seeds lose weight rapidly during the first fortnight after collection, and then more gradually till about the sixth week, after which time their weight remains more or less constant unless they are transferred to a drier atmosphere. The loss in weight appears to be due almost entirely to loss of water. From the experiment it was clear that the seeds from tapped trees are smaller, weigh less per 1,000 seeds, are actually denser, but lose more weight in drying than those from untapped trees. With regard to the germination tests, it was found that seeds from untapped trees were practically worthless if kept longer than two weeks, but that the seeds of tapped trees keep better, and both in percentage of germination and time of germination are better than seeds from untapped trees. These results, of course, apply only to germination, and as yet there is no indication as to the quality of the trees which would result from the two sets of seeds. When dry and shipped to England the kernels constitute about 50 per cent. by weight of the whole seed and yield 42.3 per cent. of oil. It is computed from the figures obtained from the experiments that 280,000 fresh seeds or 350,000 dry seeds (yielding 700,000 kernels) = 1 ton. The value of the kernels may be about £10 per ton.

MANURE AND WEEDS.—The question of the vitality of seeds in manure is one that sometimes forms the subject of discussion, and any new experimental evidence is therefore worth consideration. We learn that Mr. OSWALD has been studying the influence exerted on seeds by the processes of fermentation that go on in stored manure, comparing such effects with those produced on the seeds during their passage through the digestive tract of the cattle. His results are of interest, as showing that whilst about 12 or 13 per cent. of the seeds of weeds fed to cattle germinated if the manure was at once spread as a top-dressing, only between 2 and 3 per cent. came up if the manure was ploughed into the land, and none, or practically none, showed evidence of vitality if the manure had been previously stacked for six months in the yard.

***BRITISH MOSSES.**—Sir EDWARD FRY is known to everyone as a great legal authority, and to a few as one who for many years has taken much interest in the Mosses. The little book, the second edition of which he has just published, tells of the natural history of the Moss in delightfully simple language, and it contains also an outline sketch of the part played by these organisms in the past. It is a little book which may be read with profit by anyone who is interested in the group, and in its breadth of suggestion it is distinguished from the features that often mark booklets of this class.

* *British Mosses.* Second Edition. By the Rt. Hon. Sir Edward Fry, G.C.B. London: Witherby & Co., High Holborn, 1908.

DUBLIN SEED AND NURSERY EMPLOYEES' ASSOCIATION.—Under the auspices of this flourishing society a conversation was held in the Gresham Hotel, Upper Sackville Street, on Thursday, the 19th inst. The function was very largely attended, members and their friends present numbering more than 150. In connection with the conversation, an exhibition of various subjects was organised, and these included photographic views, a collection of cereals and dried plants representing agricultural weeds; also exhibits of wild Clovers, and a case containing Irish insects; specimens of fungi injurious to plants; autumn-tinted foliage, hedge plants, and a model of a vine border. The proceedings also included a musical programme.

THE SAN JOSE SCALE.—From time to time warnings appear with reference to the San Jose Scale insect, and the probability of its obtaining a foothold in this country. It is certain that it is imported in considerable numbers, and Mr. W. E. COLLINGE, Director of the Cooper Research Laboratory, states that in the winter of 1905-06 some 10 per cent. of the fruit imported into Germany showed its presence. Of course, as Mr. COLLINGE points out, the fecundity of the insect is so great that if an acclimatised variety did happen to settle in this country, the results might well be disastrous. But we may reflect that, even in America, it has not as yet become universal, though it is disquieting to know that it seems to be extending into Canada. We recollect, however, that about seven years ago considerable alarm was manifested when it appeared in certain orchards in Ontario, though we have been unable to learn that it has succeeded in generally establishing itself there as an important pest.

PROPER STOKING OF GARDEN FURNACES.

—Very frequently one has the opportunity of observing, even in the case of a good sort of heating apparatus, a thick cloud of smoke streaming out of the chimney, good money being, as it were, thrown into the air. In such cases it is generally the stoker who is to blame. A little care prevents this waste, and enables the heating power of the fuel to be utilised to the utmost extent. It is wrong, when supplying fresh fuel, to spread it over the entire surface of the fire, as then a large proportion of the combustible gas in the fuel escapes into the chimney unused, and the soot—the unconsumed part—blackens the whole neighbourhood. The stoker should spread the glowing part of the fuel over the entire surface of the firebars, and the fresh fuel spread over the glowing embers or partly-consumed fuel in such a manner as to leave the hinder part free. The developing gases spread over the burning fuel and are completely consumed, whereby the fullest use is made of them. The stoker should be quick in his movements—a dilatory man is never a good stoker.

Publications Received.—*Sommaire du cours de Botanique*, by Jean MASSART. Prix fr. 25.—*The New Flora of the Volcanic Island of Krakatau*, by A. ERIST, Ph.D. Translated by A. C. SEWARD, F.R.S., with two sketch maps and 13 photographs. (Cambridge University Press.) Price 4s. net.—*Life Histories of Familiar Plants*, by JOHN C. WARD (London: Cassell & Co.) WILLIAMS, M.A., Inspector of Schools, Jamaica; Government Printing Offices, Kingston.—*Trees*, Vol. IV. Fruits, by the late H. MARSHALL WARD, Sc.D., F.R.S., edited by Percy Groom, Sc.D. (Cambridge University Press.) Price 4s. 6d. net.—*The Transvaal Agricultural Journal* (October, 1908)—*Bulletin of Miscellaneous Information, Kew*, No. 9, 1908.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

CHOISYA TERNATA.—On p. 346 Mr. Earley asks for information in connection with the flowering of this shrub in the Midlands. I have not seen plants of it growing in the Evesham neighbourhood, but late in September I saw a basket of the flowers brought into a train between Evesham and Birmingham, which had evidently been cut from out-of-doors. One of the few pleasant recollections I have of a brief sojourn in Derbyshire is the memory of this old favourite flourishing extremely well in anything but a favoured district. The plants were growing against a low wall facing north, and after a severe and protracted winter were only slightly injured, and they flowered well during the succeeding summer. The situation was in the Peak district, where the snow ploughs were at work almost daily for a period of three months. It must be remembered that the plants mentioned above were planted on an unfavourable aspect, and that, given warm, sheltered spots, there is no doubt that *Choisya ternata* would prove to be hardy in many parts of Britain. *J. Wright, Evesham.*

ESCALONIA AND CHOISYA TERNATA FOR NORTH WALLS.—Mr. Earley's kindly criticism of my note suggests that these gardens enjoy exceptional climatic conditions, whereas, as I showed in a note on page 208, this is far from being correct. For instance, our mean temperature for January last was 37.09° Fahr., and the minimum was 9°. For nine consecutive days at the end of last year and beginning of this the maximum temperature was 38°. I feel safe in saying that the conditions here approximate to those around London, and with this in mind, I recommended *Choisya ternata*; but as the Escalonia seems to require considerable atmospheric moisture, I particularly mentioned the warmer districts. It may be interesting to record that, two years ago, I found a seedling *Choisya* growing under a bush in the open border. *A. C. Bartlett, Pencarrow Gardens, Cornwall.*

JAPANESE MAPLES.—Hardiness is a relative term, and especially so when applied to these plants; but if any readers who have a doubt about growing Japanese Maples out-of-doors will call here, I shall be pleased to show them a plant of *A. palmatum septemlobum*, 18½ feet high, 17½ feet across, with the main stem 2 feet 11 inches in circumference. I have often been told that this is the finest plant in the kingdom. If there is a larger one, I shall be glad to hear where it is growing. During the last three weeks this plant has been a glorious mass of shades of gold, orange, brown, and red, all mingled together, and at this stage the branches have a plumy appearance which enhances their beauty. We have no record of planting, but, judging by the rate of growth, I consider it has been here nearly 40 years. The plant was not seriously injured in the severe winter of 1893, when the thermometer on the grass registered 8° below zero, and I find plants 2 feet high and upwards will pass through the winter safely, but smaller plants are often injured and sometimes killed. I once raised 400 plants from seeds obtained from the specimen already referred to, and amongst them there were about 40 distinct varieties. These were planted out when two years old, and all died except four. We have a plant of *A. palmatum atropurpureum* and *A. p. dissectum*; I do not find any difference in the hardiness of them, and as so many forms can be raised from seeds of one plant, it does not appear likely that there is any difference in that respect. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

I agree with Mr. Clark that Japanese Maples are as hardy as Laurels. They, however, start into growth before we are free from late frosts, and the young growths are almost invariably damaged. This can be prevented if they are planted in a position with a west aspect, so that the frost will leave the plants before the sun reaches them. *W. H. G., Lincoln.*

—*W.* stated (p. 316) that my remarks on this subject proved nothing. I referred to a collection of 15 or 16 of the very best varieties, which were growing in the open,

and these include the following, many of which were mentioned in Mr. Clark's notes:—*Acer crataegifolium*, *A. japonicum*, *A. j. vitifolium*, *A. j. dissectum*, *A. carpinifolium*, *A. rubrum carolinianum*, *A. hyrcanum lobatum*, *A. rubrum*, *A. linearilobum*, *A. atropurpureum*, *A. septemlobum elegans purpureum*, *A. polymorphum atropurpureum*, &c. I am convinced that Japanese Maples should be seen in every garden. *A. S., Yorkshire.*

CRATÆGUS IN FLOWER.—We have in these grounds in an exposed position of the park, two Thorn trees. One has lost all its leaves, the other is in full leaf and flower, some of which I enclose. The trees are each about 15 feet high and cover about 20 feet of ground. They are planted 18 feet apart. *Thomas Dore, Roschill Gardens, Caversham, near Reading.*

SOCIETIES.

ROYAL HORTICULTURAL.

NOVEMBER 24.—The usual fortnightly meeting of the Committees was held in the Society's Hall, Vincent Square, on Tuesday last, and it was attended with a good average exhibition.

THE ORCHID COMMITTEE'S awards included two First-Class Certificates, three Botanical Certificates, and three Awards of Merit.

THE FLORAL COMMITTEE awarded a First-Class Certificate to a variety of *Polystichum* raised by Mr. A. T. DRURY, an Award of Merit to a new species of *Primula* introduced from China by Messrs. BEES, LTD., and a similar award to two varieties of single-flowered *Crysanthemums*.

THE FRUIT AND VEGETABLE COMMITTEE recommended an Award of Merit to a new Pear.

Considerable comment was caused by the presence of an exhibit of Bon-bons decorated with artificial fruits and flowers, which gained admission by reason of the application for space being for "artistic table decorations." The Society's officials, not less than the visitors, regretted that an exhibit of the kind should have been presented.

At the afternoon meeting of Fellows Mr. J. Cheal delivered a lecture on "Italian Gardens."

Floral Committee.

Present: W. Marshall, Esq. (chairman), and Messrs. C. T. Drury, Henry B. May, W. A. Bilsby, Jas. Walker, T. W. Turner, G. Reuthe, Chas. Dixon, R. Hooper Pearson, Walter T. Ware, Jno. Jennings, W. Howe, W. Bain, Chas. E. Pearson, J. P. Bennett, Jas. E. Shea, W. Cuthbertson, W. F. Thomson, E. H. Jenkins, W. J. James, Geo. Paul, Charles Blicq, Jas. Hudson, J. F. McLeod, and J. W. Barr.

Two excellent exhibits of *Crysanthemums* were staged. One put up by Mr. NORMAN DAVIS, Framfield, Sussex, was arranged under the wall opposite to the entrance. The manner of staging was only excelled by the high quality of the blooms, especially the Japanese varieties. Mr. DAVIS utilised eperges and large vases for displaying the flowers, and as a background he arranged tall Palms and graceful Bamboos. The groundwork was formed of smaller varieties of single and decorative varieties, above which the large vases and eperges stood in bold relief with blooms of the best exhibition quality of most of the popular and newer varieties. We noticed as especially fine, Polyphe (yellow), Mrs. J. Hygate (white), True Gold (an excellent shade of deep yellow), Dr. Enguehard (rather small pink blooms), Miss Gertie Court (rose), Edith Jameson and Mrs. J. C. Niel (yellow). The single varieties were also noteworthy, especially pleasing being *Arcturus* (scarlet-crimson) and *Mensa* (white), of regular outline and with a beautiful yellow centre. There was a host of other decorative plants used as relief, and a suitable order was made with green velvet. On an adjoining table Mr. DAVIS arranged many vases that could not be accommodated in his large group; a white sport from the well-known Edith Jameson, labelled Mrs. A. M. Falkner, was shown. Mr. DAVIS has also a white sport from the popular Walter Jinks variety. (Silver-gilt Flora Medal.)

The other large display of *Crysanthemums*

was exhibited by Mr. H. J. JONES, Ilithy Green, Lewisham, and it received the same award as the preceding group, viz., a Silver-gilt Flora Medal. This display was arranged at the end of the building sometimes occupied by the concert platform, and part of the group extended round the northern wall. It was carpeted with green cloth and many handsome specimens of *Ananassa sativa* (Blue-plate), *Codiums* (Crotons), *Abutilons*, *Ferns*, *Palms*, &c. The principal features were large groups of Japanese blooms, either in rustic tripods, eperges, or large decorative vases, and coloured foliage was intermixed with the blooms. Then there were smaller groups of single and decorative varieties, with vases of single blooms of newer varieties, also fancy baskets filled with blooms. The varieties of especial note were John Day, Lord Brook, Kitty Gulliver, Guy Hamilton, Crispus Court, Mme. R. Oberthur, White Mme. Barkley, Mrs. Wakefield (a reddish shade of terra-cotta), Lord Brook, Harold Swales, Edith Jameson (very fine), Mrs. Wynne, and True Gold.

Another large exhibit of *Crysanthemums* was presented by Messrs. W. WELLS & Co., Merstham, who showed many novelties, especially in single and decorative varieties. (Silver Banksian Medal.)

Messrs. GEO. WILLIAMS & SONS, Manor House Nurseries, Cardiff, showed a collection of seedling *Crysanthemums*, and a lemon-coloured sport from the well-known Mme. Oberthur variety.

A number of single, thread-petalled, and pom-pom *Crysanthemums* was shown by Messrs. H. CANNELL & SONS, Swanley, who had also one of their bright groups of Zonal Pelargoniums. (Silver Banksian Medal.)

Mr. R. RUSSELL, Nurseryman, Richmond, Surrey, showed two groups of hardy Bamboos, arranged with berries and ornamental-leaved subjects. (Silver Banksian Medal.)

Begonia of the winter-flowering type were shown in batches of varieties by Messrs. JAS. VEITCH & SONS, LTD., King's Road, Chelsea, and intermixed with these were groups of Rhododendrons of the javanic-jasminiflorum type, also *Luculia grattissima*, and the fragrant *Stevia serrata*. (Silver-gilt Banksian Medal.)

Messrs. CURTISH & SONS, Highgate, London, N., showed Carnations in variety, all fine blooms of popular varieties, and, as a separate exhibit, a group of ornamental-leaved plants of greenhouse species. Very pretty were plants of *Dracena Douceti*, with its stiff, narrow leaves; also the broad-leaved *D. Massangeana* and *D. Victoria*. Others were *Phenix Roelenii*, *Araucaria excelsa* and *Aralia Veitchii*. (Silver-gilt Banksian Medal.)

Filmy Ferns were shown by Messrs. H. B. MAY & SONS, The Nurseries, Upper Edmonton, in a group of other subjects. These moisture-loving Ferns are not often displayed at exhibitions, and the group attracted much interest. They were principally species of *Trichomanes*, but there were others, including the lovely *Todea superba*. The remainder of the group was made up of *Veronicas*, *Solanums*, *Begonias* of the Gloire de Lorraine type, and crested Ferns. (Silver-gilt Banksian Medal.)

Begonia The Queen, said to be a sport from Mrs. Leopold de Rothschild variety, was shown by Mr. ARTHUR YOUNG, Oxted Nursery, Surrey.

Some large plants of *Begonia* Gloire de Lorraine, all plentifully furnished with blossoms, were shown by T. F. FORTSONE, Esq., Groombridge (gr. Mr. Paskett). (Bronze Flora Medal.)

Messrs. HUGH LOW & CO., Bush Hill Park, Enfield, exhibited *Cyclamen* in batches of salmon, pink, white and other varieties; also *Leontis Leonurus* and the *New Wallflower* *Cheiranthus × kewensis*. (Bronze Flora Medal.)

A pleasing group of *Primula obconica*, with flowers having a wide range of colouring, was shown by the Duchess of BEDFORD, Chenies, Rickmansworth (gr. Mr. J. Dickson). (Silver Banksian Medal.)

Messrs. BARR & SONS, King Street, Covent Garden, London, showed *Nerine flexuosa alba*, and a few other bulbous flowers.

Exhibits of Alpine plants were presented by Misses HOPKINS, Mere Gardens, Shepperton-on-Thames; Messrs. WARE, LTD., Feltham (Silver Banksian Medal), and Messrs. JOHN REED & SONS, Norwood.

Paintings of flowers were exhibited by Miss FANNY FARRER, 19, Shaa Road, East Acton.

AWARDS.

FIRST-CLASS CERTIFICATE.

Polystichum aculeatum gracillimum Druryi.—A remarkably graceful slender form of the species, in which the normal pinnales of half-an-inch are lengthened into almost hair-like ones of 2 inches. The fronds are much widened and assume a charming semi-decumbent habit. The plant is interesting, as forming one of a batch directly derived from spores of the merely bipinnate, slender-tipped P. a. pulcherrimum, after some 35 years of sterility. About 75 per cent. of the sowing were exact replicas of the parental form, 20 per cent. marked variants on similarly slender and beautiful lines, and the balance nearly normal reversions. Shown by Mr. CHAS. T. DRURY.

AWARDS OF MERIT.

Primula malacoides.—This new species has been raised from seeds gathered by Mr. George Forrest on the high Alps (9,000 feet) of Yunnan, China. A large number of plants were shown in 3-inch and 4-inch pots. In general appearance they were like glorified plants of P. Forbesii, but with a laxer habit. Some of the plants in 3-inch pots bore as many as nine inflorescences. The flowers are borne in verticillate whorls, each flower being 3-inch to 3-inch across, pink in colour, with a yellowish eye. The plants shown were brought from an unheated frame, but it was said that others were flowering out-of-doors, the species being very much harder than P. Forbesii. Shown by Messrs. BEES, LTD.

Chrysanthemum Meritum Jewel.—A single variety with shades of bronze, yellow, and red, with a yellow ring around the disc. The blooms have a diameter of about 4½ inches. (Shown by Messrs. W. WELLS & CO.)

C. Caledonia.—An extra large single variety, with a diameter of 7½ inches. Colour rosy-lilac, with a distinct white ring around the disc. (Shown by Messrs. GEORGE WILLIAMS & SONS, Manor House Nursery, Cardiff.)

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the chair), and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, de B. Crawshaw, H. Little, W. Boxall, W. Bolton, Gurney Wilson, H. A. Tracy, W. Cobb, J. Forster Alcock, H. G. Alexander, J. Cypher, W. P. Bound, J. Charlesworth, F. M. Ogilvie, A. A. McBean, Stuart Low, R. Thwaites, R. Brooman-White, J. Wilson Potter, A. Dye, and J. Charlesworth.

Messrs. SANDER & SONS, St. Albans, were awarded a Silver Flora Medal for a group in which were two superb novelties, viz., *Cypripedium Dreadnought* and *Vanda corticea* var. *R. Chollet*. The group also contained plants of the singular *Chondropetalum Fletcheri*, showing more of the influence of *Chondrorhyncha Chestertonii* than in the plant shown at the last meeting. Also *Cirrhopteralum Korbuxhigii*, a fine specimen of C. Meduse; *Vanda Watsonii*, *Oncidium uniflorum*, and a large number of *Cypripediums*.

Messrs. CHARLESWORTH & CO., Haywards Heath, staged a select group, for which a Silver Flora Medal was voted. It was noted the showy orange and red *Vanda corticea* var. *R. Chollet*, *Odontoglossum Uro-Skinneri magnificum*, with a fine rose-spotted lip; the brightly-coloured *Odontioda Bohnhoffiae*; *Coleogyne sulphurea*, with three spikes, and a large form of *Oncidium bicoloratum*.

From the Royal Gardens, Windsor, Mr. A. MACKELLAR sent cut spikes of *Dendrobium forosium giganteum*. A noteworthy feature was the varying tint of the colour in the labellums.

Lt.-Col. G. L. HOLFORD, C.I.E., C.V.O., Westonbirt (gr. Mr. H. G. Alexander), sent *Cypripedium Hitchcockii superbum*, a variety with a fine dorsal sepal that is spotted with rose colour. An interesting cross between C. Mrs. Tautz and C. *hirsutissimum* with the peculiar broad petals of C. *hirsutissimum* and the new C. *Arthusa*. (See Awards.)

Messrs. HUGH LOW & CO., Enfield, were awarded a Silver Banksian Medal for a group in which were several specimens of *Cycnoches maculatum*, C. chlorochilum, *Platyclinis latifolia*, *Coelidia vulcanica*, *Coleogyne fuliginosa*, and other species. A very attractive white form of

Cattleya labiata resembling C. I. *Amesiana*, but with a darker lilac tint on the lip, was seen in this exhibit.

Messrs. JAS. CYPHER & SONS, Cheltenham, were awarded a Silver Banksian Medal for a group principally composed of well-grown *Cypripediums*.

Messrs. HEATH & SONS, Cheltenham, secured a Silver Banksian Medal for a group of *Cypripediums* and other *Orchids*, the best of which were C. *Blanche Moore*, a well-formed flower, finely marked.

Monsieur MERTENS, Mont St. Amand, Gand, was awarded a Bronze Banksian Medal for a small selection of hybrid *Odontoglossums*, including the dark-coloured O. *Vuyilstekei* and the finely-formed O. *Vuyilstekei*.

Messrs. J. VEITCH & SONS, Chelsea, showed the new *Cypripedium Queen of Sweden* (*Leucanum* × *Euryades*), a very distinct and beautifully coloured flower having in some parts a resemblance to C. *triumphans*. The upper sepal is bright rose with a small green base and a clear white tip and margin, the central part having deep claret-coloured lines, on each side of which were rose-purple spots. The petals are long and tinged with reddish purple; the lip is of a deep mahogany red with a shining surface, staminate yellow.

DE B. CRAWSHAW, Esq., Rosefield, Sevenoaks (gr. Mr. Stables), sent *Odontoglossum Waltoniense* variety (*Kegejani* × *crispum* Raymond Crawshaw), a handsome hybrid with the fine substance and clear yellow ground colour of O. *Kegejani* (*polyxanthum*).

Messrs. ARMSTRONG & BROWN, Tunbridge Wells, showed *Cattleya labiata Amesiana*; *Cypripedium insigne* *Sylhetense giganteum*, a very large and distinctly-marked flower; *Neobenthamia gracilis*, &c.

F. BOSTOCK, Esq., Springfield, Cliftonville, Northampton, showed *Cypripedium Acteas* *Springfieldense*, a light-coloured variety, with very pale, greenish-yellow flowers, having the greater part of the dorsal sepal pure white.

J. GURNEY FOWLER, Esq., Gblelands, South Woodford, sent a fine inflorescence of *Cymbidium Maggie Fowler*, and the large and finely-formed *Cypripedium Ernest Reid*.

Mrs. TALBOT CLIFTON, Lytham Hall, Lytham (gr. Mr. Float), exhibited a large specimen of *Odontoglossum Hallii*, a strong-branched flower-spike bearing 38 flowers.

FRANK ALCOCK, Esq., GLOUCESTER, and GURNEY WILSON, Esq., HAYWARDS HEATH, showed varieties of *Cattleya Mrs. Pitt*.

AWARDS.

FIRST-CLASS CERTIFICATES.

Cypripedium Dreadnought (Troilus × insigne Harfield Hall), from Messrs. SANDER & SONS, St. Albans.—A noble *Cypripedium*, which attracted as much attention as did Messrs. SANDER & SONS' C. *Leaanum* J. Gurney Fowler, which this novelty slightly resembles in the somewhat square expansion of its great dorsal sepal. In colouring it is nearer C. *Esou* *giganteum*, but the dorsal sepal of C. *Dreadnought* is far superior to that fine hybrid. The dorsal sepal, which is over 9 inches across, has the lower half gamboge yellow with light-purplish spotting the upper part being pure white with some purple spotting in the middle. The broad, wavy-edged petals are tinged and netted with pale purple, the broad margins being primrose yellow, and the basal portions having dark, purple-brown spots. The lip is large, the surface being tinged with reddish-brown; staminate large, and of yellow colour; lower sepals large and circular.

Vanda carulea "R. Chollet", from Messrs. F. SANDER & SONS.—A grand variety, with the bright and soft flowers appearing in body colour and not as a surface colour, as in other forms. The veining and lip is violet-blue, and the flower is perfectly circular in form. It is named in compliment to Monsieur R. Chollet, the able *chef de culture* in Messrs. SANDERS' establishment at Bruges.

Cypripedium Sanctaeus Etoniense (Acteus Langleyense × insigne Harfield Hall), from Messrs. JAS. VEITCH & SONS, Chelsea.—Since showing their fine C. *Esou* *giganteum* and C. *Acteus Langleyense*, Messrs. VEITCH have produced nothing equal to this fine new *Cypripedium*, which, when fully developed, will rank as one of the best among hybrid *Cypripediums*.

The dorsal sepal is large, pure white, with a pale, yellowish-green base that has purple-brown spotting, changing to rose colour towards the white upper part. The petals are greenish-yellow, tinged with purple-brown; the lip is of the same shade of yellow as honey, with a purplish-brown face. The lower sepals are pale green, with dark lines; staminate large and yellow. It is a solitary seedling, being the only plant raised.

Cypripedium Arthusa (Milo × Salliceria aurum), from Lt.-Col. G. L. HOLFORD, C.I.E., C.V.O., Westonbirt (gr. Mr. H. G. Alexander).—A finely-formed, and perfectly-shaped flower of good substance. The fine form of C. *Milo* and the features of C. *insigne* *Chantini* obtained through it are well retained, but the colouring of the other parent of C. *Milo* (*C. oenanthus superbum*) has been quite eliminated in this hybrid. The dorsal sepal is pure white, with a greenish-yellow basal area that is evenly spotted with clear, rose-purple. The petals, lip, and staminate are lemon-yellow, with a slight, dusky-purple hue on the veining.

Odontoglossum Groganii (Edwardii × Uro-Skinneri), from J. HEBERT GROGAN, Esq., Slaney Park, Balinglass, Co. Wicklow, Ireland.—A very remarkable hybrid, with the general characters of O. *Thompsonii*, but with well-marked indications of O. *Uro-Skinneri*, both in the pseudo-bulb and flower. The plant bore a strong, many-branched inflorescence of purple flowers, with rosy-mauve labellums having a yellow crest.

BOTANICAL CERTIFICATES.

Oncidium nitrofumum, from GURNEY WILSON, Esq., Glenhorne, Haywards Heath.—A pretty species of the O. *barbatum* section, distinguished by the large, clear, yellow petals and the similarly-coloured, petal-like, side lobes to the lip.

Coleogyne fuliginosa, from Messrs. ARMSTRONG & BROWN, Tunbridge Wells.—A singular species with tawny flowers, having a fringed labellum of a sooty-black colour.

Bulbophyllum Careyannum, from Messrs. ARMSTRONG & BROWN.—A well-known species, with a short raceme closely set with brownish flowers.

CULTURAL COMMENTATION.

To Mr. Bristow (gr. to Mrs. Temple, Leywood, Groomsbridge) for a fine plant of *Coleogyne barbata* with six spikes, all profusely flowered.

Fruit and Vegetable Committee.

Present: Joseph Cheal, Esq. (in the chair), and Messrs. W. Bates, Geo. Woodard, A. Dean, H. Parr, James Vert, A. R. Allan, J. Davis, H. Markham, J. Lyne, Edwin Beckett, Chas. Foster, J. McIndoe, J. Jaques, Geo. Wythes, Owen Thomas, H. Somers Rivers, C. G. A. Nix, G. Reynolds, and John Harrison.

The principal exhibit was a collection of Apples shown by J. G. WILLIAMS, Esq., Pendley Manor, Tring (gr. Mr. F. G. Gerrish). There were 40 dishes, and all the fruits were of remarkably fine quality, being large and coloured to a high degree on a mellow ground. The varieties represented the best of both culinary and dessert kinds. (Silver-gilt Knightian Medal.)

A collection of Apples and Pears was exhibited by Sir EDMUND LODER, Leonardslade, Hortham, Sussex (gr. Mr. W. A. Cook). The exhibit was brightened with fruiting sprays of *Cotoneaster Simonsii*, and at the back were some interesting sprays of berries and flowers. (Silver Banksian Medal.)

An exhibit of Potatoes was displayed by Messrs. GEO. MASSEY & SONS, Spalding. In addition to a large assortment of tubers of new and popular varieties, there were many seedlings of the first year's growth. (Silver Banksian Medal.)

A Cultural Commendation was awarded to Mr. J. Banting, gardener to the Earl of Deuce, Tortworth Court, Falfield, for fruits of *Diospyros costata*.

AWARD OF MERIT.

Pear Dobos Hovey.—This variety is by no means new, for it was raised as far back as 1854 by Mr. Dana, of Massachusetts, U.S.A., a rarer as being the best. The variety has several synonyms in the United States. It is a somewhat small fruit, with a russet skin and an

agreeable flavour. The flesh is soft and melting. It is in season in mid-winter, keeping in a good condition until January. (Shown by Messrs. JAMES VEITCH & SONS, LTD.)

Scientific Committee.

NOVEMBER 14.—*President*: Mr. E. A. Bowles, M.A., F.L.S., F.E.S. (in the chair); Messrs: J. Fraser, W. Cuthbertson, L. Crawshaw, R. A. Rolfe, J. T. Bennett-Poe, W. Fawcett, W. C. Worsdell, G. S. Saunders, R. Curtis, and F. J. Cuthenden (secretary).

Grease bands.—Mr. W. VOSS showed a grease band from a Plum tree from a fruit garden at Enfield Highway. The grease band was about 6 inches wide, and upon it were a few specimens of the female winter moth, *C. brumata*. The band had been on the tree a month, but not till now had any winter moth been caught. The insects were near the bottom of the band. Mr. Voss promised to send up a band from the same garden to each meeting.

Fasciation in Mushroom.—Mr. WORSDELL showed a fasciated specimen of the common Mushroom, *Agaricus campestris*. Fasciation is apparently very uncommon in fungi.

Abnormality in Ribes.—Mr. J. FRASER showed a specimen of *Rubus rhamnifolius*, with tomentose sepals and adventitious roots at the base of the fruiting panicles, which are mostly flowerless. The internodes of the fruiting panicles (or what should have been such) are very little developed on the whole of last year's stems. Barren stems and leaves of this year are normal.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

NOVEMBER 5.—Committee present. Messrs. L. ASHWORTH, R. ASHWORTH, THORP, COWAN, WARD, WARBURTON, BALL, KEELING, HOLMES, ASHTON, PARKER, and WEATHERS.

A. WARBURTON, Esq., Vine House, Haslingden (gr. Mr. Dalgleish), obtained Silver Medals for a collection of *Cypripediums* and a general group. *Cypripedium insigne* var. *excelsis* was awarded a First-Class certificate. *C. × aureum* var. *Romana*, Vine House variety, received an Award of Merit.

E. ROGERSON, Esq., Didsbury (gr. Mr. Price), staged a collection of *Cypripediums*, for which a Silver Medal was awarded. Notable plants in this group were *C. × Germain Opiox*, *C. × Thalia* var. *gigantea*, *C. × Priam*, and *C. × Boadicea* var. *rosita*, the last-named receiving an Award of Merit.

Z. A. WARD, Esq., Northenden (gr. Mr. Weatherley), staged a group of *Odontoglossums*, including the forms of *O. crispum* and a number of hybrids. A new and beautiful hybrid *Odontoglossum*, *O. × Wardii* (*O. crispum* *Luciani* × *O. × Vaylstekei*) received a First-Class Certificate. (Silver-Gilt Medal.)

R. ASHWORTH, Esq., Newchurch (gr. Mr. Fletcher), was awarded a Silver-Gilt Medal for a miscellaneous group of Orchids, in which *Odontoglossums* were prominent. *Cattleya × Labia*, R. Ashworth variety, received an Award of Merit.

Mr. J. BIRCHMILL, Alderley Edge, exhibited two forms of *Cypripedium* Charlesworthii.

Mr. W. SHACKLETON, Great Horton, Bradford, received a Bronze Medal for a group of *Cypripediums*.

J. MCCARTNEY, Esq., Bolton (gr. Mr. Holmes), was awarded a Bronze Medal for a collection consisting principally of *Cattleyas* and *Laelias*.

J. H. CRAVEN, Esq., Keighley (gr. Mr. Corve), displayed a fine form of *Cypripedium* × *Gaston* Buttel.

G. SHORLAND BALI, Esq., Under Fell, Burton, Westmoreland, was awarded a Silver Medal for a group of *Cypripediums*. *C. × Lecanum* var. *Ballii* was voted a First-Class Certificate. This flower has a beautifully-tinged dorsal sepal. *C. × Mennon* var. *Queen Alexandra* received an Award of Merit.

C. PARKER, Esq., Preston, was awarded a Bronze Medal for a group of *Cypripediums*.

J. J. HOLFEN, Esq., Southport (gr. Mr. Johnson), exhibited *Cattleya labiata* var. *Amesiana*, and *Cypripedium × tuberosum*.

H. J. BROWLOW, Esq., Raishill (gr. Mr. Morrison), staged some choice varieties of *Cypripediums*, including *C. × Thalia* var. Mrs.

Francis Wellesley, C. × *Germain Opiox*, C. × *Priam*, and *C. bellatulum album*. (Silver Medal.)

Mr. J. ROBSON, Altrincham, exhibited *Cypripedium × Dido* (*C. triumphans × C. × Sallieri* var. *Hyacum*) (Award of Merit), a similar award being given to *Cattleya × Ariadne*, parentage unrecorded.

Messrs. H. LOW & Co. staged a group of *Cattleyas*, in which were some choice albino forms. (Silver Medal.)

Mr. W. BOLTON and Mr. A. J. KEELING also staged exhibits of plants. (Bronze Medal.)

PARIS AUTUMN SHOW.

NOVEMBER 6-15.—The last of the great horticultural shows that will be held in the greenhouses on the Cours la Reine, Paris, by the National Horticultural Society of France, took place on these dates. The show was one of the grandest ever held there. The entries in the various classes numbered 319. The jury numbered 59 persons in all, and was divided into 16 sections. In some classes competition was very keen, there being, in some cases, as many as 20 or more entries. The principal prizes were as follows:—Grand Prix d'Honneur to those following:—MM. CROUX ET FILS for fruit and fruit trees; to M. CALVAT for seedling *Chrysanthemums*; Félix d'Honneur to MM. SALOMON ET FILS for Grapes; to M. PINON for trained *Chrysanthemums*; to MM. LEVEQUE for *Chrysanthemums* and Carnations; to M. DEBRIE-LACHAUME for floral decorations; to M. COLIN for *Chrysanthemums*; to M. LESTUET for Orchids; to M. GOBLIN for fruit; to MM. VALLERAND FRÈRES for flowering plants; to M. VALLIER for vegetables; to MM. NOMBLOT-BRUNEAU, VILMORIN, ANDRIEUX ET CIE., and L. CAYRON received the felicitations of the jury for the excellence of their various collections.

Among the handsome promenades by the side of the Seine were exhibits of various horticultural sundries. At the entrance to the first of the large greenhouses were groups of hardy ornamental shrubs and plants of various kinds. M. ALFRED MONNERIE planted beds with Conifers, &c. M. LÉONIE exhibited a collection of Conifers, Hollies, Eucalyptus, Box, &c.

Large numbers of trained fruit trees occupied the whole length of the central promenade in several rows. They were trained in every variety of form known to French gardeners, the exhibitors including MM. NOMBLOT-BRUNEAU, CROUX ET FILS, MOSER ET FILS, LÉONIE, A. MARTIN, GEO. BUCHER, ANDRÉ, LÉVRE, and BROCHET.

Hardy shrubs, ornamental trees, Conifers, &c., were also shown by M. A. BROCHET and M. PAUL LÉCOLIER.

The entrance afforded a view right through the first greenhouse and down the corridor that unites it with its fellow at the extreme end of the show. On entering on either side were seen borders filled with pot plants of dwarf-growing *Chrysanthemums* arranged by MM. VILMORIN, ANDRIEUX ET CIE. There were a number of medium-sized blooms on bush plants and standards, and a border of brightly-coloured pompon varieties. They also had a large rectangular sunken garden, with sloping sides. On the lower level of this garden a geometrically-arranged bed contained blooms graduated in great diversity of colour, with a huge centre trained plant of a yellow Japanese variety. Along the sides of this sunken garden were a number of pot plants disposed in beds cut out of the turf. These plants were some of the finest in the show, especially the following:—*Loiseleur-Rousseau* (immense), *Papa Bie*, *Nivose* *Femina*, and *Polyphème*.

Orchids and other plants were staged in the two side rooms behind MM. VILMORIN's borders of *Chrysanthemums*. One from Messrs. A. TRUFFAUT ET FILS was comprised of *Azaleas*, *Dracenas* in great variety, *Anthuriums*, ornamental foliage plants, *Beccarias*, &c. There were also several handsome collections of Orchids from such noted cultivators as MM. ORCHON ET FILS, LESTUET, REGNIER, C. DIEHRICH and BERANER.

Almost the whole of the body of the interior of the first greenhouse, with few exceptions, was filled with *Chrysanthemums*, the exceptions being down the sides, where the fruit was arranged.

M. LÉON CAYRON, of Cherbourg, famous for

his grafted *Chrysanthemums*, showed many plants in pots, including some that were grafted. Among the varieties was noticed *Swaney Giant*, *Surprise*, *Amateur Rozière*, *Chrysanthémiste Leroux*, and numerous French varieties but little known on this side of the Channel. Another exhibitor, M. A. GIOVANNOSO, showed a group of dwarf plants in pots, cleverly sunk in the ground. The plants had medium-sized blooms, the best known being as follows:—*Phœbus*, *Océana*, Mrs. Barkley, Le Peyron, *Pride of Exmouth*, W. Tricker, Mme. Ed. Roger, and many of French origin.

There was a large competition in the class for novelties. Eleven prizes were awarded by the jury, and the Floral Committee granted at least 60 First-Class Certificates to new seedlings. The well-known Grenoble raiser and grower, M. ERNEST CALVAT, was awarded 18; VILMORIN, ANDRIEUX ET CIE., eight; M. NONIN, eight; the Marquis de PINS, seven; M. CHANTRIER, five; and M. HERAUD, five.

Collections of plants in pots and cut blooms were arranged about the show. M. ANATOLE CORDONNIER, of Bailleul, had set up in good form four collections of cut *Chrysanthemums* in large specimen blooms, including the novelties of the Marquis de PINS. Two long narrow beds close by were staged by the well-known French nurserymen, MM. LEVEQUE ET FILS, in neat, dwarf pot plants, carrying medium-sized blooms. The same exhibitors staged a circular bed and two corner exhibits.

An exhibitor who made a fine display at the Tours Exhibition only three days before is M. PINON. Here again at Paris he made an imposing effect with tall pyramids, star-shaped specimens, fan-shaped, and Japanese pyramid *Chrysanthemums*, freely flowered, the whole lot occupying somewhere about three-quarters of the length of one side of the greenhouse.

Just opposite was a collection from M. LACHATISSAY who set in good style a long group of plants in pots, all bearing large blooms, mostly three or four on a plant. Another well-known grower, M. OPIOX, the head gardener to the Luxemburg garden, showed a tastefully-arranged exhibit of *Chrysanthemums*, edged with Ferns, single-flowered varieties, and Baronne de Vinols, with several sports from this variety; also several pompon *Chrysanthemums*, almost the only ones in the show. From the ASILE DE VILLE FRAYRE came a pretty group of pot plants. These, too, were edged with *Gerbe d'Or* pompon, an old favourite with the Parisian growers. M. J. H. LÉONIE AINÉ showed a closely-packed collection, consisting of medium-sized blooms of *Chrysanthemums* of average merit. M. GELIN contributed a rather novel group. It consisted of large trained specimens in big pots at the back, while in front at intervals were three rows of large cut blooms in vases.

MM. LEVEQUE ET FILS, who are famous not only for their Roses but for their Carnations, showed two lots of these latter flowers, prettily set up in a bed on the ground level. Another Carnation grower, M. BERANER, also showed a collection of Carnations.

In the corridor that unites the two greenhouses a spacious area contains fruit and vegetables, also numerous lots of *Chrysanthemums* and some decorative displays of other flowers.

Among the fruit exhibits was one conspicuous above all others by its novel and effective design. It occupied a large area of rectangular form, and was edged with a several panels were filled with fruit, and in the middle was a kind of tower, with shelves and rows containing other fruits. The exhibitor was M. H. LEMAIRE.

Another fruit exhibitor in the corridor was M. OLIDA, who showed a good collection of Grapes and Pears. The well-known firm of fruit growers, MM. CROUX ET FILS, also displayed a big collection of Apples and Pears on plates in immense variety. An important exhibit from M. THIBAUT consisted almost entirely of Apples and Pears.

M. MONTIGNY, Orleans, showed four groups of *Chrysanthemums*, chiefly novelties of the past two or three years. In the middle of the central passage M. FONTENAU had an effective circular group of dwarf Japanese trees. In the far right-hand corner were collections of rare old books, pictures, plates, engravings, &c., chiefly from the libraries of MM. MONTIGNY, HARMAN PAVANE, NONIN, VILMORIN, and ROSETTE.

MM. CAVEUX et LECLERC displayed a collection of flowers, and M. FRANCOIS large plants of Chrysanthemums in tubs, in addition to cut blooms of Chrysanthemums. Other exhibitors included M. LECOLIER, who staged shrubs.

Going down the flight of steps leading to the promenade along the Seine MM. VILMORIN, ANDRIEU et CIE, set up one of their usual exhibits of vegetables. M. RIGULT showed a collection of Potatoes, and close by was noticed vegetables in large and varied numbers in an immense and splendidly-arranged border, 6 feet wide and 27 yards long, the exhibitors being the ECOLE D'HORTICULTURE ST. NICOLAS. M. COMPOINT showed a large collection of Asparagus, and another firm, MM. ANGEL et FILS, exhibited a collection of Potatoes, Carrots, &c. The well-known exhibitors who trade as LA PENSÉE arranged a notable group. It was 50 yards long, and contained almost every vegetable in season. M. FERRARD showed Potatoes and Tomatoes.

In the second large greenhouse was more variation than in the first, although there was but little to choose between them in point of interest. A fine group of Hydrangeas by M. DESIRÉ RAMELOT was one of the features. Among many other interesting floral collections, M. FERRARD staged several beds containing Primula obconica, Nægelia, Cyclamen, and Ferns.

For brilliancy of colour nothing equals the single and double-flowering Begonias seen at the Paris show. Two exhibitors are always prominent, M. BILLARD and MM. VALERAND, who also showed some fine Cyclamen and Gloxinias.

In the nearest corner of the second greenhouse was a display from M. ADNET, consisting of a choice collection of hybrid Gerberas. Some of these were certificated by the Floral Committee. The firm of VILMORIN, ANDRIEU et CIE exhibited a neatly-arranged exhibit of Primula obconica. In the middle of the greenhouse, making a most conspicuous subject, was a group from M. GEORGE TRUFFAUT, who had a grand display arranged on a circular lawn. This consisted of a remarkable monument of white Lilac, at least 9 feet high in the centre, and around the base, in the middle bed, on a mossy surface, were clumps of Lily of the Valley.

M. AUG. NONIN showed several groups of Chrysanthemums, chiefly choice exhibition, decorative, and other varieties. There were among many others those following, viz., Tout Paris, W. Duckham, Gloire de Vaupes, Sapho, Naples, W. R. Church, Mrs. Coombes, A. J. Brooks, Paul Randet, and Duchesse d'Orléans.

The many grand exhibits of fruit consisted chiefly of Grapes, Apples, and Peas in immense quantity. The leading exhibitors were MM. CHATRIOT, DUBOST, MERCIER, THIBAUT, LECHEMIST et FILS, OLIDA, ANGEL et FILS, OPOUX, BROUWER, CROUAS, SARGEL, PARENT, RIBET, JULIEN DAMOY, ECOLE DE ST. NICOLAS, DUFOUR, LEQUEU, SALOMON et FILS, ROUSSEL, SAVREAC, RICOIS, ECOLE DE FLEURY-MENDON, SABRON, FAUCHEUR, LANELLE, BRIL FRÈRES, MERCIER, DEFRESLE, LUQUET, MARIN, GRAPPERIS DE SOMAIN, WHIR, BERGERON, VERRIER, BALU, GERBOUT, CHEVILLON, DUPONT-BARRER.

ABERDEEN NATURAL HISTORY AND SCIENTIFIC.

"Natural History and Forestry" was the subject of a lecture delivered by Mr. William Dawson, B.Sc., the recently-appointed lecturer in forestry at Aberdeen University, at a recent meeting of this society. Mr. Dawson said the squirrel has reduced the value of most Scottish woods of an age between 20 and 60 years by one half, and in many cases has rendered the trees worthless. In the northern half of Scotland, from Kincardineshire northwards, the depredations have been most severe. He estimated the damage done by the squirrel, at an average of £10 per acre, to amount to £2,500,000. The rabbit attacks old Beech trees, and strips them of their lower bark, thus quite destroying young woods, from which they should be kept out by strong fencing. The rabbit, as well as the squirrel, must be summarily dealt with. Roe deer and red deer were also injurious to trees, and did much damage to the bark.

The lecture was illustrated by lantern slides.

ROYAL HORTICULTURAL OF ABERDEEN.

(ANNUAL MEETING.)

NOVEMBER 7.—The annual meeting of this society was held on this date, Councillor Milne, vice-chairman, presiding. The annual report showed that the income for the year has amounted to £416 13s. 8d., and the expenditure to £477 2s. 11d., giving a deficit for the season of £60 9s. 3d., the free balance at the credit of the society to be carried forward to next year being £31 16s. 1d. The show held in August last was a good one, but the financial result was not satisfactory, owing to bad weather on the last day. The membership, unfortunately, continues to show a slight decrease. The officers were elected, and Mr. Alexander Wilson, Lord-Provost of the city, was made honorary president.

HORTICULTURAL CLUB.

"FRENCH" GARDENING.

NOVEMBER 10.—After the last monthly dinner of this club at the Hotel Windsor, Mr. G. Monro, in the chair, a paper on "French Gardening" was read by Mr. C. D. Mackay. The lecturer declined to accept any responsibility for the glowing descriptions of French methods and results which had appeared in the daily Press as it inspired by him. There is little doubt that these have led people to start the French system without the requisite experience, the inevitable result being failure. The lecturer explained that he had been induced to advocate the introduction of these methods into England after visiting France and also Belgium, and seeing what could be done there under conditions of climate and soil, which latter are in no way superior to those obtaining in England. The usual daily importation of French salad produce into this country is 4,000 to 5,000 crates of Lettuce, 300 crates of early Carrots, 100 of Asparagus, 100 of French Turnips, and 50 of Celeriac, the whole of which he contended could be profitably grown on this side of the Channel, with the contingent advantages of saving of freight dues and preserving greater freshness in the produce when delivered to the consumer, to say nothing of the increased employment of labour in the land involved. It, however, by no means follows that any market grower could adopt the French system of clothes and frames and manuring by merely reading directions. The French system is the outcome of long experience, and one very material point is that the eight-hour labour system, or any approach to it, is unknown in France in this connection, and the grower, assisted probably by his wife, devotes his whole time to culture, and is prepared at any hour to do what is needful. He has, moreover, acquired the knack of rearing successional crops of different things on the same area so as to keep his land always profitably occupied. In the subsequent discussion, participated in by Messrs. T. W. Sanders, A. H. Pearson, G. Gordon, C. Foster and G. Monro, some statements in the lecturer's book on the subject were challenged, and the difficulties involved in so-called stand-enge, and the difficulties involved in so-called stand-enge, were fully discussed. Mr. G. Monro, after his summing up, pointed out that with Tomatoes, Cucumbers and Beans, which at one time were mainly imported from abroad, our growers here, by adopting better cultural methods, have entirely turned the scale, not merely fully supplying our own needs, but actually exporting immense quantities to the Continent.

REIGATE CHRYSANTHEMUM.

NOVEMBER 11.—The 20th annual show held in connection with this society took place in the Public Hall, Reigate, on this date. The show was very successful, there being a great improvement seen on those of previous years.

In the class for 18 Japanese blooms in six varieties, shown in six vases, the 1st prize was won by V. NICHOLL, Esq., Reiston Hill (gr. Mr. F. Kemp); 2nd, A. BRUCE, Esq. (gr. Mr. F. Cordell). The best group of Chrysanthemums was shown by J. AFFRICH, Esq. (gr. Mr. W. M. Blackwood); 2nd, F. E. BARNES, Esq. (gr. Mr. T. Cutter). For a group of single Chrysanthemums the 1st prize was awarded to

Col. INGLIS (gr. Mr. F. Phillips); 2nd, T. CUTLER, R. WILTINGTON, Esq., Betchworth (gr. Mr. C. Payne), exhibited the best 25 blooms of Japanese varieties, shown in five vases, 1st; 2nd, F. PHILLIPS. In the class for 12 incurved and 12 Japanese Chrysanthemums, distinct, the 1st prize was taken by Mr. C. PAYNE.

Mr. T. KEMP won the cup offered for 18 Japanese varieties, and Mr. W. M. BLACKWOOD the cup for a group of Japanese, incurved and single varieties. Mr. W. M. BLACKWOOD had the best incurved blooms in the show, and Mr. E. H. GUY won the cup in the amateurs' and cottagers' section.

Prominent exhibitors of vegetables were Messrs. T. CUTLER, J. DILLEY, F. PHILLIPS, H. A. JOHNSON, and C. JOHNSON.

COLCHESTER CHRYSANTHEMUM AND FRUIT.

NOVEMBER 12.—The annual exhibition of this society was held in the Corn Exchange and the new Town Hall, Colchester, on this date. Never before has Colchester had a better autumn show, both in regard to quality and keen competition in most of the classes. Exhibits of fruit, for which there were more than 30 classes, were a feature of the show.

The 1st prize for a group of Chrysanthemums was taken by Mrs. DE LARENT-LEDEX (gr. Mr. W. Richardson). The arrangement of this exhibit was excellent; it contained some fine incurved blooms, and at the base were single varieties. 2nd, Mr. W. DRAPE, Colchester.

The classes for cut blooms were well represented. Miss WILLMOTT, Warley Place, Gt. Warley (gr. Mr. Preece), was an easy 1st prize-winner, having splendid blooms in both classes in the Japanese section. There were grand blooms of F. S. Vallis, and this kind secured the N.C.S. Silver Medal for the best bloom in any class. 2nd, W. E. EYRE, Esq., Braintree (gr. Mr. J. Doidge). Miss WILLMOTT also secured the premier award for incurved blooms, having choice flowers of Mrs. J.udson, Duchess of Devon, Mrs. B. Hankey, Fimbleme Poitevine, &c. W. E. EYRE, Esq., was again 2nd, having smaller but excellently-finished blooms.

Fruit was a feature at this show. Amongst Apples, Allington Pippin won the award as the best dish of dessert Apples in the show, Miss K. M. COURTAULD, Colne Engaine (gr. Mr. Barthing), being the exhibitor. Grapes were not numerous, but those staged were very good, the leading prize for black Grapes being taken by the Hon. W. LOWTHER, Campsea Ash, Wickham Market (gr. Mr. Andrews). A. T. O'BORNE, Esq. (gr. Mr. A. Gibbs), won the 1st prize for the variety Muscat of Alexandria. The Hon. W. LOWTHER (gr. Mr. Andrews) was placed 1st for a collection of kitchen Apples. Other successful exhibitors in the fruit classes were: J. L. GONLEA, Esq., Wakes Colne; E. T. BOGGIS ROFFE, Esq., Wormingford; S. F. HURNARD, Esq.; Miss K. M. COURTAULD; D. G. OXFORD, Esq.; the Rev. R. W. CHILTON, Wormingford Rectory; Hon. C. HANDEY; and Mrs. H. DE LARENT.

In the class for eight varieties of vegetables, the Rt. Hon. JAS. ROUND, Birch Hall, Colchester (gr. Mr. H. Bishopt), won the 1st prize, having fine Celery, Potatoes, and Cauliflowers. The Hon. W. LOWTHER was a very close 2nd.

The Messrs. SEABROOK & SONS, Chelmsford, staged a collection of hardy fruit not for competition.

BAKEWELL FRUIT AND CHRYSANTHEMUM.

NOVEMBER 12, 13.—The members of this society held their twelfth exhibition in the Town Hall on the above dates.

The groups of Chrysanthemums which were eight in number formed the chief feature of the show.

The challenge cup offered by F. LEE, Esq., was won by Mrs. METT (gr. Mrs. THORNTON), Station Hall (gr. Mr. G. Harvey) for the second year in succession, with a particularly good group, composed of very fine blooms of the leading varieties.

The silver trophy given by Mrs. McCleugh-Thornhill for the best group of natural-growing or decorative Chrysanthemums, brought to

competitors, and was easily won by STANLEY ORME, Esq. (gr. Mr. Keetley).

The leading class for cut blooms was one for 12 Japanese Chrysanthemums, distinct. The premier position was won by Mr. A. MCINNES; 2nd, Mrs. McCREAGH-THORNHILL.

Mr. EVANS led in two classes for incurved varieties, and he was followed closely by Mrs. McCREAGH-THORNHILL.

The exhibits in the class for four vases of single Chrysanthemums was much admired, especially that shown by Mrs. McCREAGH-THORNHILL, and to which the 1st prize was awarded; 2nd, STANLEY ORME, Esq.

The best vase of Chrysanthemums arranged with foliage was shown by Mrs. ABRAHAM.

BRADFORD AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 13, 14.—The 22nd annual exhibition of the above society was held on these dates in St. George's Hall, Bradford. The exhibition was a great success, and was visited during the two days by upwards of 5,000 visitors. The opening ceremony was performed by the Lord Mayor, Councillor Jas. Hill, J.P. Competitions in the open class was not so keen as in some past years, but the quality of the blooms was never better.

ARTHUR JAMES, Esq., Rugby (gr. Mr. A. Chandler), who has generally taken the chief award in the principal class for Japanese blooms, was this year beaten by Mr. THOMAS STEVENSON, of Addlestone, Surrey. Mr. STEVENSON also obtained the award for premier bloom. There was also a reversal of last year's decision, so far as the first and second prizes were concerned, with regard to the class for 18 blooms of incurved varieties. This time Mr. G. W. DRAKE, Cardiff, was placed 1st with a group of beautifully-formed blooms, amongst which was a specially fine specimen of the variety May Phillips, which won for him the special prize for the best bloom in this class. Mr. E. ELLIS, Heswall, followed closely. Mr. CHANDLER beat Mr. STEVENSON in the class for 12 dissimilar Japanese varieties, but for incurved dissimilars he was surpassed by Mr. DRAKE. Mr. STEVENSON also won the 1st prize in class for six varieties in 18 blooms, 1st which Mr. CHANDLER was placed 2nd. The former exhibit likewise won the chief prize for six vases of Carnations. Altogether Mr. STEVENSON won three 1st and two 2nd prizes, while Mr. CHANDLER took one 1st and three 2nd prizes. Mr. JOHN BROOKE was successful in the classes for bouquets, taking no fewer than three 1st prizes and one 2nd. In the local classes Mr. JOHN THORNTON again carried off the Lord Mayor's Cup given by Mr. J. L. Fawcett. His collection of 18 Japanese blooms in 12 varieties was a very fine one.

NATIONAL CHRYSANTHEMUM.

NOVEMBER 16.—At a meeting of the Floral Committee held at the Essex Hall on the above date, Mr. D. B. Crane in the chair, the following varieties of Chrysanthemums were awarded the Society's first class Certificate from a large collection of blooms submitted.

C. Frank Pym.—A Japanese bloom, of a charming blush shade, and a type of flower which, although of good size, showed no coarseness.

C. Noron Jay.—A decorative variety; colour, a brilliant shade of crimson scarlet, with old gold reverse. The variety is good both as sprays and when disbudded.

C. Necessus Gold.—This also is a decorative variety; colour, rich golden-yellow. It should prove a gem for autumn display.

C. Hilly Hill's.—A decorative variety of a pleasing shade of orange-buff. The flowers are well supported on stiff, erect stems.

C. Marston Jewel.—A single flower of bright lavender-red, with yellow zone around the disc.

C. Peter Pan.—This also is a single variety, of a bright fawn shade; the variety is very free in flowering, and was given the award because all the lateral flowers were open before the terminal one faded. The above varieties were shown by Mrs. WELLS & Co.

C. Abbot Hill's.—A incurved flower; colour, yellow. This is likely to develop into a useful variety for market purposes. (Shown by Mr. H. W. THORPE.)

WINCHESTER CHRYSANTHEMUM.

NOVEMBER 17, 18.—This annual show was held in the Guildhall, Winchester, on these dates, and was one of the best of the series.

In the class for a collection of Chrysanthemum plants in a limited space, quality of blooms to be the principal desideratum, there were only two exhibitors, the Earl of NORTHBROOK, Stratton Park (gr. Mr. E. Henderson), gaining the 1st prize with good blooms on tall plants. For nine distinct conservatory plants, each plant having not fewer than five blooms, there were four entrants. The best specimens were shown by J. A. FORT, Esq., 69, Kingsgate Street, Winchester (gr. Mr. G. Cousins), the varieties including J. H. Silsbury, F. S. Vallis, and Mrs. Judson; each plant having about one dozen choice flowers and desirable foliage; 2nd, Col. F. A. DICKENS, Edge Hall, Winchester (gr. Mr. G. Adams).

In the similar class for nine plants, but of white or yellow varieties, C. MITCHELL, Esq. (gr. Mr. C. White), was placed 1st, having the varieties C. H. Curtis, F. S. Vallis, and Nellie Pocket in excellent condition. Mr. A. J. FORT was awarded the 2nd prize; he showed a notable specimen of F. S. Vallis. The best exhibit of six plants was shown by the Rev. A. C. KEESE, Sunnyside, Compton Road (gr. Mr. F. W. Stone); 2nd, The Key, Canon Valpy, Winchester (gr. Mr. F. Smith). In the class for a collection of miscellaneous plants arranged for effect there were four competitors. A. P. RALLI, Esq., Twyfold Lodge, Winchester (gr. Mr. J. Hughes), was placed 1st for an attractive display, in which were several Orchids; F. C. BIRCH, Esq., Christchurch Road, Winchester (gr. Mr. E. Long), followed closely.

Japanese varieties.—Exhibits of cut blooms were numerous. The principal class for Japanese Chrysanthemums was for 36 blooms in not fewer than 24 varieties. Amongst five competitors, P. RALLI, Esq., Ashstead Park, Epsom (gr. Mr. G. H. Hunt), was an easy 1st prizewinner, with high-class examples of Miss M. Hankey, F. S. Vallis, Lady Talbot, Mrs. H. Barnes, Algernon Davis, &c.; Lord ASHBURTON, The Grange, Alresford (gr. Mr. C. E. Garratt), was awarded the 2nd prize, his blooms being less even than those in the 1st prize exhibit. In the class for 24 blooms of Japanese varieties, in not fewer than 18 varieties, ARTHUR PEARSON, Esq., Fresham Place, Ascot (gr. Mr. C. Moore), won the premier award with full-sized blossoms; 2nd, Mr. HOPKINSON, Esq., Morton House, Kingsworthy (gr. Mr. A. J. Marsh).

Seven growers competed in the class for 12 Japanese varieties, distinct, the best exhibit being shown by W. GARTON, Esq., Sarisbury Court, Southampton (gr. Mr. D. Edwards). For six Japanese varieties, three blooms of each kind, arranged in vases, there were six competitors.

Incurved variety. In the class for 36 blooms, not fewer than 24 varieties, P. RALLI, Esq., was 1st with a stand of blooms that has not been excelled this season. Amongst the best examples were May Phillips, Duchess of Fife, Mrs. M. Hankey, Mrs. R. Kingston, Mme. L. Faure, Godfrey's Reliance, Triomphe de Montbrun, Emblème Potevine, and Clara Wells.

Single-flowered varieties were well shown. The best six bunches of distinct varieties were exhibited by W. H. MYERS, Esq., Swanmore House, Bishop's Waltham (gr. Mr. G. Lillwood).

Fruit and vegetables were well and numerous shown. W. H. MYERS, Esq., showed the best exhibit in each of two classes for a collection of vegetables.

Non-competitive exhibits were staged by Messrs. E. HILLIER & SON, Winchester; W. H. MYERS, Esq.; Mr. C. FAY, Totton, Southampton; and Messrs. HEALH & SON, Cheltenham.

NEWCASTLE-ON-TYNE AND DISTRICT CHRYSANTHEMUM.

NOVEMBER 18, 19.—The 4th annual exhibition of this society was held in the Town Hall and Corn Exchange, Newcastle, on these dates. There was a good competition in nearly all the classes, although the quality of the flowers generally was not so good as on some previous occasions.

Trained plants formed one of the features of the show. Mr. W. ROME, who has previously won finally the challenge cups in both the open and restricted classes, again proved successful in these competitions.

In the open class for 12 vases of Japanese Chrysanthemums, in not fewer than 12 varieties, three blooms in each vase, there was a keen contest. JAMES KNOTT, Esq., (Close House, Wylam (gr. Mr. W. Rome), was placed 1st, having well-finished blooms of J. H. Silsbury, Algernon Davis, Mrs. A. T. Miller, T. Miller, Reginald Vallis, F. S. Vallis, Mr. G. Mleham, W. Knox, and Bessie Godfrey; 2nd, Capt. LAYCOCK, Wieston, Notts (gr. Mr. Musk).

In the class for six vases of Japanese blooms, the 1st prize was won by C. LACY-THOMPSON, Esq., who showed fine blooms of Reginald Vallis, F. S. Vallis, Mme. P. Radaelli, Mrs. G. Mleham, &c.; 2nd, Capt. LAYCOCK; 3rd, J. B. SIMPSON, Bradley Hall, Wylam (gr. Mr. J. Kerr). The best four vases of Japanese Chrysanthemums were displayed by Capt. LAYCOCK; 2nd, C. LACY-THOMPSON, Esq.

In a class confined to exhibitors from the counties of Northumberland and Durham, for four vases of Japanese Chrysanthemums, in four varieties, each vase to contain three blooms, the 1st prize and a challenge cup were awarded to Mr. J. KNOTT; 2nd, Mr. J. B. SIMPSON.

In the open class for 12 incurved Chrysanthemums, Mr. J. ELLIOTT, Juxtop, Jesmond Dene, was placed 1st, S. D. SHAFTE, Esq., Bemsh Park, following.

The classes for single vases were well contested. Mr. W. ROME was awarded the Silver Medal offered for the best bloom in the show, the variety being Bessie Godfrey.

Mr. T. REAY, South Shields, showed the best bush-trained plants.

In the fruit classes, Mr. MUSK and Mr. T. BELL were prominent exhibitors.

The vegetable classes were well contested, the local pitmen showing fine produce.

Trade exhibits were put up by Mr. W. LAWRENCE, Yarm, and Newcastle, who displayed Carnations, Orchids, Heaths, Chrysanthemums, and shrubs; Messrs. LIBRANS, Manchester, who displayed Chrysanthemums and winter-blooming Begonias; Messrs. FINNEX, Newcastle, vegetables and fruits in variety; Messrs. HUGH LOW & Co., Enfield, flowering Cypripediums in variety; Mr. W. A. WELSH, Sunderland, Cyclamen; Mr. W. R. ARMSTRONG, Newcastle, Lily of the Valley and other plants, intermixed with Orchids.

SCOTTISH HORTICULTURAL.

NOVEMBER 19, 20, 21.—With such a fine season as was experienced in the north, it was anticipated that a good display of the popular winter flower would be made at the exhibition held in the Waverley Market, Edinburgh. Certainly the show was one of the finest yet held. There was a considerable increase in the number of entries for cut flowers, and in the classes for bouquets and floral designs. For some years past this association has, in a large measure, substituted vases for boxes or stands in displaying cut blooms. At the present time there are 20 classes for vases and not one for boards. The handsome prizes offered annually for cut blooms have had a large share in gaining for the association the reputation of holding one of the best Chrysanthemum shows in Britain. The Waverley Market is an ideal site for such a show, yet even this, with its great area, was seriously taxed to accommodate the enormous number of visitors which flocked to this show to see the exhibits and listen to the band, which, on this occasion, was that of the Grenadier Guards.

For the premier prize, the City of Edinburgh Queen Victoria Memorial, consisting of the City of Edinburgh Cup and £20 in money, for 15 vases of Japanese Chrysanthemums, in 15 varieties, three blooms in each vase, Chrysanthemum foliage only to be used, open to all, there were six entrants, and the 1st prize was won by Capt. STIRLING, Keir, Dunblane (gr. Mr. Thos. Lum), who was awarded 137 points out of a possible 180. This cup, it may be mentioned, has to be won three times before it becomes the property of the competitor. The varieties were Reginald Vallis, 11 points; Bessie Godfrey, 11; F. S. Vallis, 11; Melchett Beauty, 11; Victoria and Albert,

10; Edith Jameson, 10; Mrs. F. W. Vallis, 9; Marjorie V. Venosta, 9; Mrs. C. Penford, 9; J. H. Silsbury, 9; Lady Couzens, 9; Mrs. G. Mileham, 8; A. H. Broomhead, 7; Mrs. A. S. Pine, 7; and Miss R. Stoop, 6. The 2nd prize of £15 fell to J. W. BELL, Esq., Rossie, Forganendy (gr. Mr. David Nicoll), with 123 points; the 3rd of £10 to J. D. FLETCHER, Esq., Rosehaugh, Ross-shire (gr. Mr. W. M. Moir); and the 4th of £5 to SIR JAMES SILVERWRIGHT, Tulliallan Castle, Kincardine-on-Forth (gr. Mr. Geo. Stewart).

For the Scottish Challenge Cup, which, with £10 in money, forms the 1st prize in the second class for eight vases of Japanese Chrysanthemums in eight varieties, Chrysanthemum foliage only to be used, confined to Scottish gardeners and amateurs, there were 11 entrants, and the 1st place was taken by GEO. KEITH, Esq., Usan House, Montrose (gr. Mr. A. Hutton), with 84.5 points out of a possible 90. To Mr. HUTTON'S Lady Talbot, too (which obtained maximum points), fell the Silver Medal offered for the best bloom in the show. The varieties were: Lady Talbot, 12; F. S. Vallis, 11; Reginald Vallis, 11; Mrs. G. Mileham, 11; Victoria and Albert, 10; President Viger, 10; Mrs. A. T. Miller, 9; and J. H. Silsbury, 9. SIR WALTER DALRYMPLE, Bart., Luchie, North Berwick (gr. Mr. R. Addison), won the 2nd prize of £7 with 82.5 points. The 3rd of £5 fell to A. R. BURNES, Esq., Summerhill, Shandon (gr. Mr. J. Finnie); the 4th of £3 to the Duke of ATHOLL, K.G., Dunkeld (gr. Mr. J. F. Stewart); and the 5th of £2 to the Earl of MAR and KELLIE, Alloa Park, Alloa (gr. Mr. W. J. Buchanan).

In the class for six vases of Japanese Chrysanthemums, in six varieties, three blooms in each vase, confined to private gardeners and amateurs, there was keen competition. The 1st prize of £5 was awarded to the Dowager Countess of SEAFIELD, Cullen House (gr. Mr. A. Morton); the 2nd prize of £4 to Mr. J. F. STEWART, Dunkeld; the 3rd of £3 to CHAS. DICKSON, Esq., Viewbank, Lasswade (gr. Mr. D. Mackay); the 4th to Mr. R. ADDISON; and the 5th to Mr. A. HUTTON.

In the class for two vases of Japanese Chrysanthemums, in two varieties, three blooms of each, confined to growers within the municipal boundaries of Edinburgh and Leith, Mr. K. GRIFFIN was 1st, Mr. J. MCNEVINE 2nd, and Mr. JOHN McDONALD, 3rd.

For three vases of Chrysanthemum blooms, any decorative varieties, not more than 12 sprays in each vase, there were 13 competitors. EARL WEMYSS, Gosford House (gr. Mr. W. Galoway), was 1st with La Triomphe and its sprays arranged with suitable foliage.

For one vase of disbudded blooms, arranged for effect, with any foliage, A. SINCLAIR HENDERSON, Esq. (gr. Mr. C. Scott), was placed 1st, and Mr. D. KIDD, Carberry Towers, 2nd, with handsome mass of J. H. Silsbury, relieved with sprays of Prunus pissardi.

Single-flowered varieties receive considerable encouragement at Edinburgh, their merits being recognised for decorative effect. For six varieties there was keen competition. Mr. A. E. TODD, Stonebank, Musselburgh, easily won the 1st prize with extremely fine blooms of Edith, Bronze and White Pagam, Mary Richardson, Crown Jewel, and White Bourne. Mr. W. G. TRIE, Dalhousie Castle, obtained the 2nd prize.

For six distinct varieties suitable for market, three single and three double, there were six entrants. Messrs. TODD & Co. won the 1st prize with a fine display of such varieties as Romance, Money-maker, Kitty Bourne and White Pagam. Mr. J. BRUCE, Davidson's Mains, was 2nd.

A silver medal was offered for the best new Chrysanthemum not yet in commerce, with a bronze medal as 2nd prize. The former was awarded to Messrs. G. WILLIAMS & SON, Cardiff, for Helena Williams, a primrose sport from the Japanese Mrs. Oberthur, the 2nd award going to Messrs. WELLS for T. F. Felton, decorative.

BOUQUETS AND FLORAL DESIGNS.

Five pounds were offered for one bridal and two bridesmaids' bouquets. Miss TODD, Stonebank, Musselburgh, was 1st with a choice exhibit, especially the two of Rose Mme. A. Chateau. Col. A. E. ATKIN, Lansdowne Park (gr. Mr. W. Campbell), was 2nd.

For a Chrysanthemum bouquet there were 13 competitors. Mr. A. M. CRABBE, 22, Hope Ter-

race, Edinburgh, was 1st, with a pleasing combination of Source d'Or and its yellow sport.

The best Carnation bouquet, an elegant one of Enchantment, came from Miss TODD.

For a basket of Chrysanthemums, L. BOASE, Esq., Birtock, Dundee (gr. Mr. Beats), beat seven opponents with a pleasing arrangement.

Messrs. LAIRD & SINCLAIR, Dundee, won the 1st prize for a floral wreath, and Miss TODD the 1st prize for a floral design.

For the best decorated dinner-table, 10 feet by 5 feet, of Chrysanthemums, with any foliage, £3 was offered as the 1st prize; 12 competed. The Earl of HOME, Bothwell Castle (gr. Mr. W. P. Bell), was 1st with a light arrangement of single-flowered varieties.

In the Chrysanthemum plant classes, D. R. W. HUTE, Esq., Edinburgh (gr. Mr. W. Fulman), and Lady STELL, Edinburgh (gr. W. Michie), won the chief honours, the former competitor also winning the silver medal for the best single plant in these classes, and along with the 1st prize, a silver medal for the best six Japanese plants in 7-inch pots. Mr. T. L. BELL, Edinburgh, won nearly all the 1st prizes in the amateur section, and he also obtained the bronze medal for the best specimen plant.

For the best group of Chrysanthemums and foliage plants arranged for effect on the floor of the hall there were 12 competitors, and the 1st, 2nd and 3rd prizes, of £6, £5 and £4 respectively, went to the competitors in the following order:—(1) D. JARDINE, Rawlinson; (2) J. E. DAVIS, Balathie; (3) W. H. CALDER, Lauriston Castle. In the other plant classes for Palms, foliage plants, Ferns, &c., the leading prizewinners were Messrs. A. McMILLAN (Douglas Castle), A. KNIGHT (Brayton), J. TEMPLETON (Richmond House), A. WILLIAMS (Harridge), and H. E. HUGHES (Kingsmeadows).

HARDY FRUITS.

The entries for hardy fruit were considerably under the average, but in most of the other classes for fruits the competition was good. The leading prize, for a collection of 24 dishes of fruit, on a space 10 feet by 5 feet, brought out only two competitors, Messrs. N. F. BARNES (Eaton) and D. KIDD (Carberry Towers), to whom the 1st and 2nd prizes were awarded in the order given.

The 1st prize of £10 10s. is presented by the Honorary President of the Association, Lord Elphinstone. In the other fruit classes the leading prizewinners were:—Grapes: Messrs. T. LUNT, McNEILL (Craigernie), and PIRIE (Dalhousie Castle). Apples and Pears: Messrs. N. F. BARNES, C. WEBSTER (Gordon Castle), P. MCANDREW (Husil), and P. MELVILLE (Rosemont). In the two classes for market growers, for baskets of dessert and culinary Apples, Messrs. J. HARRIS (Silsloe) and D. LOGAN (Coldstream) were 1st and 2nd respectively.

For the best collection of 12 distinct kinds of vegetable, Mr. J. GIBSON, as usual, was the last year, won the 1st prize of £6 6s., Messrs. R. STUART (Thirlestane), R. T. RAE (Roxburgh), and W. P. BELL (Bothwell Castle) being 2nd, 3rd and 4th respectively. For the smaller collection, Mr. J. HIGGATE (Yester) was 1st; and the principal prize-takers in the other classes were Messrs. J. GIBSON, J. WADIE (Dollabrig), J. PATTERSON (Rutherford), A. McMILLAN, and J. TURNER (Galashiels).

NON-COMPETITIVE EXHIBITS.

There were non-competitive exhibits from the GOVERNMENT OF THE PROVINCE OF BRITISH COLUMBIA, who showed Apples (Gold Medal); J. W. MOORE, LTD., Rawdon, near Leeds, Orchids (Gold Medal); Wm. CUTBUSH & SON, Highgate, London, Carnations (Gold Medal); W. WELLS & Co., Merstham, Surrey, Chrysanthemums (Gold Medal); Wm. BROWN & Co., Edinburgh, floral designs (Gold Medal); GEO. BOVEYS & Co., Leicester, Carnations (Silver-Gilt Medal); H. N. ELLISON, West Bromwich, Ferns (Silver-Gilt Medal); LAXTON BROS., Bedford, Apples (Silver-Gilt Medal); JOHN DOWNIE, Edinburgh, Begonias (Silver Medal); M. CAMPBELL & SONS, Blantyre, Carnations (Silver Medal); GEO. WILLIAMS & SONS, Cardiff, Chrysanthemums (Silver Medal); W. DAVIE & Co., Haddington, Potatoes (Bronze Medal); D. MCLEOD, Chorlton-cum-Hardy, Orchids; and J. A. MURIE, Edinburgh, Leeks.

A First-Class Certificate was awarded to single Chrysanthemum "Caledonia," exhibited by Messrs. GEO. WILLIAMS & SONS, Cardiff.

BOLTON CHRYSANTHEMUM.

NOVEMBER 29, 21.—An excellent show was held in the Albert Hall, Bolton, on these dates.

In the class for a miscellaneous group of plants four excellent exhibits were staged, the premier award and the president's silver cup being won by JOHN HARWOOD, Esq. (gr. Mr. W. Burgess). *Codiums* (Crotons) in this exhibit were admirably coloured, and well-flowered. *Bertolonias* were another effective feature. J. W. MACKAY, Esq., followed closely. The best group of undisbudded Chrysanthemum plants, arranged in a half-circle, was also shown by Mr. HARWOOD, with an exhibit that needed more brightly-coloured flowers, especially towards the top; 2nd, CHARLES TAYLOR, Esq. (gr. Mr. H. Wainwright), with greater variety of Chrysanthemums, but the group lacked an effective background. The best group of large-flowering Chrysanthemums was shown by H. T. PARKER, Esq. (gr. Mr. W. Drinkwater). In the class for a table of Orchids, J. MCCARTNEY, Esq. (gr. Mr. W. Holmes), won with a rich display.

Cut blooms.—In the class for 12 incurred and 12 Japanese varieties, distinct, Mr. G. W. DRAKE was 1st. A. JAMES, Esq. (gr. Mr. A. Chandler), being a close 2nd prizewinner. Mr. JAMES excelled in the class for 36 Japanese Blooms in not fewer than 24 varieties, with a choice display, his example of F. S. Vallis being extra large; 2nd, SIR E. EVANS (gr. Mr. J. Jones).

G. RHODES, Esq. (gr. Mr. James Lee), had the best six vases of single varieties, undisbudded; whilst in the class for decorative varieties, SIR JOHN MARK (gr. Mr. J. P. Heil) took the lead.

In the classes for other plants, prominent exhibitors were: G. F. ARMITAGE, Esq. (gr. Mr. C. Weaver), O. ROBINSON, Esq. (gr. Mr. J. Nixon), T. AITKEN, Esq. (gr. Mr. F. Banner), Mr. W. BURGESS, EDWARD HOPKINSON, Esq. (gr. Mr. T. Grundy), MR. JAMES LEE, and MR. H. SHONE.

In the fruit classes JAMES AVEPLETT, Esq. (gr. Mr. R. Jones), was successful for Grapes. Lady HINDLIF (gr. Mr. L. Bailey) showed the premier dessert Apples, and Mr. R. JONES the best culinary varieties. Mr. W. H. BROMLEY had the best three dishes of Peas.

Mr. C. WEAVER had the best collection of vegetables in eight varieties.

Mr. J. LEE, Birkenhead, was awarded a Certificate of Merit and a Gold Medal for a display of 70 dishes of Apples of leading dessert and culinary varieties.

Obituary.

EMANUEL BONAVIA, M.D.—We regret to have to record the death of Dr. Bonavia, an old and valued correspondent, at his residence, "Westwood," Richmond Road, Worthing, at the age of 82 years. Dr. Bonavia interested himself at Worthing in crossing plants of various kinds, and some of the seedlings have been illustrated in these pages. Two recent incursions are *Pelargonium Churuda* (see *Gardeners' Chronicle* Supp. Illust., April 15, 1909) and *Hippastrum Queen of Spots* (see *Gardeners' Chronicle* Supp. Illust., April 27, 1907). He cultivated a large number of varieties of Grapes, many of them possessing unusual interest. The variety *Cornichon Blanc* was illustrated in these pages on October 8, 1904, from fruits supplied by Dr. Bonavia. He was an enthusiastic amateur gardener, and was always anxious to assist others either in procuring rare plants or in matters of cultivation, and the long period he had spent abroad was the means of his possessing valuable information in these matters.

CECIL GREENWOOD.—Many of our readers interested in Sweet Peas will receive with regret the announcement of the death, on the 29th instant, of Mr. Cecil Greenwood, a representative of Messrs. Cassell, Ltd. Mr. Greenwood has been a member of the Executive Committee of the National Sweet Pea Society since its formation.

BLACK CURRANT SHOOTS: S. W., *Avonlea*, F. H. B., and J. C. The branches are badly affected with the Currant-bud mite. In our issue for January 26, 1907, p. 56, an article records that Mr. Collinge cured the trouble by dusting the bushes with a mixture of sulphur and lime when the insects were migrating from the old to the new buds. Mr. Collinge recommends one part of unsifted lime and two parts of sulphur, to be applied in March, April, and May. Other writers have recommended smearing the bushes with grease of any kind in January and repeating the dressing in April; spraying with soft soap, quassia extract and water at the rate of 2 ounces of soap and 4 ounces of quassia to each gallon of water; and digging out the top soil from below the bushes and burning it. If the diseased buds are few, hand-picking and burning them should be adopted, and if very badly affected, the bushes should be grubbed up and burned. Some varieties of Currant, notably the Boskoop Giant, are said to be less liable to attacks by the mite.

BOOKS: A. P. *L'Hybridation des Plantes*, by Raphael de Noter, Paris. Librairie des Sciences Agricoles, 11, Rue Cassette. Price 2s. 1d., postage extra.—E. A. We do not know of any work such as you require.

BRUGMANIA: A. Z. Brugmansias, or, as they are now called, Daturas, need, as you suppose, greenhouse treatment, and it is not at all surprising that your specimen, being a dwelling room, is losing some of its foliage. The best thing you can do is to remove it to the plant house, give it plenty of water at the roots, syringe it occasionally, and vaporise it with one of the nicotine vaporising compounds if it is attacked by the white fly, as is frequently the case with these species.

BRUSSELS SPROUTS AND CELERY AT A COMPETITIVE EXHIBITION: *Sprouts*. In the Royal Horticultural Society's *Code of Rules for Judging*, of which a revised edition has been published within the past few weeks, the maximum number of points recommended for Brussels Sprouts is six, whether shown as plants or as picked Sprouts. Celery, on the contrary, is recommended a maximum of eight points, being two each for the qualities of size, solidity, condition, and uniformity. Assuming that the judges at your show will be guided by the code we have mentioned, and provided that you have Brussels Sprouts and Celery in equally good condition, it will certainly pay you best to select the Celery for exhibition.

BULB GROWING IN LANSHIRE: R. R. You can purchase bulbs retail from any of the nurseries in the county (a list of their addresses is given in the *Horticultural Directory*); but we do not know of any Lancashire firm who make a speciality of bulb producing.

CUCUMBERS: *Constant Reader*. We are unable to say definitely what the cause of your Cucumbers being bitter, but it may arise from an extra slow development of the fruits. You had better employ sufficient fire heat to maintain the requisite temperatures, and at the same time admit a little air during favourable weather. Promote an abundance of atmospheric moisture by frequently damping the paths and other surfaces in the house. If the Cucumbers do not improve in quality, it will be well to obtain a fresh variety for cultivation next time, or, at the least, get your seeds from a different source.

DRESSING FOR PEACH TREES IN WINTER: *Avonlea One*. Diluted Bordeaux mixture is a safe and efficacious specific to use for these trees in winter.

EUPHARIAS LILIES—H. B. We presume you mean Eucharis grandiflora (amazonica) not Henschera, as you have spelt the word. The Eucharis is a bulbous plant of the Natural

Order Amaryllidaceae, and a native of the banks of the Amazon River. It is necessary to treat the plants as stove subjects, by which we mean that they require a minimum night temperature of 65° to 70°. As your specimens are now flowering, you may give them alternate waterings of diluted liquid manure, maintaining the heat at a point we have already described, and syringing the plants once or twice each day according to the weather, carrying out the operation immediately after the open flowers have been cut. A week or two after the plants have flowered they may be partially rested by decreasing the amount of liquid manure and water applied to the roots, and by reducing the temperature at night by a very few degrees. It was formerly the practice in many gardens to force batches of Eucharis to bloom at certain periods of the year, thus endeavouring to obtain two and sometimes three crops of flowers from the same specimens, but although this may safely be done for a few seasons, there is no surer way of decreasing the vigour of the bulbs. We would therefore advise you never to allow the roots to get perfectly dry. If Eucharis bulbs are allowed to greatly deplete they usually become a subject to the attacks of the bulb mite, and when this takes place the bulbs cease to be profitable.

FERN: H. V. M., *Bampton*. The markings on the fronds have been caused by thrips. Fumigate the house with some preparation of nicotine, or spray the plants with tobacco water. Maintain a moist atmosphere in the fernery at all times.

FREMONTIA CALIFORNICA: S. A. P. *Kilat*. We are unable to guess what disease your plant may be suffering from, except that the conditions you describe appear to indicate the presence of a parasitic fungus or possibly of canker. If it is merely canker, some powdered charcoal rubbed over the place affected might be of some assistance. The important thing to determine is whether the trouble commenced in the roots and it is now spreading upwards through the stem. If this is the case, we fear the specimen will not continue to thrive.

GAS LIME ON FIELD: A. Z. You cannot apply this substance to pasture land, as the caustic properties will kill the turf. Gas lime can only be safely applied to land when it is fallow, and some weeks must be allowed to elapse before crops are again cultivated on the land so dressed.

HARBY CYCLAMEN: A. Z. These might conceivably be got to flower in the dwelling room, but they could not be cultivated in those conditions throughout the year. If you wish to flower them indoors, they should be placed in a house similar to what is known as the Alpine House at Kew. You should be able to purchase Hippocrepis bulbs from any of the nursery firms.

LICHEN ON APPLE TREES: *Avonlea One*. Treat the trees with the caustic alkali wash. For recipe see p. 333 in the issue for November 7.

MARKET GARDEN—H. H. G. The sandy soil covered with meadow grass would be likely to suit many market-garden crops, but we are unable to form an opinion upon certain circumstances such as drainage, water supply, and the need there may be for expensive manuring. These matters are very important ones and should be fully considered upon the spot by some expert. A sandy soil is not the best for fruit trees unless it also contains a proportion of clay. You might purchase fruit stocks from some of the fruit-tree nurseries. They are either grafted or budded with the fruits, as circumstances render desirable in each case. Young fruit trees require a certain amount of pruning each year, but if you have no experience on this subject you had better employ an expert to do the work, it being impossible in a short paragraph to convey to you the knowledge which is usually obtained by many years of experience. You should not commence to prune your Roses before March at the earliest, and Tea Roses may very well be left until May before being pruned, it being then only necessary to cut back the shoots to a point below the portions injured by frost.

NAMES OF FLOWERS, FRUITS AND PLANTS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable outlay, both of time and money, and cannot be allowed to discourage the preparations for the weekly issue, or to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at one time; they should be very carefully packed and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in one issue are requested to be so good as to consult the following numbers.*

PLANTS: E. L. H. *Pyrus Sorbus*, the Service Tree. The fruits are "blighted," and read as are Medlars.—S. G. You should have enclosed your name and address. 1. *Viburnum Lantana*; 2. *Elaeagnus orientalis*; 3. *Ligustrum lucidum*; 4. *Lonicera species* (send when in leaf and flower); 5. appears to be a wild form of *Pyrus Malus*; 6. *Cornicola Emerus*; 7. *Cornus capitata* (*Benthamia fragifera*); 8. *Cornus*, probably *bacillaris* (please send when in leaf); 9. *Forsythia viridissima*.—N. Y. Z. *Staphylea pinnata*.—G. C. *Enonymus europæus*, the Spindle Tree.—T. H. 1. *Pteris tremula*; 2. *Pteris cretica*; 3. *Blechnum coccineum*; 4. *Epidendrum erectum*; 5. *Oncidium niphobolium*; 6. *Pleurothallis rubens*.—J. C. *Aphrodisia Mayi*, so far as we can judge by the scrap sent; 2. *Pteris cretica alba-lineata*; 3. *Pteris serrulata cristata*; 4. *Polypodium glaucum*; 5. *Adiantum formosum*; 6. *Adiantum cuneatum gracillimum*.—*Today*. *Phytolmia serrulata*.

NAMES OF POTATOS. B. Ltd. We are unable to assist you in the naming, or even in checking the names of the varieties you send. Potatoes can only be determined by cultivating the variety and noting the habit of growth, cropping quality, strength of haulm, leaf, and many other points. In an ordinary sack of, say, Up-to-Date variety, one can select tubers that represent many types of the Potato.

NEW YORK NURSERYMEN: *Enquirer*. Siebrecht & Son, 569, Fifth Avenue; Peter Henderson & Co., 35, Cortlandt Street; Chas. Thorley, 543, Fifth Avenue; J. M. Thorburn & Co., 33, Barclay Street; Suzuki & Iida, 11, Barclay Street.

NIGHT SOIL FOR VINES: *Avonlea One*. We do not recommend the use of this material for vine borders. Apply it to outdoor fruit trees, or the shrubbery.

NOTICE TO LEAVE: *Insolent*. You do not state whether you were engaged as a head or under gardener, but, assuming that you are fulfilling the position of head gardener, you are entitled by custom to a month's notice. We are not able to enter into the further circumstances mentioned in your letter.

PLANTING ONIONS FOR SEED PURPOSES: E. S. The best way of treating large Onions intended for seedling purposes is to pot them up during December into the smallest pots possible, these having a diameter of 3 or 4 inches with generally sufficient. Three parts of each bulb should be left uncovered, using only just sufficient soil for the bulbs to root into. Place them in a cool house or cold frame, keep them moderately dry, and do not allow the young growth to become drawn. Plant the bulbs in an open, sunny position early in March, and afford them a slight protection against frosts and cold winds until the weather is warmer. The bulbs should be planted three parts their depth.

SPOT DISEASE OF GRAPES: J. B. Have you tried syringing with liver of sulphur (potassium sulphide)? Mix half an ounce of the chemical with two gallons of water.

SAGE.

CUR morietur homo dum salvia crescit in horto is an oft-paraphrased question which, if we may imagine a monk indulging in a little dry humour, perhaps contains a solemn pun on the word "salvia;" for while *healthis* is flourishing in his garden, what reason is there that a man should die? Some perhaps more modern ways of setting forth the admirable properties of Sage are far more emphatic. Thus, "He that would live aye, must eat Sage in May," but the older setting of this is perhaps less open to contradiction: "Eat Sage in May and live aye," which, though like the first in indefiniteness, has at any rate a more limited construction.

It will be remembered how Chaucer, describing the epigone to a certain feat of arms, employs words which have been assumed to mean Sage:

"Some had *salves* and some hadde charmes, Fermacyes of herbes, and eke *sawe* They dronken, for they wolde here lynes have."

But there are others who consider "salve" and "saw" to be mere medicinal compounds. Yet, without accepting Sage as a panacea, it is possible to agree with Gerarde that "no man needs doubt the wholesomeness of Sage ale, being brewed, as it should be, with Sage, Scabious, Betony, Spikenard, Squinanth and Fennell seeds." And, to sum up, there are plenty of data to prove that Sage has been a

cultivated garden plant for almost as long a period as gardening records extend, and, though usually it appears as Sage or Salge, yet *Salvia* is glossed *Fonferain* in the 10th century and *Fenvern* in the 13th.

It is not a little curious how certain varieties of common plants came to be appreciated more than others, and the Sage furnishes an instance of this. As early as the 16th century Lyte described four sorts, one of them variegated, and 50 or 60 years later these and others are so well defined that there is no difficulty in identifying them. Thus, there was the common green, which had no great repute, Wormwood Sage, which "in smell and taste hath some affinity with Wormwood"; Red Sage, which was held in the greatest esteem of all. This variety procured its distinctive name from the stems, which are reddish purple, and from the leaves, which are a dull dark-green, hence in Bauhin's Pinax called "*Salvia nigra*." Tradescant the younger discovered a variety of this, which he afterwards propagated and distributed among his friends, and which Parkinson describes by the name of Party-coloured Sage. The leaves, which are blotched with white and pink, and occasionally a whole shoot with its foliage comes white and pink, sometimes only one of these, presents a very pleasing appearance. We found this some years ago in an old garden, and it has since formed one of the most interesting plants on a mixed border.

Sage of Virtue, which Evelyn calls also Guernsey Sage, is a narrow-leaved form that Professor Martyn identified with *Salvia triloba*. In the 17th century this was in great request for making Sage-tea, which, strange as it may appear, was a decoction in constant request by many people. Nearer to our own times tea was brewed from the leaves of the broad-leaved Sage, which was also called Balsam Sage. Another custom of early herbalists was to group plants, not necessarily on account of botanical affinities, into couples. Thus, they might be male and female, garden and field, tame and wild, and yet have very little in common. So it is by no means wonderful to find in *Teucrium Scordonia* the wild Sage of mediæval England. On account of its scent it was very usually named *Ambrose*, from *Ambrosiana*. *Hindheel* was another name, which is supposed to apply to some occult habit of deer to use it as a medicine in the same way that cats cure themselves with grass. *Scordonia* was bestowed on the plant on account of its smelling like Garlic, and so one of the common names found in the herbals is *Garlicke Sage*. *Salvia verbenacea* enjoyed a long period of popularity on account of its supposed efficacy in restoring clearness of vision to those whose sight was impaired. This was effected by means of the seeds, one of which, being introduced under the eyelid, in working its way out, gathered to itself any extraneous matter on the surface of the eye, which it left free of impurities. In Culpepper's words, it was "a handsomer, safer, and easier remedy by a great deal than to tear it off with a needle." Its name, "Wild Clary," was in everyday parlance *Clear-eye*, and in the lines:

"It is thyself, mine own self's better part; Mine eye's clear eye, my dear heart's dearest heart"

Shakespeare seems to be referring in oblique fashion to the plant. *Orval* is an anglicised French name, and *Oculus Christi* and others, with their English equivalents, indicate in the clearest manner the high position this weed occupied in the esteem of people of every class.

Common Clary would appear not to have been so long in use as the above, unless one may accept a line in one of Neckham's poems as alluding to it. A plant named *Oranium*, &c., was early used to cure argema of the eyes; it had leaves like Horehound and grew 3 feet in height, and is mentioned by several old authorities, but it is not till Turner describes it that one can be really certain of its identity. It, too, was called *Clear-eye*, but was administered internally. *Orvale* and *Touthonne* are other names. As a garden plant it is well worth cultivating, for though the flowers are light blue, the foliage and bracts give the whole plant a silvery aspect that distinguishes it from all others. It exists only a few years, but continues the species by odd seedlings, which, like self-sown Hollyhocks and *Mary Thistles*, are much to be preferred to artificially-raised ones.

Salvia Hornum, which Lyte styles *Double Clary*, cannot be traced further than the date of his *Herbal* (1578), in which it is remarked that it is "founde in this countree sowne in the gardens of herboristes." Aiton dates its introduction with that of Gerarde's 1596 catalogue, in which it appears by the name of *Hornium verum*, and this date has been followed by others ever since he published the *Hortus Kewensis*. The violet and red or pink varieties were also in cultivation about the same time, the best form being the violet, though some people like the last-named, but it is not at all a common plant. Usually the type is to be purchased as "*Bluebeard*." Another 16th century Sage is *Salvia glutinosa*, which appears in Gerarde's catalogue as *Colus Jovis*, and is described in his *Herball* as *Jovis Colus*, which, he says, "representeth in the highest top of the stalke a distaffe wrapped about with yellow Flax, whereof itooke his name"—Jupiter's distaffe, and in another paragraph he refers to its rarity, but "which I have in my garden." In Switzerland it is employed to snare noxious insects.

Salvia Ethiopis dates from L'Obel, and was thought to be a kind of Mullein. Of recent garden Sages, *Salvia fulgens*, splendens and patens are the best known, and, on the whole, are perhaps the pick of the Mexican species. *S. splendens* was the first of the trio to reach this country, and its variability was early discovered, Loudon in 1829 mentioning an improved form. The erratic way it flowered in the open not improbably caused it to fall into disrepute, but even when it refuses to flower till very late in the year it is yet worth the space it occupies, and there are several improved early-flowering forms of much value. *S. fulgens* appeared five years later than the last-named, or in 1827, and it at once became popular on account of the long period it continues to produce flowers, as well as for its brilliant colour, which it may be said varies considerably in plants raised from seeds. It may be noted, for the benefit of those who find it grown too tall, that it was at one time customary when planting to lay the plants on

their sides and to secure each with a peg, by which simple means a group was considerably dwarfed.

Though *S. patens* had been long known to botanists, it was not till 1838 that it was introduced to Britain. Mrs. Loudon states that tubers were imported, but Benthiam early in 1839 clearly shows that seeds were sent to several parties by Mr. John Parkinson, at that time the Consul to Mexico, and that the first plant to flower did so in the nursery of Page, Southampton. Harrison, on the other hand, while agreeing with that statement so far as regards seeds, claims the honour of introduction to Mr. Fawcett, and Low's Clapton Nursery as that in which it first bloomed. It is a mistake to propagate this species by means of seeds, on account of many of the seedlings being very inferior. A far preferable method is to select or secure a good variety and increase it by cuttings in spring, in the same way that Dahlias are propagated, or if there is a sufficient stock of plants the tubers may be split up, and, after being started enough to show the buds, they may be planted out in April. In warm, dry soils the tubers can be left out all the winter, but there is always the danger of an extra severe frost, which would assuredly destroy them. Unlike the other *Salsyas*, *S. patens* enjoys much rotted manure in the soil. It is undoubtedly one of the finest summer and autumn-flowering plants of its colour, which painters distinguish as *eceruleum*. *R. P. Brotherton*.

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM LEONIDAS (HALLIO-CRISPUM × TRICUMPHANS).

This "hybrid," if such it can be called, I raised, and afterwards exhibited in bloom at the R.H.S. meeting on June 23 last, with one of its half-brothers named Leo (Hallii × tricumphans). In this plant the additional parent of *crispum* has, up to now, exerted but very faint influence upon the seedlings, except that the markings of *Leonidas* are, perhaps, bolder and the blossom is also better in form. A reference to *Gardener's Chronicle*, May 25, 1907, p. 326, when a description of Leo was published, will be useful in tracing the details of descent.

In crosses yet raised from *O. Hallii*, its influence is almost always greater than that of the other parents, this fact, no doubt, resulting from its being a pure species, than most of the yellow and brown ones, owing to its being so far removed in its habitat from other *Odontoglossums*. *de B. Crawshaw*.

ODONTOGLOSSUM ÆMÆA.

(WATTIANUM CRAWSBAYANUM × TRICUMPHANS). I RAISED THIS CROSS to see which would prove the strongest species, *O. Lindleyanum*, *O. Hartmanni* or *O. tricumphans*; the two former having been united to make *Wattianum*.

The result has been in favour of *O. Lindleyanum*, both as to the floral as well as the vegetative habit of the seedling, for the hybrid is in full growth as well as full bloom at the same time, this being the great characteristic of *O. Lindleyanum*.

The bloom has the ground colour yellow with the segments almost totally covered with brown, though slightly marbled by the ground colour.

The lip is large, thick and stiff, with right-angled shoulders, having the narrowest margin of yellow around its edge, and a semi-circular line in front of the crest, otherwise it is one solid mass of brown. Almost all evidence of the feathery crest of *O. Hartmanni* is lacking, and two long divergent yellow keels of *O. Lindleyanum* take its place.

Its column is white. Its ♀ parent, which I raised to prove the parentage of *O. Wattianum Hartmanni*, a natural hybrid, was originally published in the *Orchid Review* for October, 1900, pp. 289-299. *de B. Crawshaw*.

ODONTOGLOSSUM OXUS

(TRIPUDIANUS × WILCKEANUM).

THIS further addition to the number of the "yellow and brown" hybrids has been raised by Messrs. Sander & Sons, and was shown in their group at the R.H.S. meeting on November 24. Intermediate in size and form between the parents, it promises to be a useful plant, though it is no advance upon existing hybrids. The sepals are light yellow, but almost covered by a confluent blotch of bright brown. The petals are creamy-white, having a blotch and a few spots as in *O. Wilckeianum*. The lip is almost white, with a blotch of bright brown. In form the flower resembles the seed parent. The crest is intermediate, and the column white with two side lines of brown. The wings are brightly tipped with brown, as is the edge of the stigma and lower surface of the column.

Some people seem to rather despise the yellow-grounded section at present, only appreciating the white and purple hybrids. All things have their turn, and so one need not be despondent at having and holding good "yellows." *de B. Crawshaw*.

BULBOPHYLLUM VIKESCENS.

A FINE inflorescence of this remarkable species, of which a full-size Supplementary Illustration was given in the *Gardeners' Chronicle*, October 13, 1906, is kindly sent by Sir Jeremiah Colman, Bart., Gatton Park, Reigate (gr. Mr. Collier), in whose collection it has attained a greater size than formerly. The very stout scape, which is a foot in height, is curved at the top, and bears a 6-inch wide umbel of nine large flowers, the upper sepals of which are about 6 inches in length, and all erected to a common centre, where their slender tips mingle. The lateral sepals, which are rather longer than the dorsal sepals, have the basal parts broad and falcate, their continuations being slender and tendril-like in appearance. The colour of the flowers is yellowish-white, veined with green, the base of the hinged labellum and face of the column being violet-purple, shading off to mauve. It is a Malayan species, requiring a moist, warm house. It belongs to the same section as *B. Fendsoni* and *B. Pahadi*.

THE ROSARY.

NOTES ON THE NEWER VARIETIES.

Continued from page 390.

GRAND DUCHESS ALEXANDRA (*H.T.*, *Jacobs Heller*, 1907).—This has bloomed well with us this year. In colour it is a creamy-white, in the way of *Kaiserin Augusta Victoria*, but the flowers are more cup shape. Perle von Godesberg, a sport from *K. A. Victoria*, we also grow; it is a light yellow flower and a stronger grower; but the beautiful lemon shade of *Kaiserin Augusta Victoria* is hard to beat.

PEERLESS (*H.T.*, *Lippitt*, 1907).—We only have had one very poor specimen of this New Zealand Rose—a pot plant; but, as far as one can judge, it seems to be quite a promising variety. The flower is fairly large, full, and well formed, and it is quite a beautiful and novel colour, being pale green shaded with white.

LADY HELEN VINCENT (*H.T.*, *Alex. Dickson & Sons*, 1907).—We have one maiden plant of this, and have not been as successful with it as we hoped to be; but, growing at the raiser's nursery, it seems to be very robust out-of-doors, so we are ordering another plant of it, and hope, as a cut-back, it will do well. It is a beautiful Rose, and no doubt will take a high place as an

exhibition variety. Its form is perfect, the flowers are large, and the buds long and beautifully pointed. The colour is shell pink, but the reflex of petals pale blush; whilst the base of petals is veined and suffused with peach, with a yellow zone. It is delightfully fragrant, and a very free bloomer.

MRS. G. W. KERSHAW (*H.T.*, *Alex. Dickson & Sons*, 1909).—This is a glowing-deep rose-pink colour, but quite distinct, and a beautiful flower of good form, with a high pointed centre. It has been marvellously free this year.

MRS. PETER BLAIR (*H.T.*, *Alex. Dickson & Sons*, 1906).—This is a splendid decorative Rose. It makes a big bush, and produces a mass of nicely-shaped flowers of moderate size. The flowers are of pale golden yellow and fragrant throughout the entire season. The plants have beautiful foliage, and the variety should be in every garden.

MARQUISE DE SINEZ (*H.T.*, *Pernet Ducher*, 1907).—This is a charming Rose, and quite remarkable for its distinct colour, which is a golden orange, shaded with bronzy-red; the buds are odre-carmine. The flowers are fragrant, fairly full, large, and of cup form, set off by dark, glossy foliage.

YVONNE VACHERON (*H.T.*, *Souper & Nolting*, 1905).—This variety has nicely-formed, large flowers, produced on stiff, upright stems. The colour is porcelain-white, suffused with soft pink. It has bloomed well this summer. *Leonard Petrie, Gayton, Cheltenham*.

FRUIT REGISTER.

APPLE BEAUTY OF HANTS.

I DO NOT know anything of the origin of this Apple beyond the fact that thirty years ago I obtained a standard-trained tree of it from Messrs. R. Smith & Co., Worcester, along with many more. In appearance it is almost identical with *Blenheim Pippin*, although it is neither so large, nor so well coloured, nor is it so good in flavour as that old favourite. As a cropper it has much to recommend it, for when there are Apples at all there are sure to be some on this tree. The particular cause of my referring to it now is that it ripens earlier than *Blenheim Pippin* (from which it may be a seedling), and it is a desirable variety for that reason, coming into use early in October when Worcester Pearmain is past and *Blenheim Pippin* and Cox's Orange Pippin are still insufficiently ripe.

APPLE JOLLY BEGGAR.

ALTHOUGH this is an old variety it is seldom seen in gardens, but those who value good quality in a cooking Apple would do well to pay attention to it. The fruits attain full size early in August, and when cooked, their quality is very good. The flesh is pure white and soft, though remaining in a whole condition when baked, for example. The growth of the tree is vigorous, and if not checked by root pruning and keeping its branches thin the tree is a long time in coming into a full-bearing condition. *E. Malynoux*.

GRAPE DIAMOND JUBILEE.

I HAVE seen this Grape growing on several occasions, but, until quite recently, not quite satisfactorily. The exception was at Byram Park, Yorkshire. Two years ago Mr. Taylor, the gardener, engrafted it upon a stout young vine of *Appley Towers*. The fruit this season is really very good, in bunch, berry and flavour. It is nearly 40 years since I first grew the true Black Morocco Grape, yet if my memory serves me right, I could see distinct evidence of its being one of the parents of *Diamond Jubilee*, both in fruit and foliage. *Yorkshire Gardener*.

NOTICES OF BOOKS.

*** NEW WORK ON NATURAL HISTORY.**

It is greatly to be hoped that all those into whose hands this book falls will carefully study Dr. Farmer's preface and ponder in their hearts the introductory problems which Professor J. Arthur Thomson lays before them in the opening chapter. For if this be not done it may easily be imagined that all the interesting and useful information with which the book is filled, is nature study, whereas it is really the material with which teachers and others who have to train pupils to acquire knowledge for themselves may advantageously work. Nature study is a method of education in which ordinary subjects are correlated with one another by bringing the pupil into closer contact with the less artificial aspects of his environment and teaching him to enquire, discover, deduce and to accumulate experience for himself, instead of leaving him in such a mental state that he requires to be told what he is to do whenever circumstances arise which are different from those to which he is accustomed.

Every true gardener remains a nature student all his life, and the conditions in which he customarily finds himself are those which the exponent of nature study looks upon as ideal. Professor Thomson rightly says, "In spring and summer the school nature study should include much observation—as far as possible in the open air—of the works and ways of animals (and he might have added of plants also, though the volume under consideration deals with the zoological side only) such as ants, bees, wasps, spiders, earthworms, snails, birds." He very wisely says also that the teacher must try to avoid the one extreme of reading the man into the beast, endowing the bees or the bird with the best human attributes (a serious fault of many popular writers as well as teachers), and the other extreme of thinking and speaking of the creature as if it were an automatic machine. Professor Thomson gives a very good table contrasting the characteristics of animals and plants which is well worth the reader's attention. A considerable portion of the first volume has been written by Mr. W. P. Pycraft, who deals in his usual accurate and straightforward way with the natural history of mammals and birds. He states that the promoters of nature study in this country most unreasonably use the word animal when they mean mammal. One cannot help feeling that he is wrong, and that he has based his statement on a curious kink in the mind of Mr. Kay Robinson, who some time ago most vigorously upheld, and has since encouraged in his paper *the Countryside*, the use of the word animal for mammal, saying that the idea implied is that the latter word is not a nice one, though we may say that most of us must have imbibed it with our mother's milk.

A good deal of information is given about creatures that are not British, which though enabling the reader to grasp the subject more easily, cannot be of much use in his actual nature study teaching. Chapters on common mammals, common British birds, and migration are included, which are much to the point.

Reptiles, amphibians, fishes and their more lowly relatives are discussed by Professor Thomson only too briefly, while Mr. Oswald Latter is responsible for the chapters on invertebrates. Readers may well learn something that they did not know before about earthworms, for much that Mr. Latter writes is based upon his own careful observations. If cockroaches do not come often within the gardener's ken the earwigs do; and the same may be said of wasps, the consideration of which brings the volume to a close.

No one can be too familiar with the habits of creatures which are of economic importance,

and the more one learns about them the more one is able to appreciate that, like men and women, few of them are wholly bad. When it is realised that many so-called pests do an immense amount of good in some directions, the problem arises as to how to take advantage of this fact by not destroying them, and yet, at the same time, to prevent the harm that they may cause in other directions.

In conclusion, it must be said that the half-tone illustrations which make up the plates are very good and represent the successful work of many natural history photographers.

The publication of the succeeding five volumes of this important work will be looked forward to with much interest. A consideration of the plant side of nature study will begin in the third volume *W. M. W.*

FIG. 163.—*NEPHROLEPIS RUFFESCENS* MAYI VAR. *ORNATA*, AWARDED AN AWARD OF MERIT AT THE MEETING OF THE R.H.S. ON NOVEMBER 10, WHEN A PLANT WAS SHOWN BY MESSRS. H. F. MAY AND SONS. (See p. 347 ante.)

* FOREST UTILISATION.

Professor Bisher's *Forest Utilization* is a revised and edited English version of Gayer's German book, which is not only the standard work on the subject in Germany, but has served as the model, and provided much of the subject matter of leading French treatises on the utilization of forest produce. The original volume contains a rich store of information on subjects so varied as the structure, physical qualities, and defects of wood, the treatment of timber in the forest, sawmill, creosoting vat, and charcoal kiln, transport by land and water (road-making, tramways, rafts), wood depots, sale of wood, conversion of timber, utilisation of minor products such as resin, peat and grass, and so forth. The English version is the result of the collaboration of three writers—Professor Mayer, H. Mayr, and Fisher. Professor Fisher has supplied a translation that reads, often at least, as if it were an original work; he has also contributed many interesting and valuable notes derived from his own wide experience and from French sources, and has added a number of well-chosen illustrations. The veteran author, Professor Gayer, has aided in bringing out the second German edition, upon which this volume is based, and has invoked the assistance of Professor Mayer, his successor to the Chair of Forest Utilization in Munich.

In a work covering so wide a field of practical knowledge, parts of the subject are apt to suffer at the hands of the authors, however erudite they be. And in the first part of the book, which deals with the structure and properties of timber, Professor Mayer unfortunately plunges into scientific discussions upon branches of the subject on which he is imperfectly informed, both as to the facts and principles, which are already generally appreciated, and as to the complexity of the problems involved.

We read the astonishing statement: "Mayer's observations . . . show that [wood] vessels never contain water, but serve exclusively for aeration and for conducting oxygen to the neighbouring parenchymatous cells."

A little later, after an airy dismissal of Hartig's sagacious work on the structure of the tree, the usual ring in relation to transpiration and nutrition, we are told: "Fibrous cells are similar-shaped, . . . parenchymatous cells, with smaller function, to those of sclerenchyma." Some pages further on we are introduced to "Mayer's Law" concerning the specific weight and hardness of wood, which is: "Assuming identity of soil, the specific weight and hardness of wood decreases with distance from the optimum climate of its production."

Within the natural habitat of any species of tree the centre of its habitat produces the heaviest and hardest wood." [By habitat, station and area of distribution are here meant.] If the statement were verified, it might be called a "rule" until the complex underlying principles were explained. But the statement is not yet justifiable, as we are still without a proper definition and method of recognising the hypothesis of optimum climate; and the measurements in different timbers are too limited in number to warrant generalisation. Moreover, the underlying facts to which Professor Mayer refers have long been known to practical men in this and other countries. What dealers in foreign timber is unaware of the soft northern Scots Pine and Oak, which contrast with the harder types occurring in intermediate localities? Equally lacking in novelty, justification, and corroboration is "Mayer's Law" concerning the durability of timber: this Law states that "the more intense the colour of heartwood the more durable it is." So far as this "rule" is applicable at all it is already well known, as regards European and some other timbers of commerce. But even among the limited number of timbers that have been more or less tested in this respect, the "rule" breaks down; indeed, its intention is given in the book under review, where white Holly wood and light-coloured Cypress woods are cited as durable.

It is to be hoped that in a future edition Prof. Fisher will ruthlessly remove these and similar blunders, which, however, are minor blemishes on a work that stands alone of its kind in

the English language, and will be found useful to all interested in trees, timber, and forests.

We note a few misprints, such as *Stuodopytia*, *Armilarera*, *Lelcowa*, "grains of resin per kilogramme" (p. 110), "data in tons of 1,000 kilos. (p. 91).

The book contains a large number of well-reproduced illustrations, including two excellent coloured plates showing types of Oak, Spruce, and Larch timber.

CULTURAL MEMORANDA.

GALEGA OFFICINALIS GRANDIFLORA ALBA.

This plant reaches a height of 3 feet; it possesses compound leaves which appear in bunches, and its blooms bear a resemblance to those of Sweet Peas; the floral season lasts from the end of June till frosts come. The flowers are not injured by rain, and retain their freshness when cut for a considerable length of time. Its cultivation is of the simplest character, the seeds being sown in a cold frame in April, or on a prepared bed in May in the open air. As soon as the seedlings are sufficiently strong they should be pricked off in four rows in a half-shaded spot at about 1½ feet apart. In a few weeks the first blooms appear, and the growths are then stopped, when from the axils of the leaves flowers continue to be produced. When the autumn frost has destroyed the flowering stems, the plants should be covered with tree leaves, twigs, or straw litter. They will in the spring push out many growths, and will produce large numbers of long-stalked flowers. The plants fill a gap at the end of a period when Pinks, Pyrethrums, Campanulas, &c., with white flowers are passing out of flower, and Asters, Dahlias, Gladioli, &c., have not yet commenced to bloom. F. M.

The Week's Work.

FRUITS UNDER GLASS.

By T. COOMBE, Gardener to Lord LEAGHTOFC, The Herdrie, Monmouth-shire.

Strawberries.—Where ripe strawberries are required very early in the season, plants may now be started into growth by arranging them upon shelves placed near the glass in a suitable house. In our case plants are arranged in this manner over a bed of fermenting tree leaves, which promotes a suitable humidity. This method is preferred to that of plunging the pots into a bed of warm leaves, as, in the latter case, they are likely to suffer a check when they are removed from the bed. Pick all the decayed leaves from the plant, and substitute for the loose surface soil a fresh compost of loam, lightly mixed with manure from a spent Mushroom bed, a little soot, and an approved artificial manure. Do not use more fire-heat than is enough to slightly warm the pipes, and in mild weather afford sufficient ventilation to cause the atmosphere to circulate both by day and night. Spray the plants overhead with tepid water early in the afternoon of fine days, and exercise care in applying water to the roots. Plants in pots at present plunged out-of-doors, and intended for the supply of successional crops, may be protected during severe frosts by a covering of bladder.

Early set water in pots.—When these vines have developed some growth and leaves, the atmospheric temperature may be increased to 60° at night, allowing a rise to 70° by day, with careful ventilation in mild weather if the heat is likely to rise above 70°. When closing the house early in the afternoon, spray the vines overhead with tepid soft water, and damp the ground surfaces of the house with weak guano water. Bind any surplus shoots whilst they are still very young, and complete the disbudding, as soon as the flowers have advanced sufficiently for the best bunches to be selected for the crop, which should not be sufficient to overburden the vines. When the disbudding has been done, remove any surplus bunches, stop the lateral growths at two leaves beyond their buds, and sub-laterals at the first leaf. When this stage has been reached the roots will be very active, and closer atten-

tion must be given to watering, using tepid water slightly enriched with liquid manure. Maintain the temperature of the plunging material at 70°.

Young vines.—Vines that have been raised from eyes this year, having now lost their leaves, should be cut back to two buds if this has not already been done, and the cut surfaces be dressed with styptic. It is assumed that these vines will be grown another season with a view to forming canes for bearing a crop in 1910. Keep them at rest until it is time to start them into growth at about the middle of next month.

The formation of vine borders.—If any vines have to be planted next spring, the borders should now be made. The chief points to consider are to provide thorough drainage, and take the necessary measures to prevent the roots of the vine penetrating into unfavourable soils. There need not be more than 3 feet deep of compost, nor need the border have a greater breadth than 1½ feet in the first year. The compost may consist of good and roughly broken turfy loam, mixing with it crushed mortar rubble or lime plaster rubble, wood ashes and finely-crushed bones, employing more or less of each material, according to the texture of the loam. The soil should be moderately dry at the time of forming the borders. It must be made tolerably firm, and should be protected from wet until the vines are planted. Borders may be formed entirely inside the house, or extending to the house or portions of the border may be inside and out, but in this case the vines should be planted inside. (See also the remarks on this subject in the issue for February 1 last.)

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. G. L. HOLFORD, C.V.O., C.I.E., Westcote, Gloucestershire.

Dendrobium.—Plants of the autumn-flowering members of this genus as *D. Phalænopsis*, *D. Statterianum*, *D. bigibulum*, and *D. formosum* have nearly all ceased flowering, and should be afforded a long and decided rest. Under proper conditions they will remain in a dormant state until next April. During the intervening period the plants should be kept in a light position in a warm atmosphere where air is admitted whenever outside conditions will allow. The affording of moisture to the roots of these *Dendrobiums* during their inactive season is a very important matter. The cultivator should be guided by the state of the pseudo-bulbs and foliage, which soon show signs of shrivelling if the rooting material is allowed to become too dry. Thrips sometimes infest these plants at the time of flowering, when fumigation cannot be practised for fear of disfiguring the blooms. The plants should, therefore, be examined at the present time, and if they are found to be infested with these pests they must be thoroughly cleaned before being placed in their resting quarters. Imported plants of the species of *Dendrobium* mentioned above often arrive during the winter months and get distributed throughout the country. These usually travel well, and arrive with sound dormant eyes, but they should not be encouraged to break away into growth immediately on being received. The plants should be first thoroughly cleaned and gradually inured to the light, afterwards placing them under similar conditions to those of established resting plants. If possible, do not allow the "eyes" to break away until the spring, when the plants may be potted up.

Panda trees.—Plants of this species have completed their growth. This fact is indicated by the natural sealing over of the points of the roots. During the winter period of inactivity, similar conditions and temperatures to those advised above for *Dendrobiums* will be found suitable for these plants. Overhead syringings should be discontinued, and water should be afforded only in quantity sufficient to prevent shrivelling. Plants of *V. Hookeriana* and its hybrid are still active, therefore, until signs of rest are apparent, continue to afford these a liberal treatment.

Cattleyas and Trichocattleyas.—Owing to the printer having omitted a heading in the "Calendar" of last week, the directions for treating *Laelias* and *Laelochs* cattleyas during the resting season appeared as if they referred to *Odontoglossum citrosum*.

PLANTS UNDER GLASS.

By THOMAS LUNT, Gardener to A. SIBLING, Esq., Kent, Perthshire, N.B.

Coleus thrysoideus.—This species should be cultivated in an atmospheric temperature of 50° during winter, and be kept in a position close to the roof glass. It is much better not to bury the plants into flower until spring, for there being more light at that time than in January the blooms develop a deeper shade of blue, and under the cool treatment the plants preserve a dwarf habit.

Cyclamen.—A batch of the earliest plants already showing flower-buds should now be introduced into heat, and placed close to the glass. Afford plenty of tepid water daily to the roots whilst the plants are in this warm atmosphere and keep a sharp look-out for thrips. When the flowers have opened, the plants must be removed to a cool greenhouse or conservatory.

Chrysanthemums.—It is now time to take cuttings of all varieties of *Chrysanthemums*. Prefer to use thin pots and place only one cutting in each pot, because then they suffer very little check when rooting becomes necessary. In the cultivation of *Chrysanthemums* for furnishing large blooms, the most important point is to preserve them from suffering a check at any time. The soil to be used in these small pots should be of the most porous character, but it should contain sufficient plant food to support the cuttings for two or three weeks after they have formed roots. A small piece of old turf should be placed at the bottom of the pot. This will serve the purpose of drainage, and the roots entering firmly into the turf, it will form a good support to hold the soil together when rooting is necessary.

Potting soil.—A favourable opportunity should be taken to procure some fresh loam from an old pasture field for use next year in potting operations. It is best to cut this turf at a time when there is a little frost on the ground, for being old pasture, it is sometimes infested with wire worm and many other pests that during frosty weather are apt to gokers than when the turves are cut. It should be about 3 to 3½ inches deep. If the turf is moderately dry at the time it is cut, it should be carted away and stacked at once, making the stack in the shape of a ridge, so that it will throw off rain. The stack should be placed as near the potting shed as circumstances will allow. Any of last year's loam that still remains should be put under cover and kept dry for immediate use. Equal foresight should be exercised in regard to the provision of leaf-mould, sand, and broken lime rubble, all of which materials should be stored in a place conveniently near to the potting shed.

THE FLOWER GARDEN.

By W. FYLE, Gardener to Lady WASTAGE, Lockinge Park, Berkshire.

Alterations.—With the exception of a few days, the weather has been favourable for all sorts of outdoor work. In most cases, therefore, it will be possible to complete the planting of trees and shrubs, and any alterations, before the end of the year. The present is a good time to drain any ground that is generally in a wet condition, and, therefore, unpleasant to walk upon. The drains should be laid at a depth of from 3 to 4 feet. If the subsoil is removed by this means, the surface water will not be likely to give much trouble. The distance allowed between each drain will depend upon the nature of the soil, and may vary from 12 to 18 feet. Drains, however, may be rendered useless by the haphazard way the trenches are afterwards filled, for if much ramming is done the soil will be rendered less porous than it ought to be. It is, therefore, better to allow the soil time to settle naturally, and if the drains are inserted below a turf-covered surface, care should be taken to employ soil of the same nature and quality as that adjoining it. Otherwise, the grass, making a different growth to that by which it is surrounded, will become conspicuous.

Plants effective in winter.—There are certain plants that are usually cut down to the ground surface at this season, which, if left, would make a good effect during the winter months. Such plants include Solidago, Phlox, autumn-

flowering Aster, Senecio, Eulalia, Hydrangea paniculata, and Fuchsia Riccartonii. *Cornus sanguinea* is well known for the good effect it affords in winter by reason of the vivid colouring of the young wood. Many of the Spiræas such as *S. Lindleyana* and *A. arifolia*, also Willows in variety, of various shades and colours, are very prominent. We have some Willow trees here planted by the late Lord Wautage in 1901. One has a height of 50 feet and a clear stem of 20 feet long, the circumference varying from 3 feet 6 inches to 4 feet. This and other specimens were planted by the late Lord Wautage from 8 to 10 feet in length, and 4 to 6 inches in circumference, and they were inserted in the ground about 4 feet deep.

Christmas Roses (Helleborus).—These plants are very useful for affording flowers for cuttings in December and January, and in order to have the blooms as pure and fresh as possible, frames should be placed over the plants as soon as the flower-buds appear. *Helleborus niger* and its varieties generally succeed best in a sheltered and shady border, having a deep rich loam into which a fair quantity of leaf-mould is intermixed. By the frequent application of liquid manure it is possible to increase the length of the flower-stems.

Shrubs.—The present is a suitable time for applying mulchings of decayed garden refuse to the shrubberies. The delicate forms of silver and golden coloured Hollies will benefit if given a good coating of fine soil, wood ashes and soot. Single specimens upon the lawn especially need this attention. A good mixture of road grit, leaf-mould and peat will help to maintain peat-loving species in the best condition.

The rockery.—Keep the rockery free from fallen leaves and rubbish, of any description. It may be necessary in some cases to add a little soil or other material to the roots of various Alpine plants, such materials as peat, slate, lime or granite. Take care that the tender species are not overgrown by stronger habited plants. There are certain species sometimes seen on rockeries that are more suitable for the woodland or wild garden.

THE KITCHEN GARDEN.

By E. B. CUMFERT, Gardener to the Hon. VICARY GIBBS, Aldenham House, Elstree, Hertfordshire.

General work.—Although there is less pressure of work at the present season than earlier in the year, advantage should be taken of good weather to do all that is possible before the advent of the New Year brings extra responsibilities.

Potatoes.—These may now be planted in fairly large quantities if the necessary means are provided for forcing very early tubers. Care should be taken to select varieties which are known to produce but little haulm, and quickly mature. The sets which have been laid out to sprout in gentle heat will now be sufficiently advanced for this purpose. I prefer growing these in 10-inch pots or boxes rather than smaller pots. The pots or boxes should be well drained and about half-filled with a compost consisting of one part well decayed leaf-soil and one part light fibrous loam, free from wireworm. Bury the tubers to the depth of 2 inches, and more soil can be added for moulding up the young plants after they have reached the top of the pots. They may be placed in a gentle heat of from 50° to 55°, applying but little water until the growth is above the soil. Any position will suffice for the sets before this stage is reached, but as soon as the growth is seen the receptacles containing them should be placed near the glass, so as to produce stout, short-jointed growths; severe forcing must not be practised. Sets may also be planted in heated pits, with the slightest possible hot-bed of leaves, allowing sufficient room between the soil and the glass for the growth to properly develop without coming into contact with the latter. The following are among the many desirable varieties for the purpose of early forcing—*Sharpe's Victor*, *Sharpe's Express* and *May Queen*. Tuber-forcing crops should be prepared and laid out thinly on suitable trays.

Mushrooms.—Beds in full bearing should not be subjected to an excessive temperature, it being far better to err on the side of too little

rather than too much heat, as by this means the quality of the produce will be not only superior, but the beds will continue to bear for a longer period. Endeavour to maintain an even temperature of from 50° to 55° during the paths and walls with tepid water about twice each day, and when the beds show signs of exhaustion apply a thorough soaking of farmyard liquid manure in a tepid state. Mushrooms growing in cool sheds will be greatly stimulated if a quantity of fresh horse manure is placed on the paths and turned over every morning. This will help to raise the temperature of the building, and the escaping steam will be beneficial. Beds which have been made up in the open during the autumn should be thoroughly covered to a depth of from 8 to 12 inches with good stable litter. Very fine Mushrooms may often be cut from these when well protected during mid-winter, but should this fail to be the case, provided the beds were properly made and spawned at the right moment, good returns may be expected in the New Year. Keep plenty of good material in preparation, and make up new beds in the Mushroom house as circumstances require. The best place for preparing the material is a good open shed facing to the north. The manure should be turned regularly until it is in a sweet condition for placing together to form a bed.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to THE DOWAGER LADY NOTHENSCHLOTT, Waterfriory, Yorkshire.

Insect pests.—The present is the best time in the whole year to do battle with insect enemies, because more drastic measures can be employed when the trees are at rest. As soon as the pruning of the trees is completed, all cuttings, leaves, and other rubbish should be cleared away from beneath the trees and burned. Although grease bands are not so generally employed as they were a few years ago, they are useful, especially in the case of large orchard trees. The band should be tied tightly around the stem of each tree, and care should be taken that there are no spaces between the paper and the tree; any places that would afford a passage for the insects should be filled up with clay. Examine the bands occasionally, and any that are not sticky should be smeared with fresh grease. Any Apple, Pear, and other fruit trees that are afflicted with mussel scale or American blight should be cleansed of these pests directly the pruning and tramping is completed, and before manure or top-dressings of any kind are applied. The caustic soda spray is one of the most simple and effective winter dressings for destroying all kinds of insect pests that attack fruit trees, and this is easily prepared. But there are many safe and effective proprietary washes that can be bought ready mixed. These winter sprays are best applied by a knapsack sprayer, but, in the case of a small garden, a hand syringe with a suitable spraying nozzle does equally as well. Care should be taken to apply the specific to every part of the tree, whilst badly-infested trees may, in some cases, need a second application at the beginning of the year, or before the buds begin to swell.

Goswberry and Currant bushes that have been badly attacked by caterpillars this season should, after their pruning is completed, have all the surface soil about them removed to a depth of 3 or 4 inches, and replaced with fresh compost. When this is done, apply a good dressing of newly-slaked lime, also dust the trees with a mixture of soot and lime, as this will deter the birds from destroying the buds. Lime is an excellent material for destroying pests of all kinds that attack fruit trees. It assists in rendering the bark bright and clean, and is also beneficial to the roots. Lime forms an excellent dressing for all fruit trees on both light and heavy soils, and its more general application is warranted.

The fruit room.—Examine the fruit frequently, and remove any that are specked and decaying. Do not handle Pears more than is absolutely necessary, and it is as well to store these fruits in a separate room by themselves, because an Apple store is usually too cold for dessert Pears. Allow a free circulation of air in the fruit room by keeping the ventilators open on all favourable occasions, and, as the fruit is kept better in the dark, the shutters should be kept closed.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens or plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, DECEMBER 7—

Nat. Chrys. Soc. Exec. Com. meet.

TUESDAY, DECEMBER 8—

Roy. Hort. Soc. Com. meet. British Gard. Assoc. Exec. Council meet.

WEDNESDAY, DECEMBER 9—

Exh. of the Perpetual Flowering Carnation Soc. in R.H.S. Hall, Westminster.

THURSDAY, DECEMBER 10—

Nat. Rose Soc. Ann. Meeting and Dinner.

FRIDAY, DECEMBER 11—

Nat. Sweet Pea Soc. Ann. Meeting.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last fifty years at Greenwich—40° F.

ACTUAL TEMPERATURES—

LONDON.—Wednesday, December 2 (6 P.M.): Max. 44°; Min. 58°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London—Thursday, December 3 (10 A.M.): Bar. 30.2; Temp. 43°; Weather—Foggy.

PROVINCES.—Wednesday, December 2 (6 P.M.): Max. 50°; Cornwall; Min. 29°; Yorkshire.

SALES FOR THE ENSUING WEEK.

MONDAY—

800 lots Dutch Bulbs, Perennials and Border Plants, at 11, 1,000 Roses, at 1.30, at 67 & 68, Chapsade, E.C., by Frotheroe & Morris.

WEDNESDAY—

800 lots Dutch Flowering Roots, Herbaceous and Border Plants, Ferns, &c., at 11, 4,500 Roses and Fruit Trees, at 1.30, 100 lots Palms and Plants, 600 Azaleas, 100 Rhododendrons, Ac. at 5, at 67 & 68, Chapsade, E.C., by Frotheroe & Morris.

FRIDAY—

800 lots of Dutch Bulbs, 200 lots of Perennials, Border Plants and Bulbs, at 11; 100 Roses, at 1.30; Imported and Established Orchids, at 12 & 15, at 67 & 68, Chapsade, E.C., by Frotheroe & Morris.

Plant Collecting in China.

Professor C. S. Sargent, of the Arnold Arboretum, Harvard University, has sent us the following extract from a letter written by Mr. E. H. Wilson on August 20 last at a point on the extreme western borders of Szechuan:—

"The trip through the Chin-ting-han region proved a failure: proximity to the Chantu Plain, with its number of large cities and populous villages, has long since caused the total destruction of the forests. This range is now clothed with dense jungle of brushwood, in which the lack of variety is disappointing.

"Descending the Min Valley towards Kuan H—, I crossed over into the territory of one of the semi-independent tribes. The Chief proved very amiable, and allowed me to traverse his country at will. The region is unknown botanically, and here and there forests remain. I secured several interesting

Conifers and various flowering shrubs. I abandoned Potanin's old route on account of a dispute amongst the tribesfolk through whose territory the route lies. Descending the Min Valley to the city of Kuan, I crossed the river, and, striking westwards after a journey of 25 days, reached Tatién-lu. The route lay through the territories of several semi-independent tribes and was full of interest. The roads and means of accommodation were excessively bad; it would be hard to imagine a more difficult journey, but none I have ever made has given such complete satisfaction. Three passes, respectively 10,040 feet, 14,600 feet, and 15,200 feet, were crossed, and the scenery generally was wild and entrancing. For days together the road led through virgin forests, with magnificent Coniferæ and Birch, with Larch overtopping all. Here and there we had to hew a pathway for ourselves, and how we managed to wade certain wild mountain torrents in safety will remain a mystery which I am unable to explain. One night we slept out in the forest under an improvised shelter of spruce boughs. However, in spite of obstacles, we got there and secured a good haul of material. Three weeks were spent in the forest around Tatién-lu, and the return journey, for sake of time, was by the main highway.

"Of Coniferæ, particularly Picea and Pinus, I have secured a large collection of material. I hardly know how many species, but at least 15 of the former genus and half-a-dozen of the latter. Of Pinus yunnanensis I have fine material, and the same is true of P. Armandii. Of this latter species I am inclined to think there are two distinct forms, one with cones half as large again as the other.

"Larch was very abundant in many places, and on the Tai-Pao-han overtopped Spruce and Silver Firs, reaching the highest altitude of any tree in the region. On my former journey here I decided that all the Larch in the west was referable to one species. I now think this conclusion hasty. Certainly, on the journey just concluded the Larch trees in three distinct regions could easily be distinguished by their cones. I managed to secure seeds of each kind, and hope you will succeed in raising plants. Of herbarium material I have ample to settle the question of identity. Larch in these regions ripens seeds the latter end of June and in early July. In the forests I secured seeds of a magnificent Birch having orange-coloured bark. This species is frequently 80 to 100 feet high by 10 to 12 feet girth. It is certainly the handsomest Birch in China, as far as my experience goes. Huge trees of Maple, Poplar, Hornbeam and Ash abound, but Oak is entirely absent. Curiously enough, whilst the forests around Tatién-lu abound in Rhododendrons, those on the new route traversed possess very few.

"Of flowering shrubs, Berberis, Hydrangea and Lonicera were richest in species. Of Lilac I got three species, all of them good. I managed to rediscover Magnolia villosa and secured material of another species having large white flowers and broadly-ovate pubescent leaves. Pyrus, particularly the section Sorbus, was very common. The hairy Davidia and Tetraacentron were found, also Salix magnifica, the latter in quantity. In the Min Valley I discovered Rosa Hugonis in quantity, much to my surprise (Père Hugué Scallan

first discovered this species, and I believe the region is doubtfully given as Shensi).

"The summer season has been very dry and hot, and, speaking generally, there is promise of a very fair seed season. Coniferæ, however, promise little or no seed. On the many thousands of specimens of Picea and Abies seen, it was only here and there that a new cone was visible. I am hoping that the autumn will prove that there are more than appear at present; otherwise, I fear we shall secure but very few seeds."

Muscat of Alexandria Grape.

A matter of interest to Grape growers is before the Fruit and Vegetable Committee of the Royal Horticultural Society in relation to the identity of a Grape which, although grown under the name of Muscat of Alexandria, is thought by some to be distinct. At the last meeting of the Committee, we are informed, Mr. James Vert placed before the Committee a bunch of white Grapes which had been cut from a vine which is one of several of the same variety grown by him for several years past. All the vines were originally received from the same nursery under the name of Muscat of Alexandria. At a local exhibition recently the variety was held by the judges not to be true Muscat of Alexandria, although evidently closely resembling it. It was this circumstance that induced Mr. Vert to place a bunch before the Fruit Committee, in order that this body might determine, if possible, whether the judges on the one hand, or himself and the nurseryman on the other, were correct. There being no certified bunch of the true Muscat of Alexandria before the Committee for comparison of wood or leaves, the Committee, whilst generally agreeing that the Grape shown was not true to name, yet invited Mr. Vert to place a second bunch before the members at the next meeting, and some of the members will bring bunches of the Muscat with leaves at the same time. On that test so far hangs the question as to whether Mr. Vert's Grape is correctly named. If it be found wrong, then there will further remain the question as to what variety it is. Without doubt it is a good keeping Grape, whatever the variety may be, but as presented at the meeting the berries appeared to lack that rich Muscat flavour so generally found in the true variety. The berries were also less long or oval in shape. The question of the identity of this white Grape naturally brings to the mind the variety which Mr. Lock exhibited at last year's Fruit Show, and which created much discussion and considerable dissent. It would be strange if Mr. Lock's vine and Mr. Vert's were found to be identical in variety and to have been put into commerce as Muscat of Alexandria. Differences in soils and situations sometimes cause slight variations in vines, but of all white Grapes few have more marked characteristics, or are more widely known, than is Muscat of Alexandria, therefore it should not be impossible to decide definitely whether these vines in question are of that variety or not. Mr. Vert has agreed to send eyes of his variety to Wisley, where it can be grown with Muscat of Alexandria. It would add interest to that test were eyes of the Outlands Park vine sent at the same time.

OUR SUPPLEMENTARY ILLUSTRATION represents two varieties of Rose of recent introduction. Albatross is a Hybrid Tea variety of ivory-white colour, slightly suffused with pink. The flowers are somewhat globular in shape, the outer petals being shell-like, with edges recurving backwards in a pleasing manner. The growth is moderately robust, and the variety promises to be valuable for garden purposes, whilst the blooms are recommended for the exhibition table. Lyon-Rose is tinted with coral-red, the bases of the petals being yellow. It is a flower of exquisite colouring. Blooms of both these varieties were exhibited by Messrs. Wm. PAUL & SONS at meetings of the Royal Horticultural Society in April last, thus proving their value for forcing as well as cultivation in the open.

NATIONAL ROSE SOCIETY.—The thirty-second annual general meeting of this Society will take place at the Westminster Palace Hotel, Victoria Street, Westminster, on Thursday, December 10, at 3.30 p.m. The annual dinner will be held on the evening of the same day at the same hotel, the function being fixed for 6 p.m.

BRITISH GARDENERS' ASSOCIATION.—On Thursday, December 10, a public meeting of gardeners will be held at Collier's Restaurant, Commercial Street, Newport, Monmouthshire, when an address will be given by Mr. J. WEATHERS, secretary. Mr. W. W. PETTIGREW, Superintendent of the Public Parks, Cardiff, will preside. The meeting will commence at 7 p.m. At the last meeting of the Executive Council the new members elected brought the total up to 1,265. A resolution was passed unanimously declaring that the association was not a trades union within the meaning of the term, and had no connection with any trades union organisation in the kingdom. The next meeting of the London branch will be held at Carr's, on Thursday, December 10, at 7.30 p.m., when Mr. A. J. HARTLESS will deliver an address on "A Gardener's Education."

THE SMITHFIELD SHOW.—Next week being that of the Smithfield Show, Lord CARRINGTON will be "at home" to farmers at the offices of the Board of Agriculture and Fisheries, 4, Whitehall Place, S.W., on Tuesday and Thursday, December 8 and 10, from 12 to 2 p.m., and from 3 to 4 p.m. It is not possible for him to accept many of the very numerous invitations he receives to attend agricultural gatherings in different parts of the country, and he hopes, therefore, that farmers who are in London for the cattle show and who desire to see him will do him the honour of calling upon him on the days mentioned. Lord CARRINGTON will visit the show of the Smithfield Club on Monday, December 7, and he has accepted an invitation to be present at the annual dinner of the Farmers' Club and the Central Chamber of Agriculture on Tuesday, December 8th.

MR. ARTHUR E. THATCHER, who has acted as foreman in the shrub and hardy plant department at Aldenham House, Elstree, during the past nine years, has accepted an appointment in the Arnold Arboretum, Boston, U.S.A. Mr. THATCHER had a good knowledge of trees, shrubs, and hardy plants generally, and the further experience he will gain will be likely to fit him for an important post later on. Mr. THATCHER was the recipient of many valuable presents, including one from the Hon. VICARY GIBBS, and others from the Hon. EDWIN GIBBS, the employees at Aldenham House, and the St. Dunstan's Lodge of Odd-fellows (of which he was an active member). He has the good wishes of all who have known him at Aldenham for the past 24 years.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held on Monday, December 7, at 5 p.m., when a paper will be read by Mr. J. A. EGGAR, entitled "Agricultural Co-operation in Connection with Small Holdings." This is one of two ordinary general meetings held, for the convenience of country members, in the afternoon instead of in the evening.

THE WARM WATER METHOD OF FORCING PLANTS.

The following remarks on this method of forcing plants are extracted from a lecture given by Dr. HANS MOLISCH, of Prague, before the meeting of the German naturalists and medical men at Cologne, in September last. The process forming the subject of his lecture was carried out in the experimental garden of the Physiological Institute of the Prague University. Twigs and branches set with flower buds were taken of hardy trees and shrubs of various lengths, from 20" to 60" C.M., and immediately submerged in warm water at temperatures varying from 25° to 40° Centigrade = 77° to 104° Fahrenheit; but mostly of a temperature of 30° Centigrade = 86° Fahrenheit, and usually for a period of nine hours. The submerged twigs, &c., were then removed from the water to a glass-house, having a temperature of 59° to 64° Fahrenheit, the butt ends being immersed in water. At first these were covered with tin caps, so as to exclude the light; but later, when it was remarked that there was little difference between covered and uncovered twigs, these were placed direct from the bath into the light, and the influence of the warm water upon them was much more distinguishable. It was noticed that not all kinds of plants in the resting stage were influenced by the warm bath; on some, indeed, no influence was observed, on others only to a moderate degree, but still others showed influence of a very marked character. On some of the subjects, twigs, shoots, &c., taken at the stage of most profound rest, no influence was noted, although later the effects were very good. The same degree of top-heat was found not to be suited to the requirements of all kinds of plants, and for the majority a temperature of 86° Fahrenheit gave the best results. Some plants were unaffected by this temperature, and it was necessary to raise it to 95° and 104° Fahrenheit before any forcing effect was observable. Temperatures higher than 104° were generally injurious. Fifteen experiments with warm water were made, and four under conditions of dryness as well as of a saturated atmosphere. In most instances of hardwood plants, the shoots and rooted plants were taken in the resting stage and immersed (the tops only in the case of rooted plants) in water of 86° to 104° Fahrenheit for nine to 12 hours, and afterwards grown on in moderate warmth. In these cases the resting period was shortened and bud expansion accelerated. Applied at the right time, the warm bath yielded excellent results with *Lilac*, *Forstia suspensa*, *Corylus Avellana*, *Cornus alba*, *Ribes grossularia*, *Aesculus*, *Salix*, &c. The success of these experiments depends on the nature of the plant, the time of year, and other circumstances. In general, six to 12 hours immersion suffices, and more than 12 hours cannot be recommended, owing to the high temperature of the water, and to the hindrance offered to the absorption of oxygen by the surrounding water. If 12 hours' immersion be exceeded, the buds are liable to be destroyed, or, at least, injured. Repeated immersion for short periods of time are either of no effect or they are a cause of injury. The same degree of warmth in the water does not suit every kind of plant, nor is the most suitable period to begin forcing identical for all species. For example, *Aesculus* and *Fraxinus* twigs cannot be forced in the early

autumn months, but in December and January forcing readily takes place. The nearer the resting period approaches its termination the smaller becomes the difference between the bathed and unbathed plants. The warm bath exercises an influence only on the immersed parts, and this influence is to be remarked whether the plant be placed in the open ground or in the forcing-house. From the foregoing it would appear that warm water immersion of the plant should prove of great value in forcing operations. The remarkable appearance produced by a plant which has been half immersed in warm water is very interesting; the immersed part in its flowering offering a picture of spring, whilst the remaining portions offer pictures of mid-winter.

BANANA CULTURE IN NORTH QUEENSLAND.

—A correspondent of the *North Queensland Herald* writes as follows concerning Banana culture in North Queensland:—Virgin jungle land of the most fertile character is essential. Such land is obtained on lease for five years on terms which vary in different districts. On the Johnstone River £1 per acre is demanded for the first year, £1 10s. for the second, and up to £2 for the third, fourth and fifth years. In other districts the land is free for the first year, 5s. per acre is charged for the second, 10s. for the third, and 15s. each for the fourth and fifth. The clearing of the land costs not less than £10 per acre, for all the smaller stumps are grubbed, while the surface must be kept as free from weeds as a gravelled path. Two hundred strong suckers, purchasable at a cost of 30s. per hundred, are planted in holes about 18 inches deep, each hole being partly filled with good surface soil. The young plant soon makes roots, and under favourable conditions evinces tropical haste in development. Before it flowers and bears its only bunch of fruit, suckers start from its base, two or three of which are permitted to grow in succession. Each, as its bunch matures, is decapitated, and for five, and even six and seven years there is a series of suckers, and, of course, bunches of fruit. The establishment of a Banana plantation will cost £20 per acre before a bunch of fruit is ready for cutting. At the end of five years ordinary land is deemed to be exhausted for Banana growing, for the plant is a gross feeder, but some jungle soils have grown Bananas continuously for 13 years without the stimulus of an ounce of manure. The grower's profit begins in 18 months from date of planting, and at the termination of his lease he has cut 2,200 bunches per acre. Calculating the wholesale market value at the low rate of 1s. per bunch, his land has earned £110 per acre, but he has worked hard, hoeing the weeds, felling and splitting timber for crates, and carrying the bunches to the tramway or the river bank for shipment.

LE CHRYSANTHEME.—The November number of this interesting publication, the official organ of the French N.C.S., is just to hand. It contains a preliminary account of the society's conference and show at Tours, the balance-sheet of the society for the past year, list of floral committee meetings and awards, report of the Fontainebleau show, and other matters. Photographic views are given of the hall of the Hotel de Ville at Tours, where the conference was held. A view of Tours Cathedral, and one of the Château de Chenonceaux, which was one of the places of interest visited by the members. Under the heading "Entente Cordiale" is printed Sir ALBERT KOLLIER'S response to the telegram addressed from Tours to the English N.C.S. by their French colleagues on the opening day of the Crystal Palace Show.

CHRYSANTHEMUM NUMBER.—Our Parisian contemporary *Le Jardin* does not yet appear to have exhausted the interest in connection with the twenty-fifth annual Chrysanthemum Show in Paris. Its issue of November 5 was a special Chrysanthemum number, and that issued on the 20th of the same month is another of the same nature. Illustrations of the Paris Show and portraits of the writers of articles make up a large portion of the issue. Of these articles M. GEO. CLEMENT writes one entitled, "The Jubilee of the Paris (Chrysanthemum Shows)" (with portrait). M. CHARVEY contributes one on "Damping." M. ROZIN BOUCHARLAT writes on the progress of Chrysanthemum culture during the last 25 years (with portrait). Mr. HARMAN PAYNE contributes an essay on French Chrysanthemums in England (with portrait). M. MAX DE LA ROCHEFERRE writes about the work of the French National Chrysanthemum Society.

THE COQUILLA NUT PALM.—Amongst the curiosities of commerce, often so intimately associated with the products of plants, is the remarkable development so frequently seen in what may at one time have been called "minor products," but which have sprung rapidly, and often unnoticed, into general use and favour. Such, for instance, is the Coquilla, or, as it is now mostly spelled, Coquilho Nut, which is the fruit of one of the very many useful Palms known in trade for its several commercial products, and notably as the source of Bahia passaba, so much used for road-sweeping and stable brooms. This Palm (*Attalea funifera*) is a native of Bahia, and the "nuts" or fruits are borne in large clusters, each fruit being from 2 to 3 inches long, and $\frac{1}{2}$ inches in diameter, oval in shape, and of a hard, bony texture, and deep chocolate-brown colour. When first introduced to commerce, the source of this fruit was not known, though it was clear that it was the produce of some Palm. The determination, however, was settled at Kew many years ago, and quantities of them soon became utilised by the turner for knobs of drawers, buttons, and small ornamental articles of various kinds. In a recent report by the British Consul at Bahia, it is stated that these Nuts are being exported in yearly increasing quantities, and amounted in 1906 to 47,883 kilos., which was an increase of 6,080 kilos. over the exports of the previous year. The bulk of the exports go from Bahia to France, where it is said they are employed chiefly for making rosaries, and are used throughout the world by both Christians and Mohamadan doers. The kernels found in these hard, bony fruits contain a large quantity of oil, which at one time was used for soap and candle making, and it is now said to be used locally for delicate machinery and even for watches. The Coquilho Palm grows to a height of from 20 to 30 feet, with a crown of graceful leaves, from the bases of which the passaba fibre is obtained.

Publications Received. *The Agricultural Gazette of New South Wales* (October, 1908) (Perth, Ood.). *Cotton Wilt*, by W. A. Oton, being Bulletin 33 of the U.S. Department of Agriculture. (Washington: Government Printing Office.)—*The Land Agriculture*. This is Bulletin No. 130 of the U.S. Department of Agriculture, and contains papers read at the second annual meeting of the Co-operative Experiment Association of the Great Plains area, held at Manhattan, Kans., June 26-27, 1907. (Washington: Government Printing Office.)—*Guide to Sowerby's Models of British Fungi in the Department of Botany, British Museum (Natural History)*. FIG. 164.—PRIMULA MALACOIDES, A NEW CHINESE SPECIES; COLOUR OF FLOWERS PALE PINK.

(From a sketch prepared by Mr. Worthington Smith of specimens exhibited by Messrs. Bees Ltd.)

PRIMULA MALACOIDES.

THIS species (see figs. 164 and 165) is a promising introduction which we owe to the enterprise of Mr. Bulley, of Ness, who has raised it from seed sent home from Yunnan by his excellent collector, Mr. George Forrest. The plant is one of restricted distribution in Yunnan, occurring only in the Tali Valley, whence specimens were sent to Paris by Père Delavay and described by Franchet in 1886. Mr. Forrest found the plant abundant around Tali in rather moist, sunny situations, as he states in his account of the Primulaceæ collected by him in Yunnan, published in *Notes from the Royal Botanic Garden, Edinburgh*, xix. (1908), where a figure is given of a plant flowering at Edinburgh.

Primula malacoides belongs to Franchet's section *Monocarpicæ* of the genus (see Pax's Monograph in Engler's *Pflanzenreich*), a section including three other Chinese species, *P. Forbesii* and *P. androsacea*, which are in cultivation, the latter also through Mr. Forrest, and *P. gemmifera*, not yet in our gardens. Franchet took the name *malacoides* from *Erodium malacoides*, the foliage of which is stimulated by the *Primula*. In general features *P. malacoides* resembles *P. Forbesii*, but it is altogether a larger plant and infinitely more freely branched. Moreover, it belies its position in a monocarpic group, for so far it has proved quite otherwise in cultivation, and whilst producing seed copiously, it can be easily propagated by division also. For outdoor cultivation—apparently it is quite hardy—it is not likely to be an acquisition, unless its flowering period can be hastened, but for greenhouse work it should prove a valuable decorative species. Its flowering at this period of the year is in its favour, and its long flowering period gives it an advantage. To some, its tint of pink or lavender-pink, in contrast with the grey mealy surface of the flower-stems, will be hardly pronounced enough for effect, but time and cultivation will alter that, and it may be predicted that this *Primula* is likely to become a general favourite, for amongst the qualities it possesses is that of few preferences, and, moreover, it is easily grown and propagated—as indeed one might expect to be the case with an agrestal plant such as this is. I. B. E.

NEW INVENTION.

A PLANT STAND

WE have received specification and photograph of a plant stand invented by Mr. F. Barnacle, gardener at The Poplars, Rowley Fields, Leicester. This stand is for the purpose of holding a plant in the plant house or out-of-doors during the process of cleansing. It consists of a support or socket carrying a small table, which is mounted upon a screwed stem, so that the table can be raised or lowered to any height and turned freely while the plant is being manipulated. The table is provided with a rim or ledge to prevent the pots falling off, and the support carries a bracket capable of holding a pot or receptacle for insecticide, which is thus kept ready in a convenient position for use on the plants. It is claimed that this stand will enable gardeners to treat their plants for cleansing or other purposes in a more convenient manner than formerly, the height being adjusted to various sizes of plants, and the materials with which the plants are treated being held in a convenient place within reach of the hand. It would seem to us that it would be more valuable if there were an appliance for holding the pot firmly in its position, as the mere act of sponging the leaves has a tendency to draw a plant forward, which the ridge of the table appears to be quite insufficient to overcome.

* A LANCASHIRE WILLOW FARM.

FOR upwards of half a century the village of Mawdesley has been famous for its Willow beds and basket-making industry, and Mawdesley-grown rods have acquired a considerable reputation in the Willow trade for strength and durability. Mawdesley differs from most Willow-growing centres in possessing very little wet or marshy land, and Willows are grown under similar conditions to such farm crops as Potatoes, Cabbages, Corn, &c. It is to this comparatively dry method of culture that the special toughness of the rods grown in the district is attributed.

Mawdesley is situated in south-west Lancashire almost midway between Liverpool and Preston, at the foot of Harrook and Parbold Hills. The nearest station is Rufford, a distance of about 2½ miles, whilst the nearest important town is Wigan, which lies a few miles away in the opposite direction.

Being in the neighbourhood recently, I took

ally required, until he and his sons had about 500 acres under cultivation. Other farmers also planted largely when the trade was at its best, but of late years, owing principally to depression in trade and foreign competition, a considerable amount of land has been reclaimed for ordinary farm crops. According to Mr. Cowley, however, taking good and bad years together, Willows pay at least as well as other farm crops.

When forming a Willow bed, the ground is well worked and cleaned, and good, strong cuttings are inserted 1 foot apart in rows 2 feet apart. The majority form sturdy plants the first year, and are assisted by being kept perfectly free from weeds and by frequent working of the surface soil. In fact, to be successful with a crop of Willows, Mr. Cowley contends that throughout life they must be kept as free from weeds as any other crop. A full crop of rods may be expected from strong-growing varieties the third year after planting, but weak-growing kinds require a year or two longer

FIG. 165.—PRIMULA MALACOIDES AS PHOTOGRAPHED IN THE ROYAL BOTANIC GARDEN, EDINBURGH.

the opportunity of paying a visit to the farm of Mr. Hugh Cowley, who is the largest grower in the district, for the purpose of obtaining information as to the methods of culture adopted, and Mr. Cowley very kindly furnished me with the particulars embodied in the following notes.

The pioneer of the movement in Mawdesley was Mr. Cowley's father, and his first venture was with a farm of 11 Cheshire acres (or about 23½ English acres). As he had learnt from old growers that Willow beds were only remunerative up to 14 years of age, he obtained a lease for that period. His methods of culture, however, proved so effective, that at the time his lease ran out the beds were more productive than they had ever been, and he was glad to renew his lease at an increased annual rental of £30. For many years the business proved highly satisfactory, and more land was continu-

ously required, until he and his sons had about 500 acres under cultivation. Other farmers also planted largely when the trade was at its best, but of late years, owing principally to depression in trade and foreign competition, a considerable amount of land has been reclaimed for ordinary farm crops. According to Mr. Cowley, however, taking good and bad years together, Willows pay at least as well as other farm crops. When forming a Willow bed, the ground is well worked and cleaned, and good, strong cuttings are inserted 1 foot apart in rows 2 feet apart. The majority form sturdy plants the first year, and are assisted by being kept perfectly free from weeds and by frequent working of the surface soil. In fact, to be successful with a crop of Willows, Mr. Cowley contends that throughout life they must be kept as free from weeds as any other crop. A full crop of rods may be expected from strong-growing varieties the third year after planting, but weak-growing kinds require a year or two longer

* A paper contributed to the *New Bulletin* (No. 9, 1908), by Mr. W. Dalmore.

Willow plantation will give good results for a very long period. I was shown fields in full vigour which had been down between 20 and 30 years, and still older ones exist. In the event of a bed being neglected and left unworked and unmanured, it is ruined in from three to five years. The destruction of a Willow bed is a simpler operation than would be expected. A strongly-horsed plough is run along a row close to the stools; it is then run along the opposite side, turning the stools over; men follow, and drag the plants out ready for the next furrow. In this way a field is ploughed in very little more time than a clear field would be.

When removed from the ground the rods are made into stacks and are left for use. Many of the finer-growing sorts are peeled for fancy work, and the peeling is done as the rods are harvested. Previous to peeling they are soaked in boiling water. From the boiler they are taken to the stripping room, where the bark is removed by women. The rods are then placed in a heated shed to dry, after which they are graded into sizes ready for use. Although attempts have been made to find a use for the bark, they have so far failed, and it is simply a waste product.

A few years ago baskets of all descriptions were made both for English and foreign markets, but now only those kinds are made for which there is a local demand, and the majority of the rods suitable for fine work are sold ready for use. A brisk trade is carried on in Potato hampers, and there is a good demand for pigeon and fowl baskets.

The majority of the varieties of basket-making Willows grown in the country have been tried at Mawdesley, but most of them have been discarded as unsuitable for the district, and only a few selected forms of two or three species are grown, which are recognised by local names. Specimens were, however, obtained, and in the following descriptions they are allotted to their respective species. The varieties are:—

"Red Buds" or "Old Dicks"; "Long Skeins" or "Light Long Skeins"; "Black Stemmed"; "Mawdesley's Long Skein"; and "Ran Dan." Two others, known respectively as "Tulip Willow" and "Kecks," were at one time widely grown, but have been superseded by "Red Buds."

"Red Buds" or "Old Dicks" is a well-marked form of *Salix purpurea*; the botanical variety *scharfenbergensis* most closely approaches it in general appearance. It is of comparatively weak growth, and is conspicuous by reason of its red stems and buds. It is the most useful of all the Willows grown in the district for neat or fancy work, and usually commands the best price. The rods are always used in a peeled state, and are obtainable in five different sizes, the longest ones being from 4 to 4½ feet in length, the shortest 2 to 2½ feet. The first-mentioned name evidently applies to the prominent red buds, whilst the latter is an abbreviation of "Old Dick Meadow's Willow." Richard Meadows was an employé of the Earl of Lathom, and amongst his other duties he manufactured rough wicker baskets for the distribution of game. On one occasion he noticed some nice Willow rods round a bundle of imported plants. From these he procured cuttings, which resulted in superior rods to anything he had previously worked. He distributed cuttings amongst his friends, and Mr. Cowley obtained a quantity. These became so popular that on one farm alone upwards of 100 tons are frequently produced in a single season. The yield of rods per acre of this variety is from eight to nine tons. *S. purpurea*, the "Purple Osier," is widely distributed through Europe and Central and Northern Asia, and is a variable plant.

The variety called "Kecks" is a form of *S. purpurea* with green bark and larger leaves than the form already mentioned; it is, however, of very inferior merit, and has been discarded.

"Long Skeins," or "Light Long Skeins," is a stronger-growing Willow than the last-mentioned, of very good quality. It is a selected form of the British *Salix viminalis*, and was originally imported to Mawdesley from Knowsley. It is used both plain and peeled, and is suitable for many kinds of work. The longest rods of a single year's growth are from 6 to 8 feet, those of two years' growth being some 3 or 4 feet longer.

"Mawdesley's Long Skein" is another European species, *Salix ulbra*. It grows to about the same height as the last-named form, and is used for similar purposes, both peeled and unpeeled; the rods are, however, said to be slightly harder to work.

"Black Stemmed" or "Black Willow" is *Salix daphnoides*, the "Violet Willow" of Europe, &c. This has not been in use many years, but is thought highly of for the larger kinds of work. Rods 12 feet in length are produced in a single season, which are found to be of excellent quality for farm baskets. The peculiar glaucous or bluish colouring seen on growing rods is even more conspicuous after the rods have been dried. My attention was called to a number of Potato baskets where this particular variety had been used in bands with another variety, and in the distance the appearance was exactly that of bands of light blue paint.

"Tulip Willow" is a form of *S. rubra*. It is said to produce rods of good quality, but has been discarded in favour of "Red Buds" on account of its liability to produce side branches, which cause extra expense in preparing for use. A peculiarity of the variety is the habit the rods have of dividing into double growths when about half grown.

"Ran Dan" concludes the varieties grown. It is correctly *Salix Smithiana* var. *acuminata*. The rods are strong, and grow to a good length the first season. They are, however, usually allowed to grow for three or four years, and are then used for splitting to use in the bottoms and sides of strong hampers.

In conclusion, it may be of interest to note that the Willow industry at Mawdesley had its origin through the chance visit of a basket-maker to the neighbourhood. He noticed a patch of Willows growing in an out-of-the-way corner of a field, and offered the farmer a price for them, which seemed more than the land was worth. This led to the first idea for a Willow farm.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

MOULTON PADDOCKS, NEWMARKET.—The Suffolk seat of Sir Ernest Cassel possesses many horticultural attractions. My visit was made in October during that bright period when the sun shone brilliantly on the many hundreds of *Salvia splendens*, which were shortly to be used for the embellishment of the winter garden. They formed one blaze of scarlet bloom, intensified by the sun-bine, and not less by the contrast with the dark, sombre green of the leaves which clothed the plants right down to the pots. A batch of *Euphorbia* (*Poinsettia pulcherrima*) was just as noticeable for the manner in which the plants had retained their lower leaves. Carnations are a great feature at Moulton Paddocks, and there were some promising plants of *Souvenir de la Malmaison* varieties very neatly and evenly staged. The winter-flowering Carnations were blooming well. The number of plants grown is very large, but the varieties are few. They include Robert Craig, Britannia, Winsor, Mrs. T. W. Lawson, Enchantress, White Perfection, Floriana, and Lady Bountiful. Among them were some very good blooms on long, erect stems. Violets in pots gave every promise of flowering well, and those planted in frames were also in good condition. The Chrysanthemums of the large-flowering type had been timed to flower in October, and were thus

necessarily dwarf, though already there were some creditable blooms of Mrs. A. T. Miller, Mafeking Hero, and Mme. Gustave Henri. Of the decorative kinds there was a large batch of Soleil d'Octobre, destined to follow the *Salvias* in ornamenting the winter garden. I was particularly impressed with a batch of blue *Heliotropis* which filled a whole house. The variety was Lord Roberts. The plants were well furnished with flowers, and the fragrance floating through the house was delightful. Among *Pelargoniums* were many large plants of Ivy-leaved varieties in pots and in baskets for flowering later, but the Zonal-leaved varieties were already in bloom. The double pink variety King of Denmark was largely in evidence, accompanied by Hermione (double white) and Kaspal (double scarlet). Plumbago rosea, Begonia Gloire de Lorraine, with its white counterpart "Turnford Hall," Begonia Rex, and other plants were looking well. Among Orchids, which are a great feature at Moulton Paddocks, were some nice plants of *Cattleya labiata*, some with three and others with four lobes to each spike. Of these large batches are grown, and the plants present every evidence of good treatment. A cool, shady house is devoted to *Odontoglossums*, with excellent provision for ensuring a moist atmosphere, and the growth of the plants benefited to the suitability of the treatment given them. A small house was rendered gay by the free-flowering of that most useful of *Dendrobiums*, *D. Phalaenopsis*. *Vandas* are also cultivated with success. A house of Black Alicante Grapes with well-shouldered bunches presented a fine picture. Alpine and perpetual-fruiting Strawberries are grown in plenty, and Fig trees in pots are well done. The method of training Peach trees across the house so that each side receives equal light is practised with good results. A peep into the fruit-room showed that the crop of hardy fruit was not only fine in quality but a plentiful one also. The out-door garden includes a pretty rockery and water garden. *William F. Rowles.*

DELPHINIUMS.—Mr. Fyfe, page 127, and Mr. Street, p. 172, obviously write from very different standpoints, the former recommending the dividing and replanting of these plants after two years, the latter advocating the discarding of named varieties, apparently in favour of seedlings. Very few gardeners will, I imagine, follow Mr. Street's advice, which amounts to throwing away a certainty for an uncertainty. I am aware that there are those who had seeds to attempt their divisions of Delphiniums, also that the plants are easily raised from seeds. These seedling strains are vastly superior to those available in the past, and are especially useful for planting in the foreground of, or in a border adjoining, a shrubbery, the more open spots in the woodland, and similar places. Mr. Street's preference for seedling-raised plants would appear to arise from an erroneous idea that the named sorts quickly deteriorate under cultivation, but this is not the case. The very old *D. formosum*, still a most effective variety, is to-day as vigorous in growth as it was 50 years ago, and the same may be said of other varieties. Indeed, no hardy herbaceous plant can boast of greater perennial vigour than the Larkspur, and, if rightly treated, the taller varieties will grow to a height of 6 or 7 feet. Few plants delight more than Delphiniums in a rich and deep soil, and unless they are to be planted in light and well-drained ground, it is a mistake to attempt their divisions during the autumn months. Much the best season of the whole year for increasing these plants is in the early springtime, that is, the end of March or thereabouts, just as the new growth is pushing through the soil. In the spring there is a renewed root action, and, carefully treated, the plants grow well and flower during the following June and July. The length of time the plants will remain before being again disturbed will largely depend upon the soil and the amount of space allotted them. I may mention, however, that clumps six years old, growing well apart in a light, well-drained soil, showed no sign of deterioration. A small black slug makes its winter quarters in the top of these plants, often destroying the crown entirely. Occasional applications of fresh soot are helpful in keeping this pest at bay. *E. H. Jenkins, Hampton Hill.*

KEW HYBRIDS.—We had occasion to look up one of the hardy Hybrid Brooms, *Cytisus Beanii*, and carefully went through the catalogues of hardy plants of the leading English growers without success in finding it quoted. We were surprised to find it offered by two of the Continental houses, and have received plants from one or both of them. Are the hybrid products of our national gardens sent to foreign traders rather than to those of us who make a business of horticulture in this country? Not having any personal acquaintance with the Director of Kew, we write you in the matter, thinking also that the facts are of some importance to the English nursery trade. *Pend. & Co.* [We understand that, although *Cytisus Beanii* may not yet have found its way into the catalogues of the leading English growers, several of them have plants of this hybrid in their collections. We have every reason for believing that the plant in question has only been given, in exchange for others received, to one foreign grower, and after it had already been distributed in this country.—Ed.]

NARCISSUS BLOOMS IN NOVEMBER.—It is an easy matter to have Narcissus blooms in November if French-grown bulbs of Narcissus Trumpet Major are potted early in August and kept growing in cold frames until the end of September, then placed on shelves in a warm, span-roofed greenhouse, exposing them to as much light and sunshine as possible. Narcissi make a welcome addition to the list of flowers for table decoration at this season. Our bulbs were potted in the last week in August, and the first bloom appeared in the last week of November. *John Bates, Meaford Gardens, Stone.*

SOCIETIES.

ROYAL HORTICULTURAL

Scientific Committee.

NOVEMBER 24.—*Present:* Mr. E. A. Bowles, M.A., F.L.S. (in the chair); Messrs. A. Worsley, G. S. Saunders, W. C. Worsdell, J. T. Bennett-Poë, G. Gordon, W. Hales, J. Fraser, W. Cuthbertson, W. Fawcett, C. T. Druey, and F. J. Chittenden (secretary).

Grease bands.—Mr. VOSS showed another grease band taken from the same tree as that shown a fortnight ago which had been placed upon the tree in succession to that. A considerable number of female winter moths had been captured near the base of the band, and a larger number of males. All, with one exception, belonged to *Cheimatobia brumata*, the exception being a male *Hibernia aurantiaria*.

Weevils in seeds.—Mr. SAUNDERS reported that the seeds of *Abrus precatorius* which Mr. BOWLES had shown at the last meeting were attacked by a species of *Bruchus* allied to, though not identical with, *B. pisi*. The weevils were nearly as large as the seeds in which they occurred.

Silver-leaf in Plums.—Mr. WORSLEY showed a portion of the trunk of a Plum tree which had been attacked by "silver-leaf" disease, caused by the fungus *Stereum purpureum*. The discoloration of the wood appeared to start from the graft. Mr. WORSLEY also showed a seedling form of *Chrysanthemum indicum* and *Jotropha podagracea* attacked by *Botrytis cinerea*.

Marks upon Apple.—Mr. G. S. SAUNDERS showed a drawing of an Apple which had a curious looking brown mark stretching up one side of it about three-sixteenths of an inch in breadth. It was thought that this had probably been caused by the destruction of the epidermis as by a scratch in an early stage of the development of the fruit.

Staphelia grandiflora.—Mr. BENNETT-POË showed a flower of this species measuring about 11 inches in diameter.

Abserrations in *Lonitica perilymnorum*.—Mr. J. FRASER showed flowers of the common Honeysuckle with the petals green. It was remarked that this condition in Honeysuckle is very frequently associated with the presence of aphid upon the plant, especially near the inflorescence. Mr. FRASER also showed a specimen of the common Honeysuckle with leaves shaped somewhat like those of the Oak—this form he had found

most frequently in plants growing in a shady wood. In *Lonitica japonica* the aberration is very common.

Variation in *Polystichum angulare*.—Mr. DRUEY showed a "seedling" from the variety of *P. angulare* (or *aculeatum*?) called pulcherrimum (which was originally found growing wild), named gracillimum. The parent plant had remained sterile for a very long period, but at last two sporangia had been found upon it (without an indusium). The spores from these had been sown, and about 75 per cent. of the resulting plants had come precisely like the parent, and the remainder consisted of about 5 per cent. reversions to the normal type of the species, and 20 per cent. rather various forms somewhat similar to the plant shown, where the frond was cut up into a number of narrow divisions. The variation had shown itself only after some time, the younger leaves being of the normal form.

Peloria in *Cattleya labiata*.—From Mr. GURNEY WILSON, of Haywards Heath, came a very perfect specimen of a peloric *Cattleya labiata* in which the perianth was perfectly regular, as is not unusual, and in addition there were three properly developed stamens adnate to the column. Mr. WILSON also showed a conversum specimen of *Cypripedium insigne*, which was not only a very perfect specimen of the rather common aberration, but was interesting on account of the fact that this is the second successive year in which the aberration has occurred in this plant.

Holly retaining berries.—Mr. CHITTENDEN showed a branch of Holly from Wisley which was still carrying the berries produced in 1907. Adjacent trees had been stripped by the birds, but this and two other trees in the garden had retained their berries until now. During the last few days some had fallen, but otherwise the tree was as thickly berried as during the autumn of 1907.

An exotic worm from Wisley.—Mr. CHITTENDEN showed an exotic worm, one of the *Platarians*, *Bipalium kewense* from the propagating pits at Wisley. The worms are of a dark greyish colour and measure up to about 15 inches in length. They are found living among the cracks at the bottom of the pots. They feed voraciously upon earthworms, and are, no doubt, capable, by reason of their shape and size, of pursuing them into their burrows. The animal is said to occur in hot-houses throughout the world.

COLONIAL EXHIBITION.

NOVEMBER 26-30.—The show of Colonial products on these dates formed the 12th held under the auspices of the Royal Horticultural Society, and it was a much finer display than any of the preceding ones. The building was well filled with exhibits, and, although there was a great similarity in the displays generally, several fresh things were noticed, and, as especially interesting to gardeners, some vegetables, such as we cultivate, from the Province of Ontario, Canada. The show failed to attract the general public, and on the second day few persons other than attendants were present.

The opening ceremony was performed by Lord Strathcona and Mount Royal, G.C.M.G., who, with Lady Strathcona, was received at the entrance by Right Hon. Lord Balfour of Burleigh, K.T., the members of the Council, and the following representatives of the various Colonial offices: Sir Henry Davison, K.T., Deputy-Chairman of the West India Committee; Sir Daniel Morris, K.C.M.G., C.M.G., late Imperial Commissioner, West Indies Agric. Dept.; the Hon. Forster M. Allevone of Barbados; the Hon. J. H. Turner, Agent-General for British Columbia; J. Howard, Esq., Agent-General for Nova Scotia; and W. Liney Griffith, Esq.

In his opening speech, Lord Strathcona said that eighty years ago there was no possibility of sending delicious fresh fruits from a distant country. Now, with cold storage, fruits are received from British Columbia, the farthest part of the Dominion, from the West Indies, and from Australia and New Zealand. It was only some thirty years ago that in England British Columbia was spoken of as a sea of mountains, fit for nothing but to look at. He regretted there was no exhibit from the Province of Quebec, which might have sent the old Fameuse Apple of Canada, than which there can be nothing more exquisite. He con-

gratulated the West India Society, which has instituted in the different islands permanent local committees, for the purpose of exhibiting and of showing to the mother country, and to the rest of the world what can be done in those islands. Canada, which was foremost in giving preference to the mother country, has also extended a preference to the West Indies. As an example of the good that this has done, millions of pounds of sugar which formerly came to Canada through Germany now come from the West Indies.

Sir Daniel Morris, K.C.M.G., C.M.G., in moving a vote of thanks to Lord Strathcona, stated that he had on several occasions visited Canada, and was acquainted with the Annapolis Valley in Nova Scotia, and also with the fruit belt in Ontario.

With regard to the exhibits, the most imposing group was from BRITISH COLUMBIA, and it consisted almost wholly of Apples, shown, for the most part, in the boxes as shipped for our markets. The quality was exceedingly good, and high colour prevailed in most of the varieties, such as Spitzenberg, King of Tomatoes County, and Wolf River—names that are becoming very familiar in our greengrocers' shops. The exhibit was really a collection of fruits from growers and institutions in the colony, and medals were awarded the exhibitors very liberally, and in value according to the individual quality. A Gold Medal was given to the collective display.

TRINIDAD showed exhibits from this colony under a canopy of white cloth, with festoons of green and yellow. The principal products were Oranges, Bananas, Limes, Shaddocks, Coconuts, Papaws (like a green Marrow and about the same size), Citrons, and one or two Pineapples, as growing on the plant. The Oranges were the most interesting, especially the seedless fruits.

DOMINICA sent a very similar collection; fruits of the Citrus family predominated, the Lime being especially in evidence, with limejuice, essential oils, and a lot of lime. Some large Shaddocks were displayed. They resemble very large Oranges; the flesh is pinkish and is eaten with a spoon, but the rind seems excessively thick in proportion to the edible part.

NEW SOUTH WALES was represented by cases of dried fruits, which had a very appetising appearance. Peaches, Pears, Apricots, and Raisins were shown in this way: in addition were bottled fruits of the same kinds, and also Almonds, Olive oil, Citron, and Lemon peel, &c.

ONTARIO showed principally Apples and Pears, generally as packed in the cases for market. There was also a large table filled with Pears, Apples, Grapes, &c., but they were badly staged, and no trouble appeared to have been taken to show them in their best condition.

Two large tables of vegetables were also shown from ONTARIO. After a journey of three weeks it was surprising to find the specimens, on the whole, in such good condition. There were huge "Cauliflowers, named "Snowball," over a dozen splendid heads quite 9 inches in diameter. They must have been almost perfect specimens when cut. Onions were very good, some of them being almost up to our best exhibition standard in size and finish. The varieties were Red Globe, Giant Perfection, Danvers, Yellow Globe, and White Globe. The latter were very fine in form, finish, and colour. The Onions were sown out-of-doors at the end of April, and it proves what a remarkably fine summer Ontario must enjoy with specimens such as were on exhibition can be harvested in September and October. Potatoes were largely shown, the tubers being of fine size, though somewhat coarse according to our ideas. Some of the varieties were:—Ontario Beauty, Crown Jewel (like White Elephant), American Wonder, Beauty of Hebron, Late Rose, Gem of Aristock, Pear of Savoy, Rural New Yorker, and Delaware. The latter resembles Up-to-Date, and is one of their best, giving a crop of 300 bushels to the acre in Canada. The Potatoes were mostly from a recently-settled district in northern Ontario. Other features of the exhibit were Celery, Carrots, Parsnips, Artichokes, Salsify, Marrows, Egg Plant fruits, and Capsicums.

NOVA SCOTIA filed two long tables with boxes of Apples, and there were miscellaneous exhibits from individual colonists, a very fine display being made by Mr. H. DALMAIN, of Wolfville, including some bottled fruits.

NEW ZEALAND was represented by Apples that had been preserved in cold stores; also jam, jellies, and other comestibles, including a great quantity of honey.

THE WEST INDIAN PRODUCE ASSOCIATION staged sauces, pickles, jams, jellies, sugar, tobacco, cigars, and other similar products; and another large display of a similar nature was made by the ARMY AND NAVY STORES, Victoria Street, Westminster.

An interesting exhibit of Nuts was made by Messrs. B. SHEARN & SON, Tottenham Court Road, London. Much table space was occupied by jams and other preserves staged by home exhibitors, some in competition, the results of which are given below.

GOLD MEDALS.—The Province of British Columbia; Nova Scotia Government; and the Government of Ontario.

SILVER-GILT HOGG MEDAL.—Mr. F. A. Parker, Berwick, Nova Scotia.

SILVER-GILT KNIGHTIAN MEDALS.—Kamloops District, British Columbia; Kaslo District Horticultural Association, British Columbia; Mr. Thomas G. Earl, Lytton, British Columbia; Mr. W. H. Woodworth, Berwick, N.S.; Mr. H. A. Blanchard, Upper Dyke, Nova Scotia; the Botanic Section, Imp. Dept. of Agric., Dominica; the Hon. H. A. Nicholls, C.M.G., St. Armand, Dominica.

SILVER-GILT BANKSIAN MEDAL.—The West Indian Produce Association.

SILVER HOGG MEDAL.—Mr. J. H. Cox, Cambridge, Nova Scotia.

SILVER KNIGHTIAN MEDALS.—Summerland District, British Columbia; Mrs. J. A. Smith, Spences Bridge, British Columbia; Mr. H. Dalmain, Wolfville, Nova Scotia; Mr. E. E. Archibald, Wolfville, Nova Scotia; Mr. R. J. Messenger, Tupperville, Nova Scotia; Mr. J. A. Kinsman, Lakesville, Nova Scotia; Mr. F. H. Johnson, Bridgetown, Nova Scotia; the Hon. J. C. O'Fallon, Wall House, Dominica; Mr. A. B. C. Lockhart, Castle Comfort, Dominica; the Jamaica Agency, Holborn; Messrs. B. Shearn & Son, Tottenham Court Road; West Indian Produce Association, Ltd., 4, Fenchurch Buildings, E.C.; Norbrook Preserving Co., Jamaica; R. Jackson & Co., 172, Piccadilly, W.

SILVER BANKSIAN MEDALS.—Salmon Arm Farmers' Exchange, British Columbia; Mr. A. L. Morse, Berwick, N.S.; Mr. E. T. Neilly, Middleton, Nova Scotia; Mr. F. Foster, Kingston, Nova Scotia; Agricultural School, Dominica; Elders & Fyffes, Jamaica; the New Zealand Government, St. Kirkpatrick & Co., Nelson, N.Z.; the Dominion Agency, 49, Lime Street, E.C.; the Government of New South Wales; W. J. Ansell, I.S.O., Cyprus.

BRONZE BANKSIAN MEDALS.—Victoria District, British Columbia; Salt Spring Island, British Columbia; James Johnstone, Nelson, British Columbia; James Gartrell, Summerland, British Columbia; Chilliwack District, British Columbia; Berwick Fruit Co., Berwick, N.S.; Mrs. Wm. Sangster, Falmouth, Nova Scotia; Ralph Eaton, Kentville, Nova Scotia; Clarke Bros., W. Langarei, N.Z.; Hokianger Co-operative Preserving Co., Rawerne, N.Z.; N.Z. Government; Mon-arted Preserving Co.

COMPETITIVE CLASSES.

Home-bottled British-grown fruits.—1st, Lady ALGERNON GORDON-JENNINGS, Brighton Castle; 2nd, W. POCART, Junr., 1, Tavistock.

Twenty-four bottles of British-grown fruits.—The 1st prize was not awarded; 2nd, Miss CAROLINE JONES, Orpington.

Twelve bottles of British-grown fruits.—The 1st prize was not awarded; 2nd, Mrs. W. H. PLOWMAN, Westminster.

Twelve bottles of British-grown fruits.—1st, GEO. H. JOLLY, 111, Long Acre, W.C.; 2nd, G. HORDAY, Romford.

Home-bottled vegetables (amateurs).—1st, Mrs. V. BANKS, 102, Park Street, W.; 2nd, Mrs. W. PARLOUR, Clifton, Darlington.

Eighteen 1 lb. clear glass jars or bottles of jam.—Equal 1st, Mrs. V. BANKS, 102, Park Street, W., and Miss M. G. THOMPSON, Potter's Bar; 2nd, Mrs. E. J. BECKETT, Aldenham Park.

Twelve 1 lb. clear glass jars or bottles of fruit jellies and fruit cheds.—1st, Mrs. V. BANKS, 102, Park Street, W.; 2nd, Miss M. G. THOMPSON, Potter's Bar.

MISCELLANEOUS EXHIBITS OF PRESERVES.

Miss EDITH BRADLEY, Greenway Court, steriliser (Silver Bankisian Medal); GEO. FOWLER, LEE & Co., LTD., Reading, sterilisers (Silver Bankisian Medal); W. POCART, Junr., Twickenham, cider, honey, and bottles (Silver Bankisian Medal); Mrs. W. H. PLOWMAN, Westminster (Silver Knightian Medal); Messrs. AUSTIN & Co., Kington, canned fruits in syrup (Silver Knightian Medal); Miss MARTIN, New York (Silver-Gilt Knightian Medal); SWANLEY HORTICULTURAL COLLEGE (Silver Bankisian Medal).

BRISTOL CHRYSANTHEMUM.

NOVEMBER 18, 19.—This annual show was held in the Drill Hall, Bristol, on these dates. Entries were not quite so numerous as former years. Orchids are always a feature of this exhibition, several classes being allotted for them.

Plants.—For a group of Chrysanthemums and foliage plants there were only two competitors. Mrs. ST. VINCENT AMES, Bristol (1st, Mrs. W. H. Bannister), was awarded the 1st prize, the plants being too crowded. The best stove and greenhouse plants, also Ferns were shown by JOHN BAKER, Esq. (Mr. J. Binfield).

For a group of Orchids arranged on a table space 4 feet by 6 feet, with Ferns or other foliage plants interspersed, A. G. GROVES, Esq., Bristol (gr. Mr. W. Gostling), was placed 1st, with a bright exhibit; 2nd, Mr. CARV BATHEN. In the class for three Orchids, Sir H. DAVIS, M.P. (gr. Mr. J. F. Antis), was awarded the 1st prize, his best examples being *Cypripedium Harrisonianum* and *Cattleya labiata*.

For two Orchids in bloom, A. G. GROVES, Esq., was 1st with *Odontoglossum grande* and *Cypripedium insigne*. Mr. CURTIS had the best single specimen in his plant of *Cypripedium Spicerianum*, which had 21 flowers. Mr. A. G. GROVES had the best three plants of *Cypripedium*.

Chrysanthemums.—In the class for 36 Japanese blooms, in not fewer than 24 varieties, there were four competitors. Mr. W. IGGULDEN, Lock's Hill Nurseries, Frome, was distinctly ahead with large and well-staged blooms. The leading varieties were F. S. Vallis, Mme P. Radaelli, Mrs. W. Iggulden, Magnificent, Bessie Godfrey, Mme. G. Rivoli, Mrs. F. W. Vallis, &c. 2nd, D. E. TAYLOR, Esq., Bristol (gr. Mr. T. Gostling) for 12 Japanese blooms. Mr. J. W. LOCKWOOD was placed 1st, with medium-sized flowers. The best six blooms of a Japanese variety, arranged in two vases, were shown by Mr. W. IGGULDEN, and he had excellent blooms of Mme. P. Radaelli. Mr. LOCKWOOD followed with F. S. Vallis. Mr. IGGULDEN also won the premier prize for six Japanese blooms of a white variety with Katie Palgrave. Mr. WOODWARD followed with Elsie Fulton. The similar class for a yellow variety was also won by Mr. IGGULDEN, the variety being F. S. Vallis. This exhibitor was also successful for six vases of distinct varieties of Chrysanthemums, three blooms of each kind.

Incurred varieties were few in number but of good quality. For 12 distinct varieties, W. J. LONG, Esq., Road Ashton, Wilts. (gr. Mr. W. Struggell), easily won the 1st prize with medium-sized, neat examples of Romance, Margery Shield, W. Pascoe, Triomphe de Montbrun, Dennis Rayner, Mrs. Judson, Embleme Pottevine, Souvenir de W. Clibran, Mark Tourle, Mrs. J. H. Wynne, and Mrs. B. Hankey; 2nd, Mr. A. SAUNDERS.

Exhibits of single Chrysanthemums were numerous. Eight growers staged in the class for six vases of blooms in distinct varieties, which resulted in W. A. TOWN, Esq., winning with a bright exhibit; 2nd, Lord Justice FARWELL (gr. Mr. F. J. Little).

Roses were finely shown. For 12 blooms, in not fewer than six varieties, Mrs. BERNARD (gr. Mr. W. Cox) was 1st with choice examples.

NON-COMPETITIVE EXHIBITS.—Messrs. JAS. CYPHER & SONS, Cheltenham, displayed an exhibit of Orchids, including a choice collection of *Cattleya* hybrids (Gold Medal). Messrs. G. WILLIAMS & SON, Cardiff, had a pleasing exhibit of Chrysanthemums, including a sport from Mme. Oberthur named "Helena Williams," of a primrose tint. Messrs. SUTTON & SONS, Reading, showed a collection of vegetables, for which the society's Gold Medal was awarded.

LINNEAN SOCIETY.

NOVEMBER 19.—Mr. Harold Wager, F.R.S., gave a lantern demonstration on "The Optical Behaviour of the Epidermal Cells of Leaves." He stated that Professor Haberlandt had suggested that the epidermal cells of certain leaves are functional as ocelli or primitive eyes and are capable of the perception of light. The structure of these cells is such that the rays of light which fall upon them are refracted and brought to a focus, and, in one case, Haberlandt was able to obtain a photograph of a microscop, the image of which was focused upon the basal walls of the epidermal cells. This image, as figured in his book, is not very clear, and it has since been found possible to obtain much clearer images of a variety of objects through the cells both of the upper and lower epidermis of many leaves, including portraits from life, flowers, houses, and landscapes, reproductions of photographs and pictures, and simple diagrams in colour on the anochrome plates of Messrs. Lumière.

In order to explain this function, Haberlandt has put forward the extremely interesting hypothesis that the convergence of the light rays causes a differential illumination of the protoplasmic layer on the basal walls of the epidermal cells, and sets up a stimulus, which results in the orientation of the leaf into that position in which it can obtain the most suitable illumination.

There is no doubt a good deal of evidence in favour of Haberlandt's view; but there are many facts to be explained before any definite conclusion can be arrived at. For example, convergence takes place in the lower, as well as in the upper epidermal cells, as shown by Albrecht for *Viscum*, and by the exhibitor in many other plants. In a species of *Mesembryanthemum* there are special lens-cells equally well developed on the lower surface as on the upper surface. In *Garrya elliptica* also there are special lens-shaped thickenings of the cuticle equally well developed on both surfaces. The papillate cells of many petals show a very clear convergence.

It is not impossible that the convergence may bring about a more efficient illumination of the chlorophyll grains. Haberlandt himself suggested something of this kind many years ago, and the numerous observations which have been made upon *Schistostegia*, *Osmundaceae*, some *Selaginellas* and *Hepaticae*, and other plants, and some observations by the exhibitor upon *Botrychium granulatum*, all clearly indicate that this hypothesis must be taken into account. It is significant, also, that epidermal cells with long focus appear to be associated with long palisade cells; whilst the cells with short focus are associated with short palisade cells.

Mr. C. T. Druery exhibited some Ferns growing in a bottle presumably airtight, on silver sand, which, during a period of four years, had nearly filled the jar.

ABERDEEN CHRYSANTHEMUM.

NOVEMBER 27, 28.—The annual exhibition of this society was held on these dates in the Music Hall Buildings, Aberdeen. The entries numbered in all about 500, a slight decrease from the previous year's numbers. The opening ceremony was performed by Mrs. Ogilvie Gordon, D.Sc., Aberdeen. The class for cut blooms formed the leading feature of the exhibition. The most important competition was for 12 vases of Japanese Chrysanthemums, three blooms of one variety in a vase. The Dowager Countess of SEAFIELD, Cullen House (gr. Mr. A. Morton), was placed 1st, no fewer than 20 points separating the 1st and 2nd prize group, shown by Captain H. LUMSDEN, of Balmadie (gr. Mr. W. Paterson).

R. H. MILLER, Esq., The Links, Montrose (gr. Mr. A. Oliphant), had the best exhibit of 12 Japanese Chrysanthemums in not fewer than nine varieties. Among other growers who took leading places in the cut-flower section were Messrs. GEORGE JAMESON, Forthborough; J. JENKINS, Junr., Woodside; JOHN PETER, Crathes Castle; WILLIAM MILNE, Corsedale House; ALANVAIR DOUGLAS, Kephelstone House; ANDREW REID, Duff House; JAMES JONES, Montrose; JAMES STRACHAN, Botanic Gardens, Old Aberdeen; and R. A. GRIGOR, Dalswinton, Dumfries.

Non-competitive displays were made by the GOVERNMENT OF BRITISH COLUMBIA, Messrs. BEN REID & Co., Aberdeen, and Messrs. T. RIVERS & SONS, Sawbridgegorth, Heits.

NATIONAL CHRYSANTHEMUM.

DECEMBER 2, 3.—The winter exhibition of this Society was held on these dates at the Crystal Palace, Sydenham. The weather was dull but fine, and the show may be reckoned as equal to an average display of the National Society in December, although the number of entries was slightly fewer than on some former occasions. Some excellent blooms were seen in the larger classes for Japanese varieties. Fourteen new varieties were presented to the Floral Committee for award, but only two received the Society's Certificate of Merit.

GROUP CLASSES.

There were two entries in a class for a group of Chrysanthemums and miscellaneous flowering foliage plants occupying a semi-circle measuring 14 feet by 7 feet. Members of the trade were excluded from exhibiting. The 1st prize was won by Lady TATE, Park Hill, Streatham Common (gr. Mr. W. Howe). At the back of the group were Chrysanthemums backed with Palms and Codiaums (Crotons), the centre having brightly-coloured Euphorbias (Poinsettias) set among ornamental-leaved plants, with single blooms of large Japanese Chrysanthemums, and at either side were banks of a yellow single variety, rising from a base of Begonia Gloire de Lorraine. Cyclamen, Cypripediums, Spiraea, and Paper-white Narcissus, with Ferns, &c., were also included in the group. 2nd, W. H. STONE, Esq., Donnington, Laurie Park, Sydenham (gr. Mr. T. W. Stevens). This group was largely composed of single and 1d decorative varieties of Chrysanthemums, and had an edging formed of Begonias and Cypripediums.

There were two exhibits also in the class for a circular group of flowering and foliage plants arranged in a circular space of 8 feet. Lady TATE was again successful in obtaining the 1st prize with a conical arrangement of Liliums, Euphorbia (Poinsettia) pulcherrima, Spiraea, Cypripediums, Begonias, &c. 2nd, Mr. H. HEDGES, Nurseryman, Sydenham; this exhibit was mainly composed of Begonia Gloire de Lorraine.

In the class for six plants of flowering Begonias there were four exhibits. The best were adjudged to be those shown by Mrs. NATHAN, Little Heath Wood, Potter's Bar (gr. Mr. W. Newton).

BLOOMS SHOWN ON BOARDS.

OPEN CLASSES.

Japanese varieties.—The principal class for Japanese varieties was for 18 blooms, in not fewer than 12 varieties. Six exhibits were staged, some excellent flowers being presented. The premier prize was awarded to PANTIA RALLI, Esq., Ashted Park, Epsom (gr. Mr. G. Hunt), for an exhibit of much excellence, and one generally regarded as fine as any seen at the November show. This exhibitor met with remarkable success, winning five 1st prizes in important classes. The varieties in the exhibit under notice were Miss Miriam Hankey (a bold bloom of pink colour), Mme. R. Cadbury (white), Algernon Davis (deep yellow), John Peed (pink), R. C. Pulling (yellow, suffused with reddish-brown), Mrs. H. Perkins (reddish), Bessie Godfrey (soft yellow), W. M. Moir (white), W. H. Whitehouse, Mrs. J. C. Neill (creamy-yellow), Thos. Stevenson (a fine bloom of this yellow variety), Mrs. R. Oberthur (white), Mrs. A. G. Pierce (yellow), and Thos. Stevenson (yellow). 2nd, Rt. Hon. Lord LUDLOW, Lamport, Northampton (gr. Mr. H. Humphrey), with finely-coloured blooms, the example of E. J. Brooks being a magnificent specimen of this rich purple-coloured variety.

In the smaller class for 12 Japanese varieties, distinct, there were seven competitors. The 1st prize was again won by Mr. RALLI with almost perfect specimens, all the varieties being included in the preceding class. 2nd, A. TAYLOR, Esq., Downside, Leatherhead (gr. Mr. W. Mease), with an exhibit not much inferior to that which won the premier prize.

Incurved varieties.—The only class for incurved Chrysanthemums was one for 12 blooms, in not fewer than six varieties. There were four groups, all of good quality for December, the best being shown by P. RALLI, Esq. The varieties were W. Wainwright, May Phillips, Middle L. Faure, G. W. Matthews, Mrs.

J. Hygate, Marjorie Shield, Talene, and The Egyptian. 2nd, Miss WILLMOTT, Warley Place, Brentwood (gr. Mr. J. Pearce), with large but less conical blooms.

CHRYSANTHEMUMS SHOWN IN VASES.

Nine vases of Japanese varieties.—Three blooms of each variety, and not fewer than six sorts, were required. There were only two exhibits, P. RALLI, Esq., winning the 1st prize easily with a collection of bold blooms on strong stems. Especially fine were the varieties John Peed, Mrs. J. C. Neill, and Mme. R. Cadbury. 2nd, T. P. BOYD, Esq., North Frith, Tonbridge (gr. Mr. A. C. Horton).

Six vases of Japanese varieties, distinct.—The better of two exhibits was shown by Mrs. NATHAN, Little Heath Wood, Potter's Bar (gr. Mr. W. Newton). There was an especially fine vase of Mme. Paolo Radaelli in this exhibit. 2nd, W. BEECH, Esq., North Ockenden, Romford (gr. Mr. Rayment).

Single Chrysanthemums.—In the class for 12 vases of single varieties, distinct, there were four entries. Each exhibit was staged on a table by itself, measuring 8 feet by 3 feet. The best collection was shown by P. RALLI, Esq. The bunches were lightly arranged, and the flowers stood well above the vases. The varieties included Annie Farrant (crimson), Princess (pale yellow), Lady Windsor (rosy pink florets with white bases), Edith Pagram (pink), and Gerbera (bronze-yellow). 2nd, Mrs. NATHAN (gr. Mr. W. Newton).

The best six vases of spidery, thread-petalled, or plumed Chrysanthemums were shown by Mr. C. B. CABRELL, Enslade, Horsell, Surrey, whilst the best exhibit of pompon varieties was shown by J. L. BURGESS, Esq., Maisy Hampton, Gloucestershire (gr. Mr. J. A. Humphries). There were two exhibits in each of these classes.

There were several handsome exhibits in the class for a vase of large Japanese and incurved Chrysanthemums arranged with ornamental foliage. The 1st prize was awarded to J. C. ERN, Esq., Wood Hill, Dulwich (gr. Mr. R. B. Leech). This exhibit contained the best flowers (Algernon Davis and Buttercup), but it was not so artistic in arrangement as some of the other vases. 2nd, W. W. MANN, Esq., Bexley, Kent (gr. Mr. J. Simon).

In the similar classes for thread-petalled and for pompon varieties, Miss COLE, Feltham, was successful in both cases.

AMATEURS' CLASSES.

Generally, the exhibits in this section were much inferior to those seen in the classes for professional growers. The best of five groups staged in the class for 12 Japanese Chrysanthemums of distinct varieties was shown by W. WALTERS, Esq., Alexandra, Burton-on-Trent. The quality of the blooms was mediocre. 2nd, W. P. PRUDEN CLARK, Esq., 4, York Road, Hitchin.

In the smaller class for six Japanese varieties there were six exhibits, the blooms being of better quality than in the preceding class. Six good blooms shown by the Rev. A. COOPER MARSDEN, 60, Wickham Road, Beckenham (gr. Mr. W. Rigby), were placed 1st. The white W. M. Moir variety was especially well shown by Mr. MARSDEN. 2nd, T. GLASS, Esq., Borrowdale, Sydenham (gr. Mr. H. Baker).

The decorative classes were keenly contested, and the following were successful exhibitors in this section—Mr. T. W. STEVENS, Sydenham; Miss C. B. COLE, Feltham; and Mr. W. WEBB, Sydenham.

CERTIFICATES OF MERIT.

Aurora Borealis.—A single variety of more than average size, having bronzy-red florets, shading to gold at the base. The colouring is very pleasing. (Shown by Mr. NORMAN DAVIS, Framfield.)

Kathleen May.—A decorative variety of very deep crimson colour, and with an "Anemone" centre. (Shown by JOHN WOOD, Esq., Crocken Hill, Kent—gr. Mr. F. Pestifield.)

NON-COMPETITIVE EXHIBITS.

Mr. H. J. JONES, Ryecliff Nurseries, Lewisham, put up one of his bold groups of Chry-

santhemums, having a green cloth ground, with the Palms, Codiaums, Pandanus, Ananassa sativa, and similar plants as a setting to large epergnes of Chrysanthemums, especially fine being the varieties Kitty Gollivan (cherry-red), Mrs. Weaver (an incurved variety), Helen Williams (a yellow sport from Mine, R. Oberthur); Snowdrift, True Gold, Mrs. Wakefield (terra-cotta-red), and the old Princess Victoria variety (white). (Gold Medal.) Mr. NORMAN DAVIS, Framfield, Sussex, showed many beautiful single varieties of Chrysanthemums of his raising. Pullux and Juno are two fine yellow varieties. (Gold Medal.) Mr. PHILIP LADDS, Swanley, Kent, staged a circular group of Chrysanthemums that embraced the finest of the market varieties in season. The blooms were of high quality. (Gold Medal.) Messrs. W. WELLS & Co., Merstham, Surrey, had an exhibit of Chrysanthemums of most types. We noticed the new Merstham Jewel, a single variety of fine colour. (Large Silver Medal.) Messrs. H. CANNELL & SONS, Swanley, Kent, showed Zonal Pelargoniums and varieties of Chrysanthemums. (Large Silver Medal.) Exhibits of Apples from British Columbia and Nova Scotia were awarded Silver Medals, and the same award was given to Mr. G. W. RILEY for an exhibit of garden furniture and greenhouse. A Bronze Medal was awarded to Mr. WILLIAMS, Faling, for flower displays.

ANNUAL DINNER.

NOVEMBER 26.—The annual dinner of this Society was held on the above date at the Holborn Restaurant, Sir Albert Kaye Rolitt, LL.D., D.C.L., President of the Society, in the chair. At this annual gathering the various prizes and medals awarded at the Society's exhibitions are presented to the winners. The president was unable to be present at the commencement of the dinner, and the chair was taken by C. E. Shea, Esq., pending his arrival. The tables were decorated with flowers and plants by Messrs. K. F. Felton and Sons, and during the evening the company was entertained to a selection of vocal and instrumental music.

Mr. J. McKeerchar proposed the toast of "The Donors of Special Prizes," and appealed to those present to show their appreciation of the work being done by the Society by coming forward with a still greater number of special prizes for the forthcoming year. Mr. Shea, in replying for this toast, congratulated the Society in having an excellent president. He was pleased to know that the condition of the finances was improving.

The presentation of prizes was the next feature. The National Challenge Trophy having been again won by the Dulwich Society, it was handed to their representative; the Holmes' Memorial Challenge, for 36 incurved blooms was won for the eleventh time in succession by Mr. W. HIGGS, Fetham Park, Leatherhead, and that for Japanese by Mr. W. Hall, of Melcher Court. The presentation of these, together with the president's cup, the R. F. Felton Cup, and others, constituted an interesting part of the proceedings.

The toast of the evening, "The National Chrysanthemum Society," was proposed by the chairman, who, on rising, stated that the Mayor of Windsor had expressed his regret at his inability to be present on that occasion, but hoped at some future time to be with them. The National Chrysanthemum Society was formed to venerate a splendid flower, which was esteemed throughout the world, and in Japan, where it constituted the badge of chivalry, the "Order of the Chrysanthemum" was the highest honour. He appealed to the ladies to become recruiting officers in order that the membership of the Society should increase.

Mr. Thos. Bevan thanked the president for the kind expressions he had made in regard to the committee and officers, also for his earnest endeavour to obtain new Fellows for the Society, and for his supporting the Crystal Palace as a suitable place in which to hold the shows. Mr. Bevan said he himself would always advocate holding the shows at Sydenham.

The "Exhibitors and Affiliated Societies" was proposed by Mr. F. E. Hawes, and responded to by Mr. W. Wells.

NATIONAL ROSE.

DECEMBER 10.—At the annual meeting of this Society, to be held on the above date, the following proposed alteration of Rules 5 and 10 and By-law 1 will be submitted to the members:—

RULE 5 (ALTERATION).

The management of the Society shall be vested in the officers of the Society, viz., a president, vice-presidents, treasurer and secretary, and a general committee which shall consist of 40 members (exclusive of the officers of the Society) and of all local secretaries of the Society who may not be specially elected on the general committee. Ten members shall constitute a quorum of such general committee. The officers of the Society shall be ex-officio members of the general committee, and the president, secretary and treasurer shall be also ex-officio members of all sub-committees. The officers and committees shall hold office until the next annual general meeting of the Society.

RULE 10 (ALTERATION).

The general committee shall at its first meeting appoint from amongst its members, including ex-officio members, the following sub-committees, viz., general purposes committee, not exceeding ten in number, for the purpose of considering and reporting upon any matters or business connected with the Society which may be brought before such general purposes committee. A finance sub-committee not exceeding five in number, a publications sub-committee not exceeding seven in number, and an exhibitions sub-committee, not exceeding seven in number. None of the before-mentioned sub-committees shall have any executive powers, and no act or decision of any sub-committee shall of itself be deemed to be the act of the general committee. The functions of such sub-committees shall continue only until the next annual general meeting.

BY-LAW 1 (ALTERATION).

The Society shall hold one or more Metropolitan exhibitions in each year (the principal Metropolitan show being held not earlier than July 1 and not later than July 31, and preliminary exhibitions when practicable), and also may hold exhibitions in conjunction with any other society.

THE YORK AND NEWCASTLE CHRYSANTHEMUM SHOWS.—Messrs Kent & Brydon, Darlington, inform us that they contributed exhibits of fruit to the recent Chrysanthemum shows at York and Newcastle, being awarded a Gold Medal and Certificate of Merit at the one held at York. We gladly publish the information, but, in view of the demands on our space, it is obvious that we cannot always undertake to mention all the honorary exhibits at these and similar exhibitions.

ENQUIRY.

PARADISE TREE.—Can any reader inform me what is meant by the Paradise tree of Buenos Ayres? *G.*

ANSWERS TO CORRESPONDENTS.

BOOK OF CURIOUS PLANTS.—*C. C.* We know of no book on this subject, but *Pestifer's Teratology*, by the late Dr. M. T. Masters, contains accounts of abnormalities in plants, and would, perhaps, be suitable for your purpose. The work, however, is out of print, and can only be obtained from the secondhand booksellers.

DIOSPYROS. *Essex.* We suspect your two plants are *Diospyros Kaka*, the Date Plum, not *D. virginiana*. The latter is quite hardy and grows into a large tree, but it does not fruit at Kew. The tree which fruits so freely every year in theactus House at Kew is *D. Kaka*. In order to succeed in fruiting the plant it seems to be necessary to plant it in poor soil, for in rich, fibrous loam nothing but vigorous growth results. Can you plant out your two specimens in the border of a cool greenhouse? This appears to be the best treatment. Are you aware that there are male

and female forms of this plant? You cannot expect to get fruits unless your plants are of the female form. It is not necessary to grow the male form in close proximity, as pollen is not necessary to induce the swelling of the "fruits."

CLEMATIS INDIVISA. *C. H. C., Boskop.* This well-known plant can be obtained from any of the nurserymen dealing in trees, shrubs, and climbers.

EDAPHIC. *Jno. C.G.* This term is derived from the Greek *edaphos*. "Edaphic conditions" equal the influence of the soil on the plants growing upon it or the suitability of particular classes of soil for certain species of plants. It was in this latter sense the term was used in the article to which you refer.

EVERGREEN SHRUBS FOR A HEDGE. *A. T. A.* *Buxus sempervirens* (Box-tree) and its variety *Handsworthii* form excellent hedges. The oval-leaved *Privet* is of quick growth, and it succeeds in all soils. *Quercus Ilex* (Holm Oak), common Laurel, and *Berberis Darwinii* are also suitable plants. Of *Conifers*, *Cupressus Lawsoniana*, *C. nootkatensis* (*Thuyopsis borealis*), *Thuja occidentalis*, and *T. gigantea* are the best. The two kinds you wish not to plant—*Holly* and *Yew*—make the best of all evergreen hedges.

FERN FRONDS DAMAGED. *Dun.* The fronds seem to have suffered from the roots being allowed to get too dry, or by bad air in the room in which the plant is kept. Such an appearance is common in plants used for decoration in dwelling rooms where gas is building for a long time, or where there has been an escape of gas. The cellular tissues in the specimens sent have collapsed entirely.

FERN WITH BROWN FRONDS. *P.* There is no disease present in the small *Pteris Fern*; the unhealthy condition is due to some error in culture.

FORCING BULBS. *S. G. R.* It will not be safe to put any of the *Narcissus* bulbs into strong heat directly they are removed from out-of-doors, as heat applied very suddenly, or at too early a date for any particular variety, usually acts as a retarding influence. You give us no idea as to what temperature is implied by "strong heat." Of the *Daffodils* mentioned, the most suitable for early forcing is the double variety. Even this one would be better introduced into a cold house at once and allowed to remain there for a fortnight before removing the bulbs into a structure where the atmospheric temperature is 45°, allowing an increase of 5° each week until the maximum of 60° or 65° is reached. *Narcissus poeticus ornatus* should be placed in a cold frame or pit until the end of December, when a mild heat, say, of 45° may be given, but not much more than this until it is seen that the flower-stapes have pushed through the neck of the bulb. This variety and *N. "Emperor"* are not suited to early forcing, but may be successfully cultivated to succeed the earliest batch.

The Tulips may be placed at once in a moist atmosphere and bottom heat of about 60°, to be increased to 75° in a fortnight's time. This crop can be best treated in a frame, covering the bulbs 4 inches or 6 inches deep, with new cocoanut fibre refuse before placing on the lights, which should be darkened with mats or mats to maintain the heat, and ensure the darkness necessary for the uniform encouragement of long flower-stems. Remove the fibre when the flower-buds are fully grown, keeping the frame covered with mats until the blooms are fit to cut.

GRAPE ROT OR ANTHRACNOSE (GLOEOSPORIUM AMPELOPHAGUM). *J. B.* It is important to remember that all fungal diseases spread very rapidly, therefore no time should be lost, directly the disease is detected, in cutting off and burning any infected leaves, berries or shoots. After this has been done the foliage shoots should be dusted with flowers of sulphur at intervals of ten days. A small quantity of quicklime should be mixed with the sulphur on the second application, and the quantity of lime should be increased on every successive occasion until the proportions of lime and sulphur are nearly equal, always keeping just a little more sulphur than lime. Thoroughly wash the branches in winter with a solution of sulphate

of iron. Do not overdoe the borders with rich stable manure. (Thanks for donation to *R. G. O. F. Davy*.)

"ILLUSTRATIONS OF THE SEXUAL SYSTEM OF PLANTS." *H. B. L.* This work, by the late Dr. Robt. John Thuret, is out of date, and its value depends entirely upon its historical significance. If you consult one of the dealers in secondhand works on natural history subjects he will be able to estimate its value for you. Perhaps Messrs. Wesley, 28, Essex Street, Strand, or Mr. Wheldon, Bookseller, Great Queen Street, W.C., will assist you.

MUD FROM A POND. *W. E.* Soil taken from a pond is usually rich in organic matter, and forms a good dressing for most soils. Allow the substance to "weather" for some months, turning it occasionally, and then use it mixed with other soil. Pond mud, after proper treatment, is an excellent material for applying as a top dressing to lawns.

NAMES OF FRUITS. *A. L.* White Paradise.—*A. G. Gagnoy*. We do not recognise this fruit, send it for inspection to the Fruit Committee of the R.H.S.—*C. W. & Sons*. 1, Gascoyne's Scarlet Seedling; 2, the fruit much resembles Northern Spy; 3, Wiltshire Defiance; 4, Golden Reinette.—*W. J. Bacon*. A, The Queen; B, Warner's King; C, Bramley's Seedling; D, Lemon Pippin; E, Chaumontel; F, Knight's Monarch.—*P. E.* 1, Green Balsam; 2, Dumelow's Seedling (Wellington); 3, Minchull Crab; 4, Gipsy King; 5, Reinette de Granville; 6, Mère de Ménage.

NAMES OF PLANTS. *J.* The Golden Arbor-Vite, *Thuja occidentalis* var. *aurca*.—*L. M. and Constant Reader*. We do not undertake to name varieties of *Chrysanthemums*. Send to one of our important traders for names of these flowers.—*G. A. C.* *Laelio-Cattleya lumbrosa* (*Laelia verticillata* × *Cattleya Dowiana aurea*), a very useful decorative plant.—*Southport*. 1 and 2, garden-raised varieties of *Begonia semperferens*; 3, *B. subpeltata* variety; 4, *B. Froebelii*; 5, *B. incarnata metallica*; 6, *B. Ingramii*; 7, *Mezembryanthemum multiflorum*; 8, *Sempervivum tortuosum variegatum*.—*A. C.*, *Bridgewater*. *Benthamia fragifera*. It bears fruits having a superficial resemblance to Strawberries, specimens of which are sent by another correspondent.

ORCHID AWARDS.—*Cypridium Sanctaui* (Linnæus), *Arcthusia*, and *Odontoglossum Groganior* gained Awards of Merit at the last meeting of the Royal Horticultural Society. In our report on p. 381 of the last issue, by the accidental omission of a head line they would appear to be First-class Certificates.

PRESERVING FRONDS OF ADIANTUM FERN. *J. C.* Some Ferns, including fronds of the Maiden-hair variety, that had been excellently preserved by Mr. Groome, of 8, Seckford Street, Clerkenwell, E.C., were submitted to us for inspection. The preserving was done by Mr. Groome's own process, and monies derived from this source is devoted by Mr. Groome to certain charities.

ROCK MELON SEED. *T. F. P.* The varieties of rock or Cantaloup *Fel.* are almost as numerous as the ordinary kind. You should ask the seedsmen for the particular variety you require. The value of this fruit is given in our market table when it is in season. See an article on this fruit in our issue for December 28, 1901, p. 465.

VIOLLET WITH GALLS. *R. R.* The galls are caused by a fungus, *Polycystus violæ*, the Violet smut. The gall is caused by hypertrophy of the tissue, due to the irritation set up by the fungus. The disease can be best prevented from spreading by burning the affected plants. Can you send us a few more specimens of the galls?

COMMUNICATIONS RECEIVED.—*J. BOTTLE* (thanks for contribution to R.G.O.F. box)—*M. K.—Dr. R., Italy*—*Douglas—H. W. W.—K.—A.—O.—Prof. I. J. W.—W. Crump—H. F. M.—A.—O.—Prof. I. J. HARDY TREES AND SHRUBS SUITABLE FOR FORCING.

FOR many years a few kinds of trees and shrubs have been cultivated for forcing, notably *Deutzia gracilis*, *Rhododendron sinense* (better known in gardens as *Azalea mollis*), and *Lilacs*. A remarkable impetus, however, has been given to this practice during the last few years, due to two causes, namely, the magnificent groups of forced plants exhibited by several nurseriesmen at the fortnightly meetings of the Royal Horticultural Society and to trees and shrubs being extensively used in several well-known public and private gardens. In addition to the three plants mentioned above, many of the most beautiful trees and shrubs which flower out-of-doors from Christmas to June can be successfully forced into flower under glass in advance of their natural season.

In gardens possessing large glass structures the forcing of early-flowering trees and shrubs in pots is necessary to keep the house bright after the gay effects produced by Chrysanthemums. During the months of January, February and March the number of tall-growing greenhouse plants in flower is few, especially in gardens around London and other large towns where smoke-laden fogs deplete the plants of flowers and, in some instances, of foliage as well. Fortunately, the flowers of hardy trees and shrubs, with one or two ex-

ceptions, are capable of withstanding fog. Wistarias, when in bloom, suffer the most.

Some people object to the use of these forced plants for indoor decoration. They think that it tends to lessen the value of the display that is made a few weeks later outside. This excuse, however, is a very lame one, for the effect of tall *Pyrus*, *Prunus*, *Lilacs*, *Forsythias*, etc., arranged indoors amongst *Palms*, *Tree Ferns*, and *Camellias* is very different to the trees and shrubs growing under natural conditions in the pleasure grounds. Any excuse on the score of expense will scarcely hold good, for they are very reasonable in price, and a goodly number are readily propagated by cuttings or division.

A collection of suitable subjects may be got together in various ways. Several nurserymen have for some years past made a speciality of trees and shrubs for forcing. Their rapidly-increasing popularity has induced others to take up the work, so that thousands of plants are now annually grown especially for the purpose. From the Continent we import many more, and they are largely composed of *Rhododendrons* (especially *Azalea mollis*), *Hydrangea paniculata grandiflora*, and *Prunus triloba flore pleno*. In gardens where plenty of ground is available the most economical practice is to grow most of one's own material, purchasing a few plants each year of the more difficult subjects to grow and prepare for forcing. It seldom pays to grow *Azalea mollis*, for instance, as if hard forced it takes several years for the plants to get back to condition, and even then they seldom force as well as purchased plants. They are, however, amongst the cheapest to buy.

The position selected for growing the plants outside should be an open one, as it is necessary to have well-ripened growths for flowering. A deep loam will suit most of the subjects to be grown, but for Ericaceous plants such as *Rhododendron*, peat and leaf-mould must be added. For these the loam should be of a sandy nature. Various methods are necessary to work up a stock; some are propagated by cuttings, others by division, seeds, budding, grafting and layering. On an average it takes from three to four years to obtain plants suitable for forcing. In the first instance this will, of course, seem a long time to wait, but when once a stock is obtained, it will not be much trouble to propagate a few plants each year.

An alternative method to propagating one's own stock consists in purchasing young plants, and growing them on in the nursery. On paper this work may appear to occupy a lot of time, but on the whole the plants do not require so much attention spent on them, as is needed in growing Chrysanthemums, for instance. Beyond a little pruning and thinning of the new growths, especially on young plants, keeping the ground free from weeds, watering if the weather is dry, and perhaps mulching, the plants require no particular attention during the summer.

The thinning out or replanting of beds and borders in the pleasure grounds often provides a few extra large specimens. If these have not been too crowded, they will most likely be well set with buds. Evergreen *Rhododendrons*, *Forsythias*, *Prunus triloba flore pleno*, *Spiraea prunifolia flore pleno*, and

Spiraea arguta are subjects we sometimes lift and force in tubs.

The next subject to be dealt with is the potting of the plants in autumn. Those which are intended to be grown for several years in pots should be given rather larger pots than the others, but varying according to the size of the ball. The potting soil should be largely made up of fibrous loam, to which is added a little leaf-mould and well-decayed manure. Coarse sand can be added according to the porosity of the loam. For *Rhododendrons* and other Ericaceous plants the compost may consist of two parts light, sandy loam, one part peat, and one part leaf-mould. Previous to potting, the balls should be immersed in water if at all dry, as is often the case with imported plants. Make the soil in the pots moderately firm. Since the wood is now well ripened, the plants may be stood in a fairly-sheltered position where, on the approach of frosts, the pots can be protected with hay, straw, or bracken. If the weather is dry, and especially in the case of the Evergreen *Rhododendrons*, the leaves of which shoot off the water, look over the pots and water those which are dry.

The time to commence forcing depends largely on when the plants are required. The grower, if he commences in December, must exercise more care in the selection of his subjects than would be necessary later in the season. *Lilacs* are forced by a few people during this month, but they are a deal of trouble, and the plants are seldom suitable for the conservatory, the flowers being only fit for cutting. *Rhododendron Nobleanum*, *R. precox*, *R. sinense* (*Azalea mollis*), *Viburnum Tricus*, *Jasminum nudiflorum*, *Daphne Mezereum*, and *Corylopsis pauciflora* can all be obtained in flower at Christmas. Early in January many more subjects become available: of these, the most useful are *Prunus triloba flore pleno*, *P. japonica flore albo pleno*, *Forsythias*, *Deutzias*, and for foliage the many beautiful varieties of coloured Japanese Maples. During February, March, and April, a warm greenhouse will be sufficient to bring most of the trees and shrubs used for forcing into flower. Several plants which do not force readily till the last-named month will be noted when treating of the various genera. One of the best-known examples is *Hydrangea paniculata var. grandiflora*. The subjects which bloom earliest in the open air should be forced first, not only because they force more readily, but when in flower outside it is not desirable to have them also in the conservatory.

In most private gardens, early vineries, early Peach-houses and orchard-houses are being started during the months I have mentioned for forcing trees and shrubs. These houses provide ideal conditions for our purpose. Vineries are started at about 50 degrees, gradually rising in about a fortnight to 60 degrees or more. When forcing trees and shrubs, a moist atmosphere must be maintained in the house by syringing the plants several times daily, also damping the stages and floors. But these are just the conditions maintained in the fruit houses. In public parks and gardens a house is set apart for the purpose when forcing is practised to any considerable extent. A few plants can be started in a stove, and for dwarf-growing subjects a

forcing pit will be suitable. It is better not to maintain too great a heat, especially when the plants are first placed inside. A commendable practice adopted in one garden where I worked, was as soon as the plants from the earliest vinery were moved out, to bring those in from vinery No. 2, place those from the third vinery in the second, and replace these with another batch from out-of-doors. The three principal evils of hard forcing are: (1) the flowers are small, and they open irregularly; (2) flowers do not last so long as when brought on gradually; (3) the plants are weakened, therefore cannot be forced again for a number of years afterwards, if at all. When the blooms are about half expanded, the plants will be better removed to an intermediate house for a day or two previous to being placed in the conservatory. The time it takes to obtain trees and shrubs in flower largely depends upon whether they are placed in heat during December, January, February or March. When placed inside during the first-named month, as a rule, a month to six weeks is required. There are exceptions to this, for *Rhododendron Nobile* and *R. praecox* often flower in a fortnight. The period of six weeks is gradually reduced till, in March and April, some subjects open bloom after a week in a warm greenhouse. Two further conditions governing the time plants take to force are, first, the season the plants flower naturally outside, and, second, the temperature in which they are forced, including the amount of sun experienced each day; the latter condition varying considerably in different localities.

TREATMENT AFTER FORCING.

This is the period when, unfortunately, owing to lack of house accommodation, many plants are spoiled. It is the spring of the year, a season when in most gardens the greenhouses are crowded with summer bedding plants. The best place for the earliest forced trees and shrubs is a warm greenhouse, where they can make their growth. For those forced in February and March a cool house will be suitable, after this a sheltered position under a hedge or wall will be sufficient for most of them. In the case of some plants, *Prunus triloba flore pleno*, for instance, hard pruning is necessary after flowering. For others the cutting out of old, and the thinning of young shoots, together with the shaping of the plants, is all that is necessary. All the flowers must be removed as soon as convenient. When nicely started after flowering, growth may be considerably improved by frequent syringing, and liquid manure water should be given.

In May all the plants may be placed in a sheltered position out-of-doors. Towards the end of the month they can be overhauled. Those suitable for forcing again next year should have the pots plunged to the rim in a bed of ashes provided for the purpose. The remainder must be planted in the nursery, unless amongst them are some which appear quite worn out, when the rubbish heap will be the best place for them. As far as possible, however, this weeding out should be done immediately after flowering, for no good purpose is served by housing the plants for two months and then throwing them away. *Rhododendron sinense* (*Azalea mollis*) are not worth keeping if they were forced into flower as early as January. The plants plunged in ashes will require plenty of water during the summer, and in most cases liberal feeding till growth is completed. Before forcing them again next year, the surface soil should be removed, replacing it with some rich soil prepared for the purpose. The drainage in the bottom of the pots must also be carefully examined.

So far, in these notes, no mention has been made of the forcing of hardy trees and shrubs for the supply of cut flowers. In both commercial and private gardens, but more especially in the former, thousands of plants are grown to supply cut flowers. Roses, Lilacs, and *Rhododendron sinense* (*Azalea mollis*) are the three

principal plants grown for this purpose. In private gardens also the smaller plants are used for house decoration. The chief subject sold in shops for this purpose is *Rhododendron sinense*, the flowers of which last well on the plants when gunned.

Several plants are grown for their beautiful

FIG. 166.—LILAC SHOOT AFFECTED BY *PSEUDOMONAS SYRINGÆ*.

foliage alone, which, brought on in heat, is often prettier than when it is allowed to develop naturally. The best known subjects for this purpose are *Acer Negundo* variegatum, *Prunus cerasifera* var. *atropurpurea* (P. Pissardi), and the many beautiful forms of Japanese Maples.

ACER.—The Japanese Maples, varieties of *Acer japonicum* and *A. palmatum*, are especially suitable for cultivation in pots for intermixing with flowering plants in the conservatory early in the year. Being for the most part of dwarf

nese Maples are forms of *A. palmatum*. A few of the best and most distinct are: *A. atropurpurea* (purple-red), *A. dissectum* (elegant dissected green foliage), *A. dissectum purpureum* (red foliage finely cut), *A. roseo marginatum* (rose-coloured variegation), *A. septemlobum*, *A. Acer purpureum* (deep purple, beautifully serrated), and *A. dissectum ornatum* (bronze-purple). Of the several varieties of *A. palmatum* the variety *aureum*, with golden foliage, is by far the most valuable for cultivation in pots.

The beautiful variegated Maple, *Acer Negundo* variegata, often used so effectively in the pleasure grounds, becomes more highly coloured when forced, the variegation being a beautiful milk-white. They are grown in four forms for forcing, namely, standards, half standards, pyramids and bushes. *A. Osborn.*

(To be continued.)

NEW LILAC LEAF DISEASE IN ENGLAND. (*PSEUDOMONAS SYRINGÆ*.)

Lilac leaves and young shoots have been sent to me from time to time showing pronounced spotting. The spots were generally covered by a dense olive-green fungus growth, which proved to be *Cladosporium hebarum*. The dead tissues were filled with the spawn of this fungus, which followed probably scorching by sun, or injury by smoke or fumes. My material for examination was generally unsatisfactory, which rendered an investigation extremely difficult. However, the disease was brought again and again to my notice, the spots being generally covered by the same fungus.

In May this year I received plenty of fresh material, with no fungus growth visible. The leaves showed in some cases a remarkable blotchiness (see fig. 166), and seemed altogether badly scorched. But Lilac, being a very hardy plant, and healthy plants being in bloom at the time, my suspicions were aroused when I ascertained that the injury appeared suddenly and seemed rapidly spreading. Some of the diseased shoots were placed in a bottle with water in a greenhouse, and were covered with a glass globe. No fungi appeared, although the spots increased in size. They travelled along the midrib and extended down the side ribs, but also appeared quite disconnected with either. Soon the leaves were greatly disfigured. Some shoots I wanted to grow under shaded globes; a blue globe, and one covered with black paper, were selected for the purpose. Strangely and inexplicably the spots present on the leaves covered by the blue globe did not increase, but dried up; while those under the papered globe increased rather more rapidly than under that of clear glass.

This observation led to the microscopical examination of the diseased tissues. Immediately a large number of bacteria oozed from the sections, but no fungus mycelium could be traced. Bacteria had been noticed in the previous specimens, but were regarded as secondary to the *Cladosporium*. I examined at the same time some other plants which showed this fungus growing on them, and I was struck by the totally different appearance of the spots, microscopically and otherwise. They seemed of more superficial nature, and generally one epidermis was found intact. Now, in the Lilac leaf spot both surfaces were destroyed. The spots seemed exactly like those produced by fire or scorplings of young and tender leaves by the sun. They were parched without being brittle and dry.

The bacteria, which I isolated from the leaves, were rod-shaped. Sometimes they appeared to be moving and sometimes they were stationary. They measured from 1.3 to 3.0 micromillimetres in length. Some of the diseased tissues were placed into a test tube with water, to which a little cane sugar and sulphate of magnesia was added. The tube was well shaken, and a little of the liquid contents was spread over the surface of a petri dish filled

FIG. 167.—*PSEUDOMONAS SYRINGÆ*. (Very highly magnified.)

habit, and comparatively slow in growth, they may be cultivated in pots and forced for several years. By no means less valuable when forced are the sorts exhibiting various shades of green. In addition to bush plants, standards and half standards of most of the varieties are sold by nurserymen making a speciality of them. The majority of the Japa-

with nutrient agar. This dish was placed into an incubator, and in 36 hours some colonies of bacteria had appeared. Unfortunately there were six different kinds, which rendered the discovery of the responsible organism difficult. However, a pure culture was made of each on gelatine and agar, to which a decoction of Lilac leaves was added. Some bacteria seemed to thrive better than others, and they were used to inoculate healthy Lilac leaves. At first none seemed to "take." The small needle punctures, made for the purpose of infection, healed up again, and the leaves remained apparently uninjured. Two months later, however, one branch inoculated with the bacterium from culture 4 showed spotted leaves, streaky, yellowish-brown at first, confluent and darker as they increased in size. Diseased tissues were fixed and sectioned. These showed bacteria in the tissues, small rods, frequently in rapid motion. On comparison with those in a slide preserved from the first (and original) specimens, they agreed in size, shape, and habit.

I now carefully cleaned a spotted leaf, and immersed it for a few seconds in a weak solution of perchloride of mercury to kill all surface bacteria, hoping that the bacteria in the tissues would not be touched. But on placing the browned tissues on sterile agar tubes, no development took place, proving that they also had been killed. I again had to resort to isolation methods, and, after a series of failures, a bacterium was isolated and grown in pure culture, which showed strong resemblance to those found in the original tissues. All diseased shoots were now cut off the Lilac bush, used in the experiment, and placed in water under globes the same as the others. They behaved in the manner already described.

Continuing the inoculation experiment, new shoots were infected with bacteria from the pure culture. Towards the end of August characteristic blotches covered the leaves. I am satisfied that this bacterium is the responsible cause of the Lilac disease, for the same bacteria were isolated from the artificially-infected leaves as from the specimens previously dealt with. Bacteria from fresh cultures showed a distinct motility. They were consequently stained for flagella or lashes with which these organisms move, and one or two polar lashes were found. Thus they seemed related to the Hyacinth germ of Walker, but they were longer, and often in chains of two and more.

In order to classify the germ, I looked up the literature on the subject, and discovered the identical injury described as caused by *Pseudomonas Syringae* Beijerinck (see fig. 167). The disease has appeared amongst Lilacs in a nursery in a north-western province of Germany, and, later on, in Holland, where the injury was described firstly by Professor Ritzema Bos, who pointed out the infective nature of the disease. Latterly, Dr. Beijerinck took up the investigation, and named the bacterium. (See C. I. L. van Hall, *Bijdragen tot de kennis der bacteriële Plantenziekten*, 1902.) He proved the parasitic nature of the bacterium by infecting *Pyrus Malus*, *P. communis*, *Prunus Mahaleb*, *Polygonum Fagopyrum*, *Atriplex hortensis*, and *Populus nigra*, on the leaves of which plant I have quite recently observed a disease which I now regard as identical with that of the Lilac.

The disease appears to be established in this country. It has been sent to me from various parts. It must be pointed out that the disease is generally more prevalent in trees growing on wet situations. Solitary shrubs and those growing on well-drained land I have never seen attacked. A careful look-out should be kept for the spots, and all diseased shoots should be cut off and burnt. Spraying is of no use. Should any other plants, mentioned in this note, be found attacked, they should be treated similarly to prevent the spread of this pest, which may be controlled if all will join in its destruction. *H. T. Goss.*

CHRYSANTHEMUM NOTES.

TABLE DECORATIONS AT THE AUTUMN SHOWS.

ALMOST every society with which I am acquainted provides a class for table decorations, but it cannot be said that the results are satisfactory, and very often this portion of the show is the least interesting. In many instances the prizes offered are inadequate, especially as the necessary flowers and greenery have generally to be purchased by the exhibitor, because these competitors are not, as a rule, themselves growers. When 20s. is offered as the first prize, small wonder if the result is of a mediocre character. There is no reason why committees should not make this a popular section of their show, in the same manner that it is at the summer displays. In many instances the classes are badly worded in the schedules, for those responsible do not appear to understand what should be the conditions or arrangements for such classes.

Sometimes prizes are offered for a decorated vase or epergne suitable for a dinner-table centre. All manner of receptacles are employed, and the space provided for their display is quite insufficient. In many instances where tables are to be decorated, they are too small; a suitable size is 3 feet long by 2 feet wide. Exhibitors, judges, and the public alike do not know whether such exhibits are intended to be taken as representing the whole of the decorations for a dinner-table or merely the centre of such. What wonder, then, if there is a diversity of opinion expressed as to the awarding of the prizes!

In some instances the tables are much too large. In nine cases out of ten the same two errors are to be found on the part of exhibitors, viz., the employment of unsuitable receptacles, and the overcrowding of the flowers and greenery.

The employment of rustic stands is far too common, and, as a rule, these receptacles are too tall to be effective. Exhibitors seem to forget that flowers are not placed upon a table to be an obstruction, but for a pleasure, and, no matter how attractive they are as flowers, if they obtrude they lose much of their interest. It was a pleasure at the November show of the National Chrysanthemum Society to see Mr. Felton break away from the stereotyped form of rustic stand. His first-prize table was an object-lesson in originality and simplicity. In another class, even though this exhibitor did not obtain a prize, the receptacles used—a silver bowl in the centre and small silver vases at the corners—were quite different to those ordinarily employed.

Many competitors overload their stands with flowers and greenery until all the beauty of the exhibit is lost.

JAPANESE VARIETIES FOR DECORATION.

AT some Chrysanthemum exhibitions, and with excellent results, one or more classes are provided for a vase of disbudded blooms arranged with any kind of foliage. They serve to demonstrate the value of large exhibition blooms for decorative purposes in the dwelling house. At Edinburgh and Windsor Chrysanthemum shows, such a class is made a distinct feature, and, as competition is keen, the display is very effective in appearance. Sometimes tall vases, as much as 4 feet in height, are employed. When such are arranged on an ordinary table they do not produce the best effect, for vases of this type should have a position on the ground, where the upper surface of the blooms can be seen to advantage. At Edinburgh, as many as 30 large blooms are employed in a single vase; while at Windsor, the number is limited to 12; for the best effect the larger number is to be recommended.

Committees are sometimes at a loss to know how to provide a change in their classes.

Here, then, is an opportunity for a pleasing change, and a substantial prize will nearly always produce a desirable exhibit. Too often one hears the remark, "These huge Japanese blooms are of no use for decorative purposes." But such a class as I have described proves the utility of this type of flower for use in the decoration of dwelling rooms.

In arranging blossoms in such vases, a colour scheme should be aimed at, such as is given by arranging together J. H. Silsbury (terra-cotta-crimson), F. S. Vallis (pale yellow), Lady Tatbot (primrose), Mrs. A. H. Lee (rich crimson), or the rich terra-cotta-red of Mrs. F. W. Vallis. Tall vases are enhanced in beauty when draped with *Asparagus Sprengeri*, trails of *Ampelopsis Veitchii*, or other similar material. Trails of coloured vines, *Fronus Pissardi*, *Guelder Roses*, *Dogwood*, *Spiraea Thunbergii*, *Green Box*, and *Golden Privet* can be interspersed with the blooms. *E. Molyneux*.

ORCHID NOTES AND GLEANINGS.

ORCHIDS IN FLOWER AT KEW.

MANY interesting Orchids are in flower in the Royal Gardens, Kew, at the present time, one of the rarest and most stately in appearance being *Lissochilus giganteus*, with its large plicate leaves and tall inflorescence of large rose-pink flowers. The genus *Catasetum* also has a goodly number in bloom, well representing the wide range in variation in the members of the genus, the species including *C. tabulare*, with its elongated labellum bearing a thickened table-like plate up the middle; the showy *C. splendens*, the prettily-marked *C. quadridentis*, and others; the allied genus *Mormodes* having *M. bicincta* and *M. badia*, with its bright claret-red flowers in bloom.

The genus *Bulbophyllum*, including *Cirrhopetalum*, are finely represented at all seasons. At present *B. Pechei*, *B. Careyannum*, *B. cupreum*, and others of that section are most in evidence, together with *B. blepharites*, *B. recurvum* and others. The species of *Spathoglottis* thrive well at Kew, and flower for a long time, those now out including *S. kewensis*, *S. aurea*, *S. picata*, and its bright-rose variety *Nicholitzii*; *Habenaria carnea* is still well in bloom, also the little-known *Mormolyce lineolata*, a Mexican species with curious red-brown blooms; *Corylogne Rossiana*, *C. flexuosa* and other *Corylogne*s; *Cymbidium giganteum*, *C. longiflorum*, and *C. Gammieannum*; *Maxillaria setigera*, *M. madida*, and various *Ornithidiums*, and *Camaridiums* were noted.

In the warmer houses a good selection of *Augreacens* are in bloom, chiefly of the section *Lastrostachys*, which are represented by *L. chailluana*; several *L. Monteiroi* and *L. pellucida*, *Mystacidium augustum*, *Phalaenopsis rosea*, *P. denticulata*, *P. Sanderiana*, *Acampe pubiflora*, and the pretty *Saundersian* *orthorhynchus*; the showy section being represented by *Dendrobium Phalaenopsis*.

In the cool houses are many species of *Masdevallia*, *Pleurothallis* and *Octomeria* in bloom; *Oncidium orthorhynchum*, and its pure white form; the dwarf *O. uniflorum*, *O. unicolor*, *O. cheiroporum*; the pretty *Sophronitis cerna*, and *S. grandiflora*; a number of bright-rose-coloured *Pinguicula caudata*, which, although not an Orchid, is usually grown in the Orchid house; *Epidendrum variegatum*, *E. Lobbii*, *E. cochlearum*, and other *Epidendrums*; *Neobenthamia gracilis*, an almost perpetual flowerer; *Oncidium Kramerianum*, *Polystachya pubescens*, with pretty spikes of yellow fragrant flowers; *P. Buchananii*, *P. laxiflora*, *Eria longispicata*, *Eulophia goniensis*, *Sobralia decora*, various *Calanthes*, including the *Veitchii* *O.*, *Domini* of the early days of Orchid hybridising; *Dendrobium erialorum*; some *Cattleya labiata*, and a selection of showy hybrid *Cattleyas* and *Laelio-Cattleyas*, which are found to be very useful for decorative purposes. *L.*

BAWDSEY, FELIXSTOWE, SUFFOLK.

THE residence of Sir Cuthbert Quilter, Bart., at Felixstowe, Suffolk, is remarkable for the site upon which the house has been built and the gardens formed. Twenty-five years ago the place was a mere sandbank, and it would be difficult to find a more windswept spot even on the East Coast than that which was selected for this residence. Considering the natural disadvantages of the environment, it is astonishing what a fine place has been laid out around the mansion, of which an illustration is given at fig. 168. Modern engineers appear capable of building handsome houses under almost any conditions, and they can make their base what they wish it to be, but it is another matter altogether when attempts are made to carry out first-class gardening under conditions absolutely opposed to the growth of all but the very hardiest species of plants. Every gardener knows the value of shelter in the cultivation of plants, and has to take measures to provide shelter in one portion or another of his garden. But at Bawdsey Manor the matter

arranged that its artificial formation is not wholly apparent. When we visited the gardens, at midsummer, there were not many species in flower, but it was evident that the selection had been made with a view to including plants most likely to thrive under the unusual conditions to which the rockery is exposed, rather than of risking a number of choice Alpine species with little hope of their ever getting satisfactorily established. We noticed species of *Thymus*, *Theris*, *Centranthus*, *Gypsophila*, *Lupinus arboreus*, *Fryngium*, *Hydrangea*, *Calendula*, *Veronica Hendersoni* "Purple Queen," *Aubrietia*, *Mesembryanthemum acnactorme*, *Coronilla glauca*, and *Fuchsia Riccartonii*, but these do not represent a tenth of the species that are planted or that have the appearance of making the best of the environment that is possible.

At fig. 169 there is shown a sunken garden, and this feature also is one to which much interest is attached, for Sir Cuthbert Quilter has formed it on the exact site of an old coastguard station, which he first had to blow up with explosives. It will be seen from the illustration that there are underground passages or tunnels

nished with such plants as Honeysuckle, Clematis, *Ficus*, species of *Rubus*, *Periploca*, and other suitable genera.

One of the most interesting plants at Bawdsey is *Cupressus macrocarpa*, for it succeeds in the most exposed situations, and the hedge formed of this species is a surprising testimony to its value for similar situations on the East Coast. We ought to add that the rockery and a considerable part of the garden faces the sea on the south or south-east and not direct east as might otherwise be supposed. Mr. Nimmo, whose maintenance of these gardens fully deserved the appreciation already given, informed us that the land winds from the north-west were even worse than those from the sea, and consequently protection of some sort or another is necessary all round.

There are fruit and plant houses for the cultivation of indoor products for supplying the residence; 800 *Chrysanthemums* are cultivated in pots, and in addition to the flower garden around the private residence, there are four acres of land devoted to the cultivation of fruit trees and vegetable crops.

FIG. 168.—BAWDSEY MANOR, FELIXSTOWE, THE RESIDENCE OF SIR CUTHBERT QUILTER, BART.

assumes a supreme degree of importance: the uncurbed winds are often sufficient to blow a plant out of the earth altogether, and it is only behind some sort of shelter that it is worth trying to cultivate ordinary species. However, Alpine and rock plants are extraordinary in their habits and powers of withstanding exposure, and many of them are quite capable of thriving upon a rockery that rises to a great height on the seashore, and is exposed to all the winds that blow from the sea. This rockery wall may be seen from the garden side, in the illustration at fig. 169, and a smaller portion of it as photographed from the water side is shown in fig. 170. The rockery fulfils the uses of a sea wall, thus protecting the gardens to some extent from sea winds. It has a height of 150 feet, and extends along the shore for a distance of 400 yards. The rockery is built of burrs embedded in cement, and Suffolk crag thrown on its surface, but the structure is so artistically and skilfully

leading from the sunken garden to the shore side of the rockery. The photograph was taken in spring, before the bedding plants were put out, but when we saw the garden it presented a very gay picture indeed, and a low brick wall, which partially encloses it, was of delightful interest, being covered with Roses and other shrubs in full flower, whilst on the top of the wall were tubs containing Hydrangeas and stone vases filled with Carnations flowering abundantly.

We have seldom seen more gorgeous bedding than was noticed at Bawdsey. There are broad borders of herbaceous plants that last season appeared so thoroughly well ordered and cultivated that our admiration was unqualified. The aim was evidently to secure the best colour effects, and in one instance a border was planted in groups of beds, representing respectively yellow, red, blue, white, and lavender.

A massive-looking pergola with stone pillars and wooden top is now almost completely fur-

FRUIT REGISTER.

RED AND GRIZZLY GRAPES.

It would be difficult to discover a reason why table Grapes other than the dark purple and white and yellow varieties are commonly so little esteemed. We grow some black (dark purple) Grapes extremely lacking in good flavour; as, for example, *Gris Colmar* and *West's St. Peter's*, the former on account of its showy bunches and large berries, and the latter because the fruit will keep in good condition for a long period of time, whether on the vine, or if cut with 6 inches of the shoot attached and stuck into a bottle partly filled with water—a process unfavourable to good flavour in any variety. It is sweet and juicy, pleasant eating but not rich in flavour. *Royal Ascot* is another purplish-black Grape of second-rate quality, the bunches being of small size. It is a variety cultivated by some persons for fruiting early. The skin is very thick, with a dense bloom. *Barron*, in his

Vines and Vine Culture, describes it as being a "second early," that is, that under hothouse culture the fruit ripens later than Royal Muscadine, Foster's Seedling, or Black Hamburg, but before Madresfield Court. Cambridge Botanic Garden is an early sweetwater of fine appearance, but second-rate in regard to flavour. The berries are of an oval shape, and the bunches 18 to 24 inches in length. As an open-air Grape it may be recommended for growing on a south wall. My purpose is to call attention to a class of Grapes not regarded with much favour at the present day by ourselves, but which are greatly liked for their fine flavour and handsome appearance, in France, Southern Germany, Spain and Italy. I refer to the rose-red, pale red, light purple, and grizzly varieties, some of which the painter delights to paint, as is to be noted in the pictures of still

Matabon and Malvoise de Tours. I assume that the first name given above should have been written Züment, a white and rose-coloured variety from Hungary or Austria. Of varieties not found in the collection from France, the following varieties of this class of Grapes, suitable for vinery cultivation or against warm aspects in this country may be mentioned, viz., Red Muscat having large berries, Merches having a medium-sized bunch and berry of a red and white colour; Assyrian, red in tint and of a fairly large size; and Auvernaise, large berries, of a bright red colour, and Muscat of Bianco is also red; De Genes has a large red berry, as is Rouge de St. Antoine; and Vellinier, a medium-sized berry of red or rose colouring.

The following are the names of a few varieties cultivated in this country, viz., Chasselas

much employed in wine manufacture on the Continent, owing to the lack of colour, the Gerinans calling the wine made from them "Scheler" or squinting; but as table Grapes they are deserving of more attention than is accorded them in this country. Most of them may be grown under the conditions necessary for sweetwater Grapes, that is, in cool vineries and against south walls in the warmer parts and in "ground vineries," such as the late Thomas Rivers advocated for cheap Grape culture. F. M.

SOME AUTUMN PEARS.

Michalmas Nelis.—The first of the Pears to which I would call attention is the new *Michalmas Nelis*, a variety Messrs. Bunyard sent out a few years ago, and its splendid quality should commend it. Grown on the Quince stock, it may

FIG. 169.—VIEW OF SUNKEN GARDEN AT BAWDSEY MANOR WITH THE SEA AT THE BACK.

(For text see p. 406.)

life of the French and Dutch schools under sunlight and artificial light. The recent show at the Franco-British Exhibition afforded the public a sight seldom before witnessed in this country of the red, grizzly, pink and light purple coloured Grapes commonly consumed in France. The following names were attached to the various bunches, viz., Piment Large Corinthe (not the Currant of commerce), Grec Rouge, Coristano Rouge, Admirable de Courtille, Boal Barbon (a Portuguese variety), Muscat Rouge de Madiera (Madeira Frontignan of English lists), a grizzly or red Grape, of fine quality, and ripening early. The bunch is of medium size, the berry round, with a thick skin, flesh firm, rich in flavour and juicy. Duke de Magenta, Hinab Turki, Drouhane (an Egyptian variety), Chasselas, Tramonier (violet coloured), Chasselas Gris, Poite

Violet, a red sweetwater, ripening at an early period of the summer; Chasselas Rose, with pretty red or rose-coloured fruits. The bunches are small, and they are well set with berries, and the fruit makes a good contrast with black, yellow or white Grapes. It has a resemblance to Royal Muscadine, excepting in colour. Muscat Champton or Champion Hanburgh Muscat has large berries of a dark red or grizzly colour, thin in the skin, melting and juicy. It has the fault of setting its fruits badly, and many of the berries in a bunch are destitute of seeds. This fault might be averted by pollination from the flowers of some other variety. The flame-coloured Tokay Grape syn. Lombardy has bunches 20 inches in length sometimes, and broadly shouldered. It sets well and is a very handsome Grape. The varieties named are not

be classed as a free grower and a good bearer. Some cordon trees fruited very freely for their size the second year after planting, and, cultivated as bushes or pyramids, it is excellent. In quality it is one of the best Pears ripening at the end of September. Although not large, it is quite sufficiently so for dessert, being below medium size, very juicy, melting, and richly flavoured, having a fine aroma, and in this respect it is not unlike the well-known Doyenne du Comice.

Dr. Jules Gayot.—This Pear is a little earlier than *Michalmas Nelis*. It is a very handsome fruit of good flavour, and it is such a compact grower on the Quince stock that it is admirably suited for cordon growth and gardens where room is none too plentiful. In some respects this variety resembles Williams' Bon Chrétien,

but it is of brighter colour, and when eaten almost direct from the tree, is well flavoured, and the fruits have a crimson flush on the exposed side. The flesh is tender, melting, juicy, and quite free from the musky flavour present in Williams' Bon Christien. It is a great bearer and a profitable market Pear.

Belle Julie.—A small fruit, but very productive if grown as a bush or pyramid on the Quince stock, and the fruits well thinned. The fruits are yellowish in colour, juicy, and highly perfumed. The variety makes an excellent cordon, and may be relied upon to fruit when others fail. It ripens in October and November.

Charles Ernest.—An October Pear of great merit, but in the north on a heavy soil I have had this variety good till December. It is excellent in October and much liked for its shape and size, being a handsome fruit, large, and not unlike the Pitmans Duchess, but of better quality. The fruits have a yellowish colour, with crimson markings on the exposed side, with minute russeted dots. The flesh is juicy and melting. The tree is erect, and makes a handsome pyramid; on the Quince stock it is suitable for espaliers or cordons. The variety received a First-Class Certificate from the Royal Horticultural Society a few seasons ago.

Marguerite Marillat.—This Pear should not be overlooked, on account of its handsome appearance, the fruits being large and beautifully coloured. As regards its flavour, it is one of the best of the early Pears. It has a distinct flavour, is very sweet, with a pleasant aroma, and the tree is a strong grower and fine bearer. It makes a fine pyramid or espalier, but in good land the trees sometimes require to be root-pruned.

Bauri d'Anolon.—This Pear is not unlike a large specimen of Brown Bauri, but it is a finer fruit, and, grown on the Pear stock, it is melting and juicy, with a peculiarly pleasing aroma. It succeeds well in a heavy soil, is a free bearer, and is in season in October and November.

Conferente.—A Pear that has become a great favourite on account of its free growth, its fruitfulness and good quality. The fruits are large and pyriform, the skin is a dark green with much russet. The flesh is salmon-tinted, melting, rich, and juicy. It is a most valuable Pear in October and November, and a variety that rarely fails to crop. It succeeds best grown on the Quince stock, and is one of the best varieties for pot culture. *G. W. H. G.*

AMERICAN NOTES.

THE CHICAGO SHOW.

The National Flower Show held in Chicago from November 6 to 14, proved a great success, financially and from a horticultural point of view. The eastern plant growers came out handsomely, bringing large Palms and other plants from New Jersey in bitterly cold weather, which were of great assistance in making the show attractive. In a large hall like the Olsens at Chicago something has to be done to break the flatness of a flower show as usually held, and in this case the management had a double series of pergolas erected, and the floor of the hall laid with turf, giving it the appearance of an Italian garden. Opinions differed as to the effect produced. From the floor of the hall it was good, but the tops of the pergolas detracted somewhat the view from the balconies—usually the finest.

An interesting exhibit was that of Elmer D. Smith & Co., consisting of 438 varieties of Chrysanthemums, old and new, ranging up from the original *C. indicum* to the firm's latest big white flower President Tait.

In the purely exhibition classes C. H. Totty, newly returned from England, made a fine show-

ing with his British and American varieties, and in plants the reputation of Chicago was well kept up. Ferns were a decided feature of the show, the Pierson Co., of New York State, showing many of its well-known sports of Nephrolepis. Mr. Dreer, of Philadelphia, also had a new sport, Scholzei, an improved Scottii, while many other new Ferns, more or less distinct, were shown. Polypodium Maudslandii, shown by the well-known nurseryman whose name it bears, is like an immense form of *Phlebodium aureum*, but deep green instead of glaucous, and very beautifully pinnatifid, the cutting up of the fronds giving it a very soft and elegant appearance. Some splendid work was put up by the retail florists, and so gratifying all around was the success of this initial show of the Society of American Florists, that already there is a talk of repeating it in one of the large eastern cities in 1910. *H. R. R.*

USE OF SUPERPHOSPHATE.

The use of superphosphate is increasing rapidly in the United States. Many farmers use the superphosphate alone. They are beginning to regard the so-called complete fertilisers with disfavour. They argue that there is not enough nitrogen and potash in the complete fertiliser to do much towards growing the crop. That if the soil needs potash and nitrogen there is not enough of these elements to pay extra cost of the goods. Some use superphosphate alone, others use it with potash and depend upon growing legumes to supply the nitrogen. Prof. Massey tells us that the farmers in Maryland have brought their land, which grew 15 bushels per acre a few years ago, into such a condition that it now produces 40 bushels per acre, by using superphosphate alone and by growing Cow Peas. This shows what can be accomplished by a good rotation and the use of a cheap fertiliser. *A. J. Legg, Albion, Nicholas Co., W. Va., U.S.A.*

TREES AND SHRUBS.

ESCALONIAS.

THE members of the genus Escallonia are all natives of South America, most of them hailing from the uplands of Chili. It follows, therefore, that they are amongst the more tender subjects in this country, though nearly all of them can be grown outdoors if given the protection of a wall. Notwithstanding that they are all of a branching, shrubby habit in the open, yet they can be grown against a wall with advantage, and the cutting-back and training necessary to keep them within bounds renders them, if anything, more floriferous than when they are grown in the open. Where Escallonias are grown in the shrubbery in conjunction with other vegetation care must be taken they are so placed that they get the benefit of every scrap of sunshine, as they are essentially sun-loving plants, and do not mind a certain amount of dryness at the root. The soil should be a rather poor one, as a rich medium promotes a sappy growth to be cut off by the first frost of winter. By giving them plenty of sunshine and a poor soil, short-pointed well-tipped wood is produced which will be covered with flowers during the greater part of the summer. Propagation is effected by means of cuttings of half-ripened wood taken in August, and inserted in pots of sandy soil. During the winter they require to be kept in a cold house or frame protected from frost and excess of moisture. About the middle of the following May they will be found sufficiently rooted to be planted out.

E. coccinea.—This is a hybrid of garden origin, raised in Messrs. Robert Veitch and Son's nursery at Exeter. It forms a branch-

ing, free-growing shrub four feet or so high, clothed with small, ovate, deep-green leaves, and bearing semi-pendant pink-and-white flowers during the greater part of the summer.

E. nitida is a native of Chili, and forms a spreading shrub 6 feet or so high with stout, resinous branches. The leaves are borne on comparatively long petioles, obovate to oblong in shape, crenulate on the edges, and covered on the upper surface with glandular dots. The white flowers are borne in terminal, branching panicles more or less all the summer. It is comparatively tender.

E. langleyensis.—This is a hybrid between *E. philippiana* and *E. maurandia*, and is a vigorous and fairly hardy plant, reaching a height of 4 feet to 6 feet. The leaves are small and very dark green, and the flowers are rose-pink and freely produced.

E. macrantha.—This is a native of the island of Chile, and is one of the hardiest of the genus. It forms a large branching shrub 6 feet or more in height, clothed with dark-green, ovate leaves, shining as if varnished above, and marked with tiny dots beneath. The edges are rather coarsely serrated. The flowers are borne in terminal, racemose peduncles, and are individually comparatively large. In colour they are a bright crimson-red, and are open more or less from June to October. Even without flowers the glossy foliage of this plant would deserve a prominent place as an evergreen.

E. montevidensis.—This is a strong-growing species from Montevideo, reaching a height of 10 feet under favourable circumstances, but it is unfortunately somewhat tender. The branches are stout and sticky, and the leaves are oblong, obtuse, and nearly, or quite, entire on the margins. The white flowers are borne in large, branching, terminal corymbs, and open from June to August. It is a rare plant, though it was introduced as long ago as 1837.

E. philippiana.—This forms an upright, branching bush 4 feet to 6 feet in height, with a more slender and twiggy growth than the majority of the genus. The small, white flowers are borne in densely-crowded terminal and lateral panicles. The leaves are small, spatulate in shape, of a rich green hue, and finely serrated on the edges. It is a native of Valdivia, and is one of the hardiest of the Escallonias.

E. punctata is a Chilean species, which forms a spreading shrub 6 feet or more in height. The deep-red flowers appear during July and August, and are borne in small, terminal clusters of from two to six flowers. The sessile, ovate leaves are dark-green and glossy on the upper surface, and paler and dotted with tiny glands beneath. It is only moderately hardy.

E. rubra.—This somewhat resembles *E. punctata*, differing chiefly in its having paler-colored flowers, which last more or less from June to October. The leaves are obovate, serrated, and dotted beneath. It is a native of Chili.

E. revoluta.—This is a comparatively tender species, introduced to this country from Chili in 1857, and is a strong, vigorous plant, reaching 10 feet in height under favourable conditions. The flowers are white, and borne in spreading, terminal panicles in August and September. The leaves are about an inch long, obovate in shape, serrated, and more or less pubescent.

The above-mentioned species are the best of the genus, and some of them are unfortunately too tender to be generally recommended, but full exposure to the sun and a poor, fairly dry soil will enable some of them to withstand much more severe weather than they otherwise would. *J. Clark, Bagshot, Surrey.*

JUGLANS REGIA FERTILIS.

No good-sized garden should be without this dwarf-growing Walnut, where the Walnut succeeds at all. The variety differs from the common Walnut in its early fruiting and the small size to which the tree attains. It is a heavy cropper, and frutes regularly. The nut is of middle size, tender in the shell, which is well filled. *F. M.*

THE PYRAMIDAL ACACIA.

ROBINIA PYRAMIDALIS (*R. PSEUD-ACACIA*) is a tree which reaches about two-thirds the height attained by the Italian pyramidal Poplar, but it is much the finer tree. The flowers are white like those of the common Acacia, and the tree grows where other trees refuse to grow at all—only wet conditions are inimical to it. In Southern Russia there exist very peculiar soils. In parts the earth is good, in others very bad. The park in Garvirilowka is situated on the worst kind of soil, and costs much money and labour to maintain it. In this estate the pyramidal Acacia grows grandly, without any artificial application of water, whereas all other sorts of trees and shrubs must be watered throughout the summer or they die. The climate in this part of Russia is unfavourable to vegetation—in the summer the temperature ranging from 30° to 34° Reaumur, = 100° to 108° Fahr., with no rain for two or three months; and in the winter the frosts reach so low a degree as 20° Reaumur = 13° below zero Fahr. and more. But this Acacia is uninjured. *H. Klier in Moller's Deutsche-Gartner-Zeitung.*

NOTICES OF BOOKS.

* GENETICS.

ANYTHING that Professor Bateson writes on the subject of heredity must necessarily command the attention of those who are at all versed in such matters. In the inaugural lecture which he recently delivered as Professor of Biology at Cambridge, he expounds in a very suggestive manner, and in a way not too difficult to appeal even to the lay reader, the methods and scope of genetics. The general results of the application of Mendelian principles in the elucidation of puzzles of heredity are familiar to our readers, but all may well add to their store of information, and what is of far greater importance, may widen their mental horizon, by the perusal of Prof. Bateson's lecture. Possibly, however, some may reflect that although permutation and combination may be held to be jointly responsible for many of the remarkable products of cross-breeding, this by no means exhausts the subject. What is the nature of the individual variations themselves, which, when they have once appeared in an individual, can be dealt, like so many cards out of a pack, to the members of its offspring? The answer to this question has not been found as yet—perhaps we may have to wait long for it. But in the meanwhile the accumulation of knowledge which is based on the sure ground of experiment is leading to practical results of great economic importance. Applications of knowledge always grow, sooner or later, out of discoveries which have often been made with little or no thought of their ultimate practical results. Indeed, the history of industrial and technical progress during the last hundred years or so is full of examples which show that where Pure Science takes the lead, Applied Science very soon follows to exploit the newly-acquired territory. For the saying that "knowledge is power" was never more true than it is to-day.

* *The Methods and Scope of Genetics*, an inaugural lecture delivered October 23, 1908, by W. Bateson, M.A., F.R.S., Cambridge: at the University Press, 1908.

* ALPINES AND BOG-PLANTS.

THOSE who are acquainted with Mr. Farrer's work, *My Rock Garden*, will not need to be told that there is much that is valuable, as well as something that is whimsical in his new and admirably illustrated book on Alpines and Bog plants. The reader must not expect to find an encyclopedic treatise; but if he wants to discover what has been the actual experience of the writer with various plants he will get it; and the story is told after the fashion of one who loves the subject, and to whom the plants themselves are real friends—or foes. The re-

massaged the shoots that have appeared above, you haven't nearly accounted for all the dreadful energies that are still lurking underneath."

Those who are thinking of laying out rock or bog gardens will do well to ponder over Mr. Farrer's advice, based, as he tells us, on his own painful experience. "Neglect initial precautions, save a few sixpences in the matter of drainage, concrete or what not, when you are making your garden, and you will certainly have to spend many sad laborious years and many unprofitable pounds in trying vainly to make good your deficiencies . . ." Such counsel,

FIG. 170.—STEPS IN THE ROCKERY FACING TO THE SEA AT BAWDSEY MANOR.

(For text see p. 406.)

marks on our native *Epilobium*s as possible introductions to the garden will perhaps bring comfort to some unwary gardeners who have hopefully introduced wild pests into their "wild" gardens. "Once, many years ago, in my innocence, I admitted *E. hirsutum* to the old garden. No decent words can express the torments that I have suffered from that horrible plant ever since. Its great white root-stems go louping along underground, and when you have

often given, is nearly as often neglected, and most of us have seen examples of the result.

* *Alpines and Bog-Plants*, by Reginald Farrer. With illustrations. (London: Edward Arnold, 1908.) Price 7s. 6d.

A considerable part of the work is devoted to sketchily dealing with the idiosyncrasies of many different plants as they have made themselves known in the author's garden. The whole book is permeated with first-hand observation on the plants themselves, and with reflections based thereon. With the latter we do not always agree, but this in no wise interferes with our own enjoyment of the volume or with our intention to recommend its perusal to others.

THE ROSARY.

CULTURAL NOTES FOR DECEMBER.

It is now time to make provision for safeguarding and protecting all tender varieties of Roses by soiling up the dwarfs and the heads of standards with Fern and straw, and mulching the roots. An effort should be made to complete the planting of Roses, Stocks, and cuttings, before Christmas.

The early planted Roses and various cuttings in the ground are likely to become loosened by the shrinking of the soil. Examine these carefully, especially the freshly-planted Standard Roses, tread them well in, and apply a fresh mulch on the surface of the ground if this is required. I have already given lists of suitable climbing varieties for covering arches, pergolas and Wicheriana Roses suitable for creeping over sloping banks.

All established pot Roses should now be brought under glass, either under a cold frame or in a light house. This is done, not so much for protection from frost as to keep them dry and the roots in a better condition of gentle forcing when required later on to follow those that were put into heat during October and November. I may here remark that the temperature during the dull season should be kept at about the same as last month. Admit air on all favourable occasions during the middle of the day and close the house early. Damp down frequently to maintain a humid atmosphere. The Tea-scented section will stand more forcing than the Hybrid Perpetuals, and the plants may, therefore, be kept at the warmer end of the house. Fumigate the house immediately the least sign of aphid is seen.

Dwarf plants which were potted up during the autumn may be allowed to remain plunged out-of-doors until after Christmas, when they can be placed under glass for succession. When the first of the grafted Roses are taken out of the frames into the house—at the middle or end of the month—other potted-up stocks can be brought in from outside to take their place. Advise the house occasionally when the plants are dry. I may here note that the Tea Scented and Hybrid Tea varieties do not take kindly to the Manetti stock, so that in all cases where propagation is effected by grafting, Binar stocks of either cuttings or seedlings only should be used, and the Manetti for Hybrid Perpetuals and most other Roses. I have found De la Griffera the best stock for all strong growing Roses.

Roses planted out under glass can now be freely pruned. Teas and Hybrid Teas should be pruned sparingly, only cutting out the weak wood and shortening the best ripened growths four to eight eyes down, the more severe treatment being best for the weakly shoots. When gentle forcing is in operation, admit air in the daytime, and at night-time slightly open the top ventilators only. On sunny or bright mornings ply the hose, or thoroughly syringe the plants so as to clean the foliage and prevent insects. J. D. G.

VEGETABLES.

PEAS THE GLADSTONE.

GARDENERS who experience a difficulty in maintaining a supply of culinary Peas late in the season should give this variety a trial. During seasons of drought, even when planted in light, shallow, or gravelly soils, it has proved one of the most reliable varieties. The plant is remarkably strong in constitution, and the foliage resists attacks of mildew when many other varieties are infested with the fungus. A long succession of pods is maintained, whilst another desirable point is that the shoots seldom exceed 4 feet in height, although they furnish as many pods as taller-growing varieties. Being comparatively dwarf they do not require tall stakes, and can be easily protected from the depredations of birds which in many gardens are troublesome amongst late Peas. In addition to the good qualities mentioned may be added the size of pod (often a pod contains 10 Peas) and excellence of flavour. This Pea is often seen in the prize collections of vegetables at many of the leading exhibitions throughout the country. Although the Gladstone is a late

Pea and is generally one of the latest sown, it does well as a mid-season variety. Although this variety is longer in coming into bearing than many others, the crop is of such excellence that it is well worthy of a place in all gardens where Peas of good quality are valued, more especially in those where mid-season and late varieties have proved difficult to cultivate with success. C. R.

The Week's Work.

FRUITS UNDER GLASS.

By T. COOMBE, Gardener to LOBB LANGATTOCK, The Hendre, Monmouthshire.

The earliest Figs.—If trees in pots were started early last month, as was suggested in a former Calendar, doubtless the pots are already plunged in a hot-bed having a heat of 60°. Should the heat decline further, then add some fermenting leaves and stable litter that have been specially prepared for the purpose. As soon as the buds have broken freely into growth, the atmospheric temperature at night may be raised to 55°, allowing a corresponding increase during the day. It will then be unnecessary to syringe the trees quite so frequently as before, nor need the ground surfaces of the house be so often damped. But it must be remembered that the pots are already filled with roots; therefore strict attention must be given to watering. In general, treatment of Fig trees planted in borders and that have already been started into growth is similar to that I have recommended for pot trees, but it may be added that any water given to the borders should be used in a tepid state, as in the case of pot trees.

Second early Figs.—A house containing trees that were forced early last season should be prepared for forcing to provide a successful crop to that furnished by the pot trees. Upon closing the house a night temperature of 50° will be sufficient and from 55° to 60° by day. Syringe the trees several times each day with tepid water.

Later Figs.—If these trees were properly thinned in the summer, little pruning will now be necessary, but the unripened pods were given should be removed. Take every care to properly cleanse the trees and the interior of the house; this being done, the trees should be trained. Until it is necessary to close the house, let the atmosphere and borders be kept cool, rarely dry, and as cool as possible, short of letting the trees become frozen.

The orchard house.—Houses of this kind that were emptied of their trees to accommodate Chrysanthemums should now have their wood-work thoroughly cleaned or painted and the walls lime-washed in readiness for the fruit trees. It will be remembered that directions were given for repotting or top-dressing these trees just before they lost their leaves, after which the pots were to be plunged out-of-doors. The present time is a convenient one to again examine them for the purpose of cleansing them of pests, using, if necessary, an insecticide for this purpose. Such hardy kinds as Plums, Pears and Apples will be benefited if sprayed with the caustic alkali spray-fluid commonly used upon outdoor trees. When this has been done, the trees may be placed indoors, and the house kept perfectly cool for the present. Permanently-planted trees should be cleansed in the same way as pot trees, and they should be pruned, taking care to keep the branches and spurs properly thinned out. The surface soil should be removed from the borders, and in its place a top-dressing applied of suitable compost containing amongst its ingredients bonedust, wood ashes and fine lime rubble.

Cucumbers.—At this dull season of the year of all others it is necessary to avoid over-cropping the plants, and it is almost equally important not to allow decayed leaves to remain upon them. It being necessary to use considerable fire heat, such pests as aphids, thrips and red spider are apt to spread; therefore, constant war must be waged against them by the syringe and by the use of the X.L.—All vapouring compound. Give careful attention to watering, and apply an occasional top-dressing to the roots. The surroundings may also be occasionally top-dressed with fresh horse manure.

Tomatoes.—Sow seeds at the present time for raising plants to supply a successional crop to

those now bearing fruit. Plant these seeds 1 inch apart, either in pots or pans, and plunge the receptacles in bottom heat until germination has taken place, when they must be removed to a position near the glass in a light house, having an atmospheric temperature of 60° to 65°. As soon as the plants are fit for rooting, pot them into 3-inch pots and keep them in a light position, affording each specimen sufficient space for the air to circulate about.

THE KITCHEN GARDEN.

By E. P. KELLY, Gardener to the Hon. VERNY GIBBS, Aldenhay House, Epsom, Hertfordshire.

Plants under shelter.—Late plants which were lifted as previously advised and placed in frames, cold houses, or other temporary shelters should receive all the air possible when the weather is favourable, and the plants should be kept scrupulously clean, and all decaying leaves removed as soon as observed.

Cauliflowers.—Though Cauliflowers are always much appreciated, there is no season of the year when they are more valuable than in mid-winter, and under proper treatment they produce small white heads of the choicest quality. Veitch's Autumn Giant is best adapted for this mode of treatment. Frequent small sowings of suitable varieties should be made from now onwards so as to maintain a constant supply during the greater part of the year. Such varieties as Early Foreing, Snowball, and Magnum Bonum should be sown in gentle heat in shallow seed-boxes. Do not allow the young seedlings to become drawn, but elevate them on shelves near the glass where there is a temperature of about 50°, and before the second leaf is made prick the seedlings out into other boxes 3 inches apart all ways. Use a compost containing half its bulk of light loam, with some well-decayed leaf-mould and a little road sand, taking care to provide a good drainage. Autumn-sown plants of the same varieties as mentioned above may now be shifted into 7 and 8-inch pots, arranging them in cool houses or pits. If brought along gently these plants will provide excellent Cauliflowers very early in the year. The compost used should consist of three parts good, fibrous loam and one part well-decayed horse or cow manure. Pot them very firmly, filling the pots about three parts full, leaving the remaining space for a good top-dressing at a later period.

French Beans.—However well one may be provided with means for maintaining a supply of these Beans, some difficulty will be experienced owing to insufficient sun and daylight. Extreme temperatures either way must be guarded against. Too much fire heat is even worse than allowing the temperature to become somewhat low, as the plants become seriously weakened and red spider is almost certain to cause trouble. Endeavour to keep the temperature of the houses at about 55°, allowing the maximum to be 60° and the minimum 50°, according to the temperature out-of-doors. The atmospheric conditions of the house must be kept moist and the foliage of the plants thoroughly syringed with tepid water about 9 o'clock a.m. on fine days, applying weak liquid manure at every other watering. The pods should be picked immediately they are of sufficient size for use. These can be preserved for several days by placing the ends in a little water and keeping the vessel in the same temperature as that in which the Beans were grown, but the water must be changed every day. Make fresh sowings in 7-inch pots once a fortnight, but apply very little water until the seed has germinated. The best method of starting them into growth is to place them on warm pipes. For forcing during the winter I prefer Ne Plus Ultra and Canadian Wonder. These may be longer coming into bearing than some other varieties, but their robust constitution enables them to grow and produce good crops under artificial conditions.

Asparagus.—There is certain to be a great demand for Asparagus during the approaching festive season, and little difficulty will be experienced in providing a supply if good crowns are placed on a mild hot-bed and a suitable temperature is maintained either in a forcing house, pits, or frames. Lift and plant the clumps immediately, burying the roots about 3 inches deep with finely-prepared soil. Afford a thorough soaking with water and syringe daily with tepid water.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to the HOWARD LABY
SUCCESSIONS, WATLEY TRIOY, YORKSHIRE.

The treatment of orchards.—If any of the trees are too aged to again become profitable, do not hesitate to grub them up and make a fresh start, but in the case of younger trees that have merely become unproductive through neglect, the present time is a suitable one to prune them with a view to increasing their fruitfulness. It is essential, however, that the pruning should be done by an intelligent and skilled workman. He must cut away branches that cross each other and thin out bunches of spray which at present prevent light and air reaching the centre of the tree. All this can be done in such a manner as will not cause a severe check to the trees, but one frequently sees cases in which unskilled workmen, by the removal of large branches, have reduced parts of the trees to mere skeletons. The stems of large branches may afterwards be coated with creosote, and the trees generally syringed with the caustic alkali wash, which will serve to cleanse them of moss, lichen, and other rubbish. Lime is an excellent agency for destroying various pests, and whether used upon the bark of old trees or applied to the soil its effect is alike beneficial. If root pruning is necessary, the operation may now be carried out as recommended in previous notes. In many instances of orchard cultivation it is extremely necessary to break up the hard surface of the ground which has become so taked by previous neglect that warmth and air can scarcely enter. When this has been done the application of a rich top-dressing will be attended with excellent results. Any kind of decomposed farmyard manure may be applied to exhausted trees, or, failing this, bonemeal, soot, wood ashes, and fresh soil such as road-scrappings and charred vegetable refuse are all valuable fertilisers, and may be used in any seasonally procurable in considerable quantities. Better results are obtained from treatment of this nature applied to trees 10 or 12 years old than from the labour expended in trenching and manuring land before such trees were planted, for in many cases the land is already too light and rich for the cultivation of young trees.

Fig trees.—If it be considered necessary to protect these trees from severe frosts, the branches should be untied, loosened from the wall and tied into small bundles, wrapping each bundle with straw or bracken and again securely fastening them to wall to prevent them suffering damage from strong winds. The strongest growing trees are those most likely to suffer, for trees growing in soil of a calcareous nature, or that are frequently lified and root pruned, produce hard and short-jointed wood usually capable of withstanding ordinary frosts.

Nuts.—March is the best time to prune Nut bushes, provided that pruning is done every year, but if any bushes have been neglected for some years, they should be given attention at once, clearing away all the suckers and freely thinning out the growths. Let the ground be cleared of all weeds and as much of the loose surface soil as possible, then apply a good dressing of manure or some suitable compost. Such a dressing may be applied with advantage to all Nut bushes at this season of the year.

PLANTS UNDER GLASS.

By THOMAS LUN, Gardener to A. STELLING, Esq.,
Kear, Fifeeshire, N.B.

Eucharistia.—Bulbs that were repotted in the autumn are now starting into growth, and they should be carefully attended to for water, but very little will be required during the winter if they are grown in pots or pans. A letter plan is to grow these useful greenhouse bulbs in hanging wire baskets, which afford ample drainage, for the plants are exceedingly liable to receive injury if water at any time hangs about in the receptacle. They should be potted in a compost consisting of loam two parts, leaf-mould one part, and sand one part, adding a good sprinkling of manure obtained from a spent Mushroom bed. This porous compost should be thoroughly well mixed together before use. After the potting operation the bulb need only a temperature above freezing point, and the pots should be placed in a position close to the glass, and ventilation should be given on all favourable occasions, at the same time preventing

draughts of cold air reaching the developing growths. When the flower-spikes commence to show, a little artificial manure, if applied to the roots, will be beneficial.

Gladiolus Colvlei 'The Bride.'—Corms which were potted up in autumn are now growing freely, and they require frequent applications of weak liquid manure, for I find that the manure water is much more beneficial to this particular plant than artificial manures of any description. The plants should be placed close to the glass in a light, well-ventilated structure with an aspect to the south. The atmospheric temperature should be from 50° to 55°. On no account attempt to force this *Gladiolus* into flower earlier than the first week in April.

Freesia.—The earliest batch is now showing the flower-spikes, therefore apply liquid manure frequently. The inflorescences should be neatly staked before the flowers commence to open, and until that stage is reached the plants should be kept close to the glass. Successional batches may be brought forward in the same manner.

The greenhouse and conservatory.—Take care always to arrange the plants in these houses so that the best colour effects will be obtained. Remove without delay any that have ceased to be effective; substitute for them fresh plants from the forcing houses. If flowering plants are found to be rather scarce at this season, a few Ferns may be grouped together amongst the flowers, and their appearance will be appreciated. Maintain a little warmth in the water-pipes each day, and open the ventilators sufficiently to cause the atmosphere to circulate freely.

THE ORCHID HOUSES.

By H. G. ATENANDER, Orchid Grower to Lt.-Col. G. L. HODGKIN, C.V.O., U.S.A., Westbury, Gloucestershire.

The approach of winter.—The present month is the most unkind of the year, for the days are the shortest. During this dull season one of the principal difficulties in Orchid cultivation is caused by the fickleness of the climate. It is very necessary, therefore, for the cultivator to be on the watch for changes in the wind, cold rains and snowfalls, which lower the atmospheric temperature in glasshouses more rapidly than sudden, sharp frosts. If the winter conditions of this season are similar to those of recent years, the worst weather may be expected after the New Year.

Artificial heat in winter.—In the first calendar of this year I pointed out how harmful excessive artificial heat is to Orchids, and emphasised the necessity of having sufficient boiler power with a good radiating surface in all the houses, in order to avoid the serious evil of overheating the pipes during severe weather. I wish again to draw attention to this, for the well-being of the plants during winter will depend largely on the heating apparatus and its management. The person in charge of the fires should exercise care and good judgment at all times, and especially in determining what the night is likely to be, for he must bank up his fires accordingly. This is not an easy matter to decide, as sharp frosts often follow days of heavy rains, the change coming so suddenly that there is scarcely time to prepare for it.

Protection of houses with canvas and other coverings.—By a judicious use of these materials, during spells of severe weather, and especially in the case of houses situated in exposed positions, much may be done to lessen the amount of artificial heat employed. Arched mats, or specially-prepared canvas, of which there are many qualities on the market, form the best protective material. These should be rolled along the lower portions of the roof, covering the sides and ends of the house also, if these consist chiefly of glass. The coverings must be made secure against wind, and those used on the roof should be removed in the morning immediately the temperature commences to rise. This system of protecting plant houses from cold is a good one, and the saving in the fuel bill will pay the cost of the protecting material many times over, whilst the occupants of the houses will benefit because a lower amount of fire heat is necessary.

Temperature.—Early in October I advised the lowering of the temperatures a few degrees, in

order to prepare the plants for winter. As the maintenance of the desired degree of warmth in the various houses will depend almost entirely on the heating apparatus, the following minimum winter figures will now suffice.—East Indian or warmest divisions, day temperature 68° to 73°, night 60° to 65°; Cattleya house, day temperature 60° to 65°, night 55° to 60°; intermediate house, day temperature 58° to 62°, night temperature 53° to 56°; cool and *Ondotoglossum* house, day temperature 54° to 58°, night temperature 50° to 54°. A few degrees less in very severe weather will do no harm. These temperatures may be allowed to vary slightly according to the outside weather conditions.

THE FLOWER GARDEN.

By W. FYFE, Gardener to Lady WANTAGE, Lockinge Park, Berkshire.

Construction of garden paths.—The width of paths will in a great measure depend upon the extent of the pleasure ground, but the main walk should not be less than from 10 to 18 feet in width. The smaller walks should range from 5 to 7 feet, according as to whether they will be used for pedestrian traffic alone or sometimes also for vehicles. Walks that will be used only by foot passengers need not have so great a depth of material at the bottom as those intended for vehicular traffic. A depth of 9 to 18 inches is ample for ordinary garden paths, but much will depend upon the nature of the soil, whether shallow and resting upon gravel, stone or chalk, for in these cases all that is necessary is to remove the top soil and utilise it for levelling purposes on either side of the path. In all paths and roadways the centres should be made higher than the sides, and these sides will then form channels for the conveyance of the surface water into drains which should be connected with outlets at convenient spots leading into catchpits or drains. If the path is a broad and important one, the soil should be excavated to a depth of 18 inches, and 1 foot deep of rough, hard material should be placed in the bottom. On the top of this place some coarse gravel to a depth of 3 inches, and finish with an equal layer of fine gravel on the top. Paths of less importance should be constructed of similar materials in proportionate thickness. After the materials for the path have been properly laid they should be well consolidated with a heavy roller.

Lily-of-the-Valley.—The present is a suitable time for replanting the crowns, and it is done carefully the flowering will not be much affected. If the beds are allowed to remain undisturbed for many years together the quality of the flowers is inferior, and few flower-spikes are produced. The soil for the reception of the plants should be well prepared by double digging and have a good dressing of manure. The old beds should be dug over with a fork, and the crowns graded into three sizes, selecting the finest either for planting by themselves or for forcing purposes. Those of smaller size should be planted in quarters having different aspects, as this will enable a succession of flowers to be had. When the crowns are planted they should be covered with about 2 inches of rich soil.

Bulbs.—Recently-planted beds should be examined to ascertain whether mice or rats have destroyed any of the bulbs, and any that are missing should be made good. All spring-flowering bulbs should, if not already planted, be inserted in the ground as soon as possible. The May-flowering Tulips are very useful for furnishing flowers for cutting, and if no other place can be found for them a batch should be planted in the reserve garden to supply cut flowers. The grand *Borlasi's* Tulips, with their long stems and beautiful colouring, are also useful for furnishing cut blooms; if these are planted sufficiently deep they can be allowed to remain in the same spot for several years.

Wallflowers are very valuable for planting stone vases, but they need to be kept well supplied with water at all times. We have just finished planting about 30,000 of these plants, and, provided the snails and slugs are prevented from injuring them, we shall undoubtedly have a good show of their pleasing and fragrant flowers early in spring.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants or flowers, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only of the paper, and as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contribution or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive original or selected photographs or drawings, suitable for reproduction, of plants, or of remarkable plants, flowers, trees, &c., but cannot be responsible for losses incurred.

Local News.—Correspondents will greatly oblige by sending to the Editor only intelligence of local events likely to be of interest to our readers, or of any matter which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

MONDAY, DECEMBER 14—

United Ben. and Prov. Soc. Com. meet.

THURSDAY, DECEMBER 17—Linnean Soc. meet.

SATURDAY, DECEMBER 19—German Gard. Soc. meet.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years, at Greenwich—40° F.

ACTUAL TEMPERATURES—

LONDON—Wednesday, December 9 (6 P.M.): Max. 48°;

Min. 40°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden London—Thursday, December 10 (10 A.M.): Bar. 29.0; Temp. 44°; 11 o'clock—

Nothing.

PROVINCES—Wednesday, December 9 (6 P.M.): Max. 48°

Cornwall; Min. 3° Hull.

SALES FOR THE ENSUING WEEK.

MONDAY—

Dutch Bulbs, Herbaceous Plants, &c., at 11, 1,000 Roses at 1.30, at 67 & 68, Cheap-side, E.C., by Protheroe & Morris.

WEDNESDAY—

Bulbs and Herbaceous Plants at 11; miscellaneous Plants and Bulbs at 11.30; 2,426 cases Japanese Lilioms at 1; 4,500 Roses, also Fruit trees at 1.30; Azaleas, Palms, Plants, &c., at 5, at 67 & 68, Cheap-side, E.C., by Protheroe & Morris.

FRIDAY—

Dutch Bulbs, Herbaceous Plants, &c., at 11.30; 1,000 Roses at 1.30, at 67 & 68, Cheap-side, by Protheroe & Morris.

The new edition of one of the classic "Floras" will be welcomed not only in America but by all who are interested in the systematic study of the distribution of plants. Asa Gray's *Manual* was a model of concise and critical treatment of the plants that occur in the area under consideration, and the authors of the present edition have done well in bringing the book into line with modern views on classification and nomenclature. It is no depreciation of the value of one of the greatest classics of systematic botany—Bentham and Hooker's *Genera Plantarum*, which represents the elaboration of the French system promulgated by the Jussieus and developed by de Candolle—to say that the development of Eichler's system, which is coming into general use in Europe and America, is more nearly in accord with present-day ideas of the relationships of the Orders and Families of plants. It is this system which, with a few deviations of minor importance, has been followed by Professors Robinson and Fernald.

The book opens with the Ferns, which are followed by the Gymnosperms with two families, the Taxaceae, represented by one species

only, Taxus canadensis, and the Pinaceae. The Monocotyledons precede the Dicotyledons, and in the latter class the families characterised by flowers with no perianth, or with a simple perianth, or free petals—the Archichlamydeae, precede those characterised by united petals the Gamopetalae or Metachlamydeae. In conformity with the recommendation of the International Botanical Congress at Vienna (1905) the term "order" is no longer used as synonymous with "family," but as denoting those groups of superior rank which are sometimes known as cohorts. As regards nomenclature generally, the authors have scrupulously followed the Vienna code "in order that American botanical nomenclature may be freed as speedily as possible from peculiarity or provincialism and assume the form which has received international sanction." As a result, we have an American flora which is in substantial agreement, as regards the names adopted for the plants, with recently-published European lists and floras, a fact which should add much to its value from the point of view of the working botanist.

In addition to changes in arrangement and nomenclature, some alterations have been made in the geographical scope of the book. In order to obtain a more natural botanical area, some British territory has been included, namely, Nova Scotia, Prince Edward Island, New Brunswick, and the greater part of the provinces of Quebec and Ontario. On the other hand, the western region between the 60th and 100th meridians has been excluded, as it contains a considerable percentage of plants characteristic of the Great Plains and not found in the rest of the area.

With regard to the vexed question of aliens, the authors have taken a wise course in omitting waifs, ballast-words and plants persisting locally after cultivation, and including only those which have given evidence of self-dissemination and shown some tendency to become permanent members of the flora. A further difficulty has presented itself in recording the results of what is described as "an unprecedented activity in the characterization of new species and varieties within our range." This difficulty is becoming a pressing one also in dealing with old-world botany, and the study of an increasing number of genera is being made impossible, except for the extreme specialist, by the fine discrimination of species and varieties which is adopted in some monographs. In not a few cases these are the work of young botanists with little experience, and, while anxious not to discourage a praiseworthy zeal, one cannot but regret the publication of work which a riper experience will not uphold. In the present case the editors have given recognition in all cases where the merit of the forms considered appeared to be demonstrated.

A useful innovation, and one which adds to the attractiveness of the book, consists in the insertion of small inset figures in the text. In such a difficult genus as *Carex*, where, with 185 species, there are no fewer than 220 figures, these form an invaluable addition. The Grasses, which have been elaborated by Professor A. S. Hitchcock, are also well illustrated; and numerous small but helpful figures of the flowers are given in the Orchidaceae, which family has been revised by Mr. Oakes Ames.

The number of species included in the Flora is 4,079, of which 666 are regarded as introduced; these represent 1,001 genera contained in 157 families.

A judicious selection of type renders the text generally clear, though somewhat closely printed; but the keys accompanying each genus are rather trying from the smallness of the type. We are glad to note that the authors have appreciated the advantage of having only one index in which both Latin and common names are included.

OUR SUPPLEMENTARY ILLUSTRATION.—

Hillebrandia sandwicensis, which forms the subject of our Supplementary Illustration, is the only known species of this genus of Begoniaceae. In many respects it resembles, in general habit, a rather coarse Begonia, but differs from that genus in the character of the ovary, which is only partly inferior in our plant, instead of entirely so as in a Begonia. The plant is of considerable interest from a systematic point of view, inasmuch as it serves to indicate possible lines of affinity between the Begoniaceae and some other Orders, such as Datisacaceae, Cucurbitaceae, and possibly also Saxifragaceae. The flowers, which are unisexual, are borne in the axils of white bracts and are grouped in cymose inflorescences. The youngest flowers are usually staminate, but often the arrangement is somewhat irregular. The sepals, usually five in number, are white or pale rose colour, and alternating with them are the very small petals. In the male flowers some of the latter may be replaced by stamens, whilst in other flowers some of the stamens are more or less barren, and tend to assume a petaloid character. The petals in the female flower may also be represented in part by structures which strongly suggest barren stamens. The carpels in the female flowers not infrequently exhibit irregularities in their number. Although typically five, as shown in the figure (B), on the left-hand side, they may be reduced to three, and the stigmas are also extremely variable, both in size and number. As a teratological feature, it is worthy of note that one or more of the styles may be transformed into white petal-like structures, and one instance was seen in which the stigma was replaced by a malformed anther-lobe which contained pollen. The plant is scarcely known in cultivation, and several botanic gardens owe their specimens, directly or indirectly, to Mr. FRANCIS FOX, of Wimbledon, who kindly presented to the Chelsea Physic Garden the example from which our illustration was drawn.

BRITISH GARDENERS' ASSOCIATION.—

The annual general meeting of the Richmond (Surrey) branch will be held at Pitt's Restaurant, Kew Green, on Tuesday, December 15, at 8 p.m. All professional gardeners are invited to attend.

LINNEAN SOCIETY.—

A meeting will be held on Thursday, December 17, at 8 p.m., when the following papers will be read.—1, Mr. W. RIDDELL, "The Anomura of the Sudanese Red Sea"; 2, Mr. R. P. GREGORY, "Formis of Flowers in Valeriana dioca"; 3, Prof. A. GRUVEL, "Études sur les *Carrubières* du Musée de Cambridge"; 4, Mr. W. L. DEXTER, "Rhynchota from the 'Sealark' Expedition." Exhibitions: 1, Mr. RUPERT VALLENTIN, F.L.S., "Lepidofasciatis and Dendrophylia conigera, from Cornwall"; 2, Mr. W. C. WORSDELL, F.L.S., "Selaginella with Rhizophores (changed into Leafy Shoots)"; 3, Mr. G. MASSEE, "The Fungus Causing Black-scab in Potatoes"; 4, Messrs. H. and G. GROVES, "British Specimens of *Luzula pallens*."

* Gray's *New Manual of Botany*, 7th edition. A hand-book of the flowering plants and ferns of the Central and North-Eastern United States and adjacent Canada. Re-arranged and extensively revised by Benjamin Lincoln Robinson and Fernald. London and Freetown, Soc., pp. 925, with 1,036 (63) figures. (American Book Co.) Price \$2.50.

PLANTS IN FLOWER OUT-OF-DOORS AT MOUNT EDGEcombe ON DECEMBER 1.—I send a list of 82 varieties of shrubs and other plants in bloom out-of-doors in these gardens. Looking at the Roses, one would think it was the month of June instead of December 1.—*Abelia rupestris*, *Acacia affinis*, *decurrens*, and *grandiflora*, *Arbutus Andrachne* and *A. Uvedo*, *Araña Sieboldii*, *Abutilon*, *Berberis*, *Brachyglottis Drummondii*, *Chrys. ternata*, *Calceolaria Burbridgei*, *C. Parsonii*, and *C. amplicaulis*; *Cortea cardinalis*, *C. bicolor*, *C. alba*, *Cornilla glauca*, *Cistus*, *Cassia corymbosa*, *Citrus medica*, *Cytisus racemosus*, *Cestrum Newellii*, *Convolvulus Cneorum*, *Diosma*, *Datura sanguinea*, *Ecremocarpus*, *Erica*, *Eupatorium Morrisoni*, *Fuchsia*, *Grevillea alpina*, *G. rosmarinifolia*, and *G. sulphurea*, *Hydrangea hortensis*, *Helianthemum*, *Jasminum*, *Lappacea alba* and *rosea*, *Lavatera assurgentiflora*, *Lasiandra elegans*, *Lavender*, *Olearia stellulata*, *Pyrus japonica*, *Pittosporum Tobira*, *Polygala myrtilloha*, *Pernettya*, *Rhododendrons*, *Raphiolepis ovata*, *Rosemary*, *Roses*, *Solanum jasminoides*, *Skimmia Portunei*, *Spiraea Thunbergii* and *Van Houttei*, *Veronica* (six sorts), *Viburnum Tinus*, *Anthericum*, *Agatha Arctost. aspera*, *Agrostium*, *Antirrhinum*, *Anemone*, *Chrysanthemum*, *Daisy*, *Diplacis*, *Canna*, *Christiana*, *Pelargonium*, *Gazania*, *Heliotropes*, *Hypericum*, *Lobelia*, *Lithospermum*, *Leptosyne gigantea*, *Margarites*, *Mesembryanthemum*, *Mignone*, *Narcissus*, *Nasturtium*, *Pentstemon*, *Pinks*, *Primroses*, *Phlox*, *Schizostylis*, *Stocks*, *Salvias*, *Sweet Williams*, *Tritoma*, *Tradescantia virginica*, *Viola*, *Viola*, *Verbenas*, and *Valerian*. *S. J. Richards*, *Mount Edgecombe Gardens, Plymouth.*

FORCING SHRUBS BY MEANS OF HOT WATER (see p. 395).—I have used this method for some little time, and happen to have a small Lilac (variety Charles X.) at the present moment which has only partly been immersed. It bears out the truth of your statement remarkably well, that the part which has had the hot bath will start growing while the rest remains dormant. I am sending it to you, as it might interest some of our readers. *C. Engelmann*, *Honeybrook Nursery, Saffron Walden*. [The specimen is a branched shoot; one branch is in bloom, and the other has not expanded the winter buds.—ED.]

STOKING OF GARDEN FURNACES.—The writer on p. 379, when he stated that "it is wrong, when supplying fresh fuel, to spread it over the entire surface of the fire," had but one type of boiler in mind, and that the horizontally-disposed one. This fact is more clearly indicated a few lines lower down, where it is recommended that the fresh fuel be "spread over the glowing embers or partly-consumed fuel in such a manner as to leave the hinder part free." But there are many boilers in existence to-day that are either of the upright or the conical pattern, and, being fed from the top, or in the case of certain types of upright independent boilers, from the front, above the fire, such a procedure as advised would be impossible. In some instances known to the writer these upright boilers have replaced others of the saddle and horizontal-tubular pattern, and have effected a considerable saving in fuel with more efficient heating. *E. H. Jenkins*.

BENTHAMIA FRAGIFERA FRUITING.—In reading the note on *S. Zeyheri* in the issue for November 14, p. 346, of *Benthamia fragifera* failing to produce fruit, I thought it would be of interest if I furnished a few details of a tree growing in these gardens, that are situated 16 miles from the south coast. The plant has fruited this year for the first time. It stands on a lawn, and is sheltered on the east by a belt of shrubs, and on the south and west by two fine cedars, but is exposed to the north winds; it is growing in a cold, clayey soil. Previous to last year the plant made indifferent growth, and had never shown signs of fruiting, but it has since developed into a fine specimen measuring 12 feet through and about the same in height. This year it developed a fine crop of fruits, and is also plentifully furnished with flower-buds that promise a fine crop next year. Seeing that nothing has been done to either root or branch to bring about this fruitfulness, the fruitation may depend upon the age of the tree rather than upon the soil in which it is growing. The

tree under notice was planted nine years ago, and, judging by the description given of its size when planted, I think its age would be about 18 years. *S. Hants*, must therefore exercise patience for a season or two, when he may have the pleasure of seeing his trees bearing fruit. I regret I cannot state whether it was raised from a seed or grafted on *Cornus sanguinea*, which is suggested by Loudon, as a possible means of rendering the tree hardier, whilst it might also make some difference as to its fruitfulness. I am forwarding a branch with fruit attached. *William Evans, Lyndhurst Gardens, Haysards Heath*. [The fruits resemble small, pale-coloured Strawberries; the stalk is about 3 inches long.—ED.]

HOME-BOTTLED FRUITS AT THE LATE R.H.S. SHOW.—With a view to the encouragement of home-bottled fruits, the R.H.S. has offered some substantial prizes during the last few years, and at the exhibition held on November 26 in connection with the Colonial-grown fruit and vegetables, there were several classes provided for home-bottled and preserved fruits and vegetables. On no previous occasion has there been so much competition, and probably these were never so finely shown. But in Classes 26 and 27, the first prizes were both withheld. In the latter class one, perhaps, can understand this being so; but in the case for 24 bottles it was most puzzling to the observer, as well as to experts, and especially as the exhibit placed second was generally considered to be far inferior to other exhibits in the same class, as well as containing 25 instead of 24 bottles as required. It would be interesting as well as educational, both to the exhibitors and the public generally, to know why the judge or judges withheld the prizes! *Enquirer*.

SOCIETIES.

ROYAL HORTICULTURAL

DECEMBER 8.—The fortnightly meeting, held on Tuesday last, was small, and the exhibits included some Carnations that remained over for the Carnation Show on the following day. There were, however, many fine exhibits of Orchids, including several novelties of merit. The following committees recommended one First-class Certificate and three Awards of Merit. Apart from an Award of Merit in favour of an incured Chrysanthemum by the FLORAL COMMITTEE, no other award was made at the meeting.

At the afternoon meeting of Fellows, Mr. D. B. Crane read a paper on "Chrysanthemum."

Floral Committee.

Present: W. Marshall, Esq. (chairman), and Messrs. Chas. T. Drury, Henry B. May, Jas. Walker, R. C. Notcutt, Jas. Douglas, T. W. Turner, W. Howe, C. R. Fielder, J. F. McLeod, G. Reuthe, J. Jennings, R. W. Wallace, Walter T. Ware, H. J. Jones, H. J. Dusbush, Chas. Dixon, Chas. E. Pearson, W. Cutts, Messrs. W. H. Thomson, E. A. Bowles, E. H. Jenkins, W. A. Bihley, Chas. E. Shea, Ed. Mawley, Geo. Paul, R. C. Reginald Nevill, James Hudson, and H. Hooper Pearson.

A beautiful display of Carnations of the winter-flowering type was made by LEOPOLD DE ROTHSCHILD, Esq., Leighton Buzzard (gr. Mr. J. Jennings). Such varieties as Beacon (scarlet), Lady Bountiful (white), Enchantress (blush), Jessica (white flaked with scarlet), Eclipse (salmon-pink), My Maryland (white), and Winsor (criste) were shown in the best condition. This exhibit gained the Veitch Memorial Medal and 45, which were offered for the best exhibit of Carnations on this date.

Messrs. HUGH LOW & CO., Bush Hill Park, Enfield, arranged an exhibit of Carnations that was quite different in its method of staging to that ordinarily adopted at these exhibitions. It consisted of a circular platform, on which was placed a bed of Ferns, Palms, and Grasses, and in these were arranged vases of Carnations. The centre supported a tall column crowned with Phoenix Robinsonii and decorated with Pink Carnations that showed well against the greenery of Fern fronds. Four baskets were suspended from iron arches, and these were

filled with white and pink Carnations respectively. There were also four pedestals rising from the main platform, and these were crowned with vases filled with Carnations. Messrs. Low also showed Cyclamen in variety on a table near by. (Silver-gilt Flora Medal.) Messrs. Wm. CUTBUSH & SONS, Highgate, London, N., filled a large table with a display of Carnations, effectively staged in tall vases, with shorter receptacles below and, at the back, a group of pot plants. The varieties represented all the best kinds in commerce. Messrs. CUTBUSH also showed ornamental-leaved plants of stove and greenhouse species similar to those they exhibited at the last meeting. (Silver Flora Medal.)

Many beautiful vases of Carnations were displayed by Mr. G. LANGE, nurseryman, Hampton (Silver Flora Medal), and opposite to this exhibit was another display of these flowers, made by Mr. A. F. DUTTON, Iver, Bucks.

Messrs. JOHN PEEB & SONS, West Norwood, London, S.E., exhibited Carnations in most of the best varieties, including the beautiful scarlet Britannia variety and the delicate-coloured variety named after Mrs. H. Burnett. (Silver Banksian Medal.)

Messrs. B. & S. SHELTON, Castle Nursery, Guernsey, also displayed vases of winter-blooming Carnations in variety, the blooms being exceptionally fine and with very intense colours. (Silver Flora Medal.)

Messrs. JAMES VEITCH & SONS, Chelsea, showed pot plants of Carnations, all well grown and freely flowered. Adjoining these were Begonias of the winter-blooming type, the varieties being all of the best. Messrs. Veitch's raising, Winter Cheer, Ensign, success, and Julius being displayed with large inflorescences in shades of rose and pink. Rhododendron hybrids, beautiful little specimens in small pots, and *Luculia gratissima* were also included in this exhibit. (Silver Flora Medal.)

Messrs. THOS. S. WARE, LTD., Feltham, Middlesex, showed a small group of Carnations, and adjoining these an exhibit of rock-garden plants suitably arranged in rockwork. (Silver Banksian Medal.)

Another exhibit of Carnations was displayed by Mr. H. BURNETT, Guernsey, who had exceptionally fine blooms of all the popular varieties, in addition to many novelties of his raising. (Silver-gilt Banksian Medal.)

Messrs. H. B. MAY & SONS, The Nurseries, Upper Edmonton, showed *Codiaeum* (*Crotons*) in variety, all well coloured, the plants being clothed with leaves to the pot level, also *Solanum* very finely in flower. Varieties of the Anderson section, *Euphorbia* (*Poinsettia*) pulcherrima, with very broad bracts, *Euphorbia Jacquiniadora*, *Statice profusa*, *Begonia* Mrs. Leopold de Rothschild, and many handsome Ferns as relief. (Silver Flora Medal.)

Messrs. H. CANNELL & SONS, Swanley, Kent, staged a brilliant group of Zonal *Pelargonium*, having many fine varieties of recent introduction, in addition to the best of the older kinds. (Silver-gilt Banksian Medal.)

Messrs. W. WATKINS & CO., Merstham, Surrey, showed a few Chrysanthemums, including the new R. E. Felton, a fine yellow decorative variety; Captain Julian, a small Japanese variety of sulphur-yellow colour; Merstham Jewel, Dorothy Portescue, a large white single Chrysanthemum with very loose flowers, and others.

Chrysanthemums were also shown by Messrs. J. and F. CLARKE, Southwick, Sussex. They were all medium-sized blooms of Japanese varieties of the type cultivated for market purposes. The blooms were remarkably fresh and bright in colour.

The Misses HOPKINS, Mere Gardens, Shepperton-on-Thames, staged a small rock-garden exhibit planted with Primroses, Cyclamen Coum, Daisies, &c.

Messrs. BARR & SONS, King Street, Covent Garden, displayed half-a-dozen plants of *Irises* *bi-tricolores* in flower.

AWARD OF MERIT.

Chrysanthemum Ball of Gold.—This is a new flower sport from the well-known market variety, Snowdrift, and has globular flowers with incured florets, similar to that variety. An Award of Merit was recommended for its adaptability for market culture. Shown by Messrs. R. H. BARR, LTD.

Orchid Committee.

Travels: J. Gurney Fowler, Esq. (in the chair), and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, W. B. Crawshaw, J. Wilson Pater, H. Little, Stuart Low, W. Boxall, J. Foster Alock, Chas. H. Curtis, R. G. Thwaites, F. M. Ogilvie, R. Brooman White, C. J. Lucas, A. A. McBean, W. Cobb, J. Charlesworth, J. Cypher, A. Dye, W. P. Bound, F. J. Thorne, W. H. White, H. A. Tracy, H. Ballantine, Gurney Wilson, and W. Bolton.

MESSRS. CHARLESWORTH & CO., Hayward Heath, staged a select group, for which a Silver Flora Medal was awarded. The central figure was the handsome *Brasso-Cattleya Cliftonii*, which secured a First-class Certificate (see Awards). Among the hybrid *Odontoglossums* was a fine form of *O. Lambeanum*, with a clear white ground colour spotted with claret; *O. Eleanor* and *O. crispum* *Haryanum*. Others noted were the claret red *Odontodia Bohnhoffiae*, the fine white *Laelia anceps Waddoniensis*, *L. Gouldiana*, the fragrant *Gomezia planifolia*, and *Trichopilia suavis*; *Cypripedium insigne citrinum*; *C. Lecanum magnificum*, and other *Cypripediums*, and *Laelio-Cattleya Lusitana*.

MESSRS. SANDER & SONS, St. Albans, were awarded a Silver Flora Medal for an excellent group, in which the best were *Cypripedium Troilus* variety *Lord Nelson* (see Awards), *C. Charlesworthi* Tenoreana, a very remarkable variety with large, broadly-ovate dorsal sepal, the upper part of which was elongated, and quite different in shape to the ordinary form; white, beautifully veined with lilac-rose; petals and lip greenish primrose-yellow with purple tinge and lines on the petals. Also *C. acteus nivalis*. Among the *Odontoglossums* were the richly coloured home-raised *O. crispum Bellerophon*, the reverse of the flowers being deep reddish-purple with a white margin, the surface white at the base, the greater part of each segment being covered with dark-reddish blotches, and the margins of the lip fringed and white. In the centre of the group were a batch of good *Oncidium varicosum*, and others remarked were an effectively coloured *Pleurothallis Scaphia*, *Hilbophyllum crassipes*, and a peculiar *Laelia*, probably a natural hybrid between *L. furfuracea* and *L. albidia*.

MR. COL. G. HOLFORD, C.I.E., C.V.O., Westnort (gr. Mr. H. G. Alexander), sent the massive *Cypripedium insigne*, Holford's variety, raised at Westnort between *C. insigne purpureum* and *C. insigne Harefield* IIal, but is of dwarfier habit, has rounder flowers of very firm substance, and a very peculiar broad and short lip. The dorsal sepal is white on the upper half and pale yellow below the white, bearing violet blotches, and the basal part probably the largest dark-reddish blotches of any variety of *C. insigne*. Also a new *Laelio-Cattleya* between *L.-C. Massangeana* and *C. Dowiana aurea*, with canary-yellow sepals and petals and dark rose lip veined with gold.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), sent *Cypripedium The Premier* (Mrs. de Curie × Mrs. Wm. Mostyn), a very fine hybrid formed somewhat like *C. Beckmannii*, but with the dark violet-purple blotching derived from Mrs. Wm. Mostyn well shown. The upper sepal is light emerald green, with a very faint bluish-darkest blotches of a very blackish-chocolate blotches, changing to violet-purple towards the white margin. The broad petals and lip are yellow, tinged and marked with purplish brown. Mr. WELLESLEY also showed *Cypripedium acteus* "Golden Gem" (insigne *Chantium Lindenii* × *Lecanum virgale*), a clear greenish-yellow flower, with the margin and upper part of the dorsal sepal pure white.

Mrs Grace the Duke of MARIBOROUGH, Blenheim Palace, Woodstock (gr. Mr. G. Hunter), sent a fine plant of *Vanda cœrulea* with four spikes, for which Mr. HUNTER was voted a Cultural Commendation. Also *Cattleya Fadia Blenheim* variety, a pretty, light form, and *C. Trianae blenheimensis*.

H. J. BROMLOW, Esq., Rann Lea, Rainhill, Lancashire (gr. Mr. W. J. Morgan), was awarded a Silver Flora Medal for a select group of finely-grown rare *Cypripediums*, among which were the original form of *Cypripedium Lord Ossulton*, *C. acteus Martine*, *C. Lecanum* (original), the superb *C. Thalia* Mrs. Francis Wellesley,

and *C. Thalia*, Rann Lea variety, a smaller but very pretty form; *C. Germane* Opoux var. *Queen Alexandra*, a very finely-formed hybrid; *C. Priam*, *C. Inshawense*, and *C. Ainos*, Young's variety.

MESSRS. JAS. CYRER & SONS, Cheltenham, were awarded a Silver Flora Medal for an effective group, the middle of which was composed of variously-tinted *Dendrobium Phalaenopsis*, good varieties of *Laelia anceps*, *Oncidium Papilio*, *Vanda cœrulea*, *Brasso-Cattleya Digbyano-Schroderae*, *B.-C. Pluto*, and *Cypripedium insigne Sanderae*. On each side were a fine set of varieties of *Cypripedium Lecanum*, *C. insigne*, and other *Cypripediums* and *Calanthes*.

MESSRS. J. & A. McBEAN, Cooksbridge, secured a Silver Flora Medal for a good selection of *Odontoglossums*, *Cypripediums*, &c., and which was the best-arranged group in the Hall. The *Odontoglossum crispum* was presented in Messrs. McBEAN's well-known good form. In the centre were a good number of the yellow *Cypripedium insigne Sanderae*, the finely-coloured *C. Thompsonii magnificum*, and *C. Parkinsianum*; *C. nitens magnificum*, Ball's variety, one of the best, and perhaps never seen so well flowered.

R. G. THWADES, Esq., Chessington, (Christchurch Road, Streatham (gr. Mr. J. M. Black), sent *Cattleya Magie Raphael* var. *Streatham* (*Trianae alba* × *Dowiana aurea*), a pretty, white flower with rose lip having gold veining.

BARON SIR H. SCHROEDER, The Dell, Egham (gr. Mr. M. H. Bland), sent the best *Cypripedium insigne andrianum* with 10 flowers, and for which a Cultural Commendation was given. Also two very fine spikes of the best form of *Cymbidium Tracynam*.

J. GERNEY FOWLER, Esq., Glebelands, South Woodford (gr. Mr. J. Davis), showed *Cypripedium acteus*, Fowler's variety, a good flower, with the greater part of the dorsal sepal white.

MESSRS. HUGH LOW & CO., Bush Hill Park, were awarded a Silver Banksian Medal for a group in which were fine examples of *Oncidium varicosum*, the Bush Hill Park variety having a chestnut-brown patch at the base of its bright yellow lip. Also noted were *Cypripedium Tracynam*, resembling a good dark *C. aureum*; the handsome *C. Thalia giganteum*, varieties of *C. Lecanum* and *C. insigne*, *Cycnoches maculatum*, and *C. chlorochilon*.

MESSRS. ARMSTRONG & BROWN, Tunbridge Wells, secured a Silver Flora Medal for an extensive group containing a large number of good varieties of *Cypripedium insigne*, including the handsome *C. insigne Monarch*, *C. Lecanum*, &c. In the middle of the group was a very remarkable *Cypripedium*, probably a natural hybrid, with a close affinity to *C. Spicerianum*, but on a larger scale. It was named *C. Armstrongii* (see Awards).

MESSRS. MOORE, LTD., Rawdon, Leeds, were awarded a Silver Banksian Medal for a group of good *Cypripediums*, including some rare hybrids. The middle was of showy hybrid *Odontoglossums*, including *O. Vuytstekei*, *O. Wilkeanum*, and *O. excellens*.

G. P. WALKER, Esq., Heatherwood, Putney Heath (gr. Mr. McGregor), showed *Odontoglossum laudatum Walkerianum* (Wilkeanum × *ardentissimum*), showy hybrid with whitish ground colour to the flowers, which are heavily blotched with bright chestnut-red over two-thirds of their surface.

JAMES H. HILL, Esq., Burgess Hill, Sussex, staged an effective group of *Odontoglossum crispum*, *O. Phœbe*, *Cypripediums*, and a fine white *Lycaste Skinneri*.

MESSRS. HEATH & SONS, Cheltenham, staged a group of *Cypripediums*, *Oncidium varicosum*, *Vanda cœrulea*, *Dendrobium Phalaenopsis*, &c.

AWARDS.

FIRST-CLASS CERTIFICATE.

Brasso-Cattleya Cliftonii (B.-C. *Digbyano-Mossia* × *C. Trianae Uplands variety*), from Messrs. CHARLESWORTH & CO., Hayward Heath. This hybrid has the beautiful shape of B.-C. *Digbyano-Mossia*, but is of very much larger proportions and more delicate colouring. It forms a most desirable novelty. The sepals and broad petals are silvery-white with a delicate lavender tint. The broad, circular, fringed lip white, with some purple markings from the base to the chrome yellow disc.

AWARD OF MERIT.

Cypripedium Troilus "Lord Nelson" (insigne *Harefield* IIal × *acteus*, *Sander's variety*), from Messrs. SANDER & SONS, St. Albans. A massive flower of fine proportions, well showing the influence of its parentage. The broad dorsal sepal is pale yellow with a slight green shade and veining, the upper part and margin being white. The lower half bears large purplish-brown blotches, and the petals and lip are yellow, tinged with purple-brown.

Cypripedium Armstrongii (natural hybrid), from Messrs. ARMSTRONG & BROWN, Tunbridge Wells. A very singular and pretty *Cypripedium*, said to have been imported with *C. Spicerianum*, and showing all the characteristics of that species, but developed in a remarkable degree. The large upper sepal is white, with a purple band up the middle, but has a small green base. Petals decurved, wavy on the upper margin and coloured yellow, with densely-arranged purple hairs and spotting. Lip yellowish, faced with reddish-brown.

Dendrobium Calogym striatum, from Mr. H. A. TRACY, Twickenham. A singular and finely-coloured form with yellow sepals and petals striped with chocolate-purple. Lip blackish-purple.

Fruit and Vegetable Committee.

President: G. Bunyard, Esq. (chairman), and Messrs. J. Cheal, W. Bates, E. Beckett, A. Dean, J. Davis, C. Foster, J. Jaques, G. Kelf, J. McIndoe, H. Parr, W. Pope, W. Poupard, G. Reynolds, O. Thomas, D. P. Tuckett, J. Vert, and G. Wythes.

A few Apples, including one from Hounslow that had been seen growing by two members of the Committee and one sent as new, which was really Golden Noble, were presented, but called for no further notice.

The chief interest attached to the consideration of the white Grape presented at the last meeting for identification by Mr. J. VERT, of Audley End Gardens, Saffron Walden, and which was then regarded as distinct from *Muscata* of Alexandria. On this occasion Mr. VERT presented a fresh bunch from the same variety, but the berries in this case were more oval, more yellow, and richer-flavoured. There were also presented bunches of the true *Muscata* of Alexandria from Mr. E. BECKETT, Aldenham House Gardens, and from Mr. J. BURY, Petersham Vineeries, Biffert, Surrey. After tasting berries from each bunch and comparing the foliage, the Committee agreed that Mr. VERT's Grape was the true *Muscata* of Alexandria. Mr. J. McINDOE referred to *Muscats* sent out as the Archerfield and Tynningham *Muscats* some years ago, but which experience has proved to be identical with the well-known variety. Mr. BUNYARD mentioned that some years since at Chiswick, in the late Mr. Barton's time, a severe test in growth and fruiting was applied to all those distinctly-named *Muscats*, and, with the exception of Canon Hall, were all found to be the same.

An exhibit of Onions was made by W. R. KING, Esq., The Braes, Berkhamstead (gr. Mr. Bedford). The produce consisted of good, solid bulbs of the varieties *Cocoa-nut*, *Excelsior*, A.L., and *Ailsa Craig* (Silver Banksian Medal).

Apple Star of Devon, which was granted an Award of Merit on November 21, 1905, was shown by the raiser, Mr. JOHN GARLAND, Broad-clyst, near Exeter. The variety has a sweet and agreeable flavour, and forms a good late dessert Apple. It was illustrated in our issue for June 9, 1906, fig. 146.

LEEDS PROFESSIONAL GARDENERS'.

DECEMBER 1.—The annual meeting of this society was held at the Green Dragon Hotel, Leeds, on this date. The officers for the coming year were elected as follows:—Chairman, Mr. H. Clapham; vice-chairman, Mr. T. Preece; treasurer, Mr. F. Franklin; secretary, Mr. George Carver, who was thanked for his past services to the society.

The annual dinner will take place early in the new year. Persons desirous of joining the society can obtain full particulars from Mr. G. Carver, Secretary, Chapelallerton, Leeds. J. D.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

NOVEMBER 19.—There was a capital display of plants at the meeting held on this date.

S. GRAYBE, Esq., Whalley Range (gr. Mr. Shill), exhibited a collection of *Cypripediums* of choice varieties. *Cypripedium* × *Queen Alexandra* (the parentage of which was not recorded) received a First-class Certificate. C. × *Beryl*, West Point var., received a similar award; while an Award of Merit was voted to *Cypripedium* insigne var. F. W. Ashton. Most of the other plants in the group had previously received awards from the society, and the display was one of the best the society has had before it. (Silver-gilt Medal.)

Z. A. WARR, Esq., Northenden (gr. Mr. Weatherby), was awarded a Silver-gilt Medal for a collection consisting principally of *Cypripediums*. There were several fine plants of *Cypripedium* insigne var. *Sanderæ*, each having from six to eight flowers.

A. WARBURTON, Esq., Haslingden (gr. Mr. Dalgleish), was awarded a Silver-gilt Medal for a group of plants which included many well-known varieties and hybrids. Awards of Merit were voted to *Cypripedium* × *Rosetta* Warburton's variety, C. × *Faryades* var. *Ruby*, C. insigne var. *Robert Scott*, C. × *Bianca*, and C. × *Sunset*.

J. H. CRAVEN, Esq., Keighley, was awarded a First-class Certificate for *Cypripedium* × *Coryneum*.

Messrs. KEELING & SONS, Westgate Hill, Bradford, exhibited a small group in which was noticed *Cirrhopetalum* *Medusæ* and *Calanthe* *Muscaea*.

G. H. PEACE, Esq., Monton, exhibited a pretty variety of *Oncidium* orantheryachium labelled *Monton Grange* var. The plant was awarded a Botanical Certificate.

E. ASHWORTH, Esq., Wilmsof (gr. Mr. Holbrook), exhibited *Zygopetalum* *Balhi*, which has previously been certificated.

Messrs. SANDER & SONS, St. Albans, obtained an Award of Merit for *Cypripedium* × *Little Gem* var. *pulcherrimum*.

H. J. BROTHLOW, Esq., Rainhill (gr. Mr. Morgan), was awarded a Silver Medal for an interesting display of *Cypripediums*. *Cypripedium* × *Elmireum* var. *splendens* was voted an Award of Merit.

Messrs. HIGH LOW & Co., Enfield, exhibited *Cypripedium* × *Mime*. *Jules Hye*, and *Cattleya* *labiata* var. *Schofieldiana*.

Mr. W. BROTHERTON, Warrington, staged some interesting plants, among which was noted *Cypripedium* *Ville de Paris*.

Messrs. JAS. CYPHER & SONS, Cheltenham, were awarded a Silver Medal for a display of well-grown Orchids, principally varieties of *Cypripediums*.

R. ASHWORTH, Esq., Newchurch (gr. Mr. Fletcher), was awarded a Silver Medal for a group of well-grown plants, amongst which were some good *Odontoglossums*. *Cypripedium* *Arthurianum* var. *pulchellum* × C. insigne var. *Sanderæ* was voted an Award of Merit.

E. ROGERSON, Esq., Didsbury (gr. Mr. Price) staged several good Orchids. *Cypripedium* × *St. Alban* received an Award of Merit, and a similar Award was given to *Cypripedium* × *Thalia* *Oakdene* var. *P. II*.

SCOTTISH HORTICULTURAL.

DECEMBER 1.—The monthly meeting of this association was held at 3, St. Andrew Square, Edinburgh, on this date, when Mr. Whytock, the president, presided over a very large attendance of the members. A paper entitled "To Prune, or Not to Prune?" by Mr. R. P. Brotherton, Tynninghame, was read by the secretary. Mr. Brotherton said that pruning was sometimes carried out with but little intelligence, but that in no way lessens the reasonableness or in any way depreciates the value of pruning. A Grape vine left alone in ainery would very soon cover every part of the house with shoots and leaves, but to obtain Grapes this growth must be restricted. In open-air fruit culture it was the same, and in this the gardener more easily adapts his pruning to that which experience had demonstrated to best meet his ends under glass. Mr. Brotherton also dealt with root pruning and with many practical details connected with pruning in general, and

the subject of the paper gave rise to a spirited discussion.

Amongst the exhibits before the meeting were plants of *Lilium Harrisii*, which had been grown under the influence of electric light at night to show how it stimulates the opening of the flowers. In the 21 days to which the plants were so exposed to the light, there was a distinct gain of seven days over those grown under ordinary conditions.

It was intimated that the Association's next *Chrysanthemum* exhibition would be held in the Waverley Market, Edinburgh, on November 18, 19, and 20, 1909.

EDINBURGH SEED TRADE.

DECEMBER 5.—The fourteenth annual dinner of the Edinburgh seed trade assistants was held on the above date in Messrs. Ferguson & Forrester's Restaurant, Princes Street, when Mr. D. S. Webster presided over a large company. Mr. J. Laird, in proposing the toast of "The Seed Trade Assistants," said very much of the success of businesses lay in the hands of the assistants. A great point in the seed trade was to have reliable men, men who had brains and who could think, for he knew of no trade that required more intelligence.

Mr. William Newton, in proposing "The Nursery and Seed Trade," said that Edinburgh was famed for sending out good seeds and nursery plants all over the country, and the young men who received their training in the city had an excellent chance of obtaining first-class situations in England and Ireland.

BRITISH GARDENERS' ASSOCIATION. LEEDS BRANCH.

DECEMBER 5.—A well-attended meeting of members of the above association was held at the Grand Central Hotel on the above date. Mr. Campbell presided. Mr. W. Hague, of Meadow Towers, gave a lecture on the cultivation of the Celery fly. Mr. Hague recommended regular sprinklings or dewings with the syringe, and afterwards dusting the plants with soot. J. D.

COMMONS AND FOOTPATHS PRESERVATION SOCIETY.

LORD EVERSHY presided over the monthly meeting of this society held recently at 25, Victoria Street, Westminster. It was stated by Sir Robert Hunter that the scheme for the acquisition of Ludshott Common had now been completed, the sum raised by the society and the local Acquisition Committee amounting to £1,810. The common, which was situated in the Highhead district, had been vested in the National Trust, and was 350 acres in extent; the purchase also included a strip of woodland lying between the common and Waggoners Wells. It was reported that Mr. John Burns, in consequence of the opposition of the Open Space Societies, had deleted the clauses from the Housing, Town Planning, etc., Bill, which would have enabled local authorities to build upon common land and other open spaces, and that amendments to the Port of London and Housing of the Working Classes (Ireland) Bill supported by the society had been accepted by the Government.

The secretary presented a preliminary report upon the private Bills to be introduced into Parliament in 1909, from which it appeared that 20 Bills would interfere with common lands and 13 would lead to the closing of numerous footpaths. Amongst the schemes are the Great Western Railway Bill, under which 92 acres of open space would be taken at Hammersmith and Acton; the North-Eastern Railway Bill, which would absorb 177 acres of common land at Preston, Yorks.; the Exmouth Water Bill, which affected 22 acres of common land at East Budleigh; and the Pontypool Gas and Water Bill, which deals with 80 acres of common land in Monmouthshire.

It was reported that the Rochford Rural District Council, the Hadleigh Parish Council, and the Salvation Army had now agreed to the society's suggestion that the dispute with regard to three alleged public footpaths crossing the Farm Colony of the Salvation Army should be referred to arbitration.

SMITHFIELD CLUB.

DECEMBER 7.—For more than one hundred years the Cattle Show of this Society has been a forcible reminder of the approach of Christmas, and, following the usual course of events, the exhibition was opened on the 7th inst. This year the absence of his Majesty the King on the opening day, owing to indisposition, was regretted, and it was the opinion of many habitual visitors to the show that the attendance suffered accordingly. There was much of interest at the exhibition, for not only is it a show of fat stock, but also of the thousand-and-one things that are required by the stock-breeder and farmer. The rows of cattle were of interesting as ever, and whenever they stood erect so that their good and bad points could be discussed they were the objects of admiring critics. The fat beast, however, is naturally tired—we had almost said lazy—but some excuse must be permitted, owing to the unusual weight the four legs have to support. The champion beast was a perfect specimen of the Aberdeen Angus breed, a hornless type of cattle with a silky black coat, and was bred by the Dowager Countess of Seaford. So many awards and decorations hung over the pen of the animal that it seemed as though there were few left for any other beast in the show. The official record of weight was 14 cwt. 2 qrs. 1 lb., but its neighbour of the same breed scaled nearly 2 cwt. heavier. Thus, size in cattle, as in most other things, is not everything. Thus, although some of the huge Mangels shown by prominent seedsmen weighed 5½ lbs. each, they perhaps did not contain so large a proportion of food to their bulk as some of the less huge but more servicable roots.

Many of the important seedsmen showed what fine roots could be produced from their seeds, and one of the largest exhibitors was the well-known Reading firm of Messrs. SUTTON & SONS. They made a kind of rock-garden with Mangels, Swedes, and other Turnips, arranging the bays and shelving with examples of *Cart*, *Carrots*, *Farnspins*, *Onions*, *Potatoes*, all of gargantuan dimensions; some of the roots of *Matchless White Carrots* weighed as much as 6 lbs. or 7 lbs. each. *Magnum Bonum Swede* is a desirable type, and roots weighing as much as 20½ lbs. were exhibited. *Of Potatoes* they showed their new *White City* variety that promises to supplant the *Up-to-Date* variety, which it somewhat resembles. It was raised from *Abundance* × *Langworthy*.

Another similar exhibit of roots and gowns was made by Messrs. JOHN KING & SONS, Coggeshall, Essex, and their huge roots built up in wall fashion looked dangerous should they fall, for they were of huge proportions. *Parsnips*, *Marrow*, *Potatoes*, *Beet* and other vegetables were displayed on the front of the stand.

Messrs. J. CARTER & Co., High Holborn, London, showed what fine produce had been obtained from their seeds, building a similar wall-like exhibit of roots, with pedigree Corn; also vegetables of all kinds, and farm Grasses interspersed at the base of the stand.

Messrs. GARTON, LTD., Warrington, showed their *Globe Mangels*, Swedes, including the useful *Keppel* variety, purple-top *Scott's Turnips*, *Oats*—their new "The Yelder" *Oat* is said to furnish 100 bushels of grain per acre—and other kinds of root.

Messrs. WEBB & Sons, Worsley, Staffordshire, had some roots weighing as much as 50 lbs. each. They were built up in the orthodox castellated wall form, and at the base of the wall were samples of large, solid grain, with *Keith's Ruby*, *Potatoes*, *Onions*, *Carrots*, &c. at the foot. The samples of Swedes, Mangels, and Turnips were exceptionally fine.

Messrs. E. W. KING & Co., Coggeshall, Essex, showed Mangels, Swedes, Beans, Peas, Corn, also Brussels Sprouts and other vegetables. Some of their *Anglian Mangels* were of very large size, and they informed us 50 to 60 tons per acre is produced on their Essex land.

Messrs. DICKSON'S, Chester, showed Apples; also Potatoes, Grass seeds, Corn, and other agricultural seeds.

A similar exhibit was made by Messrs. TOOGOOD & SONS, Southampton, who had a very pleasing exhibit; the front was arranged with Tomatoes, Potatoes, Onions, Carrots, and other vegetables.

No farm can be considered complete without

its complement of fruit trees, thus Messrs. HUGH LOW & Co. showed trained fruit trees, and as a guide in the selection of varieties showed about 50 kinds of Apples. A very similar display was made by Messrs. W. & J. BROWN, Peterborough, and another by Mr. W. HORNE, Rochester, Kent.

The KING'S CARE NURSERY Co., Hereford, showed 45 varieties of Apples, and some trained fruit trees, the display being brightened by plants of *Cupressus macrocarpa lutea*.

Messrs. HARRISON & SONS, Leicester, showed roots and Corn, and another exhibit of a similar character was made by Messrs. CANNELL & SONS, Loddon.

There were many stands of Potatoes, including exhibits from Mr. ARTHUR J. SOLS, Lincoln, A. FINDLAY, Markinch, W. DENNIS, Kilton, Messis; ISAAC POAD & SONS, York, the DALMELY HOME FARM, Messrs. FIDLER & SONS, Reading, Mr. GREEN, Wisbech, Mr. JAS. GARDNER, Perth, and Mr. JOSEPH BETTINGSON, Outwell.

Amongst the general exhibits was an interesting one from Irish contributors, one of the most important being a stand of Irish-grown Tobacco in the manufactured state. Amongst many other objects of interest to gardeners was one of unclimbable fencing, exhibited by the FERRIS FENCING COMPANY. The palings are of split Chestnut, and they are linked together by twisted strands of wire. The price—2s. per yard—appeared to us as very cheap for so serviceable a material.

PERPETUAL FLOWERING CARNATION

DECEMBER 9.—The fifth exhibition of this society was held on the foregoing date in the Royal Horticultural Hall, Westminster. The building was gay with bright displays of Carnations, nearly all of the large exhibits of this flower staged at the previous day's exhibition (see p. 417) remaining, also several of the other large groups of plants and flowers. There were several new varieties brought to the notice of the committee, but only one received the society's First-class Certificate. This was an exceptional merit, and secured no fewer than 97 points out of a possible 100.

The best collection of cut blooms of Carnations occupying an area of 10 feet by 3 feet was shown by Mr. W. E. WALLACE, Eaton Bray, Bedfordshire. The group was awarded a Gold Medal. Mr. C. F. WATERS, Balcombe, Sussex, won the 2nd prize, which included a Silver Medal.

Many of the classes were for varieties of special colours, and in the section for 26 blooms the following were the premier prize winners:—*White*: White Perfection, shown by Mr. W. E. WALLACE. *Blush*: Enchantment, shown by the NEWPORT CARNATION NURSERIES, Essex. *Light pink or salmon*: Mrs. H. BURNETT. *Deep pink or rose*: Mrs. LAWSON. *Crimson*: President. *Scarlet*: Robert Craig. The 1st-prize winner in these last four classes was Mr. W. H. LANCASHIRE, Guernsey.

The best new Carnation not in commerce was adjudged to be the variety *Carola*, of crimson colour. The exhibitor was Mr. C. ENGLEMAN, Nurseryman, Saffron Walden.

In the colour classes, from which growers in the Channel Islands were excluded, the principal prize-winners were Mr. W. H. PAGE, Hampton, Middlesex; Mr. A. F. DUTTON, Iver, Bucks; and the NEWPORT CARNATION NURSERIES, Essex.

Messrs. BELL & SHELDON, Castel Nursery, Guernsey, showed the best vase of 18 blooms of the variety *Afterglow*, the best vase of *Winona*, and also of *Winstar*.

In the amateurs' section the 1st prize for a group of Carnations occupying 20 square feet was awarded to C. F. RAPHAEL, Esq., Shenley (gr. Mr. H. Grubb); 2nd, Lord HOWARD DE WALDEY, Saffron Walden (gr. Mr. J. Vert); Mr. RAPHAEL and Sir RANDOLPH BAKER, Blandford (gr. Mr. A. Usher), between them won all the other 1st prizes in this section for pot plants of Carnations. There were several classes open to amateurs for varieties of special colours, and a special prize was offered for the best vase in these classes. This was won by H. J. KING, Esq., Eastwell, Kent (gr. Mr. J. G. Weston).

The following awards were made for honorary exhibits:—

Gold Medals.—LEOPOLD DE ROTHSCHILD, Esq. (gr. Mr. J. Jennings); Messrs. HUGH LOW & Co., Enfield; and Messrs. BELL & SHELDON, Guernsey.

Large Silver Medals.—Mr. H. BURNETT, Guernsey; Messrs. CUDDESH & SON, Highgate; Mr. C. ENGLEMAN, Saffron Walden; and Mr. G. LANGE, Hampton.

Silver Medals.—Messrs. HORRIES, LTD., Dereham; Messrs. JOHN PEED & SONS, West Norwiche; and the AMERICAN CARNATION Co., Sawbridgeworth.

FIRST-CLASS CERTIFICATE.

Carnation Rose Doré.—A variety of the same shade of colouring as the well-known border Carnation *Sappho*, and best described as rose-salmon. The blooms are large, very full in petals, and developed on stout, tall stalks. The strong foliage indicates a variety of robust habit. The calyxes possess the desirable quality of not splitting, and it does not appear to be necessary to enclose them with the usual rubber band. Shown by Mr. W. H. LANCASHIRE, Guernsey.

Obituary.

WILLIAM WHALLEY.—We regret to record the death, on November 27, of this gardener, for many years steward at Addington Palace in the services of Archbishops Tait, Benson, and Temple. He was born at Foresters' Hall, Dumfriesshire,

THE LATE WILLIAM WHALLEY.

nearly 72 years ago, and at the age of 14 entered Dalswinton Gardens as an apprentice under Mr. McIntyre. After being four years in these gardens he served with the agent on the same estate for two years, gaining experience which in after life was useful in the management of land and stock. He left Dalswinton and engaged as journeyman in Treggles Gardens under Mr. Johnstone. Treggles was at that time one of the smartest places in the south of Scotland. He remained at Treggles for three years, when he was engaged as plant foreman at Blytheswood. Two years later he left Blytheswood to take the position of foreman in Drumlanrig Gardens, Thornhill, under Mr. McIntosh, where he remained until appointed gardener and bailiff at Fulham Palace, the seat of the Bishop of London. When Bishop Tait was elevated to the Archbishopric of Canterbury two years later, Whalley went with him to take charge of the Addington estate, where he remained 38 years, and had the distinction of serving under three Archbishops. His many duties at Addington included that of guardian of the poor and overseer of the district. The deceased leaves two sons—one of whom is employed in the seed department of Messrs. James Veitch & Sons' nursery—and three daughters. The remains were laid to rest in Addington Churchyard on Thursday, December 3, in the presence of 800 mourners.

CHARLES BALTET.—Our readers at home and abroad will share with us the feelings of regret with which we record the death of this great French horticulturist. Full of years and full of honours, after a busy lifetime devoted to the highest branches of his craft, Charles Baltet has passed away. Born on January 14, 1820, he had long since passed the allotted span, but that was no reason for relaxation from work, and the grand old man of French horticulture was an ardent worker to the last. His numerous literary productions in the Press, pamphlets, and other works of horticulture would need a considerable amount of space even to enumerate them. One of the best known to English readers, *L'Art de Greffer*, ran into eight editions and was translated into English many years ago under the title of *The Art of Grafting and Budding. Culture Fruitiere Commerciale et Bourgeoise, L'Horticulture dans les cinq parties du Monde*, and many others dealing with fruit culture issued from the Press in rapid succession, and only recently Baltet wrote an historical and literary study entitled *Chrysanthème et Dahlia, leur culture en France, &c.*, showing how wide was the scope of his horticultural interest. Charles Baltet came from a family of gardeners, and his sympathies and active interest went out towards all the young men who followed the horticultural career. To him French horticulture owes much, for, if we are not mistaken, he was one of the founders of the Versailles School of Horticulture, an institution of the greatest possible value to young men who intend to adopt gardening as a profession, and of which, only during the past week, we have been asked for particulars by a young English gardener. For half a century Charles Baltet's genial features have been familiar at all the leading horticultural shows in Europe, either as exhibitor or judge, and his valuable services have often been retained as member of the committees at most of the great international gatherings. It is the writer's privilege to have known Charles Baltet for many years, and to have associated with him on the last occasion as a member of the jury at the International Horticultural Show in Paris in November three years ago. We know the high esteem in which he was held by his fellow-countrymen for his genial manner and extensive knowledge on horticultural matters. But this was not all; Charles Baltet was a good citizen and a generous worker in the interests of his fellow-townsmen at Troyes, his native place, where his nurseries were situated and where he passed the many years of his active life. Outside France there are few names more honoured than his, and for his services he had received numerous decorations from foreign Governments. He was a member of most of the leading horticultural societies on the Continent. He was also a corresponding member of the Royal Horticultural Society and of the Massachusetts Horticultural Society, and Officer of the Legion of Honour. The interment was largely attended by many old friends, and at the graveside funeral orations were pronounced by some of those who knew him best.

JOHN CARDER.—We regret to have to record the death of Mr. John Carder, which took place suddenly at his residence early on Monday, December 7. Mr. Carder was in the City among his friends on Friday, December 4, apparently in his usual health and good spirits; his death, therefore, came as a great surprise to his many Orchidist associates. Mr. Carder held a leading position for some years in the establishment of Mr. William Bull, at Chelsea, for whom he made several successful Orchid-collecting expeditions, and many rare *Massevaldian* and other Orchids were through him and his fellow-traveller, Shuttleworth, introduced to gardens. But his greatest success was with *Odontoglossum crispum*, and the fine type of this species that he collected became famous. On leaving Mr. Bull, Mr. Carder and Mr. Shuttleworth went into business as Orchid nurserymen, Mr. Carder continuing to collect Orchids. Later the business was abandoned, and Mr. Carder, on his own account, continued to import *Odontoglossum crispum*. Of uniformly kind disposition, John Carder was liked and respected by all who knew him, both at home and abroad.

MARKETS.

COVENT GARDEN, December 9.

(We cannot accept any responsibility for the subjoined reports. They are furnished to us as regularly every Wednesday, by the kindness of several of the principal salesmen, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week previous to the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the quantity ordered. We fluctuate, not only from day to day, but occasionally several times in one day.—Ed.)

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices. Columns include flower name, quantity, and price. Items include Acacia (Mimosas), Calla, Bouvardia, Camellias, Carnations, Cypripediums, Eucalyptus, Hyacinths, Lilacs, Lavender, Lilies, and Tulips.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and their prices. Columns include foliage name, quantity, and price. Items include Adiantum, Aspidistra, Begonias, Cacti, and Ferns.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various potted plants and their prices. Columns include plant name, quantity, and price. Items include Anemones, Begonias, Calceolarias, and various other flowering plants.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices. Columns include fruit name, quantity, and price. Items include Apples, Grapes, Pears, and various other fruits.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices. Columns include vegetable name, quantity, and price. Items include Artichokes, Asparagus, Beans, Cabbages, and various other vegetables.

REMARKS.—Apples are considerably dearer this week, and notwithstanding the large arrivals of colonial Apples, English Vegetables are selling freely, but are low in price. The arrivals of Pines have been comparatively small, and there is a good demand for them. E. H. R., Covent Garden, Wednesday, December 9, 1908.

Table listing various other items and their prices. Columns include item name, quantity, and price. Items include Kents, Lincolns, and various other goods.

Potatoes (Continued).

Table listing various potato varieties and their prices. Columns include variety name, quantity, and price. Items include Bedfordshire, Blacklands, and various other potato types.

COVENT GARDEN FLOWER MARKET.

That Christmas is close at hand is seen in the countenances of the florists. Holly, Christmas trees, and other evergreens, as well as the various crosses, Acacia, have become a feature during the last few years, and may be bought in the market at from 1s. to 21s. each. Some well-benched Holly is seen, but it will be scarce this season, and the dealers have more difficulty in obtaining evergreens generally than formerly.

POT PLANTS.

Dutch bulbs in flower are not yet of the best quality, yet Hyacinths will soon improve. Tulips, especially the red varieties, are useful, though small, as they provide bright colour. These are grown chiefly in small boxes. Roman Hyacinths in pots are very good; these also are grown in boxes. Of Lilliums in pots the supplies promise to be equal to demands for the Christmas trade. Plants of Spireas are well-flowered; white Marguerites are plentiful and good. Aricas are plentiful, and there will be a good supply of them in the Christmas trade. Chrysanthemums will hold out later than usual, and pot plants are of better quality than is usually seen in the season. There are some capital plants of the variety, Fraunfeld Pink is also very good; it is rather taller, but it makes a good market plant. W. H. Lincoln is a favourite amongst the late yellow varieties, Azalea indica in various colours is seen on several stands. Cyclamen are fairly good, but not so fine as they were a few years ago. Solanums from most growers are good, and are in flower. I discovered some good plants of the combed fruited Capsicum. Pointsettias have not been selling very readily. There are good supplies of all foliage plants.

CUT FLOWERS.

It is very difficult to estimate the value of any cut flower, or to suggest what the supplies may be for Christmas, but at several nurseries that I have recently visited Calceolarias have been very popular, and are likely to be plentiful, but their value is sure to advance a little, but it will be advisable to order in advance. Good Roses are plentiful, and there are many small blooms, but also large supplies from France. There are a few more valuable; Cattunias also have rather more demand, and their prices have an upward tendency. Chrysanthemums are over plentiful, and are not so well liked. I discovered an anxious to clear their houses for other plants and early crops of Tomatoes. A. H., Covent Garden, Wednesday, December 9, 1908.

DEBATING SOCIETIES.

BRISTOL AND DISTRICT GARDENERS.—At a meeting of this association, held on Wednesday, 26th, some Principal Subjects of the Hardy Fruit Garden" was the subject for the evening. Dr. Shaw presided over a good attendance of the members. The chairman, Mr. J. G. Gardner, the Marquis of Bute, Cardiff Castle, Mr. Farmer enumerated the respective merits of Pears, Plums, and Cherries, and gave a list of his own trees to cultivate stock, planting, and pruning for these fruit trees. Planting operations had best be carried out in October and November, but if it can be undertaken successfully so late as March. To illustrate the value, planting at the time of planting, the lecturer said he planted 280 fruit trees last March and pruned them the same day. The trees started well and made good growth. He has 18 trees left unpruned made very stunted growth. H. H. F.

REDHILL AND REIGATE GARDENERS.—The members of this association held their fortnightly meeting in the Fenby Hall on Wednesday 30, under the chairmanship of Mr. Round. About 40 members were present, and one new member was enrolled. Mr. W. Steman, The Gardens, Margery, Reigate, lectured on "Mushroom Culture." Mr. Steman stated that he was making some experiments with French and English spawn, and he hoped at some future date to inform the members of the result.

READING AND DISTRICT GARDENERS.—The fortnightly meeting of this association was held on Wednesday, 30th, was the largest of the present session. The subject of the evening was "Cyclamen," by Mr. Goadley, gardener of Northwick, Reading. The subject was of great interest, and District Gardeners' Association. The lecturer emphasized the necessity of frequently syringing the plants while they were in active growth, for this operation not only keeps them moist, but also keeps them free from pests, against such pests as thrip and green fly. It is not desirable to retain the plants longer than three years; indeed, the best results are obtained from growing them for one year, and introducing them to England from the island of Cyprus in 1731 and is a native of Persia. Two new members were elected.

DERBY GARDENERS.—A large and representative meeting of local gardeners, as well as amateur holders of Derby met on Friday, December 4, when it was unanimously resolved that an Association of Gardeners be established. Upwards of 100 persons have expressed a desire to be enrolled members. The meeting was presided over by the keenest interest was shown in the matter of electing the officers and members of the committee. The following individuals were elected: President, T. T. Goadley, M.R.S., Mr. A. R. Flint; vice-chairman, Mr. A. Shanderson, treasurer, Mr. F. Meakin; and secretary, Mr. W. Garton, Field House, Mickleover, F. M.

TRADE NOTICE.

MESSRS. ROBERTSON'S RUSH BULB FARM, LTD. This company has been formed with a capital of £200,000, in 100 shares, for the purpose of acquiring and growing of bulb growers carried on by Messrs. Hog & Roberts, Ltd., of Rush, Co. Dublin. Registered office, 12 Mary Street, Dublin.

THE WEATHER.

THE FOLLOWING SUMMARY RECORD OF THE weather throughout the British Islands, for the week ending December 5, is furnished from the Meteorological Office:—

GENERAL OBSERVATIONS.

The weather—over the greater part of the Kingdom the conditions were mostly dry, rain being slight and infrequent. Much fog and mist was, however, experienced over England, especially on the east coast and over the Midlands.

The temperature was above the average generally, the excess being greatest in the north and east of Scotland, the north of Ireland, and the south-west of England. In Scotland N. the departure from the normal was rather more than 6°. In England N.E. and N.W. the temperature was below the average. The highest of the maxima were recorded on variable dates, but mostly very early or late in the period. They ranged from 77° in England S.W. and Ireland S. to 53° in England N.W. and Scotland N. The maxima about the middle of the week were no higher than 49° in some parts of central and eastern England. The lowest of the minima, which also occurred on various dates, ranged from 22° in the Midland Counties (at Bawtry on November 30 and at Buxton on December 1) and 23° in England N.W. to 33° in England S.E. and to 40° in the English Channel. The lowest glass temperatures reported were 19° at Birmingham, Newton Regis, and 18° at Buxton, in England, Dublin, and Cockle Park (Morpeh), and 21° at Crathee and West Linton.

The mean temperature of the sea—On almost all parts of the coast the temperature of the water was higher than during the corresponding week of last year, the greatest difference being 4.2° at Kirkwall and 6° at Ballantrae. The mean heights for the week ranged from about 53° at Plymouth and Salebury, and 51.4° at Lamhais to 43° at Scarborough and Aberdeen.

The rainfall amounted to considerably less than the average in all districts; at Spurn Head, Bawtry, and Hastings the week was rainless.

The bright sunshine was very slight in many parts of England, and especially in the Greenock, Westmorland, and most of the stations in England E. as well as at some stations in other parts of England. In Scotland E. and England N.E. there was a slight excess, and in England N.W., Ireland N.W. and the English Channel a more decided excess. The percentage of the possible duration ranged from 39 in the English Channel and 26 in Ireland N. to 5 in the Midland Counties, 3 in Scotland N., and 0 in England E.

THE WEATHER IN WEST HERTS.

Week ending December 9.

Still another warm week.—Temperatures were rather variable, but on the whole this proved a warm week for the time of year. On the warmest day the temperature in the thermometer screen rose to 50°, and on the coldest night the exposed thermometer registered only 4° of frost. The ground is still unusually warm for December, the temperature both at 1 and 2 feet being 3° warmer than is reasonable. Pam fell on four days, but to the aggregate depth of only three-tenths of an inch. The ground, however, remains moist, so that there is each day some small percolation through both the soil layers. The sun shone on an average for 24 minutes a day, or very nearly an hour a day short of the maximum in this season. On the six days ending the 4th inst., no sunshine at all was recorded. Calms and light airs almost exclusively prevailed during the week. The mean amount of moisture in the air at 1 p.m. exceeded a seasonal quantity for that hour by as much as 9 per cent. E. M., *Berkshamsted*, December 9, 1908.

GARDENING APPOINTMENTS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for these announcements, but if a small contribution is sent, to be placed on our collecting box for the Gardeners' Orphan Fund, will be thankfully received, and an acknowledgment made in these columns.]

Mr. W. J. SIMS, late of Esher, Baginbun Gardens, as Gardener to H. G. FENWICK, Esq., Temple Dinsley, Hitchin, Herts.

Mr. J. T. MARKS, Assistant at the BOURNEVILLE VILLAGE TRUST, BOURNEVILLE, as Garden Superintendent under the HAMSTEAD GARDEN SECURAN TRUST, LTD.

Mr. J. C. BROTHERTON, for the last 6 years Gardener to Sir THOMAS WRIGHTSON, Bart., Neasham Hall, Dardington, as Gardener to Sir WYALDA EDEN, Bart., Widdowstone Hall, Ferry Hill, Dutham.

Mr. A. BARNFIELD, for nearly 8 years Gardener at Huslands Rosworth House, Rugby, as Gardener to Mrs. STUART-RICKMAN, Abberfeld Grange, Reading, Berks.

ENQUIRIES AND REPLIES.

BOOK OF CURIOUS PLANTS.—Does C. C., who has enquired for a book under the above name, mean Dr. M. C. Cooke's *Freaks and Marvels in Plant Life*, published by the Society for the Promotion of Christian Knowledge? It certainly deals largely and in a very interesting way with curiosities in plant structure and life. My copy, purchased at an old book-stall several years since, bears a gilt date of 1883, hence, unless other editions have been issued, the work is possibly out of print. A. D.

BOOKS: E. H. C. Hogg's *Fruit Manual* being out of print, the copies may become of greater value than their published price. You should ask a secondhand bookseller what he is prepared to offer you for a copy.

BORDEAUX MIXTURE: W. H. W. Put 25 gallons of water in a barrel or other wooden or earthenware vessel in which there is no metal, and wrap 84 lbs. of copper sulphate in coarse sacking, suspending this just below the surface of the water. In another vessel slake 4 lbs. of lime, bringing it into a smooth paste by adding only a little water from time to time during the crumbling of the lime. When the lime is properly slaked add sufficient water to bring the whole up to 25 gallons. When the copper sulphate is entirely dissolved and the lime is cool, pour the lime and milk and the copper sulphate solution slowly together into a barrel holding 50 gallons, stirring the whole together for a few minutes after mixing. Air-slaked lime should not be used in making this mixture, as its employment would result in causing injury to the foliage. The mixture described above can be diluted further according to the requirements of the case, and it is always better to use it rather under than over the strength that is safe.

CELERY: *Regular Reader*. The Celery may have decayed owing to water getting into the crown and to the leaves not having been properly tied before earthing-up was commenced, or it may be that the decay is due to the presence of some disease. We cannot give a definite opinion unless specimens are sent us for examination.

CYPRIPEDIUM: G. H. S. *Cypripedium* is certainly a true Orchid, and belongs to the Natural Order Orchidaceae. In *Cypripedium* the leaves are rolled (convolute), the sepals are valvate, i.e., do not overlap in the bud, and if you cut across the fruit or young seed vessels you will find there is but one cavity, and the ovules or young seeds are attached to the walls of the ovary. In *Papilionidium* the leaves are folded, not rolled, the sepals overlap in the bud, and the seed-vessels is mostly one-celled, or partially three-celled, owing to the infolding of the placentas bearing the ovules. *Selenipedium* is also maintained as a separate genus.

MANURING LAND: A. W. P. We do not advise you to spread the manure over the land and let it lie for a month before digging it in, this being a very extravagant method of applying farmyard manure. On the contrary, let it remain in a heap until you are ready to dig the ground, then spread it over the surface and dig it in at once. Under certain conditions, an-slaked lime is as useful as an application of manure, it being an agency by which plant food already in the soil is rendered available for the plants, but these conditions obtain only in gardens that have been somewhat liberally manured for a number of years, and you will know yourself whether the garden you refer to is one of this description.

MUSHROOM PEST: *Mushrooms*. The insects attacking the Mushrooms are two of the many species of *Peduridae* or "Spring Tails." Heavily spraying the beds with a solution of paraffin emulsion, so that the pests would be sure to be wetted, would no doubt kill them, but such a remedy might have an injurious effect on the Mushrooms. Spraying the beds with "Vaporite" or "Apterte" would probably be efficacious. Any insecticide compounded with soft soap should be useful, as the soap would form a coating over the insects and stifle them. Hydrocyanic gas would be effectual, but it might be difficult to render the air in the caves wholesome again, as this gas is a deadly poison to human beings. Try the various insecticides on portions of the beds, and note the result.

NURSERIES IN SCOTLAND: W. H. A list of the Scottish nurseries will be found in the *Horticultural Directory and Year Book*, copies of

which may be obtained from our publishing department, price 1s. 3d. post free.

NAMES OF PLANTS: R. T. H. 1, *Trichosma spaxii*; 2, *Dendrobium longicornu*; 3, *D. heterocarpum* (autem).—J. P. 1, *Cypripedium* *Dibdin* (Argus × Boxallii), not of any special value; 2, C. *insigne*.—W. J. F. 1, *Cupressus*, sp., specimen insufficient to identify; 2, C. *pisitera squarrosa* (*Retinospora squarrosa*); 3, C. *pisitera plumosa*; 4, *Veronica* (Traversii); 5, *Taxus baccata aurea*.—S. G. 1, *Codiaeum* (*Croton*) *angustifolium maculatum*; 2, C. *variegatum*; 3, C. *elegantissimum*; 4, C. *trilobum*; 5, C. *irregularis*; 6, C. *spirale*.—W. D. N. 1, *Coleogyne floccida*; 2, *Liparis longipes*; 3, *Calanthe rosea*; 4, *Odontoglossum constrictum*; 5, *Oncidium candidum*; 6, *Cochloda rosea*.—H. S. *Salvia leucantha*—*Bids*. *Lastrea lepida*—*Versteer*. 1, *Ruellia Portiella*; 2, *Arauja serotina* (syn. *Physianthus albens*). The weed is *Oxalis crenata*. E. B. Heikine *Soleriella*, useful for carpeting, roeties in green-houses and for other similar purposes.—W. G. 1, *Cypripedium* *Dibdin* (Argus × Boxallii), but an indifferent variety of it; 2, *Oncidium varicosum*.—S. G. *Peristrophe spicata*.

PLANTS FOR AN UNHEATED CONSERVATORY: Z. S. L. *Anything*. The following are a few suitable plants for the house you describe, presuming that the plants will be exposed to an average amount of light. In early spring there are many bulbs you can grow, such as *Narcissus* (including *Bulbocodiums*), *Hyacinths*, *Tulips*, *Scillas*, *Lis*, *reticulata*, and *Frutillaria Melegaris*. Various species of *Lilium* would flower from May till October, notably *L. tenifolium*, *L. speciosum* varieties, and *L. longiflorum*. Other bulbs are small, early-flowering varieties of *Gladiolus*, *Ornithogalum arabicum*, and the newer varieties of *Montbretia*. *Fuchsias* would succeed well in summer, provided you protected them from frost in winter. Some of the *Primulas* should do well in such a house, notably *P. denticulata*, *P. japonica*, *P. Forbesii*, and the beautiful Alpine and show varieties. *Campanulas* are another class of plants which thrive without sun. Three of the best are *C. Vidalii*, *C. pyramidalis*, and *C. isophylla*, including varieties. Other plants worthy of your consideration are *Dicentra* (*Dielytra*) *spectabilis*, *Spiraea japonica*, *Saxifraga Fortunei*, *Funkia tardiflora*, *Agapanthus umbellatus*, *Atrophodendron cirrhatum*, *Libertia grandiflora*, *Hydrangeas*, and *Francoa rubra*. Ferns would be useful to associate with the foregoing plants, more especially the bulbs. The following are a few of the best: *Adiantum Capillus-venenis*, A. *pedatum*, *Aspidium falcatum*, *Davallia bullata*, *Lomaria procer*, *Wardwardia radicans*, and many of the choice forms of the hardy varieties, notably the beautiful crested forms of *Scelopendrium vulgare*. A few suitable climbers for the roof are *Lapageria rosea* and var. *alba*, *Berberidopsis corallina*, *Trachelospermum jasminoides*, and *Clematis indivisa*.

Salvia splendens: D. C. You might very well use the plants of *Salvia splendens* for bedding out next season. In favourable localities this scarlet-flowered *Salvia* is among the most vivid border plants obtainable. The type, however, is apt to grow rather tall, and it sometimes commences to flower late in the season. Therefore your efforts should be directed towards getting the plants into bloom as early as you can. A note appeared in the *Gardeners' Chronicle* for November 3, 1906, calling attention to the magnificent effect *Salvia splendens* was then producing in Cobham Park Gardens, Surrey. There are several varieties of this species that are of a later habit and earlier in flowering than the type, one of these being known as *Zurich*.

SEEDING CARNATIONS: Dr. A. R. *Florence*. The lighter-coloured flower is a form of what is called the Dainty or Painted Lady. The darker flower is a fancy variety with white ground. We do not think that either flower is remarkable for rarity or value.

COMMUNICATORS RECEIVED.—G. H. S. (thanks for your contribution to the R.G.O.F. box; the disease is under investigation).—H. J. C.—F. W. K.—J. T.—C. J.—O. B.—A. D.—W. R.—D. E.—H. J.—W. J. B.—Rev. D. WATER AND WATERING.

WATER is the medium by which the soluble matters of the soil are conveyed through the roots into the interior of plants.

An important fact in the relation of vegetation to moisture is seen in the effect exerted by the humidity of the atmosphere upon its temperature. Without more or less vapour in the atmosphere, radiation would cool the surface of the earth so rapidly as to destroy the life of all tender plants. The principal part of the rays of the sun pass through the air, even when it is saturated with moisture, without appreciably heating it; but the heat radiated from the earth and every object upon it is intercepted and absorbed by the humidity in the air; the atmospheric warmth is, therefore, clearly related not only to the heat of the sun's rays but also to the moisture of the air. Like the covering of a cold frame, the moist air admits the light rays by day and prevents the exit of the heat to which they give rise at night. Hence the clearest, driest nights are the coldest. Also the driest regions, like the

desert of Sahara, have the coldest nights, and the cold of high elevations is due to the same cause.

Professor Tyndall says:—"The removal, for a single summer night, of the aqueous vapour from the atmosphere that covers England would be attended by the destruction of every plant which a freezing temperature would kill." Humidity and temperature are, therefore, intimately connected.

Although the heat of the sun causes evaporation from plants, its amount is governed by the humidity of the air and the velocity of the wind.

If the gardener could regulate the moisture of the atmosphere surrounding his crops, maintaining the precise conditions for keeping up the proper evaporation by applying water artificially and only in circumscribed limits to their roots, he could be assured of success. While he may do so in his greenhouse, there are no means of regulating the heat and moisture of the open air and also of the soil. It is for these reasons that watering outdoor crops in very hot weather is more often productive of harm than of benefit.

When the earth is naturally moistened by rain, the whole air is saturated with moisture, preventing both a too rapid transpiration from the leaves and an undue evaporation from, and consequent chilling of, the soil. If watering is done at all, it should be in cloudy weather; but it is most frequently injudiciously practised in dry, hot weather, and so circumscribed in extent, that it can have little or no effect upon the atmosphere. The roots are temporarily excited, and the dry, hot air robs the plants of the moisture through the leaves as rapidly as it can be supplied by the roots.

As soon as the temporary supply is exhausted, the plant not only returns to its former state of suffering, but is left more susceptible to injury than before. If the watering is repeated, the emission of rootlets near the surface is encouraged, and these grow merely to perish again unless the water is continued. Another injury may occur, as already indicated, through the decrease of temperature caused by the rapid evaporation.

In very hot weather, during periods of drought, vegetation is greatly sustained by the moisture which is returned to the earth in the form of dews; and, in order that these may be most beneficial, the soil should be deeply stirred and continue in a mellow condition upon the surface. When the soil is puddled and compacted around a plant by local watering, the amount of dew will be less owing to the decrease in the number of points of radiation presented by the compact ball of soil; besides, the diminished quantity is evaporated from the impenetrable crust without being able to reach the roots. If watered, the earth should, therefore, be stirred subsequently, or the watered surface be covered with fresh, loose soil.

If practised at all, the watering should in hot weather be applied to the roots, and not to the foliage. Evening is the proper time of day, unless in the exceptional case of watering cold frames when frost is apprehended. It is then advisable to water in the morning. The water should not be much colder than the surrounding atmosphere.

When there are facilities for moistening

the whole mass of soil by irrigation, that should not be neglected, for its great benefits are undoubted. But even then, unless the surface be so densely covered with the growing crop as to prevent it from being baked by the sun, it would be best to allow the moisture to reach the roots through percolation from open channels or drain pipes near enough to each other and kept full than to cover the soil with water.

A crop supplied with a sufficiency of soluble manure will suffer less during drought than one inadequately fertilised, and the latter will require an abundance of water.

Mulching the soil prevents a too rapid evaporation, and is, therefore, to be recommended with or without watering. *J. J. Willis, Harpenden.*

NOTES FROM A "FRENCH" GARDEN.

With Christmas the French garden enters upon a new phase of activity. The French gardener has his programme made out for the next season, and everything is arranged for working the whole of his soil and manure to the best advantage, as this must not be left idle at any time during the next six months. Gardeners who desire to grow very early Melons for planting out at the end of March should reserve frames and lights for this purpose. The cultivators around Paris generally prefer to wait until the first fortnight in April, when they can make use of the frames and lights which have sheltered the first batch of the "Passion" Cabbage Lettuce.

The ground for planting Passion Lettuce in the open is now dug, and fine decayed manure for spreading on the beds when they have been raked and made level, has been brought close to hand. On the ground allotted to the culture without hot-beds, which had been previously heavily manured and dug, we have set the frames and lights, and for every light we have put two barrow-loads of well-decayed manure where it is intended to grow the "Little Black Gott" and one barrow-load per light where the "Passion" Lettuce will be planted. The reasons for doing this work so early are, first, to have the soil in good condition for planting out the Lettuces at the end of January, and secondly, so as not to be hindered in the work when the time arrives for making the hot manure beds. These will be commenced soon after Christmas, as our Lettuce plants have grown faster than we expected; but we should have preferred to have delayed it until the middle of January. Our Lettuce plants have done very well, and we have had to ventilate them more than usual on account of the mild weather. The Cos Lettuces are growing vigorously, and should we be able to spare a few hours after commencing to plant the Little Black Gott, we shall transplant them for the third time, inserting five under each cloche. This is very profitable work, as it gives the plants a better opportunity of becoming more sturdy. We have seen several cases of mildew among Lettuces this winter. The late Professor Maxime Cornu made a careful study of this disease, and some twenty years ago presented a report of its growth and habit to the Academie des Sciences. There is no practical remedy for it, but it can be checked by spraying the plants with sulphate of copper 1-1,000, or with sulphur, keeping the clothes and lights closed. A point to be remembered is, that when the diseased plants are placed in the open air or cold frames the pest disappears, but if placed on the hot-beds the plants quickly die owing to the rapid growth of the fungus.

As the Cauliflowers are growing too fast we have had to lift and transplant them in the same place to retard them. Ample ventilation is afforded them day and night when the weather is genial. *P. Aquatius.*

BELGROVE, CO. CORK.

The garden of Mr. W. E. Gumbleton is well known to many persons; at least by repute. It is situated at Belgrove, some four or five miles from Queenstown, and overlooks an arm of Queenstown Harbour, a position of much beauty, and an almost ideal spot for a garden. The mansion is convenient and commodious, and contains one of the best private horticultural libraries in the Kingdom.

On my visit, in early August, I first inspected the conservatory. A number of pot-plants of *Disa grandiflora* were in flower, and although Mr. Gumbleton informed me they were not doing so well as usual, they were much better specimens than one usually sees in gardens. My attention was next directed to a collection of newer varieties of Fuchsia, principally hybrids of *F. triphylla*. These included such noted varieties as *Eros*, *Corale*, *Göttingen Perle*, and *Count Wernigerode*, all desirable kinds and of a class that is likely to grow in favour.

The scarce *Fallugia paradoxa*, from New Mexico, a handsome shrub with large and showy white flowers in corymbs, was observed; also several pots of an interesting bulb received by Mr. Gumbleton as a "Burmese Tuberosa." When these flowered they turned out to be the ordinary type of *Pollanthes tuberosa*, as figured in *Botanical Magazine*, tab. 1817.

Cactus-flowered Pelargoniums have also engaged the notice of Mr. Gumbleton: Fire Dragon still remains one of the best double varieties, but the original variety was double-flowered. Another plant not often seen, but which I had met with before, is *Malvastrum grossulariæ-folium*, now known as *M. hypomardum*. This species has neat leaves and pretty Mallow-like flowers.

A new *Dimorphotheca*, a genus in which Mr. Gumbleton has taken especial interest for years, was in bloom. It is a variety of *D. Barberie*, named *rosea*, and has pretty rose-coloured flowers, with bronze shading on the underside of petals.

A collection of Messrs. Cannell's newest Zonal Pelargoniums, including *Cyric* and *Celtic*, were on view; most of these are very fine, and it seems a difficult matter to make much further advance with these plants. Mr. Gumbleton has also a fine collection of Pelargoniums from other sources.

Hibiscus Manhot was in bloom, and a good collection of the new hybrid *Nerines* was doing well. The handsome form of *Crinum Moorei*, named *platypetalum*, much superior to the type, was in bloom in the conservatory. Another good plant, but, unfortunately, not in flower, is *Helichrysum rupestre*; this has yellow blooms. Mr. Gumbleton has also the pink perfection variety of *Rehmannia angulata*. *Arctotis aureola*, with the two hybrids between it and *A. grandis*, namely, *vomerosis* and *regalis*, and a number of other good things were seen in the conservatory, which was extremely bright with bloom.

The flower garden proper is not large, and is principally occupied with small beds and borders. Here Mr. Gumbleton tests many of the newer annuals, as well as shrubs and herbaceous plants. Quite a bright effect was made by the orange-yellow-coloured *Dimorphotheca aurantiaca*, probably an annual plant and one half-hardy, while among the other flowers seen were *Clematis recta* fl. pl., which, although not new, is an extremely fine subject for the flower garden.

I also noticed a fine, new, deep-coloured variety of *Aconitum Napellus*, several fine *Asters*, such as *Gloire de Cronstadt*, *Zwerg Konigin*, *Madame Gouchault*, and *Madame Cachieux*, and Messrs. R. Veitch & Sons' new hybrid hardy *Calceolaria*, named *Golden Glory*, which is here, as elsewhere, proving itself a great acquisition. Among other subjects planted outside is *Calceolaria alba*, a species not infrequently seen, but not yet surpassed by any of its colour. *Erigeron hybridum* promises to prove a useful plant, but

the name is not distinctive, as there are already several hybrids in cultivation; another labelled E. "Species No. 10" (of Perry) also promised well. Mr. Gumbleton tests the new *Chrysanthemum maximum* varieties, and among those on trial were Mrs. Lothian Bell, a variety of proved merit; Snowdon, a new one of Mr. Angus's raising; Robinsonii, together with Margaret Marwood and a few others.

Three beautiful *Nemesias*, including Carter's *grandiflora*, are lovely annuals, and a highly pleasing *Nigella* introduced in 1885 as *diversifolia* or *integrifolia* and subsequently lost, is well worthy of attention by persons fond of *Nigellas*. A plant of the hardy *Geranium Loweii*, figured in the monographs of both Andrews and Sweet as *G. anemonæ-folium*, was also in bloom. *Freynia cestroides*, a beautiful flowering shrub on the French Riviera, cannot be got to flower in this country.

Among several *Verbascoms* one of bold habit, but a biennial, attracted our notice. This was named by Mr. Gumbleton *V. rubro-nerivium*, the variety being unknown at Kew. It is distinguished by its having the mid-rib of the leaf red—a feature quite uncommon among these *Mulleins*.

Dahlias are not neglected in this Irish garden, and several of the "Colerette" section are cultivated. There is also the sweet-scented *Dahlia*, which was obtained from M. Bruant, of Poitiers; it should prove acceptable to lovers of the *Dahlia* who also appreciate fragrance in flowers. A good display was made by the bedding *Begonia Lafayette*, while among a few *Godettias* grown for trial one named *Sunset* was most attractive, it being both dwarf in habit and having flowers of a desirable colour. A collection of new *Montbretias* was also observed, but singularly unbrag, *Promethues*, which is generally tall and robust, is the dwarfest and weakest of the set at Belgrove.

Salvia dichroa, as grown here, is handsome indeed with its long spikes of purple-blue and white flowers, and there were also plants, not in bloom, of a *Cashmere* species as yet undetermined.

Among other plants noted in this garden were *Lavatera maritima bicolor*; *Argemone grandiflora*; *Alyssum spinosum roseum*; *Lilium Henryi*; a bed of Early *Cosmos*—quite good here; the handsome annual *Impatiens amphorata*, with rose-coloured and white flowers (figured in the *Botanical Magazine*, tab. 6550); and a bed of new sorts of *Trollius* on trial. Of these, *Orange Globe* and *Fire Globe* are the best; *T. ranunculoides* is a plant of much beauty. *Achillea*, *Rose Queen*, not quite new, is a good variety of *A. filipendula rubra*, whilst *Myosotis Royal Blue* is a pleasing *Forget-me-not*. *Verbascoms densiflora* and others of Mr. T. Smith's distribution are very fine. A set of *Echinaceas* also proved worthy of note, among them being *rosea superba*, *purpurea*, and others. *Brachycome iberidifolia atro-violacea* made a splendid bed, and some very fine hybrid *Dianthus*, apparently largely of the *Heddewigii* type from a German raiser, were extremely good and varied. *Gladiolus princeps*, with a blue-flowered one called "Evolution," were also good, and some pillar *Roses* were very pleasing. The blue *Anchusa petiolaris*, although only an annual, sows itself, and is pleasing with its good blue flowers. The old, but rare *Montanoa mollissima*, a Mexican shrub with white composite flowers, was also in bloom, and the two yellow *Ponias*, one the Chinese tree *Pæony P. Delavayi*, and the other an herbaceous variety, *P. Mckosewitschii*, from the Caucasus (see Supplementary Illustration in *Gard. Chron.*, July 25, 1908), in which Mr. Gumbleton takes deep interest and of which he has a fine collection, were not in bloom.

A specially fine plant of the rare *Olearia insignis* in bud, and the finest in cultivation, was among the many other things to be seen in this famous trial garden.

Outside the garden proper is a magnificent collection of *Cortaderas* or Pampas Grasses, commonly, but erroneously, known as *Gyncriums*, one of the most complete in existence in any British garden. Here, also, are the fine *Budleia variabilis magnifica*, the finest of its class, with others of the genus, and a splendid collection of upwards of 30 *Kaiphofas*, including the newest hybrid varieties, is planted in clumps, among these being the really good variety named in honour of W. E. Gumbleton, Philadelphia. *Hypericum Van Fleetii*, a fine specimen of *Veronica Kirkii*, and many more plants occupied considerable time in their examination, *Beschornia Decosteriana*; *Agapanthus caulescens*; and a collection of hybrid *Yuccas* which are of Mr. Sprenger's raising.

I also noticed fine specimens of *Daphniphyllum glaucescens*; *Abelia triflora*; *Ladastylis lutea*, and *Magnolia Campbellii*, which had 60 blooms on it before the frost in May. The gardens also contain one of Luther Burbank's new *Walnuts*. Amongst other plants there were also seen *Nuttallia cerasiformis*, the deciduous *Holly Ilex montana*, *Stephanandra Tanakæ*, *Berberis bullata* and *Wilsonii*, *Olearia virgata* the Korean *Viburnum Carlesii*, *Diervilla rivularis*, *Castanopsis chrysophyllus*, *Cotoneasters Franchetii*, *angustifolia*, *Fontanesii*, and others, together with several very pretty *Leptospermums*.

Azara microphylla belgroviana is a beautifully variegated form of this favourite shrub, and the specimen of the type itself at Belgrove is exceedingly large and well developed. There is also a notable specimen of *Juglans alantifolia*. *Lonicera pileata* is a species of considerable beauty. Among the *Olearias*, in addition to *O. insignis* already mentioned, Mr. Gumbleton cultivates *O. stellulata*, *O. nitida*, *O. angustifolia*, *O. moschata*, and *O. nummulariæ-folia*. The garden also contains a collection of 21 species of American *Cratogeomys*, besides others of earlier introduction.

In addition to *Magnolia Campbellii*, already mentioned, there is a good collection of these fine trees and shrubs, among the others being *M. Watsonii* and *M. Lennei*.

Cestrum (syn. *Ilabrothamnus*) is represented by *C. Newellii*, *C. fasciculatum*, and *C. corymbosum*. On walls were *Plagianthus Lyallii* (now known as *Gayia*), *Xanthoceras sorbifolia*, and several *Wistarias*, one plant of *W. multijuga*, the best of all, covering a space of about 14 feet in height by 70 feet in length.

The kitchen garden is extensive, and contains a number of interesting features. There is a collection of 100 varieties of Gooseberries, and an extensive number of Strawberries on trial. As is to be expected in an establishment owned by Mr. Gumbleton, all the plants are well cultivated, and the garden is maintained in an excellent condition. Apart from the fruits and vegetables numbers of flowering plants are seen in this garden, including a collection of *Hemerocallis*, many of them novelties from Continental firms. *Nymphæas* are grown in tanks elevated above the ground level. The best varieties only are retained, and for a critical inspection these tanks of new varieties are of much value.

Two plants seldom seen in bloom were flowering against a wall. These were *Feijoa elliviana* and *Mutisia decurrens*, and both were doing extremely well, the latter growing with *Frenontia grandiflora*. *Micromeria lineare*, from the Cape, and the rare *Crossosoma californica*, which Mr. Gumbleton re-introduced to cultivation, were also viewed with interest.

One of the plant-houses contained a choice collection of plants of double-flowered tuberous-rooting *Begonias*, in which Mr. Gumbleton takes much interest.

These notes are by no means complete, but they may furnish some knowledge of the wealth and interest of Mr. Gumbleton's collections of rare plants, and the best varieties of some of the more popular flowers. S. Annett.

HARDY TREES AND SHRUBS SUITABLE FOR FORCING.

(Continued from page 401.)

AMELANCHIER.—The June-Berry of North America, *A. canadensis*, is the best species for forcing. Bushy plants in pots 3 to 5 feet high are highly decorative when clothed with short racemes of flowers. These are snow-white, and are produced in advance of the foliage. There are several forms which have been given varietal names, differing in the shape of the leaves and size of the blossoms. The Amelanchiers belong to the Natural Order Rosaceæ.

CEANOTHUS.—Most of the species are rather tender, and if cultivated in the open air require the protection of a wall except in the mild parts of the south and west. Cultivated in pots, in rich loamy soil, several of the species, which naturally flower early, respond readily to gentle forcing. The best are *C. papillosus*, *C. rigidus* and *C. Veitchianus*. All have blue flowers. The plants must be placed inside in the late autumn, not being sufficiently hardy to remain out in the plunge-bed till required.

CHIMONANTHUS FRAGRANS.—The Winter-Sweet ordinarily flowers outside in January and February. The plants are, however, chiefly owing to their delightful fragrance, useful in large structures, where the flowers will not be spoilt as often happens outside, even when grown against a wall. The blossoms are pale yellow in colour. A form with rather larger flowers is named *grandiflora*.

CHOISYA TERNATA.—This evergreen bush may easily be secured in flower by Christmas. The blossoms are white and very fragrant, reminding one of Orange blossom, for which it is sometimes substituted by florists when the true flower is scarce. The plants are readily propagated from cuttings, and may be grown in pots entirely; hard forcing not being necessary to obtain the plants in flower early.

CLEMATIS.—Numerous garden varieties of the florida and patens types may be grown successfully in pots, and obtained in flower from February onwards. Several nurserymen make a speciality of Clematis in 5-inch and 6-inch pots. These are young grafted plants, trained round small balloons or three stakes. They make very useful material, carrying from 6 to 12 flowers, for the conservatory. A few of the varieties most suitable to this treatment are *Aureliana* (porcelain-blue centre, lavender stripe), *Edward Desfoise* (deeply shaded mauve, dark anthers), *Fair Rosamond* (bluish-white, red bars), *Lord Lonsborough* (silvery grey, pale bars), *Lord Napier* (mauve), *Miss Bateman* (white, chocolate anthers), *Mrs. Hewett* (tinted white), *Mrs. S. C. Baker* (French white, claret bars), *Nelly Moser* (silvery white, shaded mauve, rosy carmine bars), *Sir Garnet Wolseley* (slate-blue, plum-red bars), *Standishii* (deep lavender), *Stella* (light violet, deep plum bars), and *The Queen* (lavender).

Large specimen plants of the above varieties, grown in 12-inch or larger pots, and trained round wire balloons, are amongst the most beautiful subjects it is possible to obtain for flowering in the conservatory during May and June. For this purpose they are treated as cool greenhouse plants. After flowering it will be advisable to place the plants out-of-doors for a couple or three months.

CORYLOPSIS.—The hazel-like inflorescences are produced early in the spring in advance of the leaves. It cannot be claimed for these shrubs that the flowers are brilliant; they are, however, very interesting and particularly easy to obtain in flower under glass in January. Two species, both natives of Japan, should find a place in collections of trees and shrubs used to decorate large structures early in the year. *C. pauciflora* has two to four primrose-yellow coloured flowers in a raceme, and is of a dwarf, bushy habit. *C. spicata* is pale yellow in colour; 8 or 10 flowers are produced in a raceme,

and the plant is taller than of *C. pauciflora*. Both species have a cowslip-like fragrance.

CRATAEGUS.—Several varieties of the common Hawthorn respond readily to a little heat, but should not be forced too early. The pyramid, standard, and half-standard shapes are the most suitable. They may be grown in pots for several years in succession, and should then be planted in the nursery for a couple of years. Hawthorns are best kept in shape by pinching the young shoots during the summer; this also induces the production of flowering spurs. Good varieties for conservatory decoration are: *C.*

The blossoms of the variety *C. superba* are deeper in colour.

CYTISUS.—Several of the hardy Cytisus or Brooms will merit cultivation in pots, being free flowering and distinct in appearance. Standard specimens are obtained by grafting them on the *Laburnum*. Some attention in the way of pruning Cytisus is necessary after flowering, or they soon become leggy. It is, however, better to frequently discard the older plants and replace them with young ones. The undermentioned species are the best for forcing. *C. albus* (the White Spanish Broom), *C. biflorus*

FIG. 174.—ROBINIA KELSEYI, A NEW SPECIES FLOWERING IN THE ROYAL GARDENS, KEW, IN JUNE LAST. (For text see p. 446.)

multiflora (double white), *C. punicea* (single scarlet), *C. p. plena* (double scarlet), *C. rosea* (single rose), *C. rubra plena* (double rose), and *William Paul* (double red).

CYDONIA.—Two species of Cydonia or Quince can be effectively grown in pots for greenhouse decoration. *C. japonica* has deep red flowers, and forms a large bush, there is also a white variety *C. alba*. The other species, *C. Maulei*, is dwarfed and more compact in habit, the bright red flowers are 1 inch in diameter.

(pale yellow), and *C. scoparius* var. *Andreasenii* (rich yellow and reddish-brown flowers).

DAPHNE.—The common Mezereon, or Daphne Mezereum naturally flowers during the winter and early spring, so that the plants need no forcing, but may be placed directly in the show house when the buds commence to expand. These appear in advance of the leaves. Its greatest value is perhaps the strong fragrance of the blossoms, a plant dotted here and there round the house will pervade the whole

structure with its delicious perfume. There are several varieties with white, rose and red flowers, and is the earliest to bloom. As no forcing is necessary they may be grown in pots, using a loamy compost, with which should be mixed some lime rubble. Very slow in growth, the plants require no pruning, seldom exceeding 30 inches to 3 feet in height.

DEUTZIA—The best known species for forcing at present is *D. gracilis*. During the last few years many beautiful hybrids have been raised and distributed by Mons. Lemome, of Nancy, which, as they become better known, appear likely to displace *D. gracilis* in popular favour. In the open air the plants flower so early that they are often spoilt by late spring frosts. In one garden I had charge of a large batch of these plants grown entirely in pots. The potting soil used was loam and leaf-mould, the plants being liberally fed with manure water when making their growth after flowering. As soon as the blooms were over, the old shoots were cut out down to the base to encourage the production of vigorous young growths. The earliest forced plants flower in advance of the leaves, those blooming later opening with the foliage. After being grown for several years in pots, the clumps can be split up and planted out-side for a year or two. In addition to *D. gracilis*, two varieties deserve special mention, namely, *D. mariorata* and *D. campanulata*. Two stronger-growing species may also be readily forced, the Himalayan *D. corymbosa* and the Japanese species *D. crenata*, which is rather later in flowering. The racemes of white flowers are often 6 inches in length. *D. Lemouinei*, a hybrid between *D. gracilis* and *D. parviflora*, has upright panicles of white flowers. Of the newer Lemome hybrids, the following are great acquisitions: varieties of *D. gracilis*, *D. campanulata*, *D. candelabrum*, *D. multiflora* and *D. venusta*; varieties of *D. Lemouinei*, *D. avalanche* and *D. boule de neige*; varieties of *D. discolor*, *D. floribunda* and *D. grandiflora*.

ERICA—Several of the hardy Heaths may be successfully lifted with good balls of soil from the open border, and potted up for greenhouse decoration. This is best done in September. For about two months they should be stood in the open air behind a north wall or fence. Early in December the plants may be brought into the greenhouse. The dwarf-growing variety, *E. mediterranea* hybrid, is already in flower. Taller growing Heaths to pot up in this way are *E. Veitchii* (white), *E. lusitanica* (rodonoides) (white) and *E. australis* (rosy-purple). Any heat beyond that of an ordinary greenhouse will cause the buds to turn brown. We find it better to lift a few fresh plants each year rather than grow lifted plants a second season in pots. Young plants rooted from cuttings and grown entirely in pots may, however, be successfully used for several years if treated similar to *E. gracilis* and *E. hymenalis*.

FORSYTHIA—Ordinarily flowering outside in March and April, this yellow-blossomed shrub may be had in bloom under glass from January onwards. The tallest-growing species is *F. suspensa*, also known as *F. Fortunei*. The long, graceful shoots, thickly clothed with yellow flowers, are very valuable for associating with palms in a conservatory. Large specimens 6 to 10 feet high may be successfully lifted from the open border and placed in tubs. The species *F. viridissima* is more upright in habit. *F. intermedia*, a hybrid of the two species named, is also erect in habit. Specimens in 7-inch pots of this species are very serviceable. Forsythias are readily propagated from cuttings, and they grow freely in loamy soil.

HAMAMELIS—The Witch Hazels naturally flower during winter, when, unfortunately, the blossoms are often damaged. This does not happen if they are lifted and placed in pots or tubs under glass in a cool house. *H. arborea*,

H. japonica and the variety *Zuccarimiana* deserve special mention.

HYDRANGEA—The two species used for forcing are *H. hortensis* and *H. paniculata* var. *grandiflora*. The former is usually treated in gardens as a pot plant, so that it hardly comes within the scope of my subject. The plants readily respond to a little extra warmth, provided they get plenty of light. *H. paniculata* var. *grandiflora* is largely grown for forcing. Previous to placing the plants in heat, the strong young shoots must be cut back to within two pairs of eyes of the old wood. A beautiful plant when in flower, this *Hydrangea* will not stand early forcing of great heat. When growth commences the shoots should be restricted to one on each branch. About the period when buds ought to form in the points of the young shoots the plants should be allowed to flag for a few hours each day. This check causes the formation of a flower head in practically every shoot. After flowering in this manner, the plants should be not subjected to heat again for two years.

HYPERICUM—The species *H. Moserianum* and *H. patulum* will be found useful for flowering in April and May, but will not stand hard forcing.

JASMINEUM NUBIFLORUM—The yellow flowers of this species, which are produced all the winter, are highly appreciated at Christmas.

KALMIA—Three species, *K. angustifolia*, *K. glauca* and *K. latifolia*, flower outside in May and June. Under glass they may be obtained in flower a month earlier. These plants like a peaty soil.

KERRIA—The single species, *K. japonica*, may be forced, but the double variety, *flora pleno*, is far more valuable for the purpose. It readily forces into flower during February, while, with ordinary greenhouse treatment, the blossoms appear in March. Provided the old wood is cut out after flowering, the plants may be grown in pots several years. *Kerrias* are readily increased by division.

LABURNUM—There is no prettier sight in the conservatory in spring than a few tall standards of the common *Laburnum* (*L. vulgare*). The yellow racemes of flowers hanging amongst the tender, light-green foliage can be readily obtained in February and March.

MAGNOLIA—Several species and varieties of *Magnolia* are admirably adapted for flowering under glass. Naturally, blooming early out-of-doors, they are frequently damaged by late, spring frosts, unless in very sheltered positions. The plants are usually trained as pyramids. They require a compost of peat, loam and leaf-mould. As the propagation of *Magnolias* by grafting or layering is slow, it is advisable to purchase a few plants. When once obtained, they may be forced in alternate years for a lengthy period. *M. Alexandrina* (white, tinted pink), *M. conspicua*, the Yulan (white), *M. Lennei* (rich, reddish-purple), *M. Soulangeana* (white, flushed rosy-purple) and *M. stellata* (syn. *lilleana*) (white) are all suitable.

NEVUSIA ALBAMENSIS—This plant is much better when forced than when grown in the shrubbery border. Under glass the blossoms come white, outside they are greenish-white. Reference to the supplementary illustration of this plant in the *Gardeners' Chronicle* for January 19, 1907, shows what an excellent bush it makes for adorning large structures.

PEONIA—The tree Peonies (varieties of *P. Moutan*) are excellent for forcing, flowering readily from February onwards. They should be cultivated entirely in pots, and manured liberally after flowering. There are both single and double varieties, the former, to my mind, being the more pleasing. As the blooms drop rather quickly, it is advisable to apply a drop of gum at the base of the petals, in order to prolong them for a few days. The large, bold flowers are very rich and varied in colour, ranging from white through pink, rose and red to deep purple.

PHILADELPHUS—The best "Mock Orange" for forcing is *P. Lemouinei* var. *erectus*. The white flowers are very fragrant, but must not be forced very early. After flowering, all the old wood should be cut out. Several hybrids raised by Mons. Lemome of Nancy promise to be valuable.

PRUNUS—Two species of these evergreen Ericaceae plants are useful in late spring. *P. floribunda* has erect, waxy-white flowers, and *P. japonica* drooping white clusters.

To this genus belong several of the most beautiful subjects for forcing. The plants are easily managed, similar treatment to that accorded orchard-house fruit trees in pots suiting them when not subjected to too high a temperature. If, after two or three years pot cultivation, they deteriorate, the plants should be grown in the nursery for a couple of years. They can, however, with careful management during the summer and a judicious application of manure water, be grown for a much longer period in pots. The following varieties require hard pruning after forcing, as they flower on the current year's growth:—*Prunus triloba* fl. pl. (double pink) makes growths 2 feet or more in length, which, if well ripened, will be covered with flowers the following season, *P. japonica* *flora pleno* and *flora roseo pleno*.

Three semi-double varieties of the Peach, *Prunus Persica* (*Amygdalus Persica*) force well, namely, *Clara Meyer*, *Prunus roseo pleno* and *magnifica*. Beautiful semi-double varieties of *Prunus Pseudo-cerasus* are *James H. Veitch* and *Watereri*, *P. cerasus Rhexis flora pleno*, *P. cerasifera* var. *atropurpurea* (syn. *P. Pissardi*), valuable alike for the rich purple foliage and early flowers, and *P. subhirtella*, a single, white-flowered species from Japan.

In addition to being grown in bush or pyramid form, a number of *Prunus*, notably, *P. triloba* *flora pleno* and varieties of *P. Persica*, are excellent subjects for standards or half-standards.

PYRUS—The number of members of the Pear family are not numerous, but they are amongst the most beautiful hardy trees for forcing. They require the same treatment as that recommended for *Prunus*. No hard pruning is necessary, shortening of the shoots to shape the trees, and thinning of the shoots if too thick being all that is required. The best-known for forcing is *P. floribunda*, which has white flowers tinted with rose; the variety *atrosanguinea* has deeper rose-coloured blossoms. *P. Scheideckeri*, a hybrid between the last-named species and *P. punifolia*, is a very desirable plant for forcing. *P. spectabilis* *flora pleno* has large, double flowers, which last for some time.

RHODODENDRONS—In this genus most botanists now include the *Azaleas*, so that, from the point of view at present being discussed, it is, perhaps, the most important of all shrubs. Varieties of *Rhododendron sinense*, or, as it is better known in gardens, *Azalea mollis*, are imported in great numbers from the Continent. So much crossing and inter-crossing has been done with this species and *R. flavum*, also, in a lesser degree, with *R. calendulaceum* and *R. nudiflorum*, that it is difficult to say exactly what are the parents of many varieties. Continental nurserymen claim to have crossed two species, *Azalea mollis* and *Azalea sinensis*. As these two plants, according to the *Kew Hand-List of Trees and Shrubs*, are synonymous, they have used selected forms of the one species and crossed them. Of this section there are many named varieties, the flowers large and the colours remarkably brilliant. No good service will be rendered here by giving a list of names which can be readily obtained from a catalogue. To my mind, the best of all in this section is the variety *Anthony Koster*, with very rich, golden-yellow flowers. Several other sections closely allied to this one, but kept distinct in many catalogues, are *Azalea mollis*, *A. mollis* hybrids and *A. mollis* seedlings. Many of the varieties can be obtained grown as standards

in addition to bushes. The price of the plants varies according to the number of buds on a plant, ranging from 15 to as many as 60 on a plant.

Another set which are even more delightfully fragrant than the foregoing next claim attention. These are the Ghent Azaleas, hybrids of *Rhododendron flavum* (syn. *Azalea pontica*). The flowers are smaller than in *A. suenzisi*, but the delightful tints of the flowers are even more varied, and many of them are prettily spotted. The species itself, with rich yellow, highly fragrant flowers, must be regarded as one of the best for forcing. The best double varieties of deciduous *Rhododendrons* for this purpose are the set known as *R. Azalea rusticiflora*, said to be hybrids of *Azalea mollis*. An exceedingly pretty variety, with large clusters of orange-coloured flowers, is *R. (Azalea) altaclerense*. This name, however, must not be confounded with that of the evergreen variety of *R. arboreum* var. *altaclerense* figured in the *Botanical Magazine*, tab. 3,423. *R. (Azalea) Daviesii* has creamy-white, fragrant flowers, and is also desirable for forcing.

Most of these deciduous *Rhododendrons* force very easily. The *stenosis* (mollis) section can be had in flower by Christmas, or soon after, by plunging the plants in the propagating house and keeping the shoots well syringed. Very few of the plants can be forced with satisfactory results two years in succession, but if put in the nursery they will bud up well again in three or four years. This, however, necessitates a lot of space and trouble, which is scarcely worth while when the plants especially grown for forcing are so cheap. Home-grown plants also do not force so well as imported plants, especially early in the year. Those which are forced later we find useful for planting in the pleasure grounds.

A. O. S. (To be concluded.)

LIRIODENDRON CHINENSE.

(THE CHINESE TULIP TREE.)

ONE of the most stately and interesting trees introduced to this country from North America is the Tulip-tree (*Liriodendron tulipifera*). It is said to be the sole remnant on that continent of a genus which at an earlier epoch was abundantly represented not only in North America, but Europe as well. That another Tulip-tree occurred in China had long been known to botanists, but it was not until the enterprise of Messrs. Veitch brought about its introduction that we have been able to see it alive in Great Britain. The accompanying illustration represents a specimen probably as fine as any to be seen in Europe. It is growing in the collection of Magnoliaceæ at Kew. At first thought to be merely a geographical form of the North American species the Chinese tree has since, by both Sargent and Hemsley, been considered distinct enough to rank as a species. The flowers are not so large, the petals are narrower, and the fruit is more elongated. According to *Hortus Veitchii*, the tree in its native habitat is usually from 15 to 20 feet high. The tree illustrated at fig. 175 gives every indication of greatly exceeding those dimensions. At eight years old it is 10 feet high, and the leading growth made during the past summer was 4 feet in length. The most striking characteristic of the tree at its present stage is its magnificent foliage. A few weeks ago I measured a leaf, the blade of which was 13 inches long and 10 inches broad. It is probable, however, that as the tree grows older the foliage will be reduced in size, and approximate to that of the American species. Although this Chinese tree is not likely in any way to outstep the older *Liriodendron* in the esteem of English arboriculturists, it will make an interesting addition to a group of trees of singular charm and distinction—the arborescent Magnoliaceæ. *W. J. Bean.*

GARDENS NEAR CHEPSTOW.

THE middle of October is one of the worst seasons to inspect gardens, but plants may be observed even if they are flowerless. At Mathine Palace Mr. H. Avray Tipping has a very interesting garden. Here *Pyrus japonica* was covered with fruit, some being fully 3 inches in diameter and bright yellow in colour. On the same wall the Pomegranate, *Punica*

were sufficiently near to clash with the hue of the *Astilbe's* bloom. *Campanula Raineri* grows with extraordinary vigour here, and is to be seen in great masses among the rocks. Mr. Tipping has a charming wild garden at Mountain, a mile or two away. Here *Abutilon vitifolium* is found in quantity, examples put out from 4-inch pots when a foot high attaining a height of 12 feet in 18 months. All are in the most robust health, and even the largest show

[Photograph by E. J. Willis.]

FIG. 175.—LIRIODENDRON CHINENSE, A NEW SPECIES.

Granatum, was also fruiting well—a rather rare occurrence, I fancy, in this country, the fruit being large and brightly tinted. *Trierythron hirta* was exceptionally strong, the growths being fully 3 feet in height, but the buds were, as yet, unexpanded. A long row of *Astilbe Davidi* by the water must have presented a charming sight when in flower, especially as no other colours

no sign of dying off as they so often do in the south-west. The lower portion of the grounds is intersected by streamlets, whose banks are clothed with water-loving vegetation. Enormous clumps of *Saxifraga peltata* were showing their handsome foliage, and the bronzed leaves of *Rodgersia podophylla* were in evidence. Above a rock the branches of *Cotoneaster horizontalis*,

bright with scarlet berries, spread out above the water, creating an extremely pretty effect. Many of the *Primulas* flourish by the waterside, *P. rosea* having increased prodigiously by self-sown seedlings. Two plants were first procured, but now there must be several hundreds, which have formed large clumps around the stream bed and are in the most vigorous condition. *Cotoneaster* *adpressa* is a very attractive little shrub of prostrate growth. When once established it can easily be increased to any extent, as the branchlets root into the ground as they spread, and, if cut off, can be readily lifted with good roots and transplanted. It is intended, eventually, to cover portions of the higher levels with this *Cotoneaster*. *Polygala* (*Chamaebuxus purpurea*) was doing well and spreading rapidly, and *Oxalis cuneaphylla* was evidently at home, a number of plants having been obtained from the one originally procured. On a steeply-sloping bank, studded with rocks, many *Saxifragas* were luxuriating. Large masses of *S. Burseriana*, *S. apiculata*, *S. sancta*, and others formed mats of green between the stones, and were clearly in the best of health. *Lilium speciosum* thrives amazingly in this garden, one of a group of the variety *rubrum* measuring 8 feet in height and bearing 15 flowers. Peat-moss litter manure was incorporated with the soil when they were planted. *Coriaria terminalis* was a handsome sight, with its shoots studded with amber-yellow berries, and there was a fine colony of *Kniphofia Nordhii*. *Hoheria populnea* had flowered well this summer. The foliage of this tree is very curious, that at the base of the branches being very small, and not unlike that of *Azara microphylla*, while at the extremity of the shoots the leaves are large, the two forms being absolutely dissimilar and appearing to belong to different trees. *Plagianthus Lyallii* had also flowered during the past summer, and *Komeya Coulteri* and *Carpenteria californica* were doing well, though 17 degrees of frost were registered last winter. Mr. Tipping intends building a house on the high ground above this garden, whence a fine view of the Severn and the neighbouring wooded heights is obtained. *S. W. Fitzherbert.*

THE ROSARY.

NOTES ON THE NEWER VARIETIES.

(Continued from page 388.)

PERLE DES JAUNES (*Tea, Raymond, 1904*).—This Rose has beautiful, deep, orange-yellow coloured flowers, tinted with salmon and carmine. It is a very beautiful garden Rose, and has been perpetually free this summer.

MISS MILLY CREAN (*H.T., Pierre Guillot, 1905*).—A variety having large double flowers of globular shape, and they are silvery-pink in colour.

ROSALIND ORR (*H.T., E. G. Hill & Co., 1905*) has charmed us very much this summer, and given great quantities of lovely blooms. Its colour is a vivid rose-pink, with almost a scarlet tinge.

MRS E. G. HILL (*H.T., Souperet at Nottling, 1906*) is a good sort for cutting, as the fragrant flowers are produced on long, erect stalks. The variety has flowered very freely this year; the blooms are distinct and attractive, the inside of the petals being a pinkish-white, and the outside deep coral-red. They are also large and full.

MME. ALFRED SABATIER (*H.T., Bernaix, 1904*).—I am very fond of this Rose. It is a splendid garden Rose, and has succeeded as well this year as last. Its colour is a bright satiny peach, red in the bud, but paling as the flowers expand. A very free bloomer.

WILLIAM SHEAN (*H.T., Alex. Dickson & Sons, 1905*).—This is a magnificent Rose of immense size. It is a pure pink flower. Both this summer and last I was very much struck with it when seeing it growing in quantity at Ledbury. I have not succeeded as well as we hoped to do with it this year during the hot months, but we got two or three wonderful blooms in September. Our plants (we only have three) are not over good; they have not made much growth. Its beautiful shell-shaped petals are an enormous size and of beautiful form. No doubt this will get well on the list as an exhibition sort, for it is a glorious Rose when well grown.

LADY ASHTOWN (*H.T., Alex. Dickson & Sons, 1904*).—This variety has been beautiful through-

out the summer, though perhaps last year we got more perfect blooms, thereby indicating that it is rather a cool-weather Rose. Still, it is anything but thin, and any year stands out as one of the very best, with its exquisite Rose du Barri colour, shading to yellow at the base of the petals, and the reflex of petals a beautiful silvery pink. It is a lovely shape, and is one of the most exquisite Roses ever introduced.

FRAU LILIA RAUENSTRAUCH (*H.T., F. Lambert, 1903*) has been far better this year than last. It revels in hot, dry weather. It was quite nice last year; but this year seemed not to hang down its head so badly, a fault due to its stems not being stout enough to carry the very heavy, full, high-centred, perfectly-shaped flowers. The colour is a lovely silvery-white, tinted with most delicate rose.

QUEEN OF SPAIN (*H.T., Bide & Son, 1907*).—This summer has suited this Rose, and I think my one plant of it has done its best. Perhaps I expected too much. It is a pale flesh, darker in the centre, very full, yet holds its head up well. Its form is good, but it strikes me as being somewhat stiff and heavy. Certainly the flower is more useful for exhibition than a garden Rose. I must try it another year before passing final judgment.

MME. MAURICE DE LUZE (*H.T., Pernet Ducher, 1907*) and **KENEE WILMART URBAN** (*H.T., Pernet Ducher, 1907*).—These varieties are promising, but I cannot speak definitely, only having had one very weakly plant of each.

LAURENT CARLE (*H.T., Pernet Ducher, 1907*).—My one plant has given large flowers of beautiful form. It is a brilliant carmine colour, and the blooms are on nice long stems. Seems to be a good grower, and the variety is a promising one.

MIE. J. W. BIDDE (*H.T., Souperet at Nottling, 1906*), **JOUVENNE DE F. VERCELLONE** (*H.T., Schwartz, 1906*), **SEANNE BARIOZ** (*H.T., Guillot, 1906*), and **MME. MARIA CAPELET** (*H.T., Schwartz, 1905*).—I do not admire these Roses at all. They have been very poor here.

PEGGY (*H.T., Alex. Dickson & Sons, 1905*).—The individual blooms are not first rate; but as a decorative garden Rose it is a pretty thing, blooming in trusses continuously; small, pale, thin, primrose-coloured flowers. It makes a fine bush, and has most beautiful dark foliage, which is a pretty set-off to the crowd of flowers.

WELLESLEY (*H.T., Montgomery, 1905*).—I cannot recommend this Rose, as so far I have not succeeded in getting anything worth cutting from it, although I have a fine healthy plant. Some may grow it all right and get nice blooms, but I have failed.

FLORENCE TRON (*Tea, Nabomand, 1905*) is a beautiful garden Rose. Everyone admires it. It is always a mass of bloom, wet or fine, hot or cold. Its flowers are a very pretty carmine red, tinted madder, and they become a lighter colour on expanding. *Leonard Petric, Gayton, Cheltenham.*

The Week's Work.

THE HARDY FRUIT GARDEN.

By E. JORDAN, Gardener to The Dean and Lady Cadogan, Northwick Park, W. Uxbridge, Yorkshire.

Planting.—This work should be pushed forward without loss of time during the mild weather. Carefully examine the roots of purchased trees, trim the ends of broken and bruised roots with a sharp knife, and, if found to be dry, soak them in water. Plant the roots as near to the surface as can safely be done, and spread them out at various depths, working some fresh compost amongst them. Gently shake the tree to and fro as the work proceeds, and tread the soil firmly and evenly over the roots. Place a stake to each young tree to prevent its being loosened by strong winds, and afterwards apply a mulch of light litter or half-decayed manure over the roots to protect them from severe frosts. Permanent labels should be affixed to each tree after planting is completed. All trees should be examined at this season of the year to see that their labels are intact, and, if required, fresh ones should be affixed for future reference.

Pruning.—What remains to be done in the way of root pruning and pruning must be hastened forward on every favourable opportunity,

although a little delay in this work is preferable to treading the ground into a pasty mass, unless planks can be used for stepping upon. The same remarks also apply to the nailing and training of wall trees. In this case planks can always be used with advantage. Apricots should be nailed or tied as early as possible, so that the trees can be protected should severe weather set in, for the buds of these trees are liable to injury very early in the year. In nailing and tying, especially in the case of young trees, care must be taken to leave sufficient space for the young shoots to swell, and, where shreds are still used, they should be narrow, so as not to harbour insects. Nails and ties are preferable and cleaner in all cases. If cuttings of any bush fruits are required, medium-sized, well-ripened shoots should be selected for this purpose during the pruning. Tie them into bundles, label them, and heel them in; later, in wet or severe weather, they can be properly prepared for planting.

Covering materials.—The materials generally used for protecting fruit blossom from frost during the time the trees are in bloom should be got ready for use. *Frigo Domo* is generally considered the best, and with proper care will protect for several seasons. The stock should be repaired if this is necessary. Mere temporary appliances are also used for making wooden copings. These should be examined to ascertain if they are sound, so that all may be in readiness for use if wanted.

PLANTS UNDER GLASS.

By THOMAS LUNT, Gardener to A. STURLING, Esq., Kilmarnock, Scotland.

Begonia Gloire de Lorraine.—For the purpose of raising fresh stock of this Begonia, a batch of leaves should now be inserted either in boxes or pans. In either case the receptacles must be provided with ample drainage, and the soil should consist of leaf-mould and fine sand in equal parts. In removing the leaves from the plants, care must be taken not to bruise them, or they will decay before making any growth. The boxes should be placed over a moist bottom heat, and the leaves must be kept by occasional syringing. Plants raised by this mode of propagation have not the tendency to flower unduly early, and they are capable of making finer specimens by a more free growth than those raised by any other means. It will be seen that as soon as roots have commenced to form tiny growths will appear on the leaf. These will need to be very carefully handled and potted into 3-inch pots, using as a compost leaf-mould two parts, and peat and light fibrous loam of one part each, with a plentiful addition of silver sand. Every pot used should be perfectly clean inside, and it should contain plenty of drainage material, remembering that Begonias require considerable moisture during their season of growth.

Daffodils.—The earliest-flowering varieties, such as *Trumpet Major*, *Golden Spur*, and *Sir Watkin*, may now be placed in a gentle heat, and be given an abundance of tepid water. *Narcissus poeticus ornatus* may also be placed in the forcing-house.

Richardias.—Plants of *Richardia africana*, or *Callas*, as they are termed, that were lifted in the autumn and kept in a cool house, should be placed in heat, reserving the others for succession. These plants require an abundance of liquid manure, and should be kept in a position near to the glass. They are very subject to green fly, which is apt to spread quickly after the plants are placed in heat, therefore a sharp look-out must be kept for its appearance.

Dicentra (*Dicentra spectabilis*).—This plant is exceedingly useful for decorating the dwelling-room or conservatory. Plants to be forced for this purpose are best grown in 6-inch pots, and they should always be kept with the same side towards the light, this species having a very much better appearance if all the flowers and growth point in one direction. If it is required for single pedestal vases, two plants can easily be placed together for the purpose, arranging them so that one will point one way and the other the other. It is possible to do this without causing the plant to flag in the least. After their removal from the forcing-house, the plants should be kept in a cooler temperature for a few days before they are employed for decorative purposes.

THE FLOWER GARDEN.

By W. FYFE, Gardener to Lady STRATHGAY, Lockinge, Berkshire.

Box edgings.—The best time to transplant Box edging is the period extending from October to April. If the Box has become unsightly, it will be necessary to take the plants out of the ground and replant them, for if the gaps are merely filled up the result is not usually satisfactory. If much Box has to be replanted, entirely remove the gravel from small paths, and put it in the middle of wider paths. The ground where the Box will be replanted should be dug deeply, levelled, and made firm, keeping the gradient the same as the paths, and taking care to maintain each side on a level with the other and also with the centre of the paths. Straight lines of Box may be planted against a tightly-strained garden line if the cord is kept in position by the use of pegs. Any curves will require to be very carefully planted, or the effect will be unsightly. In making the trench, this should have an upright face for planting against. The old plants, when pulled to pieces and the long roots cut off, are generally suitable for replanting. It will not be prudent at this season to cut the plants very severely at the top with the object of levelling them, as, when this is done, severe frost is liable to cause considerable injury to them. If it is difficult to obtain a sufficient quantity of rooted plants, use may be made of cuttings about 8 inches in lengths, inserting them 4 inches deep. In this case, however, it will be necessary to supply water during spring and early in the summer until the plants are established.

Roses.—If the plants have occupied the same ground for several seasons, apply a top-dressing of rotted farmyard manure over the surface of the ground to a depth of 4 inches; such a mulch should not be applied during the time that frost is present in the soil. After applying the manure, insert plenty of new branches amongst the plants as a means of protection from frost.

Calceolarias.—We are now potting up into 3-inch pots rooted cuttings of *Calceolaria amplexicaulis* and *C. burbridgei*, to be grown as standards for next year's bedding. These plants, if used as single specimens over a groundwork of *Salvia splendens* var. *Zurich*, or if thinly dotted with dwarf plants of the same species of *Calceolaria*, invariably meet with admiration. *C. burbridgei* is adapted for forming standards, being a strong grower; the flowers are of much the same shade as those of *C. amplexicaulis*.

Propagation.—Insert cuttings of Sweet Bay, Laurel, Ribes, Viburnum (Guelder Rose), and similar subjects, with a heel of the old wood attached, in a suitable situation out-of-doors. Success is better obtained with such cuttings if a perpendicular notch is made in the ground with a spade, and the cuttings placed against the face of this notch, because the soil remains in a firmer condition than would be the case if a dibber were used. Cuttings will form roots more satisfactorily if the cuttings are inserted under a glass frame, having a moderate degree of heat.

FRUITS UNDER GLASS.

By T. COOMBER, Gardener to LORD LAMBERTOCC, The Hendre, Monmouthshire.

The early vinery.—Vines that have commenced to grow should now have a corresponding temperature at night of 55°, and by the time the first leaves have properly developed it should have been gradually increased to 60°. The day temperatures should be correspondingly higher, and in mild weather, when 70° is reached, a little air should be admitted. These temperatures, however, must be allowed to fluctuate more or less in agreement with outdoor conditions. Commence shading upon the weakest shoots as soon as these can be determined, and complete when it is seen which of the shoots are likely to produce the finest bunches. Only the best bunch should be left on each lateral, and these must be thinned after the fruit has set. Each lateral should be stopped at two or more leaves beyond the bunch, according to the space upon the trellis, and the sub-laterals at one leaf. Every lateral must be allowed ample space in order that the leaves may not become crowded. Keep the leaves clear of the glass, but do not be in too great a hurry to tie them quite down to the trellis. After the vines have made considerable growth they will require more moisture at the roots, especially in

the case of old vines which have their roots confined to inside borders. These must be given a liberal supply of tepid water, enriched with liquid manure.

Early Peaches.—Trees planted in borders or in pots, and now freely swelling their buds, have passed through the critical stage when bud dropping has to be feared. As soon as the flower buds show colour a little warmer temperature may be allowed. The house should be thoroughly fumigated on two evenings in succession, in order that the flowering season be passed without attacks from aphids. During the flowering stage syringing of the trees should be gradually lessened, and, during the blooming period, entirely discontinued, although in fine weather the floors should be damped daily. Extra care should be taken to keep the glass clean whilst the trees are in blossom, during which period, in accordance with the weather conditions outside, a greater or less circulation of air should be maintained during the day, but sudden changes of temperature must be carefully prevented. The temperature at night should be from 50° to 55°, and correspondingly higher during the day. In damp weather fire heat is especially necessary to cause a circulation in the atmosphere, and also to keep the pollen dry. The flowers must be pollinated each day.

Second early Peach-house.—To afford a second early supply of fruit, or a first supply where very early forcing is not practised, a house should be built close to the first for a little more closely close the house, after which, until the buds swell freely, only sufficient fire heat should be used to slightly warm the pipes. A night temperature of 40° to 45°, and a day temperature of 50° before ventilation is employed, but the thermometer may be allowed to register from 60° to 65° from sun heat with the ventilators open. Spray the trees and their surroundings with tepid water in the morning and early afternoon of fine sunny days. The borders must not be allowed to remain either too wet or too dry, and, in cases where, like ours, the borders are entirely inside, extra care in their management will be necessary, and the use of Kirk's soil tester indispensable.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VERNY GIBBS, Aldenham House, Hertfordshire.

Management of tools.—It is often truly said that one can tell a good workman by his tools. For carrying out the various kinds of work in a garden, sufficient tools of the best quality should be allowed. To my mind there is nothing more distasteful than an untidy and badly-kept tool-shed. Each man should be allowed his own tools, for which he should be held responsible. Every tool should be numbered, and each man allowed sufficient time for cleaning and replacing them, before "leaving-off" time. Once a year these should be thoroughly overhauled, repairs carried out, and, if necessary, new tools provided. The short, winter days, or during inclement weather, is the best time to give this work proper attention.

Root stores.—Examine all roots, whether stored in properly-constructed rooms or in suitable sheds. Sort them out for their various uses, and remove all which show signs of decay. Onions, whether stored on shelves or suspended in ropes, should be kept in a cool place that is merely frostproof. Even a few degrees of frost would injure them so much as subjecting them to a warm temperature.

Parsnips.—These are always superior in flavour if left in the ground until they are required for use, but, as at this season of the year a continuous frost may set in at any time, which would entail a considerable amount of labour in digging them up, it is advisable to lift sufficient for the necessary supply.

Artichokes (Jerusalem).—Many people prefer to leave Artichokes in the ground until they are required for use, but, although on many soils a better flavour is probably maintained, I do not think this is the case to the same extent as in Parsnips, and I advise that sufficient be lifted and kept in readiness in case of frost.

General work.—It should be the aim of all kitchen gardeners to have the ground walks and all appertaining to this department cleaned up and the refuse disposed of in some way or

order by Christmas Eve. There is no better method of getting rid of the rubbish than that of burning or charring it on the smother fire. A well-kept vegetable garden should be always interesting, and at no season of the year may the ability and forethought of the kitchen gardener be better judged by the condition of his garden than in the mid-winter. The plots of winter vegetables, many of them snugly protected from excessive frosts; the manured Asparagus beds, surfaced over with the soil taken from the alleys; the clean paths and general neatness are all matters of importance to the enthusiastic cultivator.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. G. L. HOFFMAN, C.V.O., C.R.F., Westonbirt, Gloucestershire.

Pleione.—These plants usually flower late in autumn or early in winter, and the flowers are produced simultaneously with the new growths. The blooms generally last three or four weeks in good condition, provided the materials about the roots are kept dry. Repotting should be carried out immediately the plants have ceased to flower, but it is not imperative to disturb the plants every year. Therefore, if the rooting material remains sweet and in good condition, it will be sufficient to repot the plants every alternate year. Before repotting, all the old soil should be shaken from the roots of the pseudo-bulbs, shortening the roots at the same time, but retaining sufficient to hold the pseudo-bulbs firmly in the new compost. Dwarf pans are the most suitable receptacles for these plants, especially if it is intended to suspend them from the roof rafters. The pans should be drained with clean crocks and lumps of charcoal, filling them two-thirds of their depth with these materials. Over the drainage place a layer of clean Sphagnum-moss, and above this employ a rooting medium consisting of fibrous peat, loam and Sphagnum-moss in equal parts, adding a good sprinkling of coarse silver sand and crushed crocks, first mixing these ingredients thoroughly together. The compost should be made up in a conical fashion in the pans, a commencement being made in the centre, taking every care to make the pseudo-bulbs secure in their position by pressing the potting compost moderately firm. Insert the pseudo-bulbs evenly over the surface, allowing sufficient space between each for the proper development of growth.

Lateral treatment.—*P. maculata* should be placed in the intermediate house, but *P. lagenaria*, *P. praecox*, and *P. Reichschbachiana* will succeed better where the atmospheric temperature is a few degrees cooler. *Pleione* should be kept near to the roof glass at all seasons. If the potting compost be used in a moderately moist condition, no further water need be applied until a month or six weeks have elapsed, and even then watering must be done sparingly until the roots are extending freely in the compost and growth has become vigorous. *P. humilis* also succeeds best in the cool intermediate house. This species flowers about mid-winter, and until then potting cannot be carried out.

Miltonia vexillaria.—This species needs very careful treatment during winter. If the plants are kept in too warm or too humid an atmosphere they will make soft, delicate growth that is sure to bring disappointment to the grower. A cool, intermediate temperature suits this plant best, and it should be kept well up to the light. In the present stage, watering must be very carefully carried out, as only sufficient is necessary to keep the pseudo-bulbs and foliage in a healthy condition. Examine the young growths occasionally, and if the edges of the inner leaves adhere to each other, they must be released with the aid of the thin part of a budding knife handle, or something that will serve the purpose equally well.

Insect pests.—During winter insect pests do not spread so rapidly as in warmer seasons, provided the temperatures and atmospheric conditions are what are needed. At the same time, it is absolutely necessary to keep those plants most liable to attack under close observation. Slugs, snails, and woodlice are voracious pests which should be persistently hunted down whenever they are present in the house. A few *Carrrots* or *Potatoes*, if placed along the front of the stage, will provide good traps; they should be examined every night and morning in order to destroy any pests that may be under them.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens or plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one side only or signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith.

Special Notice Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unused communications or illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of garden, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for losses or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, DECEMBER 22—
Roy. Hort. Soc. Com. Meet.
FRIDAY, DECEMBER 25—Christmas Day.
SATURDAY, DECEMBER 26—Bank Holiday.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last Fifty Years at Greenwich—38° F.

ACTUAL TEMPERATURES.—
LONDON.—Wednesday, December 16 (6 P.M.) Max. 51° Min. 41°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Thursday, December 17 (10 A.M.): Bar, 29.3; Temp. 51°; Weather—Raining.

PROVINCES.—H Wednesday, December 16 (6 P.M.)—Max. 50° England, south coast; Min. 41° Scotland N.

SALES FOR THE ENSUING WEEK.

TUESDAY—
Dutch Bulbs, Herbaceous Plants, &c., at 11; Roses and Fruit Trees at 10; Azaleas, Palms, and Plants at 8, at 7 & 68, Cheapside, E.C., by Protheroe & Morris.

WEDNESDAY—
Orchids in variety at 67 & 63, Cheapside, E.C., by Protheroe & Morris, at 12.45.

Part II. of the Annual Report of the Intelligence Division of the Board of Agriculture for 1907 has recently been issued. It is embodied in a booklet of 41 pages, of which 18 are devoted to lists—one arranged according to counties, the other alphabetically—of the names and addresses of the honorary agricultural correspondents appointed by the Board.

The remaining 23 pages contain an account of the proceedings of the Board under the Destructive Insects and Pests Acts, 1877 and 1907, and Section 2 (Subsection 3) of the Board of Agriculture Act, 1884.

Among the matters of horticultural interest dealt with in the Report, the American Gooseberry-mildew occupies the first place. Although uncertain as to the centre of distribution of the disease—that is, as to what place the diseased gooseberry bushes were first introduced—the Board has satisfied itself that the mildew has existed in the Evesham district, also in Wisbech and Huntingdon, for three or four years, and that it is at present spreading rapidly.

As soon as it was discovered that the disease was so widely spread, the Board found it advisable to modify the order dealing with the American Gooseberry-mildew requiring the destruction of all diseased bushes. Indeed, when it came to their knowledge, subsequently to the issue of the order, that only the young wood of the bushes was capable of infection, it became apparent to the Board that drastic pruning, with destruction by burning of the prunings, would be as efficacious in prevent-

ing the spread of the disease as total destruction of diseased bushes.

We shall await with interest the publication in later Reports of the results which have attended this policy.

We cannot feel confident that all that might have been done has been done in the direction of obtaining a complete knowledge of the life-history of the fungus of this Gooseberry-mildew or of its vulnerability to fungicides. In saying this we must not be understood to be casting reflections on the Board of Agriculture, but rather on the lack of system which enables diseases of this kind, whose approach has been heralded for years, to effect the invasion of the country unresisted. If the Intelligence Department of the Board of Agriculture can so systematise and guide the work which is being done, or at any rate ought to be done, at the agricultural colleges and similar institutions in this country, so that the attacks of these plant enemies may be met by organised and ready counter-attacks, it will not only have justified its existence but will also have earned the gratitude of the horticultural community.

The formation of the Intelligence Department was in itself a wise step; but it is only a first step. Horticulturists have a right to look to the Board of Agriculture for more help than they have received in the past. We believe that more money is likely to be forthcoming in the near future for the purposes of agricultural instruction and investigation. If so, then some of these extra funds should be devoted specially to horticulture. In issuing the American Mildew Order, the Board has had its eye severely on the horticulturist; in issuing the revised grants for education and research it is only fair that the Board should remember his claim to a share. It is time, for instance, that something more should be done for the benefit of the fruit-grower. What he wants is advice, based not, as it often is at present, on mere opinion, but on certainty. Certainly in these matters is not an impossibility, but it can only come when the problems like those of disease have been studied one by one patiently and thoroughly in the laboratory and when the solutions arrived at there have been properly tested in the open.

For this to be done effectively, the laboratories and experimental stations must be adequately staffed and equipped. With a more liberal endowment, ability now wearing itself out in routine teaching would be set at liberty for the purpose of investigating the many matters on which now we are in ignorance. Then, no doubt, the Reports of the Board would grow in volume and usefulness.

The new Universities have their Faculties of Commerce, their Departments of Agriculture; why should some of them not have also Faculties or Departments of Horticulture? Departments staffed by practical men of ripe experience as well as by men trained in the art and practice of scientific investigation?

OUR ALMANAC.—According to our usual practice, we shall shortly issue a *Gardeners' Chronicle* Almanac for the year 1909. In order to make it as useful as possible for reference, we shall be obliged if Secretaries of Horticultural, Botanical and Allied Societies, or any of our correspondents, will send us IMMEDIATE INTIMATION of all fixtures for the coming year.

OUR SUPPLEMENTARY ILLUSTRATION portrays two new Roses raised by Messrs. S. MACGREGG & SONS, Portadown, Ireland. They were exhibited at the meeting of the Royal Horticultural Society on October 13 last, and both received Awards of Merit from the Floral Committee on that occasion. The variety shown in the upper part of the picture—Mrs. Edward J. Holland—is a deep rose-pink in colour, and quite distinct from the reddish-yellow of the bottom flowers that are named after Mrs. ALFRED TATE. The varieties belong to the Hybrid Tea section, a class that has furnished some of the finest Roses in recent years. The variety Mrs. Edward J. Holland develops large leaves, which show to advantage the beautiful deep rose colour of the blooms, that in the older petals is of a lighter tone. The variety Mrs. Alfred Tate does not possess a large number of petals, so that a full-blown flower is like a large single Rose. The colouring in the buds is extremely beautiful, being of that beautiful coppery-red tone that is so much admired in Roses. This coppery tone loses itself in a base of yellow suffused with reddish-pink.

ROYAL HORTICULTURAL SOCIETY.—The last meeting of the Committees in 1908 will take place on Tuesday, December 22, in the Hall, Vincent Square, Westminster.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—We are informed by the secretary that Messrs. GEO. MONRO, LTD., Covent Garden, have forwarded to the funds of the Institution the sum of £5, being the amount of nominal damages received by them for the improper use of their baskets and infringement of their trade mark, "GEO. MONRO."

NATIONAL HORTICULTURAL SOCIETY OF FRANCE.—This society, which holds such fine horticultural shows in Paris every May and November, was founded in 1855. Every 10 years the shows are international. A monthly journal is supplied free to members. There is a fine library of over 15,000 volumes, housed at the headquarters of the society, 84, Rue de Grenelle. Twelve committees carry on the work of the society, which now numbers 4,023 members. The annual subscription is 20 francs.

DUBLIN SEED TRADE ASSISTANTS.—The Dublin Seed and Nursery Employees' Association held their annual dinner in the Gresham Hotel on the 12th inst., when members and guests to the number of 145 assembled. Among the speakers were Mr. JAMES ROBERTSON, of Messrs. HOGG & ROBERTSON, LTD., who occupied the chair; Mr. F. W. MOORE, of the Botanic Gardens, and Mr. J. HALLISSY, of the recently-formed department for Soil Analysis on the Geological Survey. Vocal and instrumental music was rendered during the evening.

INDELIBLE INK FOR GARDENERS' LABELS.—We have received from Mr. G. S. NEWTH some zinc labels bearing names written with a special ink which he has invented. The ink may be used also upon galvanised iron, but not upon paper or wood. The writing is said to be absolutely permanent, being entirely unaffected by weather, and it can only be erased by mechanical means, such as rubbing with a file or sand-paper. The preparation is known as the "Gardener's Labelink." There are already various inks upon the market for the same purpose, and their value, of course, depends upon their indelibility and permanence. We have had no opportunity to test this latest preparation by ordinary wear, but doubtless our readers will soon have an opportunity of testing it for themselves.

GERBERA JAMESONII.—At the recent Paris show, M. AUBERT, of Cap d'Antibes, showed a group of varieties of Gerbera Jamesonii. It was a prettily-arranged group, set out with Ferns, Ac., and the flowers were light and dainty in form. We understand M. AUBERT has obtained a large number of varieties which are valuable for floral decorations. The following were awarded First-class Certificates:—President Graveure (straw-yellow), M. S. Mottet (orange-yellow), Mlle. Kunon (pure white), Mme. de Vilmorin (salmon-rose), Mr. Irwin Lynch (violet-rose), and Mme. Bosch (orange-rose).

BRITISH COLUMBIA FRUIT.—During the last few years it has been demonstrated to the British public that British Columbia can produce excellent fruit and that this fruit can be transported to this country and hold its own in the open market in competition with the produce of other and, as yet, better known fruit-growing countries. The first occasion, we believe, at which British Columbia fruit was prominently brought to public notice here was in 1904, when an exhibit sent by the Department of Agriculture gained a gold medal and diploma of the Royal Horticultural Society. It also caused the Agent-General of British Columbia to be "deluged with letters from prominent fruit-dealers anxious to do business with British Columbia fruit-growers." Further successful exhibits have been made in succeeding years, including that on the occasion of the recent Colonial Fruit Show at Vincent Square, On Wednesday this week, Lord STRATHCOX and MOUNT ROYAL, the High Commissioner for Canada, opened at the Imperial Institute, South Kensington, an exhibition of British Columbia Apples. Some 28 varieties were exhibited, and they were in the main of very attractive appearance, having that richness of colouring which is so well marked a feature in the picked fruit from this region. British Columbia fruit, it must be remembered, has to make a long journey—some 6,000 miles—by rail and sea before it reaches this country, and the appearance of the fruit is a tribute to the care bestowed in handling and packing and to modern scientific developments in the matter of cold storage. It seems probable that the length of journey on land, in addition to the voyage and the consequent expense, will not allow the fruit ever to become cheap in the United Kingdom, but high-grade fruit attractive for dessert purposes can, it has already been shown, be sent over and sold at remunerative prices. However, British Columbia is not dependent on this market, having close at hand a demand for fruit which will no doubt keep her growers employed for some time to come and allow of great development of the industry. Although so recent a development, the cultivation of fruit is already affecting a quiet revolution in some respects in British Columbia. Former huge ranching estates of 1,000 to 30,000 acres are being cut up and parcelled out into small, often quite small, areas on which more intensive cultivation is practised. Much of the fruit is grown on what are known as "dry lands," rich loamy deposits in certain favoured valleys, which, when irrigated, yield abundant crops. The fruit is grown by the aid of irrigation in a normally dry climate. The water has sometimes to be brought from some distance, and co-operation is obviously necessary to allow the small grower to take up his work. In some cases companies have bought up large areas formerly used as cattle ranches, which, after irrigating, they are selling in lots of 10 acres or so to industrial settlers who are taking up fruit growing or mixed farming. The rapidly-developing fruit industry is an excellent illustration of commercial enterprise and applied scientific knowledge working hand in hand.

FLOWERS AND FLORISTS AT RIO JANEIRO.—The land of Brazil has many wonders of the vegetable kingdom to exhibit to the traveller; as, for example, the gigantic trees of the primeval forests, the magnificent groves of Palms on the coasts of the South Atlantic Ocean, and the wonderful Lianas, those destroyers of trees. In one point the traveller will be greatly disenchanted. Where is that rich floral beauty that he expects to find, and which he found in Madeira in endless abundance? Where are the Roses, as we have them in temperate climates, the Cannas, the Asters, the Chrysanthemums, Hortensias, and the expensive Carnations, which formed the entire riches of the floral world at Rio? With a solitary exception, that of the Bazar Rosenbaum, in the Arenides Central, no well-made bouquet of natural flowers was there to be discovered, and yet there are many strangers at Rio who are accustomed to European fashions in the bouquetist's art, and see no beauty in the "creations" of the native florists. It is by no means easy to obtain fresh flowers at all seasons; for one reason, the plants are difficult to grow, owing to the lack of a rest period. Still, what there are to be found there could be employed to better purpose than is now the case. What is required are some Europeans with a good knowledge of plants and flowers suitable for the climate; and the best manner of employing them. Persons with the necessary knowledge and equipment would be able to do a lucrative business.

"THE COUNTRY HOME."—We have received a bound volume containing the six first numbers of this monthly magazine. The articles deal with all the features and characteristics of country homes, including the furnishing, working and other matters concerning the indoor department, as well as outdoor pursuits such as gardening, beekeeping, cider making, the cultivation of small holdings, intensive culture of garden crops, rearing of poultry, pigs and goat-keeping. The somewhat difficult servant problem is dealt with under the title of "How to live without servants," but we fear that this is only possible in certain circumstances, and the advice is, therefore, of too negative a character to be generally helpful. Each number contains articles on current work in the garden, and in addition there are separate articles on the making of lawns and the cultivation of Roses. The volume is abundantly illustrated with excellent half-tone reproductions from photographs, and may be recommended as a suitable presentation book for the present season. The monthly numbers are published at sixpence.

ITALIAN FENNEL OR FINOCCHIO.—Italian Fennel is but little known in this country, but in gardens where blanched Celery is grown we ought to find Fennel, the uses being identical. The plant requires a deeply-trenched, porous, well-manured soil and a sheltered situation. Sowings should be made early in the month of May, and preferably in the open ground. Some gardeners sow Fennel seeds to the number of three in groups, distant about 1 foot apart where the plants are to grow and mature. When the seedlings have grown strong, the weaker plants should be thinned out and the strongest left to complete their growth. About the first week in September preparation should be made for blanching the stems, as is done with Celery, or the plants may be transplanted into furrows or trenches, which must be filled up by degrees. The blanched tubers are usually eaten with salt in the manner of Celery, or cut into thin slices and made into a salad.

* The Country Home, Vol. 1, May to October, 1908. (Archibald Constable & Co., Ltd. Price 5s. 6d.)

with oil, vinegar, and ground pepper. Those persons who cannot eat raw salad should have the tubers cooked till tender. The preparation of the tubers after cooking is the same as when they are eaten raw. The flavour resembles that of Celery, but is more pleasant. Further, the Fennel, when cooked, should have salt added to the water, and it may then be eaten warm, cutting it into thin slices and serving with melted butter.

IRRIGATION FIELDS AT HAMBURG.—In a lecture given recently before the Horticultural Society of Hamburg, Altona, and district, by Prof. Dr. KOLKOWITZ, of Berlin, concerning irrigated land, he stated, among other things, that on an area of one morgen of Spinach a sum of 200 marks was received in the months of March and April, in May and June 100 marks, and in July, August, and September 150 marks. Against this sum of 550 marks there accrued expenses 60 marks; but the net profits were considerably reduced by the cost of carriage to market, insufficiency of the sales, and waste.

VEGETABLE IMPORTATION INTO GERMANY FROM HOLLAND.—It is stated by a Dortmund correspondent of *Die Gartenwelt* that the imports of vegetables from Holland increase from year to year. In the present year these have reached considerable dimensions. The greater proportion of the fresh vegetables on sale at the weekly markets of such large towns as Essen, Bochum and Gelsenkirchen, come from Holland. The cultivation of vegetables in the Rhine provinces and Westphalia suffers from great competition, which makes itself severely felt in the vicinity of Dusseldorf. The heavy importation has its reason, not in the better quality of the produce or the low prices at which it is sold, as that the cultivation of vegetables in the Rheinisch-Westphalish provinces is very much below the increasing requirements of the inhabitants. It would seem that the cultivation of vegetables in both of the western provinces has not reached the dimensions which it should have reached, in view of the large local demand. This is certainly the case in the fertile district of Hellwegs, in which Corn crops are still considered of great importance, in spite of the ever-lessening prices obtained for the produce.

Publications Received.—*Amateur Gardening* (Christinas number). Price 6d.—*Live Stock Journal Almanac, 1909*. (London: Vinton & Co., Ltd., 5, Bream's Buildings, Chancery Lane, E.C.) Price 1s.—*Flore Alpine*. Par H. Corveion et Ph. Robert (Geneva: Edition Atar, Coraterrie, 12.)—*The Gloucester Diary and Directors' Calendar for 1909*. (Gloucester Railway Carriage and Wagon Co., Ltd.)—*Wax Craft*, by T. W. Cowan. (London: Sampson Low, Marston & Co., Ltd., Tudor House, 32, Warwick Lane.)—*The Estate Magazine* (December). Price 6d.—*The Journal of the Royal Horticultural Society*, (November, 1908). Vol. XXXIV, Part II. (London: R.H.S. Office, Vincent Square, S.W.) Price 5s.—*Garden Cities and Town Planning*. (December.) (London: Garden City Association, 602-3, Birkbeck Bank Chambers, Holborn, W.C.) Price 1d.—*The Agricultural Journal*, (November.) (Cape Town: Cape Times, Ltd.) Price 6d.—*Key Bulletin of Miscellaneous Information*. Appendix IV. 1908. Containing list of staffs in the botanical departments at home and in India and the colonies. (London: Wyman & Sons, Fetter Lane, E.C.) Price 1d.—*The Edinburgh Field Naturalists' and Microscopical Society's Transactions*. Session 1907-8. (Edinburgh: William Blackwood & Son.) Price 4s.—*Missouri Botanical Garden, Nineteenth Report, 1908*. Containing contributions on "The Florida Strangling Ficus," by Ernst A. Bessey; "Crataegus in Missouri," by Professor Charles Sprague Sargent; "An Ecological Cross Section of the Mississippi River in the region of St. Louis, Missouri," by Henri Hus; "Illustrated Studies in the Genus *Opuntia*,"—1., by David Griffiths; and "Agave rigida—*Furcraea rigida*—*Agave angustifolia*," by William Tutin. (Mo.: The Board of Trustees, St. Louis.)—*Vinton's Agricultural Almanac and Diary, 1909*. (London: Office of the *Agricultural Gazette*, 8, Bream's Buildings, Chancery Lane, E.C.) Price 1s.—*Wobster's Foresters' Diary for 1909*. (Seventh edition.) (London: William Rider & Son, Ltd., 164, Aldersgate Street, E.C.) Price 2s. 6d. net.

* PRONUNCIATION OF PLANT NAMES.

PRONUNCIATION.—In the first word in each line the accent (') is short; (˘) is long.

In the second word vowels are to be pronounced as—

arise, ät, äge, ärt, äir, äll
end, ägg, äat, ärr, äwe
in, it, iie, sir
on, ötter, öwe, ör, dö, öwl, öll
us, ütter, use, ür
"ch," as in chin; "th," as in thin
"s," as in soft; "f," as in fat
"g," as in go.

All other letters are unmistakable.

PUBLIC PARKS AND GARDENS.

CHRYSANTHEMUMS IN VICTORIA PARK, LONDON.

For many years an exhibition of Chrysanthemums has been held in this park during the months of October and November, and in fig 176 is reproduced a view of one of the principal glass-houses during "Chrysanthemum time." This house is 100 feet long and 25 feet wide, and, as may be seen on reference to the illustration, the plants are arranged on either side of a central path. Each end is pleasingly draped with tall, naturally-grown plants, right up to the apex of the roof. Mary Richardson, an attractive single Chrysanthemum of bronze colour, was employed at one end of the building, and the variety Margot at the other, while the sides of the building were arranged with masses of such varieties as Source d'Or, La Triumphant (both the pink and the yellow varieties), white and yellow Middle L., roix, crimson and white Quintus,

care of Mr. W. J. Moonman, who is to be congratulated on the excellent effect obtained from the Chrysanthemums this season.

WATERLOW PARK.

A suggestion was made some two years ago to the London County Council to convert a few of their "Old English Gardens" into "Shakespeare" gardens. This was adopted, and four parks, Ravenscourt, Golder's Hill, Brockwell and Waterlow Parks, were supplied with those plants the names of which were mentioned by Shakespeare which were not included in their collection of herbaceous plants.

For the guidance of visitors, the name given by Shakespeare is put on the labels, in addition to the English and botanical names, they are also marked "Shakespeare." The arrangement has not, however, brought about any great change in the arrangement of the borders. Large clumps of Rudbeckias, Helianthus,

THE WHEAT CROP OF 1908.

It has been remarked that so far as climate is concerned, the British Isles are outside the zone favourable to the growth of Wheat, and that its successful cultivation is due to the skill of the farmer in contending against adverse meteorological conditions.

It is true that the area under Wheat is rapidly diminishing, and that its continued growth appears to gravitate towards those districts where the climate or the soil, or the combination of the two, is the most favourable.

But the great decline in area cannot be attributed to any general change for the worse in the characters of the climate. Indeed, the records at the Rothamsted Experimental Station in Hertfordshire show that the season of 1908 was, upon the whole, extremely favourable for growth of the Wheat crop.

The harvest year, September 1, 1907, to August 31, 1908, shows that the total rainfall amounted to just over 30 inches, or 2 inches in

FIG. 176.—CHRYSANTHEMUM HOUSE IN THE VICTORIA PARK, LONDON.

and other decorative and well-known free-blooming varieties.

The main banks on each side of the pathway are undulating, the arrangement displaying to the very best advantage the large-flowering and fading varieties in the Japanese, incurved, and Anemone sections. In the centre of the group were several of the best single varieties, including the Pink and Bronze Pagram, Miss Mary Anderson, Anne Holden, and Mary Richardson. A group of the white Moneymaker—the long-keeping qualities of the blooms found a host of admirers—was also employed. The whole was edged with well-grown and profusely-bloomed plants of Ladysmith, a useful single variety, that well withstands the effects of the constant rubbing caused by visitors. At certain times, and especially on Sundays, visitors may be seen waiting in a row extending for 100 yards outside the entrance, for their turn to enter. Victoria Park has for many years been under the

Asters, Lilliums, Kniphofias, backed up with Dahlias of varied sorts, can be seen. Batches of Sweet Peas also run the length of the border.

Waterlow Park probably possesses more fruit trees than any other London park. With its orchard of Pears, Apples and Plums, the park also has its historical associations. Lauderdale House, the lower portion of which is used as a refreshment room, was bought by Charles H. for Nell Gwynne. The marble bath used by Nell Gwynne is still to be seen in the oak-pillared hall. Andrew Marvell also lived within the precincts in 1657. A brass tablet now marks the site of the cottage. Near by is the estate of the late Baroness Burdett Coutts. On the terrace of Lauderdale House there is a sundial with a brass plate bearing the words: "This plate is on a level with the dome of St. Paul's Cathedral," a statement which will suffice to indicate the elevation at which the park is situated.

excess of the average of 55 years at Rothamsted.

The bright sunshine showed a total of 1,641 hours, being 39 hours in excess; while the mean temperature for the year was about 4° above the average record.

It may be stated, therefore, without fear of contradiction, that it is to the greatly increased production of Wheat in other countries at a lower cost than in our own, and to the low rates of transport by which it is brought into our markets in quantity, at a price which lowers the value of the home produce, that the reduced area under Wheat is chiefly to be attributed.

From the Board of Trade returns we find that the total area under Wheat in the British Isles for the present year was 1,626,733 acres, against 1,625,445 acres in 1907, being an increase of 1,288 acres.

Fifty years ago the total area under Wheat in the United Kingdom was over four millions of acres, 30 years ago it had declined to about

3½ millions of acres, while now only about one-half that number of acres is sown with Wheat.

Wheat is still described as an average crop for 1908, and the yield on the whole has been but little affected by the ungenial weather of August, although complaints are numerous as to delay in harvesting and deterioration of quality.

ROTHAMSTED EXPERIMENTS.

The world-renowned experimental Wheat field at Rothamsted, which has this year grown its 65th crop of Wheat in succession on the same land, was most satisfactory both as to quantity and quality.

For the first eight years the manuring was of a varied description, so that only three of the 20 plots have received the same treatment during the whole period of 65 years.

The plots as seen to-day began in 1832, since which time the few changes in manuring have been matters of detail and not of principle.

The produce of Wheat for this year has been somewhat variable, about one-half the number of plots have given above the average yield, while the remaining half have produced a slightly lower than average quantity; but the quality, as indicated by the weight per standard bushel, is considerably above the average record, and ranges from 63 to 65 lbs. per bushel.

The quantity of Straw per acre is mostly a little under average, three plots only giving an excess. The proportion of Corn to Straw is generally satisfactory.

THE UNMANURED PLOT.

Probably the greatest agricultural interest is attached to Plot 3, where Wheat has been grown without manure of any kind every year since 1843, and for four years previously no manure had been applied to the field, so that the present crop of 1908 is the 68th without manure.

After a drop in production during the first few years, the yield of Wheat has been practically constant for the last 40 years, fluctuating only with the season, and showing no immediate prospect of declining. The produce of the present year is 12½ bushels per acre, of the weight of 63½ lbs. per bushel, and 7½ cwt. of Straw per acre.

In fact, this remarkable area of land, which possesses only moderate fertility of soil, gives more Wheat per acre, after this long period of exhaustive cropping than the average Wheat crop of the world, and more per acre than the average of all the rich prairie lands of America.

THE FARMYARD MANURE PLOT.

If the unmanured, Plot 3, is slightly declining in fertility and yield, there can be no doubt that the farmyard manure, Plot 2, is increasing in fertility. Analysis at different periods shows that the surface soil has become more than twice as rich in nitrogen as the unmanured land. In fact, a large amount of the constituents of dung accumulates within the soil, and they are taken up very slowly by the Wheat crop.

It is remarkable that, notwithstanding this great accumulation of plant-food within the soil, the crops on the dunged plot never show excessive luxuriance. The crop of the present year was 32½ bushels of 64.8 lbs. weight, and 34½ cwt. of Straw per acre.

EFFECT OF NITROGENOUS MANURES.

The yield of Wheat is found to increase with each addition of nitrogen. Comparing Plots 7 and 8, with 400 lbs. and 600 lbs. of ammonia salts respectively, the increase is from 33½ bushels to 47½ bushels per acre, although the weight per bushel is ¼ lb. less with the larger quantity of ammonia salts. The Straw is even more affected by a free supply of nitrogen, rising from 30½ cwt. to 44 cwt. per acre.

The proportion of Corn to Straw being, on Plot 7, with 400 lbs. ammonia salts, 65.7 per cent., while on Plot 8, with 600 lbs. of ammonia salts, it is but 62.9 per cent.

Comparing Plots 7 and 8 with Plots 9 and 16, the results show that nitrate of soda is a more

effective source of nitrogen than the ammonia salts on the moderately stiff Rothamsted soils.

With 275 lbs. of nitrate of soda per acre, combined with superphosphate and sulphate of potash, the yield is 51½ bushels of Wheat of 65 lbs. weight, the highest in the series, with 20½ cwt. of Straw; while Plot 16, receiving 550 lbs. of nitrate of soda, which corresponds in quantity of nitrogen to 400 lbs. of ammonia salts, gives 33½ bushels of Wheat of 64 lbs. weight, against 38½ bushels of 64.7 lbs. weight on Plot 7. The quantity of Straw on the two plots being 30½ cwt. and 35½ cwt. per acre respectively.

PRICE OF WHEAT.

As regards the price of Wheat, there has been a general tendency towards decline during the last 30 years. The proportion of total Wheat consumed in the United Kingdom which is derived from foreign sources is rapidly increasing, and the drier foreign Wheats will undoubtedly yield a larger percentage of flour, and flour of better quality than much of the home-grown grain, even when produced in such a favourable season for quality as the present. *J. J. Willis, Harpenden.*

LAW NOTE.

FARMER'S ACTION AGAINST SEED MERCHANTS.

At the Birmingham Assizes held on December 10, Mr. Robert Tunncliffe Pooler, farmer, of Sutton House Farm, near Newport, Salop, brought an action against Messrs. White Brothers, Limited, seed potato merchants, Evesham, claiming £335 10s. 11d. damages for certain alleged breaches of warranty on the sale of seed Potatoes.

Counsel for the plaintiff explained that the defendants admitted that they contracted to supply the Potatos, but they denied that they gave any warranty. On the contrary they said it was part of the expressed term of the agreement that they would give no warranty, and they stated that the Potatos corresponded to the description given. They denied all damage, and set up a counterclaim for the price of the Potatos. An invoice was forwarded to plaintiff on April 23, and attached to it was a pink slip stating that the defendants gave no warranty express or implied, and, while taking every care, accepted no responsibility in regard to the crop.

Plaintiff, giving evidence, said that, relying on the statement that the grower said the seed was all right, he carted the Potatos from the station to his farm, and they were planted almost immediately. They came up very irregularly, some being ready for sowing when others were just coming through the surface, this indicating different varieties of seed. He had not sold any of the crop, but had given his workmen about five acres of the Potatos to get them up and clear the land. The men would get about 5 tons, but an average good crop was 12 tons to the acre, representing 10 tons for the market and two tons for seed. There were not 2 per cent. of the Potatos of the "Up-to-Date" variety, the others being every mixture imaginable. He estimated his loss at £25 2s. 6d. per acre.

Cross-examined by Mr. Vachell, plaintiff said he had not received any letters with a pink slip similar to that attached to the invoice.

Mr. Vachell, for the defendants, contended that the contract was entered into with the most distinct notice to the plaintiff that the defendants could not hold themselves responsible for seed coming up according to the name under which it was sold.

Richard White, managing director of White Brothers, Evesham, said the "Up-to-Date" seed was purchased from William Holmes, Cambridgeshire, according to sample, and he was satisfied that it was all "Up-to-Date" seed. The pink slip setting forth the non-warranty clause was attached to all quotations and invoices. On March 14 he wrote to plaintiff quoting various prices, and to that letter a pink slip was attached. There were also slips attached to letters dated April 3 and April 4.

The Judge said the main question for the jury was whether or not the non-warranty clause on the pink slip was part of the contract between

the parties. That depended first upon the question whether the letters of March 14, April 3 and 4 were in fact written. If the jury found that the slip containing the non-warranty clause was no part of the contract, then everything was fairly plain sailing.

Mr. Vachell argued that Mr. White did all he could to ensure obtaining good seed. He went to a well-known grower in Cambridgeshire, but he was bound to protect himself, because he could not guarantee a good crop, and therefore was obliged to attach a non-warranty clause to the contract. All he said was that if customers were willing to buy seed on those terms he was willing to sell at such prices. Plaintiff had distinct notice of the terms upon which the defendants traded, because there was evidence that the letters which the plaintiff said he did not receive were written and posted, and that they contained the non-warranty clause. He contended that the plaintiff did not act reasonably in the matter. If the Potatos were bad he should have returned them to the defendants and purchased others in the market. Then he could have claimed the difference in the cost, if there was an increase, from the defendants.

The Judge reminded the jury that the plaintiff contracted to buy a certain quantity of "Up-to-Date" Potatos, and did not get them. He planted them, and got a miserable and mixed crop. Plaintiff did not get what he bought, and had consequently suffered loss. Surely he was more entitled to sympathy than the defendants. The seed was not what it was represented to be. On the question of warranty, he argued that no farmer would be bound by any such condition as that which it was alleged was imposed by the defendants. Was it reasonable to suppose that the plaintiff would accept Potatos from the defendants who said, "These are 'Up-to-Date' Potatos, but whether they are 'Up-to-Dates' or not you will have to pay the full price for them?" Plaintiff had no knowledge that the defendants only contracted on the terms specified on the pink slip. He never received a letter with a pink slip attached to it until he received the invoice. He would not have contracted with them had he known the terms contained on the pink slip.

His Lordship, in summing up, invited the jury to say, first of all, whether the contract between the parties included the non-warranty clause.

The jury retired, and on returning into Court, said they were of opinion the plaintiff was unaware of the non-warranty clause when the contract was made.

This was a verdict for the plaintiff, and the only question remaining was one of damages. The Judge addressed the jury on that point, and said there was a counterclaim for £30 13s. 6d., the price of the seed Potatos, which had not been paid for, and the jury might if they liked deduct that sum from the damage they awarded.

The jury assessed the damages at £242 less the amount of the counterclaim. Judgment was consequently given for £216 6s. 6d. Execution was stayed on the usual terms.

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

GARDENERS AND MUSIC.—I was much interested in reading the paragraph about Kubelik on p. 413, and to learn that he was the son of a gardener. I have often thought that there was nothing in life so beautiful as music, children and gardening. If any young gardener has a desire for a hobby, let me advise him to take up the study of some musical instrument such as the violin, flute, piccolo or concertina, or if anyone is gifted with a musical voice let him cultivate it. I know of nothing, apart from my gardening practice, that has given me so much pleasure as music. I shall never forget a holiday I spent with my musical friend, H. Maukham, at Wrotham Park, when, night after night, until midnight, we made merry with such concerts as were probably never heard before in the same room in which the celebrated Gramophone, the late W. Thompson, wrote his book on vine culture. Nothing will be lost by encouraging musical opinion amongst young gardeners. *Victor H. Lucas, Gardener to the Borough Council, Barrow-in-Furness.*

WHITETHORN IN BLOOM.—A small tree of the ordinary Whitethorn or May (Crataegus Oxyacantha) has several trusses of flowers open and in bud at the present date (December 12). We have many other trees and shrubs flowering out of their usual season, but I have never known the ordinary May to do this in December before; the tree is growing in a moist, shady position, surrounded by other trees and shrubs, and it flowered as usual last spring. There are no leaves on it, neither young nor old. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

ESCALLONIAS.—In Mr. Clark's published list on p. 408, he omitted two varieties which succeed here better than all others. *E. Ingranii* is the hardiest of all, and grows here freely on north walls, where it very seldom gets injured by frost; even the severe frost of February, 1890, did not kill it. I do not know the origin of this variety, it resembles *E. punctata* more than any other that I know, and I have previously referred to it in these pages under that name—it now proves to be distinct. The *New Hand-List* includes it under *E. macrantha*, but it has not much resemblance to that variety, and it is very much hardier. Probably it was raised at Windsor and sent here afterwards, as in the case of several seedling fruits. It flowers very freely, and soon makes a bush measuring 10 feet across. The other variety omitted is *E. sanguinea*, this is entered under *E. punctata* in the *New Hand-List*. The Escallonias are a very dark red, the darkest of all the Escallonias. It grows rather thinly, with long shoots, after the style of *E. punctata*, and is certainly one of the most desirable in the whole genus. I noticed it some years ago growing remarkably well near Waterford, Ireland; probably all the forms would do better in that warm, moist climate than they do in this country, but we can grow most of them here on warm walls. *W. H. Divers, Belvoir Castle Gardens, Grantham.*

RED AND GRIZZLY GRAPES.—If *F. M.* would teach cultivators who are not proficient in knowledge how to grow the desirable black and white Grapes, such as Muscat of Alexandria on the one hand and Madresfield Court, Black Hamburg and Mrs. Pince on the other hand, he would render more assistance than in attempting to resuscitate such sorts as West's St. Peter's Royal Ascot, and many other sorts named by him on p. 406. With regard to flavour, Gros Colmar is not highly prized with that quality, but this Grape is prized by invalids because it is juicy, soft in the flesh, refreshing, and, what is also of much value, it is not sweet. *Z.*

GRAPE MUSCAT OF ALEXANDRIA.—This Grape has been the cause of more discussion as to nomenclature than almost all the vines in commerce, but surely the recent incident at the R.H.S. Hall was the most novel and astounding of all! The facts appear to be these. Mr. Vert entered (at a local show) two bunches of Grapes in a class for Muscat of Alexandria cut from a vine which he had grown for some time as that variety. The judges agreed that for colour and finish this exhibit was distinctly superior to any other, but deciding that the Grape was not Muscat of Alexandria, they awarded Mr. Vert the second prize. The class was distinctly confined to a particular variety. This particular exhibit was not regarded as true to name, yet they awarded it the second prize. If the Grape was not true to name it should have been disqualified and no prize awarded. One of the judges is reported to have said at the committee meeting that the berries from the bottom of the bunch there tested were of better flavour than those from the top of the same bunch. I do not think such an opinion as that will carry any weight with experienced Grape growers; it would be difficult to understand why there should be any distinction in the flavour of one part of the bunch to another, especially the bottom in preference to the top. I tasted the berries cut from the bunch in both places, and failed to detect the slightest difference. I have no hesitation in saying that the Grape is true to name. I know that soil, treatment and contact with other Grapes—that is, contact when inarched on another variety—do influence the flavour of this Muscat; especially will different culture make a slight variation in flavour. I am an adherent of the opinion so

freely expressed that there are but two varieties of white Muscat—Alexandria and Canon Hall, the latter a seedling raised from the former variety at Canon Hall, near Barnsley. The late Dr. Hogg, in his *Fruit Manual* gives no fewer than 15 synonymous names for Muscat of Alexandria. Such so-called varieties as Rowood Muscat are simply seedlings from the original Spanish Grape, but they do not differ sufficiently to warrant separate names. *F.R.H.S.*

SOCIETIES.

ROYAL HORTICULTURAL

Scientific Committee.

DECEMBER 8.—*Present:* E. A. BOWLES, M.A., F.L.S. (in the chair), Messrs. G. S. SAUNDERS, W. C. WORSDELL, W. FAWCETT, J. T. BENNETT-POE, A. WORSLEY, J. DODGAS, W. HALES, J. ODELL, G. MASSEE, J. FRASER, and F. J. CHITTENDEN (secretary).

Eggs of earthworm.—Mr. G. S. SAUNDERS showed some of the egg capsules of the earthworm—small, roundish or ovoid sacs of a yellowish-white colour, each containing a few fertile eggs.

Grease bands.—Mr. VOSS again showed a grease band taken from the same tree as that shown at the last meeting. A few male and female specimens of *Cheimatobia humata* had been captured during the past fortnight.

Proliferation in Pear.—Mr. W. C. WORSDELL showed a Pear having a second Pear developed from the apex just within the calyx.

Rhizophores of Selaginella.—Mr. WORSDELL also showed specimen of *Selaginella inaequalifolia* having rhizophores developed into leafy shoots. In this species the rhizophores are dark brown, and are borne normally at the fork of the stem, one on the upper and one on the under surface. In several instances in the specimens shown the rhizophores had become changed into leaf shoots, sometimes partially, sometimes entirely. Mr. WORSDELL said this could be induced if the two branches of the forked stem are cut off just above their place of origin in their young state. In some plants of *S. Martensii* at Kew growing in a pan, those parts which were most bore rhizophores in the normal manner, while in the upper part where the atmosphere was drier, instead of rhizophores, leafy shoots had developed.

Stemms of Orchids variable in number.—Mr. W. FAWCETT showed drawings of the Orchid *Epidendrum Ottonis* made from plants occurring wild in Jamaica. The flowers always there have three stamens, while in Trinidad five stamens are developed in the same species, and in Venezuela the structure, according to Reichenbach, is normal.

Raisins.—Mr. BENNETT-POE showed a portion of a bunch of excellent Raisins. Last year (1907) two bunches of Black Muscat Raisins had been placed in bottles in a dark cupboard. They had been forgotten, but were found in November of this year, when it was seen that each of the stems had sent out roots, which had died, owing to the subsequent drying up of the water. The Grapes had dried up and become converted into Raisins of excellent appearance and flavour.

Nerine hybrids.—Mr. WORSLEY showed inflorescences of two *Nerines* to illustrate the fact that *Nerine tardiflora* is a hybrid, having *N. flexuosa* var. *pulchella* as one of its parents. He also showed part of the scape of a *Marica*, on which numerous small plants had developed, and stated that plants raised from these buds took longer to arrive at a flowering stage than those of the same species raised from seed. In some species of *Marica*, however, there is no retardation of flowering following vegetative reproduction.

Interesting Orchids.—Mr. F. W. MOORE, of Glasnevin, sent two very interesting Orchids, *Arachnanthe Lowii* and *Angraecum caudatum*. In the former the first three or four flowers of the very long inflorescence are somewhat smaller and of a quite different colour from those of the rest, from which they are separated by a considerable length of stem. No satisfactory suggestion as to the cause of this difference was given. The

flowers of *Angraecum caudatum* are remarkable for the extraordinary length of their spurs—quite 12 inches in one of the flowers, and nearly as much in the others on the same inflorescence.

Leaf-cutting of Anthurium.—Mr. CHITTENDEN showed a specimen illustrating a method of reproduction in *Anthurium Dechardii*. Mr. Blakey, at Wisley, had inserted a leaf taken off the plant with its base intact, but without any part of the stem, in a propagating pot. Four buds had been produced on the inner surface of the basal part of the leaf, and numerous roots had developed. Two of the shoots had grown out into rhizomes 10 inches to 12 inches in length, bearing at their tips well-developed plants, and the other two shoots had grown out for a short distance.

Poinciana regia.—Mr. E. H. JENKINS sent a specimen of this plant. It was raised from seeds received from the Gold Coast, where it is known as the Pride of Barbados (it is also called Barbados Fence Flower and Peacock Flower). The seed was sown in March, 1907, and was raised by Mr. Edward Barker, The Gardens, Brenton, Surbiton. The yellow-flowered *P. Gilliesii*, raised from seeds by the late Rev. H. Ewbank, Ryde, took 12 years to reach the flowering stage. It is interesting to note the sensitiveness of the plant, the leaves folding in a downward direction when exposed to cold, and remaining so when placed in warmth till the stem was split at the base. When this was done the plant showed signs of reviving within an hour or so.

EVESHAM MARKET GARDENERS'.

NOVEMBER 30.—The annual meeting of the Evesham and District Market Gardeners' and Fruit Growers' Association was held at the Town Hall on the above date. The president (Mr. W. A. Fisher) was in the chair. Mr. H. White had been arranged that Mr. Martin Stainforth should attend the meeting and open a discussion on the protection of fruit crops from spring frosts, with special reference to the stove he has invented for the purpose, but the Chairman said Mr. Stainforth would not be present that evening, as he had decided to give a demonstration with his stove in some of the gardens on December 17, to be followed by a meeting in the evening, when Mr. Stainforth would read a paper. The Treasurer (Mr. E. T. Field) read his financial statement. He said the amalgamation of the Evesham Fruit Pests Committee and the Evesham Market Gardeners' Association took place in the early part of the year, and this had very much added to the funds of the association, if not to the number of members. There was a balance in hand of £48 18s. 9d. The accounts were adopted.

Mr. Fisher was re-elected as president of the association. The committee and other officials were also appointed.

Mr. White said he thought one thing the committee could do was to see that growers were not imposed upon in the purchase of spray fluids. Several gardeners sprayed last year at a loss. The Chairman: We all did. I sustained £10 loss. Mr. White said the wash was guaranteed to kill eggs, but it did not kill a single one. If gardeners were going to spray, the committee should see that they were not imposed upon. The wash was warranted to kill every egg and every insect on the tree, but it did not, and he thought the committee should do what they could to prevent this kind of thing. The Chairman said he knew a gentleman who used £40 worth of spray fluid, and he did not think it had done him £1 worth of good. He was endeavouring to get compensation.

LINNEAN SOCIETY.

DECEMBER 3.—At a meeting held on this date a paper by Mr. Bunzō Hayata, and communicated by Mr. W. Botting Hemsley, F.R.S., was briefly explained by Dr. O. Stapf, Sec.L.S. It was entitled "Note on *Juniperus taxifolia*, Hook. and Arn." This species had been described from specimens from the Bonin Islands, but had also been recorded from the province of Hupeh, China; further examination shows that the Chinese plant is specifically distinct from that occurring in the Bonin Islands.

MANCHESTER AND NORTH OF ENGLAND ORCHID.

DECEMBER 3.—Committee present: E. Ashworth, Esq. (chairman), and Messrs. R. Ashworth, Ashton, Cowan, Cypher, Holmes, Keeling, Parker, Shill, Sander, Thorp, Ward, Warburton, and Weathers (hon. sec.).

Although cold and foggy weather prevailed, there was an excellent display of plants, no fewer than 16 groups being staged.

Messrs. Heath & Sons, Cheltenham, were awarded a Bronze Medal for a group of *Cypripediums*, consisting principally of good forms of *C. insigne*.

Mr. C. PARKER, Ashton-on-Ribble, was awarded a Silver Medal for a collection of *Cypripediums*, amongst which were *C. insigne* var. *Luciani*, *C. insigne* Hatfield Hall var., and *C. x Milo* var. *Prestona*.

Z. A. WARD, Esq., Northenden (gr. Mr. Weatherby), staged a splendid group of *Odontoglossums*, including a number of hybrids of exceptional beauty. (Silver-Gilt Medal.)

Mr. W. OWEN, Northwich, was awarded a Bronze Medal for a group of *Cypripediums*.

A. WARBERTON, Esq., Haslingden (gr. Mr. Dalgleish), staged a group of choice *Cypripediums*. *Cypripedium x Dorman-Hare*, a hybrid between *C. insigne* var. *Dorman* x *C. var. Merit*, *C. x Floradora* and *C. x Ossultonii* var. *Grace Osborne* received similar awards. *C. x Lecanum* var. *Lavertonium* received a First-class Certificate.

Messrs. CYPER & SOSS, Cheltenham, were awarded a Silver-gilt Medal for a well-grown and beautifully-arranged group of miscellaneous plants, consisting principally of *Cypripediums*.

H. L. CRAVEN, Esq., Keighley (gr. Mr. Corney), exhibited a small collection of choice plants.

J. MCCARTNEY, Esq., Bolton (gr. Mr. Holmes), was awarded a Silver Medal for a group of *Cattleyas* and *Laelio-Cattleyas*.

E. ROGERSON, Esq., Didsbury (gr. Mr. Price), obtained Awards of Merit for *Odontoglossum crispum* var. *Lord Lansdowne*, *O. c.* var. *Arduwickense*, and *Cypripedium x Acteus* var. *Sanderæ*.

Mr. J. ROBSON, Altrincham, exhibited *Cypripedium x Parkerianum* and *C. x Minos* var. *Youngii*.

Mr. A. J. KEELING, Westgate Hill, Bradford, was awarded a Silver Medal for a display of plants, in which were some interesting botanical specimens. An unnamed species of *Catasetum*, was awarded a Certificate.

H. J. BROMLOW, Esq. (gr. Mr. Morgan), was awarded a Silver Medal for a group of *Cypripediums* of good quality.

Messrs. MOORE & Co., Bradford, staged a good group of plants (various), for which a Silver Medal was awarded.

Mr. J. STOTT, Radcliffe, and Mr. W. SHACKLETON, Bradford, were awarded Bronze Medals for exhibits of *Cypripediums*. P. IV.

NATIONAL ROSE.

(ANNUAL MEETING.)

DECEMBER 10.—The annual general meeting of the above Society was held on this date at the Westminster Palace Hotel, when a large number of the members assembled under the chairmanship of the retiring president, E. B. Lindsell, Esq., who was supported by Sir Alfred Tate, the Rev. Page-Roberts (president-elect), and many other prominent rosarians.

After the formal business of reading the notice convening the present meeting and the minutes of the last annual general meeting had been disposed of, and Messrs. John Green and H. R. Darlington nominated as scrutineers of the ballot, the President called upon the hon. secretary, Mr. Edward Mawley, V.M.H., to read the annual report, from which we extract the following:—

EXTRACTS FROM ANNUAL REPORT.

The report is the most favourable that has yet been placed before the members, and more particularly as regards the increase in membership. In 1901 the number of members for the first time reached one thousand, in 1906, three years later, two thousand, and now, two years later, they have to record a membership of over three thousand.

The Metropolitan Show was noteworthy as being the largest which the Society has yet held, 8,000 blooms of "exhibition" Roses being staged, in addition to the

numerous stands of decorative Roses and other interesting exhibits.

The Provincial Show was held at the White City, Manchester, on the site of the Gardens of the Royal Botanical and Horticultural Society at Old Trafford. This exhibition was of less than average extent, but the quality of the blooms was good, and they retained their freshness very much better than at the Metropolitan Show, which was held on what proved to be the hottest day of the whole year.

The Autumn Show was not quite so large as that of the year, but the general quality of the blooms was surprisingly good, considering the trying character of the season. Now that this exhibition is becoming generally known, it is attended by the members in largely increasing numbers.

The twelve Five Guinea Silver Cups, so generously presented last year to the Society by Mr. W. E. Nicholson, for the raisers of the best white, the best pink, the best crimson, and the best yellow dwarf and climbing Roses for general culture—those which came out first in the ballot instituted by the committee—have been duly awarded. Also, as far as possible, the twenty-four handsome diplomas, likewise the gift of Mr. Nicholson, for the raisers of the Roses which obtained the second and third positions in the ballot. The official report of the ballot will appear in the "Gardener" of January 1909.

The Society's new handbook, entitled "The Enemies of the Rose," is of interest as being the first publication issued by this Society, and is well coloured and illustrated. It is with much regret the committee have to announce that Mr. H. E. Molyneux has found himself reluctantly compelled to resign the treasurership, a position which he has so ably filled for the last four years.

During the past year seven rose and other horticultural societies, hitherto unaffiliated, became members of the total number of societies in affiliation with the National Rose Society to 52.

The amount received in gate-money from the general public at the Society's Exhibition in the Royal Botanic Gardens was somewhat larger than in any year since the exhibition has been held in those gardens. The receipts from all sources during the past year, including a balance from the previous year of £201 9s. 4d., amounted to £2,666 9s. 9d., and the expenditure to £2,229 7s. 7d., leaving a balance of £437 12s. 2d. in the treasury's hands of £427 8s. 2d. The reserve fund now stands at £450.

During the past year 785 new members joined the Society, so that in 1908 there were 3,500 members. Allowing for the losses by death and resignation, the total number of members is now 3,450. Taking the year as a whole, the new members have, on an average, been added to the list of membership.

INCREASE IN MEMBERSHIP SINCE 1903.

	1903.	1904.	1905.	1906.	1907.	1908.
Number of members....	1,903	1,308	1,637	2,034	2,484	3,150
Net increase since previous year....	—	414	304	359	397	451
						666

The arrangements for 1909 include the Metropolitan Exhibition, which will again be held in the Royal Botanic Gardens, Regent's Park, and the date fixed for the Exhibition being Friday, June 2nd.

The Provincial Show will take place at Luton, in conjunction with the Luton Sweet Pea and Rose Society's Exhibition in July.

Our rosarians have again been made with the Royal Horticultural Society to hold the Autumn Show in the Royal Horticultural Hall, Vincent Square, Westminster, on Thursday, September 10th.

The February new year members will receive a new and enlarged edition of the "Handbook on Pruning Roses." This has been thoroughly revised and will contain several new features and also directions for pruning about 200 more varieties than were included in the previous edition. At the same time will be issued the Society's "Rose Annual for 1909," containing many articles and illustrations of interest to all classes of rosarians.

In the course of his financial statement the treasurer stated that at the present rate of progress the subscriptions alone would next year exceed £2,000.

The President moved the adoption of the report and a balance-sheet. All interested were glad to hear of the continued prosperity of the National Rose Society, but this increase of membership meant increase of work for the officers and the committee, and he was sure that every member of the Society would regret the retirement of the hon. treasurer, Mr. H. E. Molyneux, after holding office for four years. Mr. C. E. Shea, in seconding the adoption of the report, stated that, although the Society is growing rapidly, the management must not cease to be careful or to relax its efforts to extend its influence on all possible occasions. The work of the officers was now very great, and, as might be observed in the suggested alterations of the by-laws, a Finance Committee is being formed.

The hon. treasurer was optimistic in his anticipated income from subscriptions next year, but Mr. Shea preferred to deal only with the actual position as it stood to-day. Mr. Molyneux, in reply, stated that his forecast, instead of being imaginary, was a real one, as there are at the present time 3,150 members,

whose subscriptions alone would exceed the sum of £2,000 he had mentioned. The Rev. J. H. Pemberton wished to know why the place of meeting had been changed from the Hotel Windsor, which had come to be regarded as the social centre of horticulture, and he moved: "That it be an instruction to the committee to arrange to again hold the annual dinner and meetings at the Hotel Windsor as early as possible." After debate, the motion was put and lost. The meetings will, therefore, be held at the Westminster Palace Hotel. Mr. G. W. Cook, one of the Society's auditors, called the attention of the meeting to the necessity of appointing a chartered accountant to audit the accounts annually. The suggestion was agreed to by the General Committee, and the opinion of the meeting was in support of the proposal.

Mr. A. W. Butler called attention to the catering at the Metropolitan Show, held at the Botanic Gardens, and stated that the provision made was inadequate. The President said there was generally a difficulty in regard to the catering; it might, in fact, be termed a "hardy annual." A long discussion on the subject ensued, and it was eventually decided to write to the caterer and express strong disapproval of the manner in which the catering was carried out.

The report was then put to the meeting and adopted.

The President stated that it was considered some recognition should be given to the vast amount of work done for the Society by Mr. Edward Mawley.

The sub-committee appointed to consider the question suggested that the sum of £100 be presented to Mr. Mawley, and this the meeting cordially agreed to.

Mr. Mawley, who was loudly applauded on rising, tendered his warmest thanks to the meeting for their generous and thoughtful gift.

The proposed alterations of Rules 5 and 10 (see p. 402 in the issue for December 5) were next adopted with unimportant alterations.

Mr. G. W. Cook was nominated to fill the post of hon. treasurer rendered vacant through the retirement of Mr. Molyneux, who was warmly thanked for his services. Mr. Edward Mawley, hon. secretary, and the committee and other officers were also appointed. The Rev. F. Page-Roberts was elected president.

ANNUAL DINNER.

The thirty-second annual dinner was held on the same evening as the annual general meeting and in the same building. The president, the Rev. F. Page-Roberts, occupied the chair, and he was supported by Sir Daniel Morris, K.C.M.G., V.M.H., Sir George Watt, C.F.E., Sir A. Tate, Messrs. W. J. Grant, O. G. Orpen, John Green, George Paul, H. R. Darlington, and others.

Sir Daniel Morris, in reply to the toast of "Our Guests," congratulated the Society on its progress. He referred to the excellent manner in which many of our Roses thrive in the West Indies.

Mr. R. F. Felton decorated the tables, and a musical programme added much to the pleasure of the evening.

BIRMINGHAM & MIDLAND COUNTIES CHRYSANTHEMUM, FRUIT, AND FLORICULTURAL.

DECEMBER 10.—The members of this society assembled at the annual dinner on this date under the chairmanship of Mr. W. Jones. In proposing the toast of "The Society and Officers," Mr. W. H. Dyer remarked that the society was now one of the largest, if not the largest, of the societies of its kind in England, and their exhibitions were of an all-round excellence. It was a matter for regret that their receipts this year were not so good as they could wish them to be. This placed the committee in a rather serious position.

Mr. T. Humphreys, the treasurer of the society, responded. The society was started 43 years ago, with the object of improving the cultivation of the Chrysanthemum, and popularising truly honest practices in showing. That their efforts had been successful was beyond question. But out of Birmingham's population they had fewer than 250 subscribers, and their total subscriptions amounted to

something like £112. That amount was sufficient only to pay for the lighting and use of Biagley Hall, whilst the exhibitions cost the society from £700 to £900. This year a sum of £287 was received at the gates, which was £52 less than last year. They must get more annual subscribers, and be more independent of the gate money, which was always more or less increased by bad trade and the weather. The committee had economised as much as possible, and would continue that policy, but not at the expense of anything necessary to the well-being of the society.

Acting on the suggestion made during the evening that a reserve fund should be formed, the following gentlemen guaranteed £5 each: Messrs. Yates & Son, W. Jones, J. Goodacre, T. Humphreys, J. Randall, A. Noakes, and W. H. Dyer.

NATIONAL SWEET PEA.

(ANNUAL MEETING.)

DECEMBER 11.—The annual meeting of the members on this date was the largest since the formation of the Society, there being about 60 persons present. The president, Mr. W. Cuthbertson, occupied the chair. Mr. W. Cuthbertson announced the receipt of several letters, including one from a member expressing dissatisfaction with the conduct of the Society's trials at Reading, and other matters. It was agreed that no notice be taken of the communication beyond a formal acknowledgment of its receipt by the secretary. Several of the members testified to the very impartial and efficient conduct of the trials by Mr. Foster. The report and balance-sheet were next submitted, and of these we extract the following:—

EXTRACTS FROM THE ANNUAL REPORT

"The London exhibition on July 24 was the prettiest yet held by the Society. The flowers were of good quality, the competition was keen, the attendance was good, and £30 was taken at the doors. The Dublin show was a great success so far as the flowers and competition were concerned, and Mr. F. W. Moore, in their power to make the function a financial success; but the committee regrets to learn that the Royal Horticultural Society of Ireland have launched a competitor in the undertaking, notwithstanding the double attraction of their own and the Sweet Pea classes.

"The trials of Sweet Peas conducted by Mr. Chas. Foster in the gardens of the University College, Reading, proved very interesting and instructive. In only four days the committee proposed to receive new varieties, but it is arranged that a further set of trials will be held at Reading next year, under the committee's direction, for the sole purpose of testing the correctness and purity of stocks of Sweet Peas that may be sent by seedsmen.

"One of the most pleasing events of the year was the presentation of some substantial tokens of recognition of their valued services to our worthy hon. secretary and his wife at the dinner following the great summer show.

"At the annual meeting of 1907, allowing for losses by death and other causes, and including 17 new members who had joined for 1908, there were 652 members. Since then no fewer than 279 new members have joined the society, 22 of these joining for 1909. There have been numerous losses through death and removals, and a rather large number have lapsed through non-pay of subscriptions. At present there are 729 members, and 51 societies in affiliation.

"Although the return from the sale of *Annals* was rather less in 1908 than in 1907, it must be remembered that new members and new societies in affiliation took well over 300 copies, and in scores of instances the *Annals* has been the direct means of securing new members.

"The London exhibition has been fixed for Friday, July 23, at the Royal Horticultural Hall, Westminster, and the committee regrets to find it impossible to obtain the hall for a rather earlier date. On July 13 the provincial show will be held at Saltaire, Yorks., in connection with the enterprising and successful Saltaire Rose and Horticultural Society.

"The balance-sheet showed a total income of £273 14s. 6d., including £263 0s. 7d. subscriptions for 1908. The expenditure was £241 10s. 6d., leaving a balance of £31 13s. 10d., but £11 15s. 2d. being due for outstanding cheques, there remained a final balance of £23 8s. 11d.

The president moved the adoption of the report, which was a record of good work and good results. The chief interest of the Society centres in the Floral Committee, for with them rests the future of the Sweet Pea, in selecting what varieties and types are placed before the public. The report needed a little amending, for it stated that the testimonial to the hon. secretary was £60, but since the report was printed he had received a further sum of £10 5s. 6d. from Mr. Sherwood, and he had pleasure in handing the cheque to Mr. Curtis. Mr. Alex. Dean, who seconded the adoption of the report, stated that the Society

was a wonderful one in its rate of progress, and he anticipated a membership next year of one thousand. He eulogised the hon. secretary, and referred to the vast amount of work the Society entailed. The conduct of the Reading trials was all that could be desired, and he was certain that any variety sent to Mr. Foster for trial would receive impartial and fair treatment. The adoption of the report was carried without dissent.

Votes of thanks were next proposed to the president and other officers, also to Mr. Foster for his trouble in conducting the Society's trials and other work.

Mr. Cuthbertson, the retiring president, proposed that Sir Randolph Baker, Bart., Blandford, be elected president for 1909. This was carried unanimously. Mr. Horace J. Wright was elected Chairman of the Committee. The hon. secretary, Mr. C. H. Curtis, was re-elected with acclamation, and he was presented with an honorarium of 25 guineas for his past year's services. The election of the General Committee was next proceeded with. The chairman announced, in connection with this business, that the Executive Committee think it desirable "that any member who had not attended a committee meeting during the year should be ineligible to serve another year." After much discussion, it was decided that the committee's recommendation be withdrawn until another year. Some members who were unable to attend the meetings of the committee owing to living at a distance, were rendering good service to the Society in their immediate districts, and it was thought desirable to retain their names on the list of committee-men. The committee was therefore re-elected *in bloc*, with the addition of those following: Messrs. H. G. Bartlett, W. J. Stevens, W. Lumley, E. H. Christy, R. F. Felton, Wm. Deal, H. C. Tilt, H. D. Tigwell, W. Cuthbertson, H. Shaue, and Silas Cole.

The alteration of Rule 3, to the effect that subscriptions become due on the 1st of January in each year instead of February, was adopted.

ROYAL SCOTTISH ARBORICULTURAL.

(ABERDEEN BRANCH.)

DECEMBER 12.—The annual general meeting of the Aberdeen branch of this society was held in the Aberdeen University Buildings on this date. Mr. Sidney J. Gammell occupied the chair, and there was a large attendance of the members. Mr. Robert Scott, hon. secretary of the society, submitted his annual report, which showed that interest in the society's work was well sustained, that the membership had been considerably increased, and that financially the balance was greater than that of last year. The report was unanimously adopted. Office bearers for the ensuing year were elected, Mr. Gammell retaining the presidency. The committee were also elected, Mr. Irvine, of Drum, and Mr. J. Maxtone, forester to the Duke of Fife, being appointed in place of deceased members.

Mr. Robson, Aberdeen, submitted a recommendation from the committee that instruction should be given in forestry, and that steps be taken to this end. The motion was approved. Mr. Dawson, lecturer in forestry in the Aberdeen and North of Scotland College of Agriculture, expressing his great pleasure at the desire of the branch to give co-operation in this work, and stating that he was arranging a course of lectures on forestry to commence shortly after the New Year holidays.

At this stage, Mr. Gammell left the chair to read a paper entitled "An estimate of the possible cubic production of average woodland from portions of Aberdeenshire and Kincardineshire." The lecturer stated that the methods of measurement in this country differed considerably from those in use on the Continent, and it was highly desirable that a standard should be fixed and adhered to. His plan had been to take a portion of a wood where the crop seemed heaviest, measure the area of a square chain, count the stems, take the average cubic contents, and from that deduce what might have been grown on the acre. He had found that the annual yield of Larch was 48 cubic feet per imperial acre, and that at 16d. per cubic foot (which was not an excessive price for good, clean Larch) would realise £2. With the Scots Fir at 6d. per cubic foot, they would get an annual return for

the 39 cubic feet per imperial acre of £1 9s. 6d. For Spruce, at 8d. cubic feet per imperial acre, the price at 4d. per cubic foot would be £1 8s. Those of course were gross returns, but they seemed to him to indicate that, making a full allowance for costs of formation, management and rent of ground, the returns were sufficient to leave a substantial margin of profit to the grower.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

DECEMBER 14.—The monthly committee meeting of this society was held at the Royal Horticultural Hall, Vincent Square, Westminster, on this date, Mr. Chas. H. Curtis in the chair. Four new members were elected, making a total of 75 for the year. The death of a member who joined the society four years ago was reported. Although only 45 has been paid by him to the Benefit Fund, he has received £31 sick pay, and the balance to be received by his nominee is £2 6s. 1d. The committee are using their influence in endeavouring to elect two children of deceased members on the Royal Gardeners' Orphan Fund. Any votes sent to the secretary, Mr. W. Collins, 9, Martindale Road, Balham, will be utilised on their behalf.

NATIONAL DAHLIA SOCIETY AND LONDON DAHLIA UNION.

DECEMBER 15.—The annual meeting of these societies took place on Tuesday last. The proposed amalgamation was adopted, and Mr. H. H. Thomas and Mr. E. Hawes, the respective secretaries, were appointed joint secretaries of the combination. We are compelled to hold over a report of the proceedings until our next issue.

Obituary.

LORD ANNESLEY.—We regret to announce the death of Earl of Annesley, on the 15th inst., at Castlewellaun, his Irish seat, at the age of 77 years. Castlewellaun is situated in County Down, and the local climate being favourable to the growth of half-hardy trees and shrubs, Lord Annesley has for many years past taken the greatest interest in their culture, his collection of exotic species being amongst the most celebrated in these islands. Our readers have been indebted to his late lordship for many notes and photographs, published in these pages, of interesting plants at Castlewellaun, and we have at present an unpublished note on *Wildenowia teres*, otherwise known as *Restio subverticillata*. This South African species has proved hardy at Castlewellaun, and it is described as worthy of cultivation on account of its distinct habit of growth. It will be remembered that in 1903 Lord Annesley published an exceedingly interesting book, *Beautiful and Rare Trees and Shrubs*, which was illustrated with 70 reproductions of photographs taken by himself.

JAMES WHEELANS.—Mr. James Wheelans, formerly for 17 years gardener at Hassendeanbank, Hawick, died suddenly at Oxford while in the service of Miss Jessie Watson. The funeral took place on Friday, November 27, at Hawick. Mr. Wheelans leaves a widow and grown-up family, three of his sons being resident in Hawick. The late Mr. Wheelans only removed to Oxford from Hawick in May last, when he was presented with a gold watch, together with a marble timepiece for Mrs. Wheelans, as parting gifts. The presentation was made, in the name of the subscribers, by Mr. Forbes, of the Royal Nurseries, who paid a high tribute to the many excellent qualities of the recipients.

TRADE NOTICE.

MR. JOHN R. BOX, Croydon, has retired from the West Wickham Nurseries, and will continue to carry on business under his own name at the East Surrey Seed Warehouse, Croydon. Mr. Box has also undertaken a partnership in the firm of William Knight, of the Floral Nurseries, Finsbury, with Mr. Albert Hillman. Mr. Henry Hillman has retired.

MARKETS.

COVENT GARDEN, December 16. [We cannot accept any responsibility for the subjoined reports. They are intended to be regularly every Wednesday, by the kindness of several of the principal auctioneers, who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week, and the date of our report. The prices depend upon the quality of the samples, the way in which they are packed, the supply in the market, and the demand, and may fluctuate from one day to another, but occasionally several times in one day.—E.D.]

Cut Flowers, &c.: Average Wholesale Prices.

Table listing various cut flowers and their prices, including Azalea, Camellias, Carnations, and Chrysanthemums.

Cut Foliage, &c.: Average Wholesale Prices.

Table listing various cut foliage and their prices, including Adiantum, Asparagus, and Holly.

Plants in Pots, &c.: Average Wholesale Prices.

Table listing various plants in pots and their prices, including Ampelopsis, Azalea, Begonia, and Cactus.

Fruit: Average Wholesale Prices.

Table listing various fruits and their prices, including Apples, Grapes, and Vegetables.

Vegetables: Average Wholesale Prices.

Table listing various vegetables and their prices, including Cauliflowers, Celery, and Cucumbers.

REMARKS.—Nova Scotian and Canadian Apples are in good demand, but arrivals are comparatively small. Large consignments of Pines are on sale this week, and, as usual at this time of the year, they are selling readily and making high prices. Trade in Oranges remains good and with little alteration in prices, except that Jamaican produce is slightly cheaper on account of increased quantities. English Grapes are plentiful and are a good trade. English Tomatoes are practically finished, but foreign grown are still available in an excellent condition and are selling freely. The vegetable trade all round is very quiet. Holly and Mistletoe are seen in large quantities; the latter is of good quality, but the Holly is mostly without berries, consequently there is a poor trade in this exception with the exception of the hotted branches which are making high prices. The fruit trade generally is quiet, but a good market is expected at the latter end of this week and the beginning of Christmas week. Fruits and vegetables in general are plentiful. E. H. K., Covent Garden, 16, December 16, 1908.

Potatoes.

Table listing various potato varieties and their prices, including Kents, Snowdrap, and Evergold.

COVENT GARDEN FLOWER MARKET.

Although the supplies are abundant the salesmen always endeavour to raise the prices of flowers at Christmas time. Lily of the Valley, for example, was offered in the streets after the close of the market this morning at a very low price, and certainly much cheaper than a regular buyer could obtain it early in the morning. When supplies are in excess of demands the surplus flowers are kept in a close place to keep them, but they deteriorate very quickly when exposed again. Last week I bought inflorescences of Euphorbia (Poinsettia pulcherrima) and they did not last two days, yet when I have cut them in the nursery they have kept well for a fortnight.

POT PLANTS.

Chrysanthemums are still remarkably good and plentiful, and the best quality are making good prices; but there is much difference in the quality and size of these plants. Italian (Paris) plants are better than the English, but are about the average, but some specimens are worth 30s. per dozen. Euphorbias (Poinsettias) have been selling very well. Azalea, indeed, at several colours, are very good. Erics are making rather better prices. Marguerites are well flowered. Lily of the Valley, in pots and in boxes, is of the best quality. Lilium longiflorum is also good. Plants of Spiraea are well wanted. Ferns in all sizes are plentiful, but they do not sell readily. Palms are making rather better prices. Acalafus, Ficus, Aspidistras and other foliage plants are in excess of all demands.

CUT FLOWERS.

It is difficult to say what the supplies for Christmas may be, but if the weather continues to cut blooms will be abundant. Chrysanthemums are later than usual and the supplies are not likely to be short for some weeks to come. Lilium are a little uncertain, but, what I have seen at the nurseries I think supplies will be equal to all demands. Carnations may advance in price a little, but unless the weather is very dull supplies will not be short. Roses are more uncertain, for those intended for the Christmas trade developed earlier. Callas, Tulips, in all colours, Narcissus from English growers, and Violets are all plentiful. Folia Violets are being cheaper this year than usual. J. H., Covent Garden, Wednesday, December 16, 1908.

GARDENING ANSWERS.

[Correspondents are requested to write the names of persons and places as legibly as possible. No charge is made for their communications, but contributions sent, to be placed in our collecting box for the Gardeners' Orphan Fund, it will be thankfully received, and an acknowledgment made in these columns.] Mr. HUGH JONES, late Gardener to A. EARLE HUNT, Esq., Treasury Lodge, at Gardener to THOMAS MOORE, Esq., Dulwich, London, S.E. 15, writes:— Mr. C. HARVEY, for the past 16 months Gardener to D. A. BEVAN, Esq., Burles, Royston, Herts, as Gardener to H. G. FEILDEN, Esq., Colchester Park, Witney, Oxon. (Thanks for 2s. sent for R.G.O.F. box.) Mr. GEORGE COWLEY, for the past 11 years and 8 months as Gardener to A. COX, Esq., Mill Hill, Derby, as Gardener to the same gentleman at Spondon Hall, near Derby. Mr. F. A. EDWARDS, for over 12 months Gardener to the late Lady CHICHESTER, Arlington Court, Barmstaple, as Gardener to Miss CHESTER at the same place. Mr. A. ARCHER, for the past 4 years Foreman at Mansdown Park, Basingstoke, Hants, as Gardener to Mrs. DAVIS, Smeaton Manor, Northallerton, Yorkshire. Mr. W. SKEET, for the past 14 years Gardener to RICHARD HILL, Esq., The Hollies, Exeter, Sussex, as Gardener to F. T. MOSELEY LORIMER, Esq., Cressington Park, Reading. (Thanks for 2s. for R.G.O.F. box.) Mr. P. G. WASHFORD, for nearly 3 years Gardener to the late HENRY ADAMS, Esq., Cannon Hill, Braywick, Maidenhead, Berks, as Gardener to A. DE WINTON, Esq., Dawson at the same place. (Thanks for 2s. sent for R.G.O.F. box.) Mr. W. TAYLOR, for the past 5 years Gardener to ALBERT HOLLAND, Esq., Kenilworth, Kent, as Gardener to F. E. HUGHES, Esq., Emmetts, Isle Hill, Kent. Mr. J. GIBBERT DAVIS, for some time with Mr. AMOS PERRY, at the Hardy Plant Farm, Enfield, and formerly at Kingswood, Enfield, as Gardener to A. DE WINTON, Esq., Eggesington Hall, Derby. (Thanks for 1s. for R.G.O.F. box.) Mr. W. WILLIAMS, for the past 2 years in the Garden at Kingsdown, Clapham, Hounslow, Middlesex, and at the Botemeyde Village Trust, Birmingham. Mr. THOS. PARRY, for the past 3 years and 9 months Gardener to A. HUGHES, Esq., Parkwood Grange, Knowle, near Birmingham, as Gardener to T. S. CHAPPEL, Esq., Wells-bourne, Wiltshire. Mr. J. W. JEVENS, for 2 years Assistant Instructor at Swarley College, and previously at Folkland Park and Lathom Gardens, as Gardener to LORD DUNSTON, Setford Park, Slough.

DEBATING SOCIETIES.

BRISTOL AND DISTRICT GARDENERS.—Dr. Shingdon Smith presided over a largely-attended meeting of this association, held on Thursday, December 11, at St. John's Parish Rooms. Mr. W. E. Budgett lectured upon "Cypripediums," of which plants he displayed a collection. Not the least interesting part of the proceedings was a practical demonstration upon fertilisation. Mr. Budgett cut the pouch of a flower exposing the pollen mass, and explained how insects crawling into the pouch for water rub off the pollen and carry it to other flowers. H. W.

CARDIFF GARDENERS.—The fortnightly meeting of the above society was held at St. John's Schools on Tuesday, the 8th inst., Mr. H. R. Farmer presiding. A lecture on "Orchids" was given by Mr. Hatting, a representative of the Bristol association, who confined his lecture to the two genera, *Cypripedium* and *Dendrobium*. The lecturer gave a demonstration in the art of potting these plants, using cork baskets, or pots with Elm or teak base in preference to pans or teak baskets. In potting *Cypripediums* the use of good yellow loam, with peat and Sphagnum-moss, was advocated. For *Dendrobiums*, Osunda fibre was superior to peat, with a quantity of dry Oak leaves and live Sphagnum-moss. K. T. W.

CHESTER PAXTON.—The annual general meeting of this society was held in the Grosvenor Museum on Saturday, December 12, under the chairmanship of Mr. A. W. Armstrong. The hon. secretary (Mr. G. F. Misp) submitted the statement of accounts and report for the past year, which showed that the exhibition held in November was the largest and most successful ever held in connection with the society. The following officers and committee were elected for the ensuing year:—President, T. Gibbons Frost, Esq., C.C.; vice-presidents, Major McGillicuddy, J.P., and James G. Frost, Esq., J.P.; chairman of committee, Mr. A. W. Armstrong; executive committee: Messrs. N. F. Barnes, J. Clack, O. Edwards, W. Evans, T. Gillett, H. Lawson, H. G. Little, G. Lyon, S. May, W. Pringle, W. Reeves, Jos. Ryder, W. Seddon, E. Strabbs, R. Wakefield, J. Weaver, and J. Wynne; secretary, culturing naturalists: Mr. R. Newstead, M.B.Sc. It was decided to hold the next exhibition of fruits, *Chrysanthemums*, &c., on Wednesday and Thursday, November 17 and 18. A course of winter lectures was also arranged, the first of which will be by Mr. J. D. Siddall on "Winter Botany."

THE WEATHER.

THE WEATHER IN WEST HERTS.

Week ending December 16.

The fifth warm week in succession.—This was a more unseasonably warm week than the previous one. On three days the highest temperature in the thermometrical screen rose by, or exceeded, 50°, and on the coldest night the exposed thermometer registered only 5° of frost. The ground is now as at the same time in the preceding week. It is rather in seasonably, both at 1 and 3 feet deep. Rain has fallen on all but two of the last 12 days, but to the total depth of only 1½ inch. Of that amount six gallons of rain-water has come through the bare soil percolation gauge, or virtually the whole of the rain which fell during that period, and 4½ gallons through that on which short grass is growing. The sun shone for an average of one hour and a minutes a day, or for half an hour a day longer than is usual in the middle of December. The wind has been, as a rule, rather high, and in the windiest hour the mean velocity amounted to 19 miles—direction W.S.W. The average amount of moisture in the air at 3 o'clock in the afternoon fell short of a reasonable quantity for that hour by 2 per cent. E. M., *Berkhamsted*, December 16, 1908.

ADDRESS: P. Y. We cannot help you in this matter. It might be useful to insert an advertisement.

BEGONIA DISEASED: F. J. B. The trouble is caused by mites; syringe the plants with tobacco water. The leaf is probably *Aeranthus Leonis*, an Orchid. If not an Orchid, please state habit of plant and flower. Why address the publisher on such subjects?

BIRDS DESTROYING BUDS: S. P. The greenfinch or green grosbeak and the chaffinch will often attack the buds of fruit trees, but the other little bird you send—the blue cap or blue tit-mouse—lives chiefly on grubs, although it is said to sometimes damage buds in order to obtain its prey.

CAULIFLOWER FOR NAMING: *Cauliflower*. We cannot undertake to name varieties of vegetables. You omitted to enclose either your name or address, which should always accompany such communications to the editor, although these particulars are not required for publication.

CORRECTION: In the paragraph on the Bordeaux mixture printed on p. 422 of the last issue "84 lbs. of copper sulphate" should have read 6 lbs.

FICUS REPENS: W. B. The specimen you send is not a sport. The plants has reached the fruiting stage when it assumes a more or less arborescent habit, as in the case of an Ivy that has reached the top of a tree or wall. We frequently receive examples such as you send. See illustrations in *Gardeners' Chronicle*, March 12, 1904, p. 171.

FUNKIA: J. P. If it is a hardy Funkia used as a greenhouse plant, place it in a cold frame and apply but little water until spring.

GRAPE VINE FAILING TO FRUIT: T. E. As you state the vine is a young one it will be advisable to dig it up at this season, and, after first ascertaining that the border and the means for its drainage are satisfactory, replant in some fresh compost, bringing the roots near to the surface. The rods should be cut well back into hard, ripened wood. Do not overdoe the border with moisture.

HERBACEOUS PLANTS: E. M. Provided the border is not composed of heavy clay, the mulching of stable manure will do good. On clay soils a mulching of well-decayed leaf-mould and wood ashes is preferable.

INSECTS IN ORCHID HOUSE: T. E. N. The small beetle you send is one of the weevils. Trap them with pieces of some vegetable such as Carrot or Potato. They feed in the dark and can often be caught by the aid of a lantern at night time.

MAKING A POND: C. S. You appear to have puddled your clay too much; it should be about the same consistency as putty, not lime mortar. It is always a difficult matter to secure a water-tight pond with puddled clay, unless the clay rests on a solid base of clay soil. Give the basin another lining with clay, or, better still, concrete the whole.

MILLER'S "DICTIONARY OF GARDENING": G. E. V. S. The edition corrected and arranged by T. Martyn was published in 1807. The work has little value beyond an historical one, and is to be had from the secondhand booksellers for a few shillings.

MONOGRAPH ON MAPLES: B. Z. The articles you refer to were written by the late George Nicholson, and published in the *Gardeners' Chronicle*. They appeared in both the volumes for 1881. The numbers are out of print; but you can refer to them at the Lindley and other important libraries.

NERINE FLEXUOSA AND OTHER NERINES: B. Z. *Nerine flexuosa* and *N. flexuosa alba* are more evergreen in their nature than those of the *N. sarniensis* and *N. curvifolia* (Fothergillii) class, and should not be subjected to the severe drying off for so long a period in sum-

mer as those of the *N. sarniensis* group, although a reasonable resting season after the foliage has turned yellow should be observed. The *sarniensis* group produce the flower-spikes before the leaves and if water be given before the spikes appear, the probability is that the leaves will get ahead of the flower-spikes and the blooms may not be produced. *N. flexuosa*, its varieties and some of its hybrids, however, produce the leaves and flower simultaneously, and may be sparingly watered immediately the leaves appear and growth commences. The members of this section deteriorate rapidly if subjected to a long, dry, resting season. The *Nerines* do not lend themselves to forcing or retarding to any appreciable extent. In different gardens they get varying treatment and conditions, and, nevertheless, the flowers appear everywhere about the same time. Attempts to force or retard them usually result in degeneration. *Nerine flexuosa alba* is in flower now. Its resting time is about the same as that of other *Nerines*. There appears to be no method of ensuring its flowering at a given time other than autumn.

NAMES OF FLOWERS, FRUITS AND PLANTS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits, which work entails considerable outlay of time and money, and cannot be allowed to disorganise the preparations for the weekly issue, or to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits in one lot; they should be very careful to pack and label them properly, to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our trouble, and run the risk of delay and incorrect determinations. Correspondents not answered in one issue are requested to be so good as to consult the following numbers.

FRUITS: G. Henley, The Queen.—J. Watkins, 1, Wadhurst Pippen; 2, Crismon Quoining; 3, Golden Knob; 4, Calville Malting.

PLANTS: *Cactif.* *Chimonaanthus fragrans*.—W. Bulbophyllum hirtum.—J. H. 1, *Macodes Petola*; 2, *Epidendrum virens*; 3, *Restrepia maculata*.—*Fresia*. The *Cypripedium* is near *Cypripedium Harrisonianum*, and is an indifferent variety of little value.—F. J. The green flower is *Epidendrum hibernicum*; the other *Epidendrum* is *Chimonaanthus fragrans*. The *Viola* appears to be a garden hybrid of *Viola tricolor* with a near reversion to the species. The *Verbena* is a garden variety of *Verbena incisa*.—T. E. *Alce socotrana*. The damage has been caused by too much moisture at the roots and in the atmosphere of the plant house. We cannot determine the name of the other plant from a leaf only.—T. H. *Helleborus foetidus*.

POTATO TRIALS WITH SCOTCH AND IRISH SEED: J. V. Experiments with seeds obtained from Scotland, Ireland and various parts of England have been conducted by several authorities, and the results recorded in our possession in 1906 an important comparative trial of this nature was carried out by Messrs. Sutton & Sons, of Reading, who will, no doubt, furnish you with particulars. In 1905 Mr. John Wright conducted a trial at Merton in Surrey, with the following results:—From Irish sets 140 lbs., Scotch sets 119 lbs., Middlesex sets 74 lbs., and Surrey sets 71 lbs. You will obtain much information on this subject from the *Potato Year Book, 1907*, the official journal of the defunct Potato Society.

VANDA AMESIANA: W. B. The plant in bud would have been better in a rather cooler and drier atmosphere. The range of temperature (80° to 55° Fahr.) is too great. We presume that the lower temperature is that maintained at night. The dull weather at this season is against the production of flowers unless under the most favourable conditions of light and temperature available.

TROPICAL FRUITS IN COVENT GARDEN.

ACCORDING to a leading fruit salesman in Covent Garden, "the demand for rare tropical fruits is increasing." Not many years ago the Banana, for instance, was a rare fruit in England. To-day the fruits are within the reach of all classes, being retailed in every greengrocer's shop, as well as in the costermonger's barrow. Moreover, Bananas are now imported not only in the fresh, but also in the preserved state, as well as in the form of flour. The imports of this fruit in the fresh state have in a few years increased by millions of hunches; at certain seasons special express trains are provided for the speedy and safe conveyance to London of West Indian Bananas arriving at Bristol. A similar story could be told of Pineapples, which are now becoming a popular fruit in England, being imported from the Canary Islands, Straits Settlements, West Indies, and Natal. The culture of Pineapples in English hot-houses is no longer necessary, although it affords an interesting pursuit to those who can afford it as a luxury.

The principal hindrance to the increased importation of tropical fruits lies in the fact that they decay so readily after reaching a certain stage of ripeness. This difficulty is, however, being overcome to some extent by means of effective cold storage on board

ship, and by rapid sea transit. It is to these circumstances that we chiefly owe such recent introductions from tropical climes as the Mango (*Mangifera indica*), Avocado-pear (*Persea gratissima*), Grape-fruit, Cherimoyer (called Custard Apple in Covent Garden), and Passion fruit (*Passiflora*). So far, the demand for these "fancy fruits," as they are called in the trade, is limited, and the prices charged for them are high. As the fruits, however, become better known and the means of transport more perfect, it is reasonable to suppose that they will become popular, and with a greater demand they could be sold at lower prices. It is often said that the chief recommendation of most tropical fruits lies in their novelty. Although this may be admitted in some cases, there are striking exceptions. It is true that the taste for certain tropical fruits has to be acquired, but in the case of the Tomato, an acquired taste has been followed by the immense popularity of this fruit. It has been said by travellers that the three most delicious fruits in the world are the Pineapple, Cherimoyer, and Mangosteen (*Garcinia Mangostana*). The Mangosteen is as yet practically unknown in Europe, but its good qualities may be judged from the opinion of Dr. Abel, who said that "of eastern fruits the celebrated Mangosteen is first in beauty and flavour." Another authority declared that "the flavour of the Mangosteen partakes of the combined taste of the Pineapple and Peach, and other equally good but inexpressible qualities." A peculiarity of this fruit is that a large number may be eaten at once. Therefore one can understand why these are always charged for as extras on hotel menus in Ceylon.

Covent Garden, the great horticultural market of England, affords a special opportunity of forming an acquaintance with tropical fruits which are seldom seen elsewhere in this country. Rare tropical nuts and fruits may also be seen and tasted at Searn's Fruitarian Restaurant in Tottenham Court Road, where numerous dainty dishes are made entirely of fruits.

The following sorts have recently been noted in Covent Garden, and it may be of interest to give a few of the particulars concerning these, as well as descriptive notes from my own experience in the tropics:—

MANGO (*Mangifera indica*) (see Supplementary Illustration).—This is a medium-sized or large tree; the fruit varies from the size of a plum to that of a large goose's egg; very juicy and often of a delicious flavour; it is very popular in the Eastern tropics for dessert and for making chutneys. The fruits seen in Covent Garden are usually brought from the Canary Islands, and they are small. They are sold wholesale at from 4s. to 6s. per dozen, good specimens being retailed occasionally at 2s. to 3s. each.

AVOCADO-PEAR (*Persea gratissima*) (see fig. 177).—A small evergreen tree, having fruits similar to large green Pears, sometimes streaked with red. It is a salad fruit rather than dessert; the pulp is of the consistency of firm butter, and is scooped out with a spoon, being flavoured with vinegar, pepper, and salt. This fruit has recently become popular in America. It is regularly imported to London from the Canary Islands, and finds ready

buyers in Covent Garden at 4s. to 6s. a dozen, but good fruits are sometimes retailed at the price of 2s. to 2s. 6d. each.

GRAPE-FRUIT (*Citrus decumana* var.).—A globular fruit resembling a large Orange, to which it is allied. It is imported in cases of 50 to 100 or more fruits, according to their size, and the fruits are retailed at 6d. to 10d. each. This fruit comes chiefly from Florida, where it is very popular. Americans resident in London are the principal buyers. "Grape-fruit" is an American name, the fruit being a variety of the Pomelo or Shaddock.

POMEGRANATE (*Punica granatum*).—A shrub or small tree, with showy scarlet flowers. The fruits are large and globular, about 3 inches or more in diameter, sometimes of a bright red or orange-yellow in colour. The interior consists of numerous, closely-packed, large seeds, which are coated with an acid, juicy, and rather astringent pulp. Pomegranates are imported from South Europe and the Mediterranean, and occasionally retailed in London at about 6d. to 10d. each or cheaper.

PERSIMMON (*Diospyros Kakii*).—A small bushy tree of the Ebony family. The fruit is of the form of a moderately-sized Apple, bright orange-yellow in colour, with a shiny rind. The pulp, yellowish in colour, is of a peculiar astringent flavour, for which a taste has to be acquired before it can be enjoyed. The fruit has an attractive appearance, and it travels well. Persimmons are sent to Covent Garden from South Europe, neatly packed in tissue paper and shavings, in boxes containing about two dozen fruits in each. The fruit sells at about 8d. to 10d. each.

CHERIMOYER OR CUSTARD APPLE (*Annona Cherimolia*).—A large, heart-shaped, dull-green fruit, the rind of which has the appearance of being formed of scales. The interior contains white granular sweet pulp, somewhat resembling custard. Weekly consignments arrive in Covent Garden from Madeira during the winter months. The fruits are retailed at about 1s. or more each, being sometimes sold in West End shops at double or treble this price. Cherimoyers do not travel well, and a large proportion of every consignment arrives in London in an unsaleable condition.

PASSION-FRUIT (*Passiflora edulis*).—The fruit of a pretty climber, of the size of a large Plum, purple when ripe; the interior consists of sweet acid pulp intermixed with the seed; this, beaten up with a pinch of bicarbonate of soda, forms a delicious drink. When ripe, the rind soon shrivels, giving the fruit an unfavourable appearance; hence it is not suited to the English market. Trial shipments have been made from Australia which stood transport well, but the shrivelled appearance of the rind is usually against its sale. In Covent Garden the name "Passion-fruit" is given to another species of *Passiflora*, which seems to be the Sweet Cup.

SWEET CUP OR WATER LEMON OF JAMAICA (*Passiflora laurifolia*).—The fruit of this is of the size of a duck's egg, the rind being smooth and of a pale amber colour. It is imported regularly from Madeira, where it is known by the name "Maracugia." The fruits are retailed in London at 6d. to 8d. each. Both this and the preceding species are sometimes known in Covent Garden by the name

"Granadilla," a term which is more correctly applied to *Passiflora quadrangularis* (see Supplementary Illustration).

MONSTERA DELICIOSA.—A very handsome creeper, with huge, leathery, curiously-perforated leaves. The fruit is like a long, green cone, from 8 to 15 inches long; it is pleasantly fragrant when ripe, and partakes of the flavour

woody shell, which can only be broken by an axe or similar implement. The seeds are the Butter Nuts of shops; each contains a large, white kernel, which has a very pleasant, nutty flavour. The Nuts are sold in England at about 3d. or 4d. each.

CASHEW NUT (*Anacardium occidentale*).—The fruit of a moderate-sized, spreading tree. It

good samples at 6d. to 8d. a lb. The Nuts will keep in good condition for several years if kept dry. A sample 10 years old was exhibited at the recent Colonial Fruit Show at the R.H.S. Hall.

GROUND NUT or **MONKEY NUT** (*Arachis hypogaea*).—A small, leguminous annual, which has the peculiar habit of burying its young pods underground, where they develop and ripen; these are forked up when ready for harvesting, cleaned, sorted and exported in their small, grey, papery shells. They keep good for a long period, and are generally seen in small lots for sale in greengrocers' and fruiterers' shops, the retail price being about 3d. to 4d. a lb.

LICHI or **LITCHI** (*Nephelium Litchi*) (see fig. 179).—A celebrated Chinese fruit borne on a medium-sized tree. The Lichi is usually of the form of a small Plum, with a thin, brittle shell of a reddish colour, covered with wart-like protuberances. It is filled with a sweet, jelly-like, opaque pulp, and is held in great esteem for dessert and preserves in China. Lichies are obtainable in London at 1s. to 1s. 6d. per lb.

LOQUAT (*Photinia japonica*).—A small Japanese tree. The fruit resembles a small Apple or Medlar, and is of a sub-acid flavour. It is sometimes imported from South Europe.

FIG. 177.—FRUITING SPRAYS OF (TOP) THE AVOCADO-PEAR (*PERSEA GRATISSIMA*) AND (BASE) THE SAPODILLA OR NASEBERRY (*ACHRAS SAPOTA*). (See pp. 443 and 445.)

of Pineapple, but the small, black hairs attached to the edible portion cause an uncomfortable sensation in the throat. The fruits arrive in Covent Garden from the Canary Islands, and occasionally from Jamaica, and are sold at 1s. 6d. to 2s. 6d. each.

GUAVA (*Psidium Guava*).—A small tree. The fruit varies in size according to variety, but usually it is oval and about the size of a medium Pear. It is renowned for making jelly, but is not popular for dessert. Yet the fruit has arrived in London from Madeira in increasing quantities during the last few years; it is said to sell at 2s. 6d. to 3s. 6d. a dozen.

BRAZIL NUT (*Bertholletia excelsa*) (see fig. 178).—A tall, handsome tree of Brazil. The fruits are globular in shape and dark brown, 4 to 6 inches in diameter, with a thick, woody husk; this contains the hard-shelled seeds, which are the Brazil Nuts of commerce. They are commonly retailed at 6d. to 8d. a pound, according to quality. These are used at some restaurants instead of suet for making puddings.

SOUARI NUT or **BULLER NUT** (*Caryocac nuciferum*).—A lofty, handsome tree, with large, opposite leaves, native of tropical South America. It produces large, dark-brown fruits of the size of a child's head, and similar to the Brazil-nut fruit. It contains about four large, kidney-shaped seeds: these have a reddish,

consists of two distinct parts—a much-enlarged, succulent, green receptacle, at the end of which is the hard, brown, kidney-shaped fruit. The latter contains the Nut, which, when roasted, is very palatable. These Nuts, though scarcely known in Covent Garden, are imported from India and the West Indies by a few dealers, who find no difficulty in disposing of

In addition to the foregoing fruits, there are those which have become standard commodities, such as Oranges, Dates, Figs, &c. Of equal or strictly tropical fruits, however, there yet remain unrepresented in Covent Garden in number which are of excellent quality, and which could not fail to become popular in Europe if they could only be imported in good

condition. The celebrated Durian fruit, for instance, is itself "worth a journey to the East to enjoy the pleasure of eating it," in the estimation of so high an authority as Dr. Russell Wallace. Notwithstanding its very offensive odour, the Malays attribute marvellous properties to this fruit, and when it is in season they camp out in families so as to enjoy it to the full. The following fruits are all of excellent quality, and worth the attention of epicures and dealers in tropical fruits.

DURIAN (*Durio zibethinus*) (see fig. 180).—A gigantic, quick-growing, handsome tree, thriving only in moist and hot districts. The large, oblong fruits, which are covered with formidable

a snowy-white substance, which has a delicious flavour and melts in the mouth. The fruits are sold at about 1s. to 1s. 4d. per dozen. They are always charged for as an extra at hotels in Ceylon. A few specimens of this fruit were once grown in the conservatory at Syon House Gardens, near London, and were, I believe, presented to the late Queen Victoria.

SAPONILLA OF NASEBERRY (*Achras Sapota*). (See fig. 177).—A small, slow-growing tree. The fruits vary from round to oval in shape, and are about the size of small Apples. When ripe they become soft and of a dull-brownish colour, the skin being very thin. The brownish pulp is of a sweet, delicious flavour. Few tropical fruits

beers. Orange-yellow or reddish-purple when ripe, it has a very pleasant, slightly acid flavour, and is used as dessert or stewed. Though of the Tomato family and resembling the Tomato in the interior, it has no resemblance to it in flavour. The tree is suited to sub-tropical conditions, and the fruit bears transport well.

RAMBUTAN (*Nephelium lappaceum*).—A large, spreading tree. The fruit is orange-yellow or bright red, about 2 inches long, of an oval form, and covered with long, soft, fleshy spines of the same colour as the rind. Surrounding and adhering to the seeds is a white, acidulous pulp, which is pleasant and refreshing.

PURPLE GUAVA (*Psidium Cattleianum*).—A small, slender tree with smooth bark and shiny leaves. The fruits, which are produced in great abundance, in two crops a year, are readily distinguished from the common Guavas by their deep, claret-coloured rind. They are filled with a juicy, very agreeable, acid-sweet pulp.

The following fruits have an important economic value in the tropics, but, owing to their perishable nature, are not exactly suitable for importation to this country:

BREAD-FRUIT (*Artocarpus incisa*) (see Supplementary Illustration).—A medium-sized, very handsome tree, with large, shining, deeply-cut leaves. The fleshy, oval fruit is of the size of a Musk Melon, pale green in colour; it consists of a solid mass of succulent pulp, which, when sliced and roasted, is said to "resemble the crumb of a new loaf." It is esteemed as a vegetable for curries, and is prepared and eaten in various other ways. The Rev. Firminger, who partook of the fruit in Ceylon, considered it "hardly distinguishable from an excellent batter pudding." This fruit forms the principal diet of the natives of the South Sea Islands. On the recommendations of Captain Cook, the explorer, special expeditions were sent by the British Government to the South Sea Islands for the purpose of transporting live plants of the Bread-fruit tree to the West Indies, where the tree is now established and commonly cultivated. The best varieties do not bear seed. The tree is largely grown along the south-western sea-coast in Ceylon.

JAK-FRUIT (*Artocarpus integrifolia*).—This enormous fruit, which may weigh anything up to 112 lbs., is borne on the trunk and older branches, sometimes at the base of the trunk, or even under the ground surface. It is always green, with a white or cream-coloured, fleshy, solid mass of pulp. In shape it is usually oblong and irregular, though sometimes almost round or oval. The succulent rind consists of somewhat hexagonal knobs. In Ceylon the Jak-fruit forms an important article of food to the natives. It is cut up into sections and sold in every bazaar or botique at a few cents per portion. When ripe, the whole fruit has an overpowering odour. The large, oval seeds are roasted and eaten in curries.

GRANADILLA (*Passiflora quadrangularis*) (see Supplementary Illustration).—A strong-growing climber, bearing large, oblong, greenish-yellow fruits, not unlike small Vegetable Marrows, which are hollow when ripe and contain a mass of purplish, sweet-acid pulp, mixed with the flat seeds. In an unripe state the succulent portion of the fruit is boiled and used as a vegetable. The fleshy, tuberous root also furnishes an article of food.

HONDAPARE (*Dillenia indica*) (see fig. 181).—A medium-sized tree, with large, handsome, serrated leaves, native of Ceylon and other parts of tropical Asia. It produces a profusion of large, round, green fruits, each about 3 inches in diameter, being very juicy and acid. The fruit is formed by the much-enlarged, fleshy, closely-imbriate sepals; it is used for making jelly and a cooling drink, also as a vegetable in curries. The tree is suited to most districts at medium elevations, and is often cultivated both for ornament and its fruit. *H. F. Macmillan, F.L.S.*

spikes, are borne mostly on the stouter branches, each weighing, when ripe, several pounds. The edible portion is the peculiar, fat-like, creamy substance in which the seeds are embedded. In spite of its odour, Europeans and others soon acquire a taste for it, often preferring it to all other fruits. Locally, the fruits are sold at the equivalent of 10d. to 1s. 6d. each. This fruit has probably never been grown in Europe; indeed it may be questioned whether it has been seen there in an edible condition.

MANGOSTEEN (*Garcinia mangostana*).—A medium-sized, slow-growing tree, with large, handsome leaves. The pretty, smooth-skinned fruits are of the size of Apples, perfectly round, and purple when ripe. Surrounding the seed is

can equal this one as a dessert fruit. I am not aware that it has ever been seen in Europe.

PAPAW or TREE-MELON (*Carica Papaya*) (see Supplementary Illustration).—A small, herbaceous tree, with large palmate leaves, the large, hollow fruits are roundish or oblong in shape, 10 to 15 inches long, resembling a Sweet Melon. They are very refreshing, and are said to be an excellent aid to digestion. Vegetable pepsin (papain) is obtained from the fruit in an unripe state. The leaves have the property of rendering meat tender if wrapped in them for a short time.

TREE TOMATO (*Cyphomandra betacea*).—A shrub or small tree. The fruit is of the form of a hen's egg, and is produced in large num-

HARDY TREES AND SHRUBS SUITABLE FOR FORCING.

(Concluded from page 429.)

EVERGREEN RHODODENDRONS.—These are not quite so important as the deciduous varieties for forcing, but amongst them there are many beautiful plants—*R. nobileanum* (rose-carmine) and *R. praecox* (rose-purple); both of these can be easily obtained in flower at Christmas. For later forcing the following are recommended:—*fastuosum* flore pleno (double lilac), Cunningham's White, Prince Camille de Rohan (pale-pink, dark spot), Rosa Mundi (rosy-red, dwarf), Chevalier Felix de Sauvage (red, dark spots), Purity (white), and John Walter (crimson). With the exception of *R. praecox*, which can be forced for several years in succession, it is necessary to grow most of the plants in the nursery before using them again for forcing. The flowers of all Rhododendrons are better gummied, i.e., a drop of floral gum should be placed at the base of each flower as soon as it is expanded. We use a small cycle oil-can for the purpose. In addition to the value of these plants when forced for conservatory decoration, the flowers are very useful for cutting, more especially when gummied.

RIBES.—Several of the flowering Currants can be readily brought into flower under glass. The best for the purpose are *R. aureum* (yellow), *R. sanguineum* (deep rose), and the varieties *albiflorum* (white), *atrosanguineum* (dark red), and the double form, *flore pleno*. The Fuchsia-flowered Gooseberry, *R. speciosum* (deep red), can also be readily brought into flower indoors early in the year.

ROBINIA.—Established plants in pots of the species *R. hirsuta* will respond to a little extra heat. The pendulous racemes of soft, pink flowers are very pleasing.

ROSES.—These are very largely grown under glass, especially for cut-flower purposes, a large number of the varieties being suitable, especially amongst the Hybrid Teas. The plants must be grown at least a year in pots previous to forcing.

SPIRÆAS.—Amongst the shrubby Spiræas several can be forced, and they are very effective. The plants may be used for two or three years in succession in pots, before they are well established in the ground. The following species have white flowers:—*S. arguta*, *S. prunifolia* flore pleno (the long growths are thickly studded with small, double blossoms); *S. Thunbergii*, and *S. van Houttei*.

STAPHYLIA.—The species *S. colchica* is a grand subject for conservatory decoration, the pendant, white flowers being more pleasing under glass than out-of-doors, and they are fragrant.

SYRINGA (LILAC).—These shrubs are largely forced to supply cut bloom in several market nurseries. Many florists' shops are gay with Lilac in winter. To obtain the flowers early the plants are lifted and subjected to great heat, at the same time keeping the house dark and very damp. With such drastic treatment the plants are little or no use for conservatory decoration. To flower plants suitable for the latter purpose a temperature of 65° to 75° F. is sufficient. Till the trusses are well developed, the plants should be kept in the dark, after which the light may be gradually admitted and the temperature reduced. After flowering, all the plants will require at least two years in a nursery. The shoots must be cut hard back, and, as soon as growth commences, all surplus growths rubbed off. The chief object to aim for in growing Lilacs is a few very strong shoots, the number, of course, being governed by the size of the bushes. On small plants six shoots are ample, while on extra large ones 15 to 18 shoots can be left to mature. As most of the Lilacs are grafted it is important to cut away all suckers which appear at the base. In the August preceding the lifting of the plants for forcing it is important to chop around them with a spade. This materially assists the ripening of the growths. In addition to Lilacs in bush form, some varieties make very nice standards. The two best varieties for forcing are Marie Legraye (white), and Charles X. (rose-purple). Other good

sorts are *alba grandiflora* (pure white), *Solevenir de Louis Spathe* (dark purple), *Mme. Lemoine* (double white), and *President Grey* (light blue). Small bush plants in 6-inch pots 20 to 24 inches in height of the variety Marie Legraye form charming subjects for small greenhouses or the side stages of larger structures. These are known in the trade as miniature Lilacs.

VIBURNUM.—Several of these readily lend themselves to forcing, but, with the exception of *V. Tinus*, which flowers outside in mid-winter, forcing should not be attempted too early in the year. *V. macrocephalum* (snow-large, white flowers), *V. opulus* var. *sterile* (Extra-large Tree), *V. tomentosum* var. *prototum*, and *V. Tinus* (Laurustinus) are the best. With the exception of *V. Tinus*, *Viburnum*s seldom force satisfactorily two years in succession.

WISTARIA.—Grown in the form of small standards, there is nothing amongst the many trees and shrubs used for forcing to surpass a well-flowered plant of *W. chinensis* (sinensis). This spring we had a plant in a 9-inch or 10-inch pot with 80 racemes of lilac-coloured flowers. The variety *alba* is pleasing, but it is surpassed by *V. multi-juga* var. *alba*, which is very free flowering.

XANTHOCERAS.—The Chinese species *X. orbifolia* is a lovely plant, with racemes of white flowers streaked with red at the base. We find it advisable to purchase specially-grown plants for forcing, as it is necessary for the wood to be extra vigorous.

ZENOBIA.—*Z. speciosa* and var. *pulverulenta* are evergreen shrubs with waxy-white blossoms, which are useful towards the end of the forcing season. *A. Osborn*.

FORESTRY.

FAILURES IN PLANTING.

The article by *W. P. R.* on p. 357, under the above heading, possessed much interest. May I suggest that the real cause of his failures was that he commenced planting too late in the season? The secret of success lies in getting the plants in early, as the tree or plant gets settled down and the soil becomes firm before the plant shows any sign of life. In *W. P. R.*'s case the sap must have been well on the move, even if no outward signs of it could be seen. Last season I planted 35,000 plants, and I have a 90 per cent. living now, but I had finished planting by the 10th of March. The varieties planted were Scotch Fir, Austrian Pine, Hazel, Abies Douglasii (a splendid, quick-growing Conifer both ornamental and for timber value), English and Japanese Larch, Holly, Yew, and Picea grandis, this latter variety being planted more for experience than otherwise. It is a handsome Conifer, and I find it has made very good growth for one season. The Austrian Pine is, I think, one of the easiest-grown Conifers we have, as it has a natural tendency to making plenty of fibrous roots; therefore, it is quite easy to transplant. The cost of labour depends on the kind of soil. The general price for hole digging in this neighbourhood is 15s. per 1,000 (the soil is rather chalky), and the size of the hole is 15 inches square by 10 inches deep. These measurements allow plenty of room. The planting is generally done by day work, it being next to impossible to get good planting done by piece work. It is useless to plant Spruce Fir on this soil, as last season I cut 30 large trees, and not one of them was sound, whilst some were mere shells. The reason appears to be that the tap root had entered the chalk and had set up a rot which extended, in some instances, 30 feet up the tree. I have been informed that there were some 200 cut here 10 years ago, and not one tree was sound. Perhaps some forester will give us his experience in the matter? *A. Gooding, Eastham House, Chichester.*

The Week's Work.

PLANTS UNDER GLASS.

By THOMAS LUNT, Gardener to A. STEWING, Esq., Kirt, Perthshire, N.B.

Clivias.—The plants which bloomed first last spring must now again be placed into heat, for, by using the same plants for early flowering each year, they may be got quicker into bloom, having had their proper resting period. Apply liquid manure to the roots as soon as the plants have commenced to grow.

The Fernery.—All Ferns, but especially Adiantums, should be carefully examined and any decayed fronds in the centre of large specimens should be removed, also any fronds that are infested with scale insects; these leaves should be burned.

Stove plants.—Any of the plants in the stove that are infested with insects that cannot be killed by means of a vaporising compound, should be carefully cleaned with a liquid insecticide and all large-leaved species sponged with clean soft water. It is necessary to cleanse the underside of the leaves, as any red spider that is present is generally to be found there. At this season very little syringing can be done, except on bright mornings, therefore the greater need exists to keep a sharp look-out for insect pests. Admit a little air through the bottom ventilators whenever the weather is favourable; if this is practicable only for a few minutes it will do good.

Camellias.—Make frequent applications of liquid manure to the roots of plants now swelling their flower-buds. If two or three buds are found together upon one shoot, thin them out to one bud. If the plants are growing in a border, take every precaution to examine the soil to see if water is needed; otherwise, if the slightest drought is experienced, the flower-buds will drop.

Palms.—Any Palms that are in a cool temperature should be kept rather on the dry side at present, but care must be exercised to prevent the plants suffering injury from drought.

Nerine.—Plants that have made their growth should be gradually dried off. Place them in a position on the southern side of a greenhouse.

Caryatine.—Any specimens that have lost their lower leaves should have their tops taken off, and the tops may be placed in bottles of water containing pieces of charcoal. They will soon form roots, and may be potted up when this has taken place. The stems should be kept for propagation, and may be inserted later in the same manner as are vine eyes.

Miscellaneous forcing plants.—Batches of all the forcing plants at command should be placed in heat at intervals of ten days or a fortnight, according to the demands of the establishment.

THE ORCHID HOUSES.

By H. G. ALEXANDER, Orchid Grower to Lt.-Col. G. L. HARRIS, C.V.O., G.L.S., Westbury, Gloucestershire.

Cypripediums.—Members of this genus belonging to the cooler section are amongst the most important Orchids flowering at this season of the year. For ease in culture and free blooming these slipper Orchids have no equals. The flowers possess great lasting qualities, and suffer little from the effects of fogs, which damage almost all other Orchid flowers, so that these winter-blooming Cypripediums form a most useful and popular class of plants. For all kinds of decorative purposes the flowers are invaluable; they may be used as cut blooms, or the plants themselves may be taken into the dwelling rooms for a few days, and, with reasonable care, no harm will result. When cut, the flowers are useful, on account of their long-lasting properties, and, arranged with suitable ornamental foliage, they will present a pleasing appearance. Cypripediums when in flower should always be grouped by themselves, as they are more effective than when placed amongst other flowering Orchids.

Winter treatment.—Cypripediums are never inactive at any time of the year; therefore to allow them to remain dry at their roots for any considerable length of time

is an injurious practice. On the other hand, excessive applications of water to the soil during the winter season are not advisable. When a plant has its flowers fully developed very little water will be required, following up this treatment during the flowering period and for some few weeks afterwards. A moist atmosphere must be maintained always, but care should be exercised to avoid a saturated condition of the atmosphere when the plants are in bloom, and especially during the night. If everything is done to maintain the correct atmospheric temperature and the plants are in a clean, healthy and sturdy condition, they will grow all the more freely when the days lengthen in the New Year.

Cattleyas.—At this season of the year not many species of these beautiful plants are in flower, but the bicolor, T. labri-cattleyas are nearly always more or less in flower, and the great diversity in shape, size and colouring of their flowers is not to be wondered at. With the blooming of the C. labri variety comes the C. Trianae and C. Percivaliana will be the next to flower. Some plants have already flower-buds showing in the sheaths, and in a few weeks' time these will be in their full beauty. Afford such plants a suitable position in which to develop their blooms, and take measures to keep the rooting material a little more moist than hitherto. These remarks also apply to Cattleya hybrids that are in a similar condition.

Oncidium chrysophorum.—This charming little plant is again in flower, and it is one of the brightest of winter-blooming Orchids. The plants should be afforded a cool-intermediate temperature, and should not be given large receptacles or much rooting compost. Owing to the liability of this species to decay from damp, the plants should be kept well up to the roof, and the pans be well drained, so that when water is applied it will soak away readily. Ample root moisture is necessary, but it is to be remembered that such a small-habited plant may be easily injured by an over-dose of moisture, which may happen when the receptacle is not perfectly provided with material for drainage.

Vanda Jamesiana and *V. Watsonii*.—These very distinct and beautiful Vandas are now flowering, and as winter-blooming subjects they are difficult to surpass. After the flowers are over the plant passes through a brief period of inactivity, when but little water at the roots is required. Do not allow the plants to shrivel, as such treatment—by many persons miscalled rest—is very weakening and harmful to them.

Sophronitis grandiflora.—This charming little species is now blooming, and is always pleasing when dotted about the houses. The flowers are produced on the partly-developed growths, and until such time as the laths are fully furnished with growth, moisture should be afforded at the roots plentifully. Plants needing new rooting material should have this afforded when new roots are seen pushing forth from the new growths.

THE KITCHEN GARDEN.

By E. BECKETT, Gardener to the Hon. VICE-MY, Alderman House, Epsie, Hertfordshire.

The annual seed order.—Nearly every post brings a catalogue of vegetable or flower seeds for next year's crops, and these are sufficient to remind us that we must be commencing another season. Many of the catalogues are got up in an excellent manner, and contain plates which illustrate some of the principal kinds of the popular vegetables. It is a difficult matter nowadays for gardeners to consider which is the best seed firm, and my advice is that they should not confine their orders to any particular firm, but obtain the best novelties direct from the firms producing these novelties, for in this manner they will be most likely to obtain true stock. There is no time to be lost now in preparing the seed list. In order that suitable selections may be made, its preparation needs much care, and it is essential that the compilation of such a list should be exclusively left to the responsibility of the gardener, who knows best what is requisite to maintain a supply of fresh vegetables throughout the year which will meet the demand. The collections advertised by the seedsmen are many of them admirable, but I do not recommend

their purchase, for the reason that the man in charge of a particular garden may be expected to know best what is required, and it may happen that the particular crop he may require in large quantities may be but indifferently represented, even in the best collection of seeds. The seed order should consist in the main of standard varieties that are known to succeed well in the locality. But if a few of the most promising of untried novelties are also obtained for comparison with standard sorts, the result will always be interesting, and occasionally the crops will have a peculiar value.

Onions.—The culture of extra large Onions mainly depends upon ensuring that the plants will have a long season of growth. The seeds therefore may be sown before the end of December, but not later than the third week in January. Prepare a compost consisting of slight, fibrous loam, two parts, and leaf-mould and manure from a spent mushroom bed, one part each, adding sufficient road or river sand to ensure porosity. Mix the ingredients thoroughly together and have the compost sufficiently dry that it may be pressed firmly together, which would be inadvisable if it were in a wet condition. Boxes having a depth of 4½ inches should be provided with drainage and filled with the compost. In sowing the seeds, these should only barely be covered with some of the finest of the soil. Apply a good watering after sowing, and place the boxes in a heat of 50° to 55°. Reliable varieties include Ailsa Craig, Cranston's Excelsior, and Leamington Giant.

Tomatos.—Plants which were raised last month and are now in 3-inch pots should be placed on shelves in the lightest possible position where the heat is about 55°. Extreme care must be exercised in watering these, it being necessary to keep them on the dry side, and any water that is applied should be tepid when used. The plants must not be over-potted, and the 3-inch pots will generally be found sufficient until the middle of next month, when the plants may be repotted into 5-inch pots, taking care to provide them with perfect drainage.

Celery.—At this time of the year, when Celery is so much in request, it is desirable to lift a good stock and store the plants in a cool shed in sand or ashes, when, if not placed too thickly together, they will remain perfectly good for three weeks or a month.

Preparations for seed sowing.—In a very short space of time it will be necessary to sow seeds of various crops in gentle heat under glass. Repair the seed boxes, therefore, and make new ones if required. Prepare labels, tie them into bundles, and place the various kinds of soil under cover, so that all will be in readiness for use.

THE HARDY FRUIT GARDEN.

By F. JORDAN, Gardener to THE DOWAGER LADY NUNBURGHOLME, WATER PLODY, YORKSHIRE.

Wall fruit trees.—The top dressing and renovating of wall trees should be pushed forward at every opportunity. The prunings and leaves should always be carefully raked up and burnt, and never dug into the ground, otherwise the spread of insect pests will result.

General work.—If Peach trees have not yet been detached from the walls, no time should be lost in having them untied and made secure from accidents by wind or snow. Burn the trees or shrubs, and avoid washing these or other trees during severe weather. In frosty weather work can be done in the way of carting manure and soils to positions where they will be required, also in making stakes and labels. Get the rubbish together and burn it, and mix the ashes and surplus soils in readiness for future top-dressings. Clean out liquid manure tanks and apply the manure water to orchard trees that have carried heavy crops of fruit, but first loosen the surface soil or turf. The cleansing of trees from injurious insects should be persevered with at every opportunity while the trees are in a dormant state. Scale insects on Peaches and Pears are difficult to destroy, and in bad cases they should be removed by means of a strip of wood, and afterwards washed with a stiff brush before syringing. Where Black Currant bud mite is in evidence, hand-picking should be resorted to if possible, burning the buds afterwards.

THE FLOWER GARDEN.

By W. FLETCHER, Gardener to LADY WASTON, Lockinge Park, Berkshire.

Ornamental water.—Few features are more effective in the pleasure ground than a stream or brooklet of running water. We have recently been engaged in the interesting work of changing the course of the overflow from a sheet of ornamental water. The original overflow dropped unobserved into a culvert 9 feet deep, in which it remained for a length of about 50 yards. The result of our work is the provision of an open brooklet of irregular width, and of nearly the same length as the original culvert. There are four perpendicular falls, two of these being 2 feet 6 inches each, and two 8 feet 6 inches. We have preserved the sound of the falling water, and have, in addition, obtained the pleasure of seeing the water rush over the shining pebbles and falls. Two years ago we converted a culvert nearly 100 yards in length into an open brooklet. This has now all the character of a running stream of clear spring water, together with the addition of trout. Such a brooklet permits of bold masses of Japanese Irises being planted along its banks, and their effect is insignificant in July and August. These Irises are capable of thriving in almost any soil and situation, but in a heavy clay soil, the addition of leaf-mould and peat will promote a freer growth. If any planting of Japanese Irises or similar species has yet to be done, it had better be deferred for two months. Spanish Irises planted over a ground-work of Polyanthus have an admirable effect, and will flower in May and June, therefore before the Japanese species. For flowering in August and September, *Nemesis strumosa*, and its numerous shades of colour, and *Lilium speciosum* may be recommended. There will also be planted such shrubby Sparaxes as *S. tomentosa*, *S. rubetima*, and the variety *Anthony Waterer*; *Senecio chrysum*, and, as individual specimens by the water banks, *Verbascum Olynchum*, *Rheum atropurpureum*, *R. palmatum*, *Saxifraga peltata*, *Yucca recurva glauca*, *Y. filamentosa*, *Gunnera manicata*, *Funkia grandiflora*, *F. Sieboldii* elatior, *Eulalia zebrina*, *Pampas Grass* and *Bardy Bamboos*, if arranged according to their heights and colours and flowering season along the banks of such a stream will constitute a delightful scene.

FRUITS UNDER GLASS.

By T. COOMBE, Gardener to LORD LLANGATOCK, The Hendre, Monmouthshire.

Early Pineapples.—Where ripe fruits are required in June, plants of The Queen Pine, being the best variety for early fruiting, should now be started. If they are plunged in a bed that will retain a temperature from fire heat of about 85°, the plants need not be disturbed, but if the bed is formed of fermenting materials alone, it may be necessary to remove the plants, add fresh fermenting materials to it, raise the heat, and then firmly replunge the plants. This cannot be done without the plants receiving some injury, but it will afford an opportunity to top-dress them with artificial manure and fresh compost. The atmospheric temperature at night should range from 65° to 70°, and that for the day, obtained from fire heat, 70° to 75°, slightly ventilating the house when the sun causes the temperature to rise to 80°, but closing the ventilators again as soon as the warmth commences to wane, spraying the surfaces of the bed and the pathways with tepid water at the same time. On fine days the pathways should also be damped early in the morning. Be careful not to over-water the plants, but apply tepid water when it is necessary, slightly enriched with Peruvian guano. On very frosty or windy nights cover the roof of the house with blinds so as to maintain the necessary temperature without excessive fire heat.

Plants for succession.—Plants raised from suckers last autumn should be kept at rest until the middle of February in an atmospheric temperature at night of 55° to 60°, allowing this to rise slightly during the day. The plunging material should possess a temperature of 75° to 80°. Particular care should be taken in watering at this time when the roots are inactive, remembering, however, that if the plants are allowed to become too dry they will be liable to fruit prematurely.

EDITORIAL NOTICE.

ADVERTISEMENTS should be sent to the PUBLISHER, 41, Wellington Street, Covent Garden, W.C.

Letters for Publication, as well as specimens of plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible and duly signed by the writer. The signature will not be printed, but kept as a guarantee of good faith.

Special Notice to Correspondents.—The Editor does not undertake to pay for any contributions or illustrations, or to return unasked-for illustrations, unless by special arrangement. The Editor does not hold himself responsible for any opinions expressed by his correspondents.

Illustrations.—The Editor will be glad to receive and to select photographs or drawings, suitable for reproduction, of gardens, or of remarkable plants, flowers, trees, &c., but he cannot be responsible for loss or injury.

SALES FOR THE ENSUING WEEK.

WEDNESDAY—

Dutch Bulbs, Perennials and Herbaceous Plants, at 11, 3,500 Roses and Fruit Trees, at 1,300. Thousands of miscellaneous bulbs and roots, at 11.30. 1,633 cases Japanese Liliums, at 1. Azaleas, Rhododendrons, Palms, &c., at 6, at 67 & 68, Chisepside, E.C., by Frotheroe & Motter.

AVERAGE MEAN TEMPERATURE for the ensuing week, deduced from observations during the last fifty years at Greenwich: 39° F.

ACIAL TEMPERATURES.—

LONDON.—Tuesday, December 22 (6 P.M.): Max. 48°; Min. 39°.

Gardeners' Chronicle Office, 41, Wellington Street, Covent Garden, London.—Wednesday, December 23 (10 A.M.): Bar. 30.1; Temp. 44°; Weather—Overcast.

PROVING.—Tuesday, December 22 (6 P.M.): Max. 50°; Weston-super-Mare; Min. 39°; Cromer.

In reviewing some of the chief Events of events that have marked the Year, year now nearing its close, our thoughts are once again directed to the exhibition held in April last at Ghent. The usual quinquennial exhibition of the Société Royale d'Agriculture et de Botanique de Gand was invested this year with more than its usual importance by the fact that it commemorated the Society's centenary. Many of our readers are already familiar with the brilliant history of the Ghent Society, and its intimate association with the extraordinary development of Belgian horticulture. Those who had the opportunity of visiting the exhibition for themselves could not fail to admire the excellent manner in which the arrangements for so vast a display were carried out, as well as the hospitable welcome offered to foreign guests of every nationality. Time had wrought great changes since the holding of the previous quinquennial show; the president, secretary, and several other officials had fallen by the hand of death, and their places were worthily taken by others; but the traditions of Ghent horticulture were maintained in the fullest degree, and from every point of view the exhibition was successful. During the Ghent week a botanical congress took place, at which several important papers were read, including one by M. Noel Bernard upon "Symbiosis," which formed the subject of a review in a recent issue of this journal; thus something was done to honour the excellent counsel offered by the late Comte Kerchove de Denterghem in the address he delivered to a quinquennial jury in 1903.

Although there has been no unusual event of first-rate importance in our own country, the year has been marked by activity in all departments. The Royal Horticultural Society has held the customary exhibitions in the Temple gardens and at Holland House, and they have been even more successful than hitherto, the numerous visitors

at the Temple Show being now regarded, singularly enough, as something of a disadvantage. On the last occasion the Council reserved the exhibition for several hours on the second day exclusively for Fellows, and in this way sought to restore to them the opportunity for making a critical inspection of the exhibits that has become almost impossible in recent years owing to the vast numbers who visit this show. We would express the hope that a similar concession may be granted in the future, for, since the Council are unable to arrange for larger tents and broader paths in them, there appears to be no other method by which the enthusiastic horticulturist can hope to reap the full advantages which are offered by the show.

The exhibition of British-grown fruits was held at a rather late date in October, and, consequently, the display was principally one of Apples, Pears, and Grapes, the softer fruits from out-door culture having passed several weeks earlier. The show, on the whole, was not above the average merit, for, whilst the season's Apple crop was a fairly abundant one, Pears were remarkably deficient. During the exhibition there was a conference on the spraying of fruit trees for the destruction of insect and fungal pests, and several papers on the subject were contributed by scientific experts. These papers were published in our own columns, and it was pointed out that the various opinions expressed by the experts appeared to practical men so conflicting that the immediate value of the conference was somewhat depreciated. There is little doubt, however, that we are apt to expect too much from the experts, and in our impatience look to them for simple directions for effectually destroying every pest that menaces our crops. This is obviously unreasonable, and cultivators must not be despondent when they are told that preventive measures are usually effective, but remedial measures rarely satisfactory. The points that were most clearly proved were (1) that greater attention must be paid to the preparation of the spray fluids, and (2) that much of the success depends upon the season at which they are applied and the form in which they are delivered from the spraying apparatus.

It will be seen from a paragraph which appears on another page, that the fruit show is to be discontinued next year, and in its place are offered a series of prizes for British-grown fruit and vegetables spread over the whole twelve months. This appears to us an excellent arrangement, as it will give an additional interest to the fortnightly meetings.

The meetings of the Society have been held almost every fortnight during the year, and in order that the sequence might not be seriously interfered with, the Council again convened meetings in two cases immediately following Bank Holidays, thus causing inconveniences that have already been commented upon by some of our correspondents.

The special societies have generally prospered, and it is again our pleasure to remark upon the increased support given to the National Rose Society, whose growth in recent years has been of an extraordinary character. Twelve months ago we commented upon this circumstance. The total

membership was then 2,484, and during the present year there has been an increase of 666 members. At the recent annual meeting of this Society, the members made a presentation to the honorary secretary, Mr. Edward Mawley, in recognition of his valuable services.

The National Sweet Pea Society has also increased its membership from 602 to 779, and appears in every way to be flourishing. The National Carnation and Picotee Society has recently sustained a serious loss in the death of its president, the late Martin R. Smith. This Society, together with the National Auricula and Picotee, the National Chrysanthemum, National Dahlia, and the Perpetual-flowering Carnation Societies, have all held exhibitions, and most of them have issued useful literature to the members. A few days ago the National Dahlia Society and the London Dahlia Union were amalgamated with each other, and doubtless this fact will increase the prestige of the newly-formed body. The British Gardeners' Association has also increased its membership.

Several horticultural shows have been held at the Franco-British Exhibition; but although these were successful as mere displays of horticultural produce, they were scarcely so interesting or informative as could have been desired, and, in the minds of many there was considerable disappointment in the lack of consideration shown by the authorities towards the claims of scientific horticulture. Nevertheless, the exhibition was the means of bringing large numbers of foreign horticulturists to these shores, and many of them took the opportunity to visit the botanic gardens, principal nurseries, and seed-growing establishments.

In the field of legislation the principal measure affecting market-gardeners has been the consolidating Act relating to small holdings, which will come into operation on January 1. We propose to refer to this at greater length in an early issue. Parliament has shown an increased interest in agricultural and horticultural matters, and numerous questions have been asked in The House respecting the operations of the Board of Agriculture and Fisheries in regard to the control of pests and diseases. This Board has evinced greater activity in such work than formerly, and there appears a desire on the part of the public to accept a measure of State control that would not have been welcomed some years ago. A well-merited concession has recently been made to florists in respect to the Shop Hours Act, it being admitted that the florist's business is so fluctuating, and the materials handled so perishable, that the enforcement of hard-and-fast rules would be attended with undue inconvenience and loss during times when there is more than the usual pressure of work.

The Wisley gardens have showed considerable development during the year, and numerous independent plant trials have been conducted there under conditions as favourable as the circumstances of the place will allow. The laboratory has been used mainly for the teaching of students, and there is perhaps a danger that such routine work may operate against the carrying out of scientific research, which was the main object in the minds of those who were anxious that a

properly equipped laboratory should be provided in the Royal Horticultural Society's gardens. Mr. Chittenden, however, has conducted experiments upon the effect of nitro-bacteria upon leguminous crops, and the results are published in a recent number of the Society's *Journal*. We merely mention this fact at the present time, reserving a fuller notice for another occasion.

During the present year we have chronicled the establishment of a State Department for Horticulture in Belgium, and the news was received with pleasure in this country, coupled with a feeling that horticulturists at home may reasonably look forward to some recognition by the State of the growing importance of the science and industry of gardening. A year ago we remarked upon the establishment of a chair of Forestry at Oxford, and it has been pointed out on several occasions there are aspirations amongst gardeners that a chair of Horticulture may also be instituted at one of the principal universities.

Considerable excitement was caused during the commencement of the summer by the booming of the French system of market gardening. Several books were published and articles appeared in the daily Press that were calculated to exaggerate the advantages of the French methods in the minds of lay readers. It has been stated that public companies have been formed and considerable sums of money laid out in establishing French market gardens, and doubts are expressed in respect to the success of such ventures. But as it is so easy to overstate the probable returns from the culture of early crops, it is also possible to under estimate them, and in most cases it may be found that the degree of success obtained will have a direct relation to the amount of energy, brains, and experience brought into the business. At any rate, this revival of the hot-bed system of forcing salads and vegetables should serve as a lesson for head gardeners and market gardeners who, having gained their professional knowledge since the establishment of the hot-water system of heating, are less familiar than their forefathers with the peculiar advantages to be got from a good hot-bed.

In the world of books there has been a steady and continuous outpour of works relating to gardening. Another supplement to that most indispensable work, the *Index Kewensis*, has been issued, and amongst other important works may be mentioned another volume of *The Trees of Great Britain and Ireland*, by H. J. Elwes and Aug. Henry; *Trees and their Life Histories*, by Percy Groom; the first volume of the *Vegetable Growers' Guide*, by John Wright; *The Royal Gardens, Kew*, by W. J. Bean; a new edition of Gray's *Manual*; two works on Alpine plants by Reginald Farrer; and a superbly illustrated volume on the same subject by Henri Correvon.

We have had to lament the removal by death of many well-known horticulturists, including George Nicholson, V.M.H., Martin R. Smith, V.M.H., Dr. Bonavia, the Earl of Amesley, Henry Balderson, and Charles Baillet.

The gardening charities have continued their excellent work amongst the widows and orphans, and their appeals for support have met with a gratifying response. The Old Age Pensions Act, which will come into

operation on January 1, will not relieve us of the care of the widows and orphans, although the Gardeners' Royal Benevolent Institution may possibly find it necessary to slightly modify the rules governing the allowances to pensioners.

In the past few months we have published a list of generic plant names, with a view to spreading a knowledge of the proper pronunciation of the words. Although it has not been found practicable to insist on the application of definite rules in all cases alike, and concessions have been made to established usage, the list has been received with unmistakable approval, and in response to numerous requests it has been decided to re-issue the list in the form of a book.

COMPETITIONS FOR BRITISH-GROWN FRUIT AT R.H.S. MEETINGS.—In consideration of the facts (1) that the annual autumn show of British-grown fruit is every year practically a replica of the previous year's show; (2) that many British-grown fruits cannot possibly be shown (or shown in perfection) at any one show of fixed date; and (3) that vegetables are somewhat neglected, the Com.tee have decided to omit the great autumn show for one year, and in 1909 to substitute in its place a somewhat similar series of prizes for British-grown fruit, but spread over the whole 12 months, so that every fruit may have a chance of being seen at its best. A

FIG. 179.—FRUITS OF THE LITCHI.
(See p. 444)

schedule of prizes will, therefore, be found offered at every "fortnightly" show at Vincent Square during 1909. In all cases quality and flavour will have most consideration, the judges to have option of tasting. The competition for January 12 is for late Grapes, and on January 20 Seakale and Rhubarb.

THE SURVEYORS' INSTITUTION.—The next ordinary general meeting will be held on Monday, January 11, at 8 p.m., when the discussion on Mr. HERBERT T. SCOBLE'S paper entitled "The Administrative Aspects of Sewage Disposal," read at the meeting of November 23, 1908, will be continued.

*** INSECTIVOROUS PLANTS.**—These plants always arouse interest, and it is gratifying to see that it has been found possible to place Darwin's *Insectivorous Plants*, well printed and nicely bound, before the public at the modest price of half-a-crown. Everyone knows of the illuminating investigations which Darwin conducted on these carnivorous plants, and doubtless many people will be glad to have the book, and to see at first hand what were the methods of observation and experiment which yielded so rich a harvest in one of the most attractive fields of research.

* *Insectivorous Plants*, by Charles Darwin; revised by Lewis Darwin. With illustrations. London, John Murray, Albemarle Street, 1908. Cheap edition, price 2s. 6d.

CYTISUS • BEANII.—In reference to this hybrid *Cytisus*, about which a question was asked by Messrs. PAUL & SON on p. 399, it has been pointed out to us that Messrs. JAS. VEITCH & SONS made an excellent exhibit of the plant at the last Temple show.

BLACK-SCAB OF POTATOS.—This disease, accounts of which have appeared in our own pages, is exciting some alarm in Germany, where it is said to be spreading. It appears to have been recognised as of local occurrence for some years in the neighbourhood of Dusseldorf, Ellerfeld, and some other places, but during this season it has proved so injurious as to have entirely destroyed the crop in many gardens where Potatos have been raised year by year.

ATTAR OF ROSES.—Some interesting facts relating to the well-known perfume attar of roses are given by our contemporary *Die Landisgarber*. Bulgaria is one of the important centres of its production, and exports from that country to France alone amount to nearly 1½ tons. This represents a considerable money value when it is remembered that the attar costs the French importer something like £20 per pound, and even then the purity is not guaranteed, and there is also a heavy import duty to be paid. The Roses which yield the oil in Bulgaria are *R. gallica byzantina* and *R. alba suaveolens*, while in France *R. centifolia* is grown for the same purpose, and in Germany the Damask Rose is similarly cultivated. In order to obtain the oil, layers of the flowers are treated with petroleum ether, and 5,000 lbs. of Roses yield about 1 lb. of the essence. In the French garden at L'Hay, south of Paris, a pound of the oil of guaranteed purity fetches about £50.

GARCINIA MANGOSTANA.—At Government House Grounds, Port of Spain, the only fruiting tree contained in the collection again ripened fruit in August last. This particular tree has been on former occasions brought into prominence by Mr. J. H. HART, F.Z.S., late superintendent of the Trinidad Botanical Department, through successfully sending fruit to England, which were placed upon the royal table, duly acknowledged, and the fact published in former publications issued from the Botanical Department. Owing to the difficulty that has been constantly experienced in transplanting seedlings, the Mangostana, writes Mr. W. E. BROMWYD, has remained to the present time an exceedingly rare fruit in Trinidad. The fruit is considered by many inferior to a first-class grafted Mango, such as Peter's, Jule or Caylon No. 1 (of Grenada).

FLOUR AND PARAFFIN EMULSION.—Paraffin emulsion is well-known as an insecticide, but it is apt to be rather troublesome to make, owing to the ease with which the oil separates from the soap solution. Prof. MACOUN, of Canada, has experimented on substitutes for the soap, and has obtained excellent results by using flour. He recommends adding to a gallon of paraffin about ½ lb. of flour (the cheapest sort will answer), stirring them well together. Three or four gallons of water are then added, and the whole is well beaten up for four or five minutes, when more water to make up to 10 gallons is poured in and the emulsion is ready for use. It is claimed for this form of paraffin emulsion that it is easier to make, and remains without the separation of the oil for a much longer time than when made with soap. Of course, the oil will float to the top if it be left too long, but the emulsion will keep 4 or 5 months in a state fit to use.

INSTRUCTION IN POULTRY-KEEPING.—University College, Reading, has issued a special list of courses in poultry keeping to be given there with practical training at the College Poultry Farm, Theale. Additional lectures are given by members of the staff on Zoology, Soils, Manures and Pastures, Chemistry of Foods, and Book-keeping. The courses include (1) For the full certificate, occupying one year; (2) terminal course, commencing April 22, 1909; (3) short course commencing February 18, 1909; and (4) combined courses, which can commence at any time. Those who desire practical work alone without theoretical teaching are accommodated upon the College Poultry Farm.

Publications Received.—*Beautiful Flowers and How to Grow Them*, by Horace J. and Walter P. Wright. (Part 5). (London: T. C. and E. C. Jack.)

NOTICES OF BOOKS.

"HOLLY, BOX, AND YEW."

Mr. W. DALLIMORE, of the Arboretum, Royal Gardens, Kew, treats in this book of the various Hollies, Yews, and Boxes employed in garden decoration. In addition to descriptions of most of the best sorts being given, notes on cultivation and uses are introduced, with a selection of extracts from various works on the superstitions, legends and poetry of the genera. The descriptions of the varieties of *Ilex Aquifolium*, as far as possible, are those of the late Thomas Moore, which appeared at irregular intervals in the *Gardener's Chronicle* during the years 1874, 1875 and 1876. Most of the leaf illustrations will be recognised by all who know Moore's *Monograph*, as it appeared in these pages; there are, however,

number is reduced to three, or even one. In the *Prinos* or deciduous set, however, six seeds are usually found in each fruit. In isolated trees 20 to 30 yards distant from pollen-bearing specimens, it is not uncommon to find from 25 to 60 per cent. of the seeds sterile. Much difference of opinion has existed on the part of botanists, not only in the creation of species, but also in generic titles; and of the score of generic names given in the *Index Kewensis*, Oti'era is still occasionally used in nurseries for the Japanese *Ilex integra*, and *Prinos* is associated with certain deciduous species of North American and Japanese origin. Whilst the number of distinct species of *Ilex* recorded in the *Kew Index* is 167, the synonyms amount to 138. The distribution of the genus is very wide. Its headquarters are in South America, Brazil alone being the home of 60 species. Leaf variation is very great, and among a batch of seedlings of *I. Aquifolium*, as many as 16 different variations of leaf have been noted. This peculiarity is not confined to British species.

A chapter treating of cultivation contains the result of Mr. Dallimore's personal experience, and his further remarks on soil, pruning, feeding, and enemies are valuable. Good illustrations are given of specimen trees now to be seen in the Royal Botanic Gardens, Kew. Mention is made of John Evelyn's impregnable hedge 400 feet long, 9 feet high and 5 feet in thickness, in his garden at SAYS COURT.

Mr. Dallimore asserts that the Holly thrives in any position, which may be true of this country, but in some parts of Europe it grows well only in partial shade, exposure to hot sunshine causing the leaves of *I. Aquifolium* to fall. In many parts of England Hollies are found in the wild state. Johnston, in his *Botany of the Eastern Counties*, mentions the remains of natural woods at Detchant, near Belford, in Northumberland; and there are numerous Hollies on the banks of the Findhorn, in Aberdeenshire. The legends and superstitions connected with the Holly make interesting reading. The illustrations of the leaves of Holly have great value in the identification of varieties of *I. Aquifolium*.

Other evergreen species are described, and some of them figured, including American, Japanese, and those from China, viz.: *I. Fargesii*, *I. Perynii*, *I. Aquifolium chinense*, and *I. crenata*, in the possession of Messrs. J. Veitch & Sons.

The chapters on the Yew contain a fund of curious information, and the uses of the Yew in topiary are briefly referred to, as are the varieties of *Taxus baccata*, which are 39. Mention is made of other species, such as *Taxus brevifolia*, introduced by the Veitchian collector, W. Lobb, in 1854; *T. canadensis*, and *T. cuspidata*, used in Japan for cabinet work and indoor decoration of the best houses.

In addition to a good chapter on the Box, there are appended short notes on various shrubs, but these latter scarcely form a useful part of the book, and appear more of the nature of an *aldenda*. F. M.

(Barbados: Imperial Commissioner of Agriculture for the West Indies.)—*The City* (January). (London and Letchworth: J. M. Dent & Co.) Price 6d. net.—*The British Astronomical Weather Almanac and Chart, 1909*, by B. G. Jenkins, F.R.A.S. (London: R. Morgan, 65, Westow Street, Norwood, S.E.) Price 2d.—*Memoirs of the Royal Caledonian Horticultural Society*. (Edinburgh: The Royal Caledonian Horticultural Society.)—*Ninth Report of the Woburn Experimental Fruit Farm*, by the Duke of Bedford, K.G., F.R.S., and Spencer U. Pickering, M.A., F.R.S. (London: The Amalgamated Press, Ltd.) Price 2s. 6d.

numerous new ones, together with illustrations of isolated plants and groups, all of which are from photographs by Mr. E. J. Wallis.

Appropriately in a book of this kind, and at this season, the Holly occupies the first part. The flowers of the Holly are borne in the leaf axils, and are white or cream in colour, usually fragrant, and may be monocious, dioecious or hermaphrodite. The fruits are more or less globose, often bright red in colour, sometimes deep red, purple, black or yellow. The normal number of seeds in most of the evergreen Hollies is four in each fruit; in one or two species this

Holly, Box, and Yew, with notes on other evergreens, by W. Dallimore. (London: John Lane, The Bodley Head, New York: John Lane Company. Price 7s. 6d.)

HOME CORRESPONDENCE.

(The Editor does not hold himself responsible for the opinions expressed by his correspondents.)

GRAPE MUSCAT OF ALEXANDRIA (see p. 438).

—As one of the judges at the local show where Mr. Vert exhibited and the disputing question arose, perhaps I may state the following facts? The class was for two bunches of Muscat of Alexandria Grapes, and the competition was good. My two colleagues and myself judged the Grapes on their merits, and made the awards accordingly. It is true that, had these Grapes been judged from appearance only, Mr. Vert's exhibit might have been placed first; but their appearance, both in colour and shape of berry, led each of us to be suspicious, and we resolved to taste them in fairness to other competitors. The flavour was distinctly poor, being very much inferior to the exhibit to which

we awarded the first prize. These latter Grapes were larger bunches, had fine berries, and were very richly flavoured, being equal, in every respect except colour, to those shown by Mr. Vert. I believe it to be a fact that the more highly finished as regards colour a Muscat of Alexandria Grape is the better the flavour, and as this quality is the most important in dessert fruits, we awarded the first prize to what we considered to be the best. We did not go so far as to say Mr. Vert's Grape was not a Muscat, or we most certainly should have disqualified it; but surely F.R.H.S. (see p. 438) must admit that any Grape—it matters not what it is named—should possess high flavour as it is understood in the variety it claims to represent. F.R.H.S. goes on to say one of the judges is reported to have said at the committee meeting that the berries from the bottom of the bunch there tested were of better flavour than those from the top of the bunch. Now, as I was the only judge sitting on the committee of the R.H.S., this must refer to me, but I have not said one word as to this, and, in point of fact, no berries were taken from the bottom of the bunch or bunches at the exhibition. The bunch Mr. Vert brought up to the R.H.S. meeting on November 27 was, in my opinion, precisely the same as those he entered for competition, and I think I am right in saying that nearly all the committee had the opinion that the flavour was very poor indeed, and there was unquestionably

legia, Arctotis aureola, A. arboreascens, A. robustus, Aralia Stebboldii, Arbutus magnifica, A. Unedo, Ardisia japonica, Armeria, Aster grandiflorus, Azalea mollis, Barosma betulina, Bauera rubrioides, Begonia corallina, B. semperflorens, Berberidopsis corallina, Berberis Bealii vera, B. Darwini, B. stenophylla, Bignonia capensis, Brachyosma latifolia, Buddleia asiatica, Calceolaria Burbidgei, Calceolaria, Calliophore involucreta, Campanula gossanica, C. persicifolia, Candytuft, Cannia, Cassia corymbosa, Ceanothus Gloire de Versailles, C. Veitchii, Cestrum Parqueti, Choisya ternata, Chorozema cordatum splendens, C. M.H.G., Trewidden, Buryas Bridge, Cornwall.

TABLE DECORATIONS.—Mr. E. Molyneux (see p. 405) has fallen into the error so often made by judges, that of criticising stands. You will often find them making such remarks as these: "What a lovely stand, how beautifully made, what splendid colouring, and what a vase as well." Now, I assert that the duty of a judge is to decide on the harmony, the general effect; in fact, the decoration complete. Does it effect its purpose, showing Nature's products in a natural way. The most perfect stand is one that does this without being unduly prominent. The choice of a stand remains with the exhibitor. Your contributor seizes on a table at the N.C.S. November show to hold up as an example, and what does he like? We find him applauding a style of decoration in vogue in my childhood's days—in the days of the '51 exhibition. As a boy I recollect them well—flowers pressed together, showing no stalks or foliage, like as though a basin had been pressed over them and they had been moulded into shape, a mass, so welded together that you could not discern a complete flower. We do not want to go back to this, yet there are many in the floral trade and among flower-show judges who steadfastly set themselves against any progress, and who, like your contributor, still cling for the days of their youth. Thomas S. Williams, Eding. W.

FIG. 151.—DILLENIA INDICA, A NATIVE OF TROPICAL ASIA. THE FRUITS ARE USED FOR MAKING JELLY AND ALSO A COOLING DRINK. (See p. 445.)

a great doubt among many as to whether it was a Bunch of Muscat of Alexandria or not. Therefore it was decided to invite others to send some true Muscats, and Mr. Veit kindly consented to send another bunch, which he did on December 8. This Grape was tasted first, and from some unexplained reason the flavour was all that could be desired in Muscat of Alexandria. F.R.H.S. has a perfect right to his opinion as to there being only two varieties of white Muscats, Alexandria and Canon Hall; but, as he agrees that Canon Hall is a seedling from the other, there is certainly no reason, considering the large number of seedlings raised from this favourite variety, why there should not be others also in cultivation of inferior quality to either of the sorts I have mentioned. Edwin Beckett.

PLANTS IN FLOWER IN DECEMBER.—I send a list of plants which were in flower out-of-doors at Trewidden on December 8.—Abelia floribunda, A. rupestris, Abutilon grandis, A. Mme. Trehayne, A. President McKinley, A. Scarlet King, A. vexillarium and A. v. variegatum, Acacia platyptera, Acanthus latifolius, Acauba japonica, Adenocarpus angustus, Alonsoa Warszewiczii, Alyssum saxatile, A. sulphurea, Anemone fulgens, Apogoneton distachyon, Aquil-

Pelargonium Henry Jacoby, Paul Crampel and Moeresnight (scented leaf), Gerbera Jamesoni, Godetia mixed, Grevillea thelranniana, Guevina Aveliana, Hamamelis arborea, Hardenbergia monophylla, Helianthemum, Heliotrope, Helleborus, Hydrangea cyanoclada, H. hortensis, H. paniculata, Hypericum calycinum, H. patulum, Iberis sempervirens, Impatiens Holstii, Intermediate stocks, Iris stylosa, Jasminum nudiflorum, J. primulinum, Lapageria rosea and L. alba, Larkspur (annual), Lasiandra macrantha, Lavatera, Leptospermum bullatum, Leycesteria formosa, Linaria cymbalaria, Linum tetragynum, Lithospermum prostratum, L. rosmarinifolium, Lobelia cardinalis, L. "Emperor William," Lotus polyborhynchus, Loniceria gigantea, Lopezia immitata, Lychnis, Manettia bicolor, Marguerites, Megasea cordifolia, Mesembryanthemum, Mignonette, Nandina domestica purpurea, Nasturtium, Nicotiana Sanderaiana, Nigella "Miss Jekyll," Omphalodes verna alba, Enothera Youngi, Osmanthus illicifolia, Pansies in variety, Penstemon, Perennials, Petasites fragrans, Pittosporum sinense, Plumbago capensis, Polyanthus, Polygala dalmaisiana, Potentilla nepalensis, Primula Arendsi, P. japonica, P. megaseaefolia, Rehmannia anclata, Rhodochiton volubilis, Rhynchospermum jasmimoides, Romneya (winter), Ross, Dorothy Perkins, Macartney and others; Rubus innominatus,

THE POTATO IN SCOTLAND.—Many people account the data given in Chambers' Traditions of Edinburgh, and imagine that this esculent was unknown to the Scot till the eighteenth century. Some years ago I showed that it was cultivated in gardens previous to 1683, and recently I had a book of farming through my hands by James Donaldson, and entitled Husbandry Anatomized. It was published in 1697, and though the book as a whole is of no great value, it is interesting inasmuch as it contains something new about the Potato. There were two varieties grown by farmers, the one the "knobbed round" and the other an oval variety, which was cut into sets for planting. Those who can recall the methods of the field culture of the Potato 30 to 50 years ago will recollect that the manure was spread along the bottom of the drills, and each set was placed directly on the dung. This is exactly what Donaldson recommends to be done. For the garden he considered that the Potato was useful only for improving a piece of unfavourable soil. Like the pig, the Potato, though it is almost certain it must have been cultivated much earlier than we possess means of proving, was not liked by the majority of Scotsmen. It would seem it carried with it the indefinable something that rendered Convolvulus Batatas infamous previous to the introduction of the Potato. I am acquainted with a very old man, who still waits with expectancy an increase of the population in the year succeeding a large crop of the Potato. So that we have existing over centuries methods of cultivation, and a curious belief in the physical qualities of the tuber, the truth or falsity of which has never been investigated. R. P. Bretherton.

LAWN-CLEANING.—We are using the "Pennsylvania Lawn Cleaner" on the lawns here with great success. It removes leaves, twigs, small stones, &c., with the greatest of ease, and the grass looks better than when swept with a broom. The machine can be used by a lad as fast as one can walk. J. S. Hines, Rigg Gardens, Corwen.

GRAPE CANON HALL MUSCAT.—Your article, (p. 394) on Canon Muscat of Alexandria, reminds me of a conversation I had a few months ago with Mr. Batley, gardener at Wentworth Castle, near Barnsley. Amongst other gardening subjects we then discussed was the origin of the above-named Grape. I chanced to say that it was nearly 47 years since I called at Canon Hall gardens and saw what I was then told was the original seedling vine of this well-known Grape. Mr. Batley said that a good many years ago the then agent at Canon Hall—a gentleman named Mr. Wemyss—told his late father that the vine in question was not a seedling. It came with other vine cuttings from France, being either brought by, or sent to, a former owner of the estate, which has been possessed by the family of Spencer Stanhopes for a long period. I have not now at hand the late Mr. Barron's book on vines, but under the impression it is there described as a seedling at Canon Hall, or it may be so in Hogg's *Fruit Manual* [Ves.—Ed.], which is not at hand either. Mr. Batley is the third generation of gardeners at Wentworth Castle. He and his forefathers have always been in touch with the gardeners at Canon Hall, which is situated only a few miles distant. *H. J. Clayton, Ulleskelf, York.*

GARDENERS AND MUSIC.—Permit me to hazard a few remarks on p. 487. I have met gardeners whose performances both vocally and instrumentally have been much above the average, and this leads me to ask if it would not be possible for some of the gardening musical talent to combine and get up a concert in aid of the two most excellent and deserving gardening charities—the Royal Gardeners' Orphan Fund and the Gardeners' Royal Benevolent Institution? Two head gardeners among my acquaintances hold the position of organist. *H. Mount H. Yates, The Gardens, Motherfield Park, Alton, Hants.*

PERSISTENCE OF HOLLY BERRIES.—*Ilex Maroonckii*, an old variety of Holly that one seldom sees, has the peculiarity of retaining its berries for more than a year. Perhaps the specimens exhibited before the Scientific Committee of the R.H.S., mentioned on p. 399, were taken from a tree of this variety. For over 30 years I had under my care a large tree of *I. Maroonckii*, and I regularly noticed its peculiarity in this respect. In growth it is more straggling than the common Holly, the berries being thinly set thereon, sometimes for fully 18 inches of their length. Individually, they are larger and more distinct in colour, being of a bright vermilion red. We several times were able to get sprays for Christmas decorations from it when the birds had cleared the others. Why these were not also taken I cannot explain, except that in taste they were more bitter. Mr. William Atkinson of the Hlandswoth Nurseries, Sheffield, named the specimen in question for me fully 25 years ago. *Yorkshire Gardener.*

AN EXTRACT FROM AN EIGHTEENTH CENTURY GARDEN ACCOUNT FOR COUNTY OF WORCESTER.—I send herewith an extract from an old garden account, which gives the prices paid for labour, etc., in the county of Worcester 166 years ago—1740—February 14, one man six days, 7s.; February 21, peck of Romuald Peas, 2s. 6d.; March 2, spade, 4s.; March 2, sawing a Fir tree, 1s. 6d.; March 6, a rake, 1s. 6d.; March 14, making a hot-bed frame and nails, 3s.; white lead and oyle for ditto, 1s. 8d.; May 17, six beeswax 7d., a hoe 1s., 1s. 7d.; June 11, a woman for six days weeding, 3s.; September 6, a wheelbarrow, 7s. 6d.; 1741—May 27, 2 ounces Savoy seed 2s., ditto cabbage 2s., 4s.; September 20, Dessey, for cyder making, two days, 2s.; 1742—May 1, Joyce Field, for two days weeding, 1s.; May 27, Jno. Nash, for binding 200 faggots, 2s. *Andrew South, 18, Bellevue Road, Kingston-on-Thames.*

WHAT IS AN AMATEUR?—I was surprised to find this subject cropping up at a meeting of members of gardeners' mutual improvement societies in October last, as I had held the primary purpose of these societies was to promote wider knowledge in gardening amongst the members, and not to promote flower-show competitions. But in relation to the proper description of a show-

competing amateur, Mr. Wilks seems to have defined the status of such individual very well. At local shows exhibitors are defined, as a rule, as nurserymen, gardeners, amateurs, cottagers, and ladies; and I find their respective positions generally very well understood. I specially agree with Mr. Wilks in his assertion that the status of an amateur is not a matter for the show judges to determine. When committees accept entries, the responsibility of determining the position of the entrant should rest with the committee, and it is most unfair to drag judges into any such dispute. With respect to the question as to whether any person who may sell surplus produce occasionally from his garden, is or is not, an amateur, I would ask is a cottager who may sell a few bunches of cut flowers or some fruit or vegetables of which he has more than he needs any the less a cottager? So far from being disqualified, he is to be commended. If he published lists or advertisements that he had produce for sale, he would be an amateur no longer, but to make him a trader because he may dispose of a little surplus produce rather than let it waste would be absurd. *A. D.*

SOCIETIES.

ROYAL HORTICULTURAL

DECEMBER 22.—The final meeting of the Committees for 1908 was held on Tuesday last. There was a bright display of flowers and fruits, also a noteworthy exhibit of ornamental shrubs. Orchids were numerous, and there were also brilliant groups of Begonias, Pelargoniums, Carnations and other flowers. Messrs. JAMES VEITCH & SONS, LTD., were awarded two Gold Medals, one for the exhibit of shrubs referred to, the other for a display of Apples and Pears.

THE ORCHID COMMITTEE granted three First-class Certificates, three Awards of Merit, and two Botanical Certificates.

THE FLORAL COMMITTEE granted one First-class Certificate and one Award of Merit.

Two varieties of Apples were recognised by the FRUIT and VEGETABLE COMMITTEE, one gaining a First-class Certificate and another an Award of Merit.

Floral Committee.

Present: W. Marshall, Esq., chairman, and Messrs. Chas. T. Drury, Jas. Walker, T. W. Turner, G. Reuthe, E. H. Bowles, Chas. E. Pearson, W. Howe, J. F. McLeod, W. Bain, Chas. Dixon, J. T. Bennett-Poe, Herbert J. Cutbush, W. Cuthbertson, W. P. Thomson, E. H. Jenkins, W. J. James, W. T. Ware, Arthur Turner, Jas. Hudson, W. A. Bilbey, and K. Hooper Pearson.

Messrs. JAMES VEITCH & SONS, LTD., King's Road, Chelsea, exhibited a very large collection of ornamental shrubs. The group occupied the whole length of the building, and ten large vans were required for the transport of the plants. There were Hollies, Aucubas, Arbutus, Enonymus, Olearia, Ivies, Pittosporums, Viburnums, Magnolias, Phillyreas, Crategus, Skimmia, Bamboos, and numerous other subjects represented in all the types and varieties. Amongst uncommon species may be mentioned *Cotoneaster humilis* with long trailing shoots; *Olearia autumnalis*, *Berberis pinnatifida*, *Rhamnus alaternus folio marginata*, *Viburnum rhytidophyllum*, and *Ilex Peryi*. The same firm also showed a bright exhibit of greenhouse flowering plants, having many beautiful varieties of their type of winter-blooming Begonias, the yellow-flowered *Cereopsis Grantii* and the pink *Crowea latifolia* major, the whole relieved with Ferns and Palms.

Messrs. H. CANNELL & SONS, Swanley, showed pyramidal-trained plants of Begonias *Gloire de Lorraine*, Mrs. L. de Rothschild, Turnford Hall, and a large flowered variety named *The King*. All the specimens were profusely flowered and showed to advantage on a white ground, relieved with Adiantum Ferns and *Isolepis gracilis*. Adjoining the Begonias were varieties of Zonal Pelargoniums. There were several new varieties, and of these we may instance *Leonus* (deep crimson), *Venus* (white with "pips" of perfect form), *Uranus* (some of the individual flowers measured 2½ inches across, the colour

is rosy cerise), *Vesta* (rose-salmon with a large white eye), *Mars* (crimson; the petals are of great substance) and *Mercury* (orange-scarlet, very large in size). (Silver-gilt Banksian Medal.)

Messrs. W. M. CUTBUSH & SON, Highgate, London, N., showed an assortment of berried plants, and a large number of well-fruited specimens of *Citrus sibensis*. The exhibit also included *Ternstroemia* (both purple and white berried), *Stammia japonica*, *Ardisia crenulata* (a very elegant berried plant), *Daphne indica*, and *Aucuba japonica*. The same firm also exhibited a charming group of perpetual-flowering Carnations, having most of the best varieties of this popular flower, either as cut blooms or pot plants. (Silver-gilt Flora Medal.)

Messrs. HUGH LOW & CO., Bush Hill Park, Enfield, showed perpetual-flowering Carnations in assortment, several species of *Acacia*, *Correa cardinalis*, *Daphne indica rubra*, and other seasonable greenhouse plants. (Bronze Flora Medal.)

Messrs. H. B. MAY & SON, The Nurseries, Upper Edmonton, showed choice and rare Ferns in variety. We noticed the new *Nephrolepis Amerpohlii*, a very elegant variety of *N. exaltata*, also *N. e. superba* with erect-growing fronds pleasingly fringed, *Asplenium nidus multifloratum*, the fronds being each divided at their upper parts; *Adiantum formosum*, *Lomaria platyptera*, *Asplenium Belangerii*, *Platycaerum grande*, *Pteris argyrea*, &c. (Silver Banksian Medal.)

Messrs. PAUL & SON, The Old Nurseries, Cheshunt, showed flowering plants of *Montanoa bipinnatifida*, which formed the subject of the Supplementary Illustration in the issue for January 13, 1908.

Mr. W. P. HORTON, Cravenhurst, Seaford, Sussex, staged an exhibit of greenhouse flowering and foliage plants, including Begonias, Primulas, *Salvia splendens*, *Cinerarias*, *Cyrtopodiums*, &c., relieved with Ferns and Palms.

Mr. G. REUTHE, Keston, Kent, displayed a few interesting Alpine plants in flower.

AWARDS.

Acanthus montanus.—This is an old species introduced from West Africa many years ago, but it is rarely if ever seen in English gardens. Messrs. JAS. VEITCH & SONS exhibited a plant in a 6in. pot, with long, deeply-cut leaves mottled with yellow and green. The inflorescence was about 8in. long, and the bracteoles veined with light purple, causing the flowers to appear of that colour, although this species is sometimes described as rose coloured. The three-lobed lip is perfectly white. The plant needs stove treatment. (First-class Certificate.)

Sarcococca ruscifolia.—This is a new species introduced from China, and described in *Hortus Veitchii* under the name of *S. prunifolius*, but it has since been named by Dr. Stapf *S. ruscifolia*. It is a dwarf evergreen shrub with foliage like that of a *Ruscus*, bright green and shiny. Small clusters of whitish, fragrant flowers are produced in the leaf axils, and the fruits are described as bright blue. The shrub will bear cutting almost like a *Privet*, and it is said to grow well in shade. From Messrs. JAS. VEITCH & SONS, LTD. (Award of Merit.)

Orchid Committee.

Present: J. Gurney Fowler, Esq. (in the chair), and Messrs. Jas. O'Brien (hon. sec.), Harry J. Veitch, de B. Crawshaw, H. Little, W. Boxall, Stuart Low, F. J. Hanbury, F. M. Osgilvie, K. G. Thwaites, C. H. Curtis, H. J. Chapman, J. Forster Alcock, J. Charlesworth, A. Dye, J. Cyprien, H. G. Alexander, W. H. White, H. A. Tracy, H. Ballantine, A. A. McBean, J. Wilson Potter, Gurney Wilson, and R. Brooman-White.

Messrs. SANDER & SONS, St. Albans and Bruges, were awarded a Silver Flora Medal for a very interesting group containing several remarkable novelties, the central figures being the new and fine *Odontoglossum Magali Sander* (see Awards); a supposed new *Odontoglossum* named *Mooreana*, an elegant species, probably nearest to *O. Kranzlinii*, and with flowers bearing some resemblance to *O. ramosissimum*; *Cyrtopidium Penelope* (*Hitchinsia* × *Leeana*), a very pretty and distinct *Cyrtopidium* of attractive coloring; a variety of *Laelia anceps*, *L. autumnalis* alba, *Oncidium Loxense*, &c., were also shown.

MESSRS. CHARLESWORTH & CO., Hayward's Heath, were awarded a Silver Flora Medal for a select group, in which were a fine specimen of the best form of the now rare *Vanda lamellata* Boxalli, the white *V. Watsonii*, an elegant plant of *Gongora quinquenervis*, with three long spikes of flowers; various hybrid *Odontoglossums*, the brightly-coloured *Plelio-Cattleya Charlesworthii* principles, &c.

F. MENTHEITH OGLIVIE, Esq., The Shrubbery, Oxford (gr. Mr. Balmforth), received a Silver Flora Medal for a group of *Cypripediums*, *Lycaste hybrida*, *L. Balliae*, three pure white *L. Skinneri* alba *magnifica*, &c.

MESSRS. J. & A. MCBEAN, Cooksbridge, were awarded a Silver Flora Medal for a very effective group of fine varieties of *Odontoglossum crispum*, the best of which were the very beautiful variety *Majesticum*, a grand white flower, with a few dark spots on the sepals; and a new, heavily-blotched variety, flowering for the first time. Also in the group were the excellent forms of *Laelia* and *V. autumnalis*, with seven spikes, and various good *Cypripediums*.

MESSRS. JAS. CYPHER & SONS, Cheltenham, showed a select group of *Cypripediums*, which included C. F. Sander, a remarkable flower, with some resemblance to C. nitens, but with a distinct green reticulation in the leaf; C. Thompsonii; C. triumphans, C. Minos Young's variety; varieties of C. Euryades, C. insigne, &c. (Silver Banksian Medal).

MESSRS. COL. HOLFORD, C.I.E., C.V.O., Westonbirt, sent *Cypripedium Beacon* (J. Howes × nitens *Lecanum*) and *Oncidium Forbesii*, Westonbirt variety, having a large yellow lip, with some brown blotches in front. Also two others.

FRANCIS WELLESLEY, Esq., Westfield, Woking (gr. Mr. Hopkins), showed *Cypripedium Ernest Swinton* (Godfroye × Bechene), with beautiful cream-white leaves, prettily netted with green, and flower formed like C. William Lloyd, cream-white, densely blotched with claret colour, also a yellow *Laelio-Cattleya*.

DE B. CRAWSHAY, Esq., Rosefield, Sevenoaks (gr. Mr. Stables), showed *Cymbidium Rosefeldense* (Tracyanum × grandiflorum), a very promising hybrid, with large flowers, in which both parents can easily be traced. When grown it should be very handsome.

SIR THELWYD LAWRENCE, Bart., K.C.V.O. (gr. Mr. W. H. White), showed a *Sophrora-Laelia* between *S. grandiflora* and *L. Jongheana*, of the form of the latter, but smaller.

J. GORDON FOWLER, Esq. (gr. Mr. J. Davis), showed a very fine and well-grown *Odontoglossum crispum* with very large flowers.

MESSRS. JAS. VEITCH & SONS, Chelsea, sent *Cypripedium Thalia splendens*, approaching in size and colour the famous C. Thalia Mrs. Francis Wellesley; C. Crusader; and the very handsome C. Elator.

H. T. PIER, Esq. (gr. Mr. Thurgood), sent *Cypripedium Felicity*.

MR. H. A. TRACY showed *Cypripedium Goodsonianum*.

MESSRS. HUGH LOW & CO., staged a group of *Cypripediums*, &c., which included C. Minos Young's variety, C. Tracyanum, C. Helen II., and varieties of C. insigne.

MESSRS. ARMSTRONG & BROWN, Tunbridge Wells, sent *Cypripedium Helen II.* var. *Armstrongiae*, an ivory-white flower, prettily spotted, and C. Minos Young's variety.

NORMAN C. COOKSON, Esq., Oakwood, Wylam (gr. Mr. H. J. Chapman) showed a selection of his very fine hybrid *Celanthus*.

MRS. MERLENS (Ghent), showed several pretty hybrid *Odontoglossums*.

R. G. THWAITES, Esq., Streatham (gr. Mr. Black) staged a selection of his white-petalled forms of *Cattleya Maggie Raphael*.

AWARDS.

FIRST-CLASS CERTIFICATE.

Odontoglossum Megali Sander (*Rolfæ* × *Adriana* var. *F. K. Sander*), from Messrs. SANDER & SONS, St. Albans. A grand variety with very large flowers, broad in all the segments and especially in the very remarkable lip, the fibrillation of whose margin gives indications of *O. Adriana*, the flower generally approaching nearer to *O. Rolfæ*, but in its dense spotting *O. Adriana* again appears. Sepals and petals cream white, slightly mottled with rose and with transverse bars of confluent blotches, with surrounding smaller blotches of

claret purple. Lip white, with a complicated yellow crest, with purple lines, and having one large red-dish-purple blotch, in front of which is a mottled ray of deep rose colour. Margin white and fringed.

Calanthe Angela (*Burfordensis* × *Chapmanii*), from NORMAN C. COOKSON, Esq. (gr. Mr. H. J. Chapman). A grand improvement on the richly-coloured C. Chapmanii and with larger distinctly three-lobed lip of an intense ruby crimson, the sepals and petals being of a lighter tint.

Cypripedium Antinum (*J. Howes* × *Adonis*), from Lieut.-Col. G. L. HOLFORD, C.I.E., C.V.O., Westonbirt (gr. Mr. H. G. Alexander). A very handsome hybrid with a fine white dorsal sepal spotted with purple on the lower half. Petals and lip pale yellow with a slight orange shade, and obscure green veining.

AWARD OF MERIT.

Cypripedium Elator (*Lecanum* × *Baron Schröder*), from Messrs. JAS. VEITCH & SONS, Chelsea. A very beautiful *Cypripedium* and an improvement on C. Baron Schröder in size and form. Ground colour white, finely blotched and tinged with deep violet-purple.

Calanthe Norman (*vestita gigantea* × *rubro-oculata*) (hybrid), from NORMAN C. COOKSON, Esq. A very bright hybrid rather lighter in colour than C. Angela and with rather larger flower. Lip mauve-crimson, petals rose-purple, sepals tipped with white.

Oncidium bicallousum Sanders variety, from Messrs. SANDER & SONS. Sepals and petals chestnut brown, lip large yellow.

BOTANICAL CERTIFICATE.

Dendrobium elongatum.—An elegant little species of the *D. cymbidioides* section with slender spray of white flowers with yellow lip, margined with purple.

Epidendrum punctiferum.—A rare species of the *E. inaequantum* type, with upright spikes of green flowers with white lips spotted purple. Both from Sir THELWYD LAWRENCE, Bart., K.C.V.O.

CULTURAL COMMENDATION.

To Mr. H. J. Chapman (gr. to NORMAN C. COOKSON, Esq.), for a *Cypripedium Lecanum Chickabarium*, with 15 flowers.

To Mr. H. G. Alexander (gr. to Lieut.-Col. G. L. HOLFORD, C.I.E., C.V.O.), for the rare *Cœlogyne Mooreana* with two fine spikes.

Fruit and Vegetable Committee.

Present: Geo. Bunyard, Esq. (in the chair), and Messrs W. Bates, Alex. Dean, H. Parr, A. R. Allan, Wm. Pope, James Gibson, J. Davis, G. Reynolds, Owen Thomas, C. G. A. Nix, W. Poupard, Jos. Cheal, and James Vert.

MESSRS. JAMES VEITCH & SONS, LTD., King's Road, Chelsea, displayed a very fine exhibit of well-kept Apples and Pears. There were 150 varieties of the former fruit and 16 of Pears, and, in addition, there were six dishes of French-grown Pears and Apples. The whole formed one of the finest exhibits of Apples and Pears ever exhibited in December: the Committee awarded it a Gold Medal.

An excellent exhibit of Apples and Pears was shown by Messrs. H. CANNELL & SONS, Swailey, Kent (Silver Knightian Medal); and another smaller group of Apples was shown by Messrs. HUGH LOW & CO., Bush Hill Park, Enfield. (Silver Banksian Medal).

LORD HAWKINGTON, Elvaston Castle, Derby (gr. Mr. J. H. Goodacre), exhibited 15 magnificent bunches of Muscat of Alexandria Grapes. (Hogg Medal.)

AWARDS.

FIRST-CLASS CERTIFICATE.

Apple Encore.—This variety was granted an Award of Merit on December 11, 1906, and is figured and described in the issue for January 5, 1907. From Col. ARTHUR HOUBLON.

AWARD OF MERIT.

Apple William Crump.—A dessert variety raised from Cox's Orange Pippin × Worcester Pearmain. From Mr. W. CRUMP, Madresfield Court Gardens.

NATIONAL DAHLIA.

DECEMBER 15.—The annual general meeting of the above Society was held at the Hotel Windsor on this date. Mr. Edward Mawley, V.M.H., presiding. The first business was the confirmation of the scheme of amalgamation agreed upon by the members of the London Dahlia Union and by the committees of both Societies. This was adopted without dissent.

The Secretary next read the annual report, from which we extract the following:—

EXTRACT FROM ANNUAL REPORT.

The annual exhibition, for the first time, was held in the new Hall of the Royal Horticultural Society. The total number of entries for the show in 1908 was 303, as against 253 in 1907, but the bad weather just before the Show prevented some who had entered from competing.

Some 70 new varieties were submitted to the inspection of the judges, who awarded certificates to 41 of them. On September 29 the Joint Committee of the National Dahlia Society and the Royal Horticultural Society met for the purpose of making awards to new Dahlias. Certificates were awarded to nine varieties. The total number of certificates awarded in 1908 was 151, in 1907, 155, and in 1908, 200.

The Chelsea and Crystal Palace value 15 guineas; in Class 6, for 18 bunches of *Cactus Dahlias*, was won outright by Messrs. Stredwick & Son, and the Silver Challenge Cup, value 5 guineas, in Class 15, for 24 blooms of show or fancy Dahlias, was won outright by Mr. Thomas Jones. Subscribers are invited to replace these, and should be sent to the hon. treasurer, by whom they will be gladly acknowledged.

The number of new members joining the Society in 1908 was 28; in 1907 there were 28; in 1906, 38; and in 1905, 32 new members. Thirty-nine members have resigned during the past year. The committee regret that their appeal to obtain new members has not met with the support they anticipated.

The trial of garden varieties of Dahlias was again held at Wisley. Two visits were made by a Joint Committee, and seven varieties were highly commended. The trial of Dahlias will be continued in 1909, by the courtesy of the Royal Horticultural Society. *Cactus* show Dahlias of any kind, either garden or exhibition, will be excluded from the trial.

The balance-sheet showed a total income of £163 10s. and a balance of £6 6s. 2d.

The Treasurer stated that, owing to the kindness of the trade growers generally in not taking their prizes, the Society was able to carry forward a balance of £19 9s. 8d., including the reserve fund.

The President then moved the formal adoption of the report with mingled feelings of regret and pleasure—regret that the attempt made to hold a London show had not proved successful and pleasure at the fact that the two Societies had to-day agreed to amalgamate, which would tend to place the new Society on a firm basis. A generous offer had been made by the Crystal Palace Company to hold the next show at the Palace, which would no doubt be accepted; a second show will also be held in London.

Mr. Geo. Gordon advocated the claims of the garden varieties of Dahlia, and he thought trials for the purpose of ascertaining the best garden kinds should be conducted; also that more publications should be issued. The report was adopted.

It was agreed to form a General Committee of not more than 40 members, from which an Executive Committee of 12 members should be annually elected to conduct the business of the Society. The number of vice-presidents was increased, and the names of Mr. John Green and Mr. W. Cuthbert were added.

Mr. Edward Mawley was re-elected president of the Society for the ensuing year, and Mr. C. E. Wilkins was appointed treasurer. Mr. E. F. Hawes and Mr. H. H. Thomas were elected as joint honorary secretaries. On a ballot for the members of the Executive Committee, the following persons were declared elected:—Messrs. Brousson, Baxter, Adam, Cheal, Doncaster, J. Green, Lockyer, Mortimer, Riding, Stephens, Stredwick, and J. West. Mr. W. Stephens was elected as auditor.

TRADE NOTICES.

MR. JOHN A. LANG, Seedsman, Seal Chart, near Sevenoaks, informs us he is in no way connected with Messrs. John Lang & Sons, of the Forest Hill Nurseries.

MR. ADRIANUS has accepted an engagement to undertake the development of a new garden at Tipitree, Essex, for Mr. F. Mynott, of Brook Hall.

MESSRS. HOWARD & HEMSLEY, LTD.

This private company has been formed with a capital of £2,000, in £1 shares, to acquire the business of Mr. Howard, &c., carried on at Little Pycham, Lincolnshire, by T. Howard and J. S. Hemsley, as Howard & Hemsley, and the Lincolnshire Tomato Growers.

APPLES: C. W., British Columbia. According to Hogg's *Fruit Manual*, Cox's Orange Pippin was raised at Colnbrook Lawn, near Slough, Buckinghamshire, by a Mr. Cox, who was formerly a brewer at Bermondsey, and who retired to Colnbrook Lawn, where he devoted the remaining years of his life to gardening pursuits. The Apple originated in 1830, and is said to have been raised from a pip of Ribston Pippin. The Ribston Pippin did not become generally known till the end of the 18th century. The original tree was first discovered growing in the garden at Ribston Hall, near Knaresborough, but how, when, or by what means it came there has not been satisfactorily ascertained. One account states that about the year 1688 some Apple pips were brought from Rouen and sown at Ribston Hall; the trees produced from them were planted in the park, and one turned out to be the variety in question. The original tree stood till 1810, when it was blown down by a violent gale of wind. It was afterwards supported by stakes in a horizontal position, and continued to produce fruit till it died in 1835. The gardener at Ribston Hall, by whom this Apple was raised, was the father of Lowe, who, during the last century, was a fruit-tree nurseryman at Hampton Wick. Lord Suffield was raised by a hand-loom weaver named Thomas, of Boardman Lane, Middleton, near Manchester, and was first distributed in 1836 or 1837. It was called Lord Suffield on account of that nobleman being at the time lord of the manor of Middleton.

APPLE SHOOTS: G. H. S. This is true "canker" (*Nectria ditissima*). Get rid of any "American blight" that is present, as canker almost invariably follows that pest. In one place the canker has followed on after the shoot was attacked by the Apple scab fungus. Spraying in the winter with 1 lb. bluestone to 25 gallons of water will remove much of the "scab." Cut out the cankers and protect the wounds by painting them over with Stockholm tar.

ASH: A. Z. The difference in fertility in the Ash trees is due to some specific or varietal characteristics. Varieties of all trees and plants are liable to vary in their capacity for flowering and fruiting.

BLACK CURRANT BUDS: J. T. A. The buds are affected with the Currant-bud mite. It is recommended that bushes only slightly affected should be dusted with a mixture of lime and sulphur in March, April, and May. Badly infested bushes should be burned.

CHRYSANTHEMUM WESTERN KING: G. J. The pale lemon colour in your sport of this variety is scarcely pronounced enough to be valuable.

DAHLIA: D. & Co. The Dahlia is attacked by a fungus known as *Sclerotinia*. The dark, bean-like substances you refer to are the "sclerotia," or dormant mycelium (spore mass) of the fungus, which can be removed by rubbing a letter (unstamped) to the Secretary, Board of Agriculture, 4, Whitehall Place, London, S.W. This leaflet gives a full description (illustrated), and suggests remedies.

FRUIT TREE SHOOTS: T. C. Although there is some "scab" fungus present (*Fusicladium dendriticum*) on the twigs, the main injury is being caused by canker (*Nectria ditissima*). If any American blight or woolly aphid is present on the trees, take steps to get rid of it at once. See also the reply to G. H. S.

GRAPE FRUIT: H. E. K. You will find a paragraph on this fruit (*Vitis rotundifolia*) on page 443. We do not think its cultivation in this country would be profitable, but if you wish to raise plants from the seeds you have imported, this may be possible provided you have got the conveniences of a hot-house.

HORTICULTURE: H. E. K. If you intend to commence business as a market gardener or nurseryman, your best plan would be to seek employment in some of the best market gardens or nurseries. During the time you are gaining practical experience you could study and attend classes in chemistry, botany and

physics. The nurserymen would give you a least a subsistence wage, and thus you might succeed in leaving your capital untouched until it is necessary to purchase a business.

HORTICULTURAL EXHIBITIONS: M. J. The difficulties you describe are not uncommon to those concerned in the management of exhibitions, whether horticultural or otherwise. In nearly all cases committees have found it necessary to have a rule that all produce exhibited by competitors shall have been in the possession of such exhibitors for a certain length of time previous to the exhibition. Having read your letter carefully, we think your best course would be to delete the word "such," as proposed, and adopt the additional rule marked "A," which will certainly give the committee all the power they require.

NAMES OF FLOWERS, FRUITS AND PLANTS.—We are anxious to oblige correspondents as far as we consistently can, but they must bear in mind that it is no part of our duty to our subscribers to name either flowers or fruits. Such work entails considerable labour, both of time and money, and cannot be allowed to disorganise the preparations for the weekly issue, or to encroach upon time required for the conduct of the paper. Correspondents should never send more than six plants or fruits at a time; they should be very careful to pack and label them properly to give every information as to the county the fruits are grown in, and to send ripe, or nearly ripe, specimens which show the character of the variety. By neglecting these precautions correspondents add greatly to our labour, and run the risk of delay and incorrect determinations. *Correspondents not answered in one issue are requested to be so good as to consult the following numbers.*

FRUITS: H. Anxious. Cheshunt Pippin.—*G. B., St. Donats.* 1, Reinette de Canada; 2, Durnelov's Seedling (syn.) Wellington, 3, Lord Kerby; 4, Cox's Pomona; 5, Beauty of Kent (a very fine fruit); 6, Golden Reinette.—*Devonian.* 1, Grange's Pearmain; 2, Sturmer Pippin; 3, Hamwell Souring; 4, Potts's Seedling; 5, P. W. Lemon Pippin; 6, Queen Caroline.—*J. C. W. & Sons.* 1, Harvey's Wiltshire Defiance; 2, Pile's Russet; 3, Reinette Van Mons.

PLANTS: M. E. A variety of the Common Capsicum, *Capsicum annum*.—*F. E. G.* Helixine Soleroia.—*W. J. F.* 1, Epiendrum ciliare; 2, Selaginella caulescens; 3, Cypripedium barbatum; 4, Carex japonica variegata; 5, Chlorophyllum elatum variegatum; 6, Begonia Gloire de Lorraine.

NUTS: Ignoramus. The seedling Filberts will bear fruits without any special treatment provided you thin out the growths, keeping the middle of the bushes from developing into a thicket. These Nuts are usually propagated by suckers, and these always fruit earlier than seedling plants. The seedlings may differ in various qualities from their parents and from each other, but suckers may be depended upon to reproduce the same variety as the bushes from which they are obtained.

PERSIMMON CULTURE: T. H. The Persimmon (*Diospyros virginiana*) is hardy in this country, and is found growing wild in the United States as far north as 38° lat. Trees sometimes reach a height of 80 feet. The Persimmon is readily propagated from seeds, but the plants should be budded or grafted when two or three years old. The Japanese Persimmon (*D. Kaki*) should be accommodated in a greenhouse, where it will fruit when about three years from the graft. In Kew Gardens the plant fruits in the succulent house, where it is—or was—planted out in one of the central beds. See also reply to *Essex* on p. 402 in the issue for December 5.

RHOODODENDRONS: H. R. C. For a succession of Rhododendrons you cannot do better than plant nobleanum, crimson, which flowers in February as a rule, though sometimes it is earlier, and is followed by Water's cascade (pink), altalerander (red), Ascot Brilliant (scarlet), Jackson's (rose-pink), Smith's album (white), Blanche superbe (white), Grand Arab (crimson), Fortunei (white, sweet-scented), Broughton's (red), Blandyanum (red), Cynthia (rose), George Hardy (white), Mrs. E. C. Stirling (bluish), and Pink Pearl (pink). These flower in succession in the order given, and carry the period of blooming to the end of May, when the bulk of the Rhododendrons

come into flower. Late sorts that bloom from about the middle of June are Alarm (white, with scarlet edge), B. W. Elliott (pink), Countess of Clancarty (red), multi-maculatum (white), Warrior (crimson), Mrs. J. Kelk (fine red), Sunshine (red), pictum (white), Maggie, Heywood (bluish-white), and Beauty of Bingshot (pink). These carry the period of flowering to about the end of the first week in July. The best plants to mix with Rhododendrons to stand well above them are some of the Liliums, more especially *L. auratum* and others that delight in a peaty soil. Some of the tall-growing Japanese Maples can also be used, the autumn tints of some of them contrasting well with the dark green of the Rhododendrons.

SALISFY: Woodston. What you send appears to be Salisfy; there are varieties of this vegetable, which may be the cause of the confusion.

SEAKALE: G. J., Loughton. There is no *Rhizoctonia* present on the plants. It is possible that the decay is being caused by the recently-described bacterial disease of the Seakale. Remove affected plants and burn them; dust the remaining plants over with flowers of sulphur.

SOIL: J. H. We cannot determine what affected the vines merely by examining a sample of the soil. We require specimens of the vine itself.

TULIP: F. A. The bulb has commenced to decay from some reason or another, and the check that caused this has also prevented the flower from developing so well as it ought to have done.

TULIPS AND DAFFODILS: G. B. We are unable to say what is the highest price recently obtained for a new variety of Tulip or Daffodil, but propagation of both bulbs being somewhat slow, novelties of extra merit always remain expensive for some considerable time after introduction to commerce. If you get the nurserymen's catalogues you may see the prices asked for the principal novelties.

VALLOTA PURPUREA: N. S. The Scarborough Lily is one of the most valuable bulbs for culture in the greenhouse. One has only to visit a cottagers' show in August, or see the plants flowering in a cottage window, to see how easily the plants may be grown. Yet many gardeners find it difficult to flower the bulbs successfully. The bulbs dislike too frequent repotting, yet they need attention all through the year, rather than merely at the time they are expected to flower. As with Nerines, so with Vallotas; the more root-bound the plants are the better they seem to bloom. The most suitable soil for them is a mixture of fibrous loam, a little leaf-mould, dried cow manure, and sand. When repotting is actually necessary, it may be done in June and July, or immediately after flowering. In other seasons the loose surface soil should be removed, and a top dressing applied of some compost as we have recommended for peatting, adding a large proportion of cow manure. The bulbs must not be dried off in winter, although the soil should not be kept so moist as when the plants are growing freely. Frequent applications of liquid manure will be beneficial to pot-bound plants during their period of active growth. At all times the plants should occupy a light position on a shelf near the roof glass in a cool house, and they must never be shaded. There are several varieties of the species, differing chiefly in the size and shade of colour of the blooms. The most distinct are major (large, reddish-scarlet flower), magna (a robust grower, having large flower, with a white throat), and a rather small-flowered form named minor. Considerable variation in the colour of the blooms has been obtained by crossing the Vallota with *Cyrtanthus sanguineus*, the offspring being known as *V. hybrids*. A few of the best flowers, and another with vermilion-coloured blooms, are most distinct.
